All State Engineering Services & PSUs Examinations

MECHANICAL ENGINEERING

Previous Years

Chapterwise Objective Solved Papers

Useful for : **UPSC ESE, UPSC JWM, UPPSC AE, UPRVUNL AE, UP Jal Nigam AE, UKPSC AE, UJVNL AE, HPPSC AE, BPSC AE, MPPSC AE, JPSC AE, CGPSC AE, WBPSC AE, RPSC AE, MPSC AE, OPSC AEE, GPSC AE, TSPSC AEE, APPSC AEE, TNPSC AE, KPSC AE, Nagaland PSC CTSE, Assam PSC, ISRO Scientist/Engineer, TRB Polytechnic Lect., BHEL ET, CIL MT, SJVN ET, VIZAG Steel MT, DRDO Scientist, Haryana PSC, Mizoram PSC, Oil India Ltd., NPCIL ET, Sikkim PSC, TANGEDCO AE, TSGENCO AE, Punjab PSC, RRB SSE.**

Compiled and Edited by
Er. Pradeep Kumar, Er. Shiv Sunder Singh,
Er. Bhupendra Pratap Singh, Er. Ashutosh Kumar

These ebooks are free of cost, Join our telegram channel: @apna_pdf

Edited and Published by A.K. Mahajan for YCT Publications Pvt. Ltd.
and printed by Om Sai Offset, Prayagraj. In order to publish the book,
full care has been taken by the editor and the publisher,
still your suggestions and queries are welcomed.
In the event of any dispute, the judicial area will be Prayagraj.

Rs. : 795/-

CONTENTS

- Mechanical Engineering Exam Syllabus 3-7
- Mechanical Engineering Exam Papers Analysis Chart 8-13
- Mechanical Engineering Exam Papers Pie Chart and Bar Graph 14-14
- Engineering Mechanics 15-156
  1. Forces and Force Systems 15
  2. Moments and Couples 46
  3. Friction 49
  4. Centroid, Centre of Gravity & Moment of Inertia 67
  5. Trusses and Beams 81
  6. Kinematics and Kinetics of Particles & Rigid Body 95
  7. Work, Power and Energy 117
  8. Principle of Virtual Work & Simple Machines 127
  9. Impulse, Momentum and Collision 131
  10. Simple Harmonic Motion and Projectile Motion 145
- Strength of Materials 157-443
  1. Simple Stress and Strain 157
  2. Principle Stress and Strain 211
  3. Shear Force and Bending Moment Diagram 236
  4. Bending Stresses and Shear Stresses in Beams 279
  5. Torsion of Shafts 313
  6. Thick and Thin Cylinders and Spheres 350
  7. Theory of Columns 369
  8. Strain Energy Method 387
  9. Deflection of Beams 395
  10. Theory of Failure 413
  11. Springs 424
- Theory of Machines 444-648
  1. Mechanisms and Machines 444
  2. Velocity and Acceleration Analysis 472
  3. Cams and Follower 488
  4. Gears and Gear Trains 495
  5. Belts, Ropes and Chains 545
  6. Brake and Dynamometer 558
  7. Static and Dynamic Forces Analysis 561
  8. Flywheel and Governors 566
  9. Balancing 587
  10. Gyroscope 600
  11. Vibrations 605
- Machine Design 649-743
  1. Design for Static and Dynamic Loading 649
  2. Design of Shafts, Keys and Couplings 667
  3. Design of Threaded Joints and Power Screws 679
  4. Design of Riveted and Welded Joints 695
  5. Design of Bearings, Brakes and Clutches 709
- Material Science 744-846
  1. Material Properties 744
  2. Atomic Structures, Crystallography and Phase Diagrams 757
  3. Mechanical Testing 789
  4. Heat Treatment Process 797
  5. Engineering Materials 811
- Production Technology 847-1131
  1. Metal Casting Processes 847
  2. Metal Joining Processes 880
  3. Metal Cutting Processes 910
  4. Machining and Machine Tool Operations 949
  5. Metal Forming Processes 1004
  6. Unconventional Manufacturing Methods 1040
  7. Numerical Control and Computer Numerical Control Systems 1060
  8. Jigs and Fixtures 1080
  9. Powder Metallurgy 1085
  10. Metrology 1088
- Mechatronics and Robotics 1132-1148
- Renewable Sources of Energy 1149-1152

Note : Thermodynamics, Power Plant, RAC, IC Engines, FM, HMT, Industrial Engineering Study Volume-II

सत्यमेव जयते

UPPSC

Uttar Pradesh Public Service Commission

Government of UP, Prayagraj

Combined State Engineering Services

(General Recruitment/Special Recruitment) Examination

Examination Pattern and Syllabus

The following two objective type papers will be for the Combined State Engineering Services Examination.

PAPER-I

Subject	No. of Questions	Marks	Total Marks	Time
General Hindi	25 (Each question of 3 marks)	75	375	2.30 Hours
Main Subject (Mech. Engg.-I)	100 (Each question of 3 marks)	300		

PAPER-II

Subject	No. of Questions	Marks	Total Marks	Time
General Studies	25 (Each question of 3 marks)	75	375	2.30 Hours
Main Subject (Mech. Engg.-II)	100 (Each question of 3 marks)	300		

Personal Examination (Interview) – 100 Marks

Total – 375 + 375 + 100 = 850 Marks

SYLLABUS

General Hindi – Hindi syllabus will be made in such a way that the candidates under standing of Hindi language and efficient use of words can be checked. Its level will be of high school.

General Studies – The question paper of General Studies will include information focusing on current events and their scientific aspects of such things which come in everyday experience and which can be expected from an educated person. The question paper will also included such questions in the history, politics and geography of India, to which candidates will be able to answer without special study.

MECHANICAL ENGINEERING

PAPER-I

1. **Engineering Mechanics:** Analysis of force systems, friction, cendtroid and centre of gravity, trusses and beams, principle of virtual work, kinematics and kinetics of particle, kinematics and kinetics of rigid bodies.
2. **Mechanisms and Machines:** Velocity and acceleration of links, cams and followers gears and gear trains clutches, belt drives, brakes and dynamometers, Flywheel and governors, balancing of rotating and reciprocating masses, balancing of multi cylinder engines, Free and forced vibration, damped vibration, whirling of shafts.

Search on Telegram @apna_pdf

3. **Mechanics of Solids:** Stresses and strains, compound stresses strains, Torsion of circular shafts, stresses and deflections in beams unsymmetrical bending, curved beams, Thin and thick cylinders and spheres, Buckling of columns, Energy methods, helical and leaf springs.

4. **Design of Machine Elements:** Design for Static and dynamic loading, Theories of failure, fatigue principles of design of rivetted, welded and bolted joints, shafts, springs, bearings, brakes, clutches and flywheels.

5. **Engineering Materials:** Crystal systems and crystallography, crystal imperfections, Alloys and phase diagrams,

   Heat treatment, ferrous and non ferrous metals and alloys, Mechanical properties and testing.

6. **Manufacturing:** Metal casting, metal forming, metal joining, Mechanics of metal cutting, machining and machine tool operations, unconventional machining methods limits, fits and tolerances, inspection: Surface roughness, comparators, computer integrated manufacturing, Flexible manufacturing systems, jigs and fixtures.

7. **Industrial Engineering:** Production, planning and control, inventory control and operation, research, CPM and PERT.

8. **Mechatronics and Robotics:** Microprocessors and microcontrollers, Architecture, Programming, Computer interfacing Programmable logic controller, sensors and actuators, Piezoelectric accelerometers, Hall effect sensors, optical encoder, resolver, Inductosyn, Pneumatic and Hydraulic Actuators, stepper motor, control system, mathematical modeling, control signals, controllability and observability, Robotics: Robot classification, robot specification. Notation: Direct and inverse kinematics homogeneous co-ordinates and arm equation of four axix SCARA Robot.

MECHANICAL ENGINEERING

PAPER-II

1. **Thermodynamics:** Thermodynamic systems and processes, properties of pure substances, concepts and applications of zeroth, first and second law of thermodynamics, entropy, availability and irreversibility, detailed analysis of thermodynamic cycles, ideal and real gases, fuels and combustion.

2. **Fluid Mechanics:** Basic concepts and properties of fluids, manometry, fluid statics, buoyancy, equations of motion, Bernoulli's equation and applications, viscous flow of incompressible fluids, laminar and turbulent flows, flow through pipes and head losses in pipes, dimensional analysis, Forces on immersed bodies and boundary layer over a flat plate, isentropic and adiabatic flows, normal shock waves.

3. **Heat Transfer:** Modes of heat transfer, steady and unsteady heat conduction, thermocouple time constant, critical thickness of insulation, heat transfer from fins, momentum and energy equations for boundary layer flow on a flat plate. Free and forced convection, radiation heat transfer, Stefan-Boltzmann law, shape factor, black and grey body radiation heat exchange, boiling and condensation, heat exchanger analysis, LMTD and NTU – effectiveness methods.

4. **Energy conversion:** SI and CI engines, performance characteristics and testing of IC engines, combustion phenomena in SI and CI engines, carburetion and fuel injection systems, emissions and emission control. Reciprocating and rotary pumps, pelton wheel, Francis and Kaplan turbines, velocity diagrams impulse and reaction principles steam and gas turbines; Rankine and Brayton cycles with regeneration and reheat, high pressure boilers, draft, condensers. Unconventional power systems, including nuclear, MHD, biomass, wind and tidal systems, utilization of solar energy; Reciprocating and rotary compressors; theory and applications, Theory of propulsions, pulsejet and ramjet engines.

5. **Environmental control:** Vapour compression, vapour absorption, steam jet and air refrigeration systems, properties of refrigerant and their nomenclature, psychometrics properties and processes, psychrometic relations, use of pschrometic chart, load estimation, supply air conditions, sensible heat factors, air conditioning system layout, comfort chart, comfort and industrial air conditioning.

ESE MECHANICAL ENGINEERING

Contents for syllabi of both the Papers together for Preliminary Examination/ Stage-I (objective type Paper–II) and separately for Main/ Stage-II Examination (Conventional type Paper-I and Paper – II).

PAPER–I

1. Fluid Mechanics:

Basic Concepts and Properties of Fluids, Manometry, Fluid Statics, Buoyancy, Equations of Motion, Bernoulli's equation and applications, Viscous flow of incompressible fluids, Laminar and Turbulent flows, Flow through pipes and head losses in pipes.

2. Thermodynamics and Heat transfer:

Thermodynamic systems and processes; properties of pure substance; Zeroth, First and Second Laws of Thermodynamics; Entropy, Irreversibility and availability; analysis of thermodynamic cycles related to energy conversion: Rankine, Otto, Diesel and Dual Cycles; ideal and real gases; compressibility factor; Gas mixtures.

Modes of heat transfer, Steady and unsteady heat conduction, Thermal resistance, Fins, Free and forced convection, Correlationsfor convective heat transfer, Radiative heat transfer – Radiation heat transfer co - efficient; boiling and condensation, Heat exchanger performance analysis.

3. IC Engines, Refrigeration and Air conditioning:

SI and CI Engines, Engine Systems and Components, Performance characteristics and testing of IC Engines; Fuels; Emissions and Emission Control. Vapour compression refrigeration, Refrigerants and Working cycles, Compressors, Condensers, Evaporators and Expansion devices, Other types of refrigeration systems like Vapour Absorption, Vapour jet, thermo electric and Vortex tube refrigeration. Psychometric properties and processes, Comfort chart, Comfort and industrial air conditioning, Load calculations and Heat pumps.

4. Turbo Machinery:

Reciprocating and Rotary pumps, Pelton wheel, Kaplan and Francis Turbines, velocity diagrams, Impulse and Reaction principles, Steam and Gas Turbines, Theory of Jet Propulsion – Pulse jet and Ram Jet Engines, Reciprocating and Rotary Compressors – Theory and Applications

5. Power Plant Engineering:

Rankine and Brayton cycles with regeneration and reheat, Fuels and their properties, Flue gas analysis, Boilers, steam turbines and other power plant components like condensers, air ejectors, electrostatic precipitators and cooling towers – their theory and design, types and applications;

6. Renewable Sources of Energy:

Solar Radiation, Solar Thermal Energy collection - Flat Plate and focusing collectors their materials and performance. Solar Thermal Energy Storage, Applications – heating, cooling and Power Generation; Solar Photovoltaic Conversion; Harnessing of Wind Energy, Bio-mass and Tidal Energy – Methods and Applications, Working principles of Fuel Cells.

PAPER–II

7 . Engineering Mechanics:

Analysis of System of Forces, Friction, Centroid and Centre of Gravity, Dynamics; Stresses and Strains - Compound Stresses and Strains, Bending Moment and Shear Force Diagrams, Theory of Bending Stresses - Slope and deflection-Torsion, Thin and thick Cylinders, Spheres.

8. Engineering Materials:

Basic Crystallography, Alloys and Phase diagrams, Heat Treatment, Ferrous and Non Ferrous Metals, Non metallic materials, Basics of Nano-materials, Mechanical Properties and Testing, Corrosion prevention and control

9. Mechanisms and Machines:

Types of Kinematics Pair, Mobility, Inversions, Kinematic Analysis, Velocity and Acceleration Analysis of Planar Mechanisms, CAMs with uniform acceleration and retardation, cycloidal motion, oscillating followers; Vibrations –

Search on Telegram @apna_pdf

Free and forced vibration of undamped and damped SDOF systems, Transmissibility Ratio, Vibration Isolation, Critical Speed of Shafts. Gears – Geometry of tooth profiles, Law of gearing, Involute profile, Interference, Helical, Spiral and Worm Gears, Gear Trains- Simple, compound and Epicyclic; Dynamic Analysis – Slider – crank mechanisms, turning moment computations, balancing of Revolving & Reciprocating masses, Gyroscopes –Effect of Gyroscopic couple on automobiles, ships and aircrafts, Governors.

10. Design of Machine Elements:

Design for static and dynamic loading; failure theories; fatigue strength and the S-N diagram; principles of the design of machine elements such as riveted, welded and bolted joints. Shafts, Spur gears, rolling and sliding contact bearings, Brakes and clutches, flywheels.

11. Manufacturing ,Industrial and Maintenance Engineering:

Metal casting-Metal forming, Metal Joining, Machining and machine tool operations, Limits, fits and tolerances, Metrology and inspection, computer Integrated manufacturing, FMS, Production planning and Control, Inventory control and operations research – CPM-PERT. Failure concepts and characteristics-Reliability, Failure analysis, Machine Vibration, Data acquisition, Fault Detection, Vibration Monitoring, Field Balancing of Rotors, Noise Monitoring, Wear and Debris Analysis, Signature Analysis, NDT Techniques in Condition Monitoring.

12. Mechatronics and Robotics:

Microprocessors and Microcontrollers: Architecture, programming, I/O, Computer interfacing, Programmable logic controller. Sensors and actuators, Piezoelectric accelerometer, Hall effect sensor, Optical Encoder, Resolver, Inductosyn, Pneumatic and Hydraulic actuators, stepper motor, Control Systems - Mathematical modeling of Physical systems, control signals, controllability and observability. Robotics, Robot Classification, Robot Specification, notation; Direct and Inverse Kinematics; Homogeneous Coordinates and Arm Equation of four Axis SCARA Robot.

GATE MECHANICAL ENGINEERING

Section 1: Engineering Mathematics

Linear Algebra: Matrix algebra, systems of linear equations, eigen values and eigenvectors.

Calculus: Functions of single variable, limit, continuity and differentiability, mean value theorems, indeterminate forms; evaluation of definite and improper integrals; double and triple integrals; partial derivatives, total derivative, Taylor series (in one and two variables), maxima and minima, Fourier series; gradient, divergence and curl, vector identities, directional derivatives, line, surface and volume integrals, applications of Gauss, Stokes and Green's theorems.

Differential equations: First order equations (linear and nonlinear); higher order linear differential equations with constant coefficients; Euler-Cauchy equation; initial and boundary value problems; Laplace transforms; solutions of heat, wave and Laplace's equations.

Complex variables: Analytic functions; Cauchy-Riemann equations; Cauchy's integral theorem and integral formula; Taylor and Laurent series.

Probability and Statistics: Definitions of probability, sampling theorems, conditional probability; mean, median, mode and standard deviation; random variables, binomial, Poisson and normal distributions.

Numerical Methods: Numerical solutions of linear and non-linear algebraic equations; integration by trapezoidal and Simpson's rules; single and multi-step methods for differential equations.

Section 2: Applied Mechanics and Design

Engineering Mechanics: Free-body diagrams and equilibrium; friction and its applications including rolling friction, belt-pulley, brakes, clutches, screw jack, wedge, vehicles, etc.; trusses and frames; virtual work; kinematics and dynamics of rigid bodies in plane motion; impulse and momentum (linear and angular) and energy formulations; Lagrange's equation.

Mechanics of Materials: Stress and strain, elastic constants, Poisson's ratio; Mohr's circle for plane stress and plane strain; thin cylinders; shear force and bending moment diagrams; bending and shear stresses; concept of shear centre; deflection of beams; torsion of circular shafts; Euler's theory of columns; energy methods; thermal stresses; strain gauges and rosettes; testing of materials with universal testing machine; testing of hardness and impact strength.

Search on Telegram @apna_pdf

Theory of Machines: Displacement, velocity and acceleration analysis of plane mechanisms; dynamic analysis of linkages; cams; gears and gear trains; flywheels and governors; balancing of reciprocating and rotating masses; gyroscope.

Vibrations: Free and forced vibration of single degree of freedom systems, effect of damping; vibration isolation; resonance; critical speeds of shafts.

Machine Design: Design for static and dynamic loading; failure theories; fatigue strength and the SN diagram; principles of the design of machine elements such as bolted, riveted and welded joints; shafts, gears, rolling and sliding contact bearings, brakes and clutches, springs.

Section 3: Fluid Mechanics and Thermal Sciences

Fluid Mechanics: Fluid properties; fluid statics, forces on submerged bodies, stability of floating bodies; control-volume analysis of mass, momentum and energy; fluid acceleration; differential equations of continuity and momentum; Bernoulli's equation; dimensional analysis; viscous flow of incompressible fluids, boundary layer, elementary turbulent flow, flow through pipes, head losses in pipes, bends and fittings; basics of compressible fluid flow.

Heat-Transfer: Modes of heat transfer; one dimensional heat conduction, resistance concept and electrical analogy, heat transfer through fins; unsteady heat conduction, lumped parameter system, Heisler's charts; thermal boundary layer, dimensionless parameters in free and forced convective heat transfer, heat transfer correlations for flow over flat plates and through pipes, effect of turbulence; heat exchanger performance, LMTD and NTU methods; radiative heat transfer, Stefan- Boltzmann law, Wien's displacement law, black and grey surfaces, view factors, radiation network analysis

Thermodynamics: Thermodynamic systems and processes; properties of pure substances, behavior of ideal and real gases; zeroth and first laws of thermodynamics, calculation of work and heat in various processes; second law of thermodynamics; thermodynamic property charts and tables, availability and irreversibility; thermodynamic relations.

Applications: Power Engineering: Air and gas compressors; vapour and gas power cycles, concepts of regeneration and reheat. I.C. Engines: Air-standard Otto, Diesel and dual cycles. Refrigeration and air-conditioning: Vapour and gas refrigeration and heat pump cycles; properties of moist air, psychrometric chart, basic psychrometric processes. Turbomachinery: Impulse and reaction principles, velocity diagrams, Pelton-wheel, Francis and Kaplan turbines; steam and gas turbines.

Section 4: Materials, Manufacturing and Industrial Engineering

Engineering Materials: Structure and properties of engineering materials, phase diagrams, heat treatment, stress-strain diagrams for engineering materials.

Casting, Forming and Joining Processes: Different types of castings, design of patterns, moulds and cores; solidification and cooling; riser and gating design. Plastic deformation and yield criteria; fundamentals of hot and cold working processes; load estimation for bulk (forging, rolling, extrusion, drawing) and sheet (shearing, deep drawing, bending) metal forming processes; principles of powder metallurgy. Principles of welding, brazing, soldering and adhesive bonding.

Machining and Machine Tool Operations: Mechanics of machining; basic machine tools; single and multi-point cutting tools, tool geometry and materials, tool life and wear; economics of machining; principles of non-traditional machining processes; principles of work holding, jigs and fixtures; abrasive machining processes; NC/CNC machines and CNC programming.

Metrology and Inspection: Limits, fits and tolerances; linear and angular measurements; comparators; interferometry; form and finish measurement; alignment and testing methods; tolerance analysis in manufacturing and assembly; concepts of coordinate-measuring machine (CMM).

Computer Integrated Manufacturing: Basic concepts of CAD/CAM and their integration tools; additive manufacturing.

Production Planning and Control: Forecasting models, aggregate production planning, scheduling, materials requirement planning; lean manufacturing.

Inventory Control: Deterministic models; safety stock inventory control systems.

Operations Research: Linear programming, simplex method, transportation, assignment, network flow models, simple queuing models, PERT and CPM.

01.

ENGINEERING MECHANICS

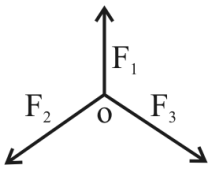
1. Forces and Force Systems

1. The forces, which meet at one point and their lines of action also lie on the same plane, are known as

(a) coplanar concurrent forces
(b) coplanar non-concurrent forces
(c) non-coplanar concurrent forces
(d) non-coplanar non-concurrent forces

Assam PSC AE (IWT) 14.03.2021
Oil India Limited Sr. Engineer (Drilling) 30.11.2019
KPCL AE 2016
MPPSC State Forest Service Exam, 2014

Ans. (a) : Coplanar Concurrent Forces–The forces which meet at one point and their lines of action also lie on the same plane, are called coplanar concurrent forces.



Coplanar Non-Concurrent Forces–The forces which do not meet at one point but their lines action lie on the same plane are known as coplanar non-concurrent forces.

Non-Coplanar Concurrent Forces–The forces which meet at one point but their line of action do not lie on the same plane are known as non coplanar concurrent forces.

Non Coplanar Non Concurrent Forces–The forces which do not meet at one point and their line of actions also do not lie on the same plane.

2. Non coplanar concurrent forces are those where

(a) All forces do not lie in one plane and their lines of action intersect at more than one point
(b) All forces are parallel to each other and lie in single plane
(c) All forces do not lie in one plane but their lines of action pass through one point
(d) All forces lie in one plane but their lines of action pass through one point

CGPSC AE 15.01.2021
Rajasthan Nagar Nigam AE 2016, Shift-II
VIZAG STEEL MT - 2011

Ans. (c) : Non Coplanar Forces : Those forces which are not acting from a same plane.

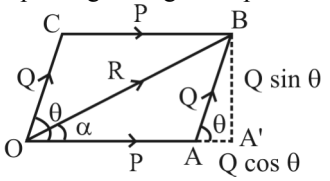
Concurrent Forces– A set of points forces is considered concurrent if all the lines of action of those forces meet come together at single point.
Coplanar Forces–Those forces which are acting in same plane.

3. If the resultant of two forces P and Q acting at an angle θ, makes an angle α with the force P, then

(a) $\tan\alpha = P\sin\theta / (P + Q\cos\theta)$
(b) $\tan\alpha = P\cos\theta / (P + Q\cos\theta)$
(c) $\tan\alpha = Q\sin\theta / (P + Q\cos\theta)$
(d) $\tan\alpha = Q\cos\theta / (P + Q\cos\theta)$

GPSC Engineer, Class – II Pre-19.01.2020
HPPSC AE 2018
APPSC AE Subordinate Service Civil/Mech. 2016
APPSC AEE Mains (Civil Mechanical) 2016
Assam PSC CCE Pre 2015
CSE Pre-1998

Ans. (c) : Parallelogram Law of Forces– "If two forces acting at a point can be represented in magnitude and direction by the two adjacent sides of parallelogram then their resultant is represented in magnitude and direction by the two adjacent sides of parallelogram then their resultant is represented in magnitude and direction by the diagonal of the parallelogram passing through that point."



If the angle between the force is θ, then

$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$$

The direction of resultant with P will be

$$\alpha = \tan^{-1}\left[\frac{Q\sin\theta}{P + Q\cos\theta}\right]$$

4. Which of the following states, "If a number of coplanar forces are acting simultaneously on a particle, the algebraic sum of the moments of all the forces about any point is equal to the moment of their resultant force about the same point"?

(a) Lami's theorem
(b) Varignon's principle
(c) Principle of super-position
(d) D' Alembert Principle

VIZAG MT, 14.12.2020
HPPSC AE 2018
Vizag Steel (MT) 2017
TSPSC AEE 2015
Kerala LBS Centre For Science & Tech. Asstt. Prof. 2014

Search on Telegram @apna_pdf

Ans. (b) : Varignon's Theorem–It states that if a number of coplanar forces are acting simultaneously on a particle the algebraic sum of the moments of all the forces about any point is equal to the moment of their resultant force about the same point.

5. According to Lami's theorem :

(a) three forces acting at a point will be in equilibrium

(b) three forces acting at a point can be represented by a triangle, each side being proportional to force.

(c) If three forces acting at a point are in equilibrium, each force is proportional to the sine of the angle between the other two

(d) If three forces acting upon a particle are represented in magnitude and direction by the side of a triangle, taken in order, they will be in equilibrium.

CGPSC AE 15.01.2021
WBPSC AE, 2017
GPSC Executive Engg. 23.12.2018

Ans. (c) : According to Lami's theorem,

If three forces acting at a point are in equilibrium each force is proportional to the sine of the angle between the other two.

6. The Lami's Theorem is applicable only for _____ force system.

(a) Non-coplanar and Non-concurrent

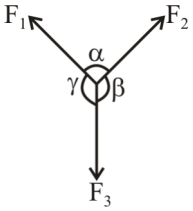
(b) Coplanar and concurrent

(c) Non-coplanar and concurrent

(d) Coplanar and non-concurrent

VIZAG Steel MT 24.01.2021
TRB Polytechnic Lecturer 2017
GMB AAE 25.06.2017

Ans. (b) : The Lami's theorem is applicable only for coplanar and concurrent.



$$\frac{F_1}{\sin\beta} = \frac{F_2}{\sin\gamma} = \frac{F_3}{\sin\alpha}$$

7. If the resultant of two equal forces has the same magnitude as either of the forces, then the angle between the two forces is :

(a) 30° (b) 60°

(c) 90° (d) 120°

HPPSC Poly. Lect. 05.07.2021
Vadodara Muncipal Corp. DEE, 2018
PTCUL AE 25.06.2017
Assam PSC CCE Pre 2015
TSPSC Managers, 2015
Kerala LBS Centre For Science & Tech. Asstt. Prof. 2014
J&K PSC Civil Services Pre, 2010

Ans. (d) : Given, Resultant of two forces has same magnitude

$$R = F$$

or $F_1 = F_2 = F$

We know that,

$$R = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos\theta}$$

$$R = \sqrt{F^2 + F^2 + 2F^2\cos\theta}$$

$$F = \sqrt{2F^2 + 2F^2\cos\theta}$$

$$2F^2 + 2F^2\cos\theta = F^2$$

$$2F^2\cos\theta = F^2 - 2F^2$$

$$2F^2\cos\theta = -F^2$$

$$\cos\theta = -\frac{1}{2} = \cos 120°$$

$$\boxed{\theta = 120°}$$

8. A force is completely defined when we specify

(a) Magnitude (b) Direction

(c) Point of application (d) All of the above

CGPSC AE 15.01.2021
APPSC Poly. Lect Automobile Engg. 2020
OPSC AEE 2015 PAPER-I
UKPSC AE 2007 Paper -I

Ans. (d) : Force is a vector quantity

A force is completely defined when we specify

(i) Magnitude

(ii) Direction

(iii) Point of Application

9. A force which combines two or more forces to produce equilibrium is called

(a) resultant (b) equilibrant

(c) couple (d) moment

HPPSC Poly. Lect. 05.07.2021
Assam PSC CCE Pre 2015

Ans. (b) : A force which combines two or more forces to produce equilibrium is called equilibrant.

10. According to principle of transmissibility of forces, the effect of a force upon a body is

(a) maximum when it acts at the centre of gravity of a body

(b) different at different points in its line of action

(c) the same at every point in its line of action

(d) minimum when it acts at the C.G. of the body

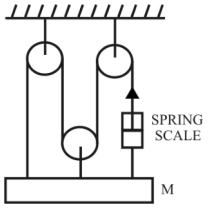
Karnataka PSC AE (WRD) 31.07.2021
GPSC DEE, Class-II (GWSSB) 04.07.2021
TRB Asstt. Prof., 2012
UKPSC AE 2013 Paper-I

Ans. (c) : Principal of transmissibility–

The state of rest or of motion of a rigid body is unaltered if a force acting on the body is replaced by another force of the same magnitude and direction but acting anywhere on the body along the line of action of the applied forces.

Search on Telegram @apna_pdf

11. A spring scale indicates a tension T in the right-hand cable of the pulley system shown in the figure. Neglecting the mass of the pulleys and ignoring friction between the cable and the pulley the mass M is :

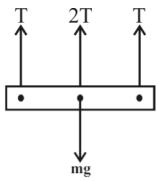


(a) $\frac{2T}{g}$ (b) $\frac{T(1+e^{4x})}{g}$

(c) $\frac{4T}{g}$ (d) None of the above

Vadodara Muncipal Corp. DEE, 2018
UPRVUNL AE 2014
OPSC Civil Services Pre. 2011
GATE 1995

Ans. (c) :



By resolving vertical forces, $\Sigma F_v=0$

$\Rightarrow T + 2T + T = mg$

$\Rightarrow 4T = mg$

$\Rightarrow \boxed{m = \frac{4T}{g}}$

12. Two equal forces equal to P inclined at θ will have their resultant with the angle with one of the force as:

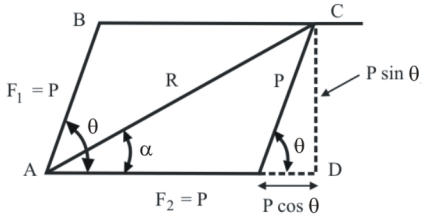
(a) 2 P cos $\frac{\theta}{2}$ and $\frac{\theta}{2}$ (b) 2 P cos $\frac{\theta}{2}$ and 2θ

(c) P cosθ and θ (d) P cos $\frac{\theta}{2}$ and $\frac{\theta}{2}$

APPSC Poly Lect. 13.03.2020
TNPSC AE 2018
JUVNL AEE (GTO) 05.03.2017
J&K PSC Civil Services Pre, 2013
VIZAG STEEL MT 2011
WBPSC AE 2003
CGPSC AE 26.04.2014 Shift-I

Ans. (a) : $F_1 = F_2 = P$

The angle between F_1 & F_2 is θ and angle between Resultant & force is α.



from $\angle ACD \rightarrow$

$(AC)^2 = (AD)^2 + (CD)^2$

$R^2 = (P + P\cos\theta)^2 + (P\sin\theta)^2$

$R^2 = [P^2 + P^2\cos^2\theta + 2P^2\cos\theta] + P^2\sin^2\theta$

$= P^2 + 2P^2\cos\theta + P^2(\sin^2\theta + \cos^2\theta)$

$= P^2 + 2P^2\cos\theta + P^2 \quad [\because \sin^2\theta + \cos^2\theta = 1]$

$= 2P^2 + 2P^2\cos\theta$

$= 2P^2(1 + \cos\theta) \quad [\because \cos\theta = 2\cos^2\theta/2 - 1]$

$= 2P^2(1 + 2\cos^2\theta/2 - 1)$

$= 4P^2\cos^2\theta/2$

$R = \sqrt{4P^2\cos^2\theta/2}$

$\boxed{R = 2P\cos\theta/2}$

$\tan\alpha = \frac{CD}{[AE + ED]} = \frac{P\sin\theta}{P + P\cos\theta} = \frac{\sin\theta}{1 + \cos\theta}$

$\tan\alpha = \frac{2\sin\theta/2\cos\theta/2}{1 + 2\cos^2\theta/2 - 1} \quad \because \sin\theta = 2\sin\theta/2\cos\theta/2$

$= \frac{\sin\theta/2}{\cos\theta/2}$

$\tan\alpha = \tan\theta/2$

$\boxed{\alpha = \theta/2}$

13. A system of masses rotating in different parallel planes is in dynamic balance if-

(a) Resultant force is zero
(b) resultant couple is zero
(c) resultant force in numerically equal to resultant couple
(d) resultant force and the resultant couple both are equal to zero

ISRO Scientist/Engineer 12.05.2013
ISRO Scientist/Engineer 2006

Ans. (d) : Dynamic Balance:-When a system of masses rotating in different parallel planes.

Its, $\Sigma F = 0, \Sigma M = 0$

Static Balance:-When a system of mass rotating in same plane.

$\Sigma F = 0$ only.

14. If a distributed force system on a beam is replaced by its statically equivalent force system, which of the following is same for both the beams?

(a) Support reactions
(b) Shear force diagram
(c) Bending moment diagram
(d) Maximum bending moment

UPPSC AE 13.12.2020, Paper-I

Ans. (a) : Support reactions.

Search on Telegram @apna_pdf

15. The free body diagram of a body shows the body ..... .

(a) with its surrounding and external forces acting on it.
(b) isolated from all external effects.
(c) isolated from its surrounding.
(d) isolated from its surroundings and all external actions acting upon it.

GWSSB DEE 07.07.2016

Ans. (d) : The free body diagram of a body shows the body isolated from its surroundings and all external actions acting upon it.

16. Dimensions for moment of momentum are

(a) $FL^{-1}T^{-1}$ (b) FLT
(c) FL^{-1} (d) FLT^{-1}

HPPSC Poly. Lect. 05.07.2021

Ans. (b) : Moment of Momentum = Angular momentum.
Angular momentum = mvr

$$= \text{kg-}\frac{\text{m}}{\text{sec}}\text{-m}$$

$$= \left(\frac{\text{kg - m}}{\text{sec}^2}\right)\text{m} \times \text{sec}$$

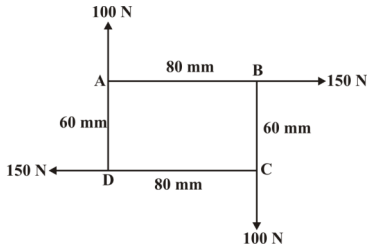
Moment of momentum = [F L T]

17. A rectangle ABCD has sides AB = CD = 80 mm and BC = DA = 60 mm. Forces of 150 N each act along AB and CD, and forces of 100 N each act along BC and DA. The resultant moment of the force system is

(a) 9000 Nmm (b) 8000 Nmm
(c) 1000 Nmm (d) 17000 Nmm

HPPSC Poly. Lect. 05.07.2021

Ans. (d) :



Resultant moment of force system,

$\Sigma M_D = 100 \times 80 + 150 \times 60$
$= 8000 + 9000$
$= 17000$ N-mm

18. Consider the following statements

1. Light year is a unit of time.
2. Momentum and impulse have the same units
3 A body falling freely under gravitational force has no weight

Which of these is / are false statement / statements?

(a) 1 only (b) 2 and 3
(c) 1 and 3 (d) 1 and 2

HPPSC Poly. Lect. 05.07.2021

Ans. (a) : Light year is a unit of distance.

19. Given that $\vec{P}+\vec{Q}=\vec{R}$ and also P = Q = R. Then the angle between vectors $\vec{P}$ and $\vec{Q}$ is

(a) 0 (b) P
(c) $\frac{2\pi}{3}$ (d) $\frac{\pi}{3}$

HPPSC Poly. Lect. 05.07.2021

Ans. (c) : Given,

$$P = Q = R$$

$$R = \sqrt{P^2 + Q^2 + 2PQ\ \cos\theta}$$

$$P = \sqrt{P^2 + P^2 + 2P^2\ \cos\theta}$$

$$P^2 = 2P^2\ (1 + \cos\theta)$$

$$\cos\theta = -\frac{1}{2}$$

$$\theta = \frac{2\pi}{3} \text{ radian}$$

20. All of the following are correct statements, except

(a) Force is a vector quantity whereas displacement is a scalar quantity
(b) Space is a region which extends in all directions and contains everything in it
(c) The member of base and supplementary units in SI system are seven and two respectively
(d) The unit of amount of substance in SI system is called mole

HPPSC Poly. Lect. 05.07.2021

Ans. (a) : Force and displacement both are vector quantity, whereas distance is scalar quantity.

21. Which of the followings is the supplementary unit in SI system?

(a) ampere (b) candela
(c) radian (d) mole

HPPSC Poly. Lect. 05.07.2021

Ans. (c) : radian

22. The resultant of two forces P and Q is R. If one of the forces is reversed in direction, the resultant is S. Then for the identity $R^2 + S^2 = 2(P^2 + Q^2)$ to hold good,

(a) forces are inclined at 60° to each other
(b) forces are collinear
(c) forces act at right angles to each other
(d) forces can have any angle of inclination between them

HPPSC Poly. Lect. 05.07.2021

Ans. (d) : Given,

$$\vec{R} = \vec{P} + \vec{Q} \quad \text{.....(i)}$$

After reversing direction of one force (Q) we get

$$\vec{S} = \vec{P} - \vec{Q} \quad \text{.....(ii)}$$

Let angle between P & Q be θ
So, resultant

$$R^2 = P^2 + Q^2 + 2PQ\cos\theta \quad \text{.....(iii)}$$

Search on Telegram @apna_pdf

$S^2 = P^2 + (-Q)^2 - 2PQ\cos\theta$ .....(iv)

Adding equation (iii) & (iv)

$$\boxed{R^2 + S^2 = 2\left(P^2 + Q^2\right)}$$

So, the identity does not depends on angle θ.

Hence, forces can have any angle of inclination (θ) between them.

23. Identify the wrong statement about matter, particle and body

(a) A body exhibits no relative deformation between two parts when it is acted upon by a force system

(b) Matter is anything that occupies space, possesses mass and offer resistance to any external force

(c) A particle is a body of infinitely small volume and its mass is considered to be concentrated at a point

(d) A body has definite shape and consists of number of particles

HPPSC Poly. Lect. 05.07.2021

Ans. (a) : A body exhibits no relative deformation between two parts when it is acted upon by a force system

24. Newton's first law of motion gives the concept of

(a) Force (b) Inertia

(c) Energy (d) Work

HPPSC Poly. Lect. 05.07.2021

Ans. (b) : Inertia

25. All of the following are scalar quantities except

(a) Energy (b) Temperature

(c) Time (d) Displacement

HPPSC Poly. Lect. 05.07.2021

Ans. (d)

(i) Scalar quantities– Distance, speed, time, temperature etc.

(ii) Vector quantities– Displacement, force, acceleration etc.

26. For analysis purposes, a body can be modeled as rigid if:

(a) It has continuous distribution of mass.

(b) Its dimensions are small compared with the coordinates describing its motion

(c) Relative deformation between its parts is negligible

(d) It is characterized by some preferred configuration of its own

HPPSC Poly. Lect. 05.07.2021

Ans. (c) : For analysis purposes, a body can be modeled as rigid if Relative deformation between its parts is negligible.

27. Two forces of magnitude $\sqrt{2}$ N and 2 N act at origin, each making 60^0 and 30^0 respectively with positve x axis. The angle made by their resultant with positive x axis will be

(a) 12.36^0 (b) 42.36^0

(c) 72.36^0 (d) 57.36^0

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : Given,

$F_1 = 2$ N

$F_2 = \sqrt{2}$ N

$F_x = F_1 \cos 30° + F_2 \cos 60°$

$= 2 \cos 30° + \sqrt{2} \cos 60°$

$F_x = 2.439$ N

$F_y = F_1 \sin 30° + F_2 \sin 60°$

$= 2 \sin 30° + \sqrt{2} \sin 60°$

$= 2.224$ N

The angle 'θ' made by resultant with positive x-axis,

$$\tan\theta = \frac{F_y}{F_x} = \frac{2.224}{2.439}$$

$\theta = \tan^{-1}(0.911)$

$\boxed{\theta = 42.36^0}$

28. A body is in equilibrium under action of three forces. The forces acting on it can be analyzed by

(a) Lami's theorem only

(b) Resolution of forces method only

(c) Either by Lami's theorem or by resolution of forces method

(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : A body is in equilibrium under action of three forces. The forces acting on it can be analyzed by either by Lami's theorem or by resolution of forces method.

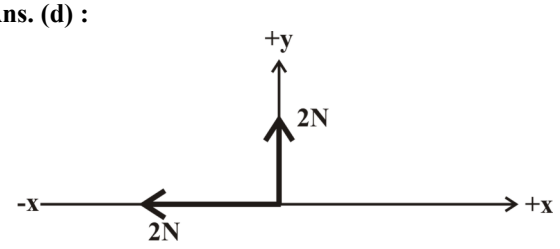
29. A force of 2 N acts along positive y-axis and another force 2N acts along negative x-axis. The angle made by their resultant with positive x-axis will be

(a) 0^0 (b) 45^0

(c) 225^0 (d) 135^0

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) :



$F_x = -2$N

$F_y = +2$N

The angle θ made by their resultant with positive x-axis will be,

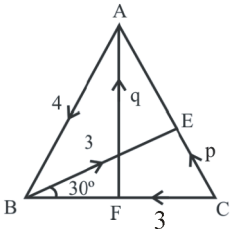
$$\tan\theta = \frac{F_y}{F_x} = \frac{+2}{-2}$$

$\tan\theta = -1$

$\boxed{\theta = 135°}$

Search on Telegram @apna_pdf

30. E and F are the mid points of sides CA and CB respectively of an equilateral triangle ABC. Forces 3, p, 3, 4, q are acting at A in the direction of the lines BE, CA, CB, AB and FA respectively.
(all forces are in Newtons)



Find the values of p and q in order that the system may be in equilibrium.

(a) p = –4.80, q = 6.12 (b) p = 4.80, q = –6.12
(c) p = 6.12, q = –4.80 (d) p = –6.12, q = 4.80

Karnataka PSC Lect., 27.05.2017

Ans (a) : $\Sigma F_v = 0$
$\Rightarrow q + p \sin60^\circ + 3 \sin30^\circ - 4 \sin60^\circ$
$\Rightarrow q + p \sin60^\circ = 1.964$
$\Rightarrow q + 0.866p = 1.964$…….(i)
$\Sigma F_H = 0$
$\Rightarrow 3 \cos30^\circ = p \cos60^\circ + 4 \cos60^\circ + 3$
$\boxed{p = -4.80}$
By using equation (i)
$q = 1.964 - 0.866(-4.80)$
$\boxed{q = 6.12}$

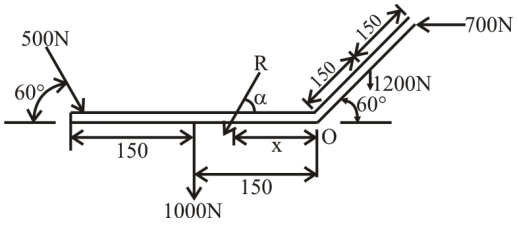
31. The unit of a physical quantity which does not depend on the unit of any other physical quantity is called

(a) independent dimension.
(b) fundamental dimension.
(c) core dimension.
(d) All of the above

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : The unit of a physical quantity which does not depend on the unit of any other physical quantity is called fundamental dimension.

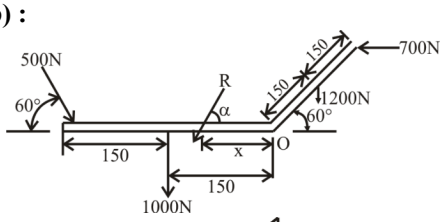
32. The system of forces acting on a bell crank is shown figure. Determine the magnitude of the resultant.

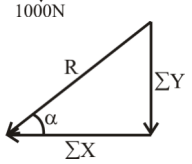


(a) 567 N (b) 2671 N
(c) 1680 N (d) 1232 N

Oil India Senior Officer 23.12.2020

Ans. (b) :





$R_X = \Sigma X = 500\cos60^\circ - 700$
$= -450$ N
$R_Y = \Sigma Y = -1200 - 1000 - 500\sin60^\circ$
$= -2633.01$
$R = \sqrt{(-450)^2 + (-2633.01)^2}$
$\boxed{R = 2671.19\,N}$

33. The resultant of two forces, one of which is double the other is 260 N. If the direction of the larger force is reversed and the other remain unaltered, the magnitude of the resultant reduces to 180 N. Determine the magnitude of the forces.

(a) 50 N, 200 N (b) 50 N, 100 N
(c) 300 N, 100 N (d) 100 N, 200 N

Oil India Senior Officer 23.12.2020

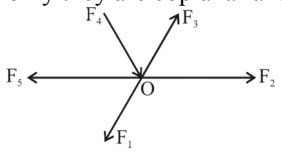
Ans. (d) : Let the forces be of magnitude P & 2P then,
$P^2 + (2P)^2 + 2P \times 2P\cos\theta = (260)^2$ .....(i)
And similarly when larger force is reversed
$P^2 + (-2P)^2 + 2(P)(-2P)\cos\theta = (180)^2$
$P^2 + 4P^2 - 4P^2\cos\theta = (180)^2$ .....(ii)
Adding equation (i) & (ii)
$2P^2 + 8P^2 = 260^2 + 180^2$
$10P^2 = 100000$
$P^2 = 10000$
$P = 100$
Larger force = 2P = 200
Hence, magnitude of the forces are 100 N & 200 N.

34. Three forces acting on a body can keep it in an equilibrium, only when they are _____.

(a) coplanar an non-concurrent
(b) non-coplanar and non-concurrent
(c) coplanar and concurrent
(d) non-coplanar and concurrent

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) : Three forces acting on a body can keep it in an equilibrium, only they are coplanar and concurrent.



Coplanar concurrent

- The forces which meet at one point and their lines of action also lie on the same plane.

Search on Telegram @apna_pdf

35. A 100 N force acts from point A (0, 0, 0) to point B (1, 1, 1). The force vector is represented by

(a) $100\left(\bar{i}+\bar{j}-\bar{k}\right)$ (b) $\frac{100}{\sqrt{3}}\left(\bar{i}+\bar{j}-\bar{k}\right)$

(c) $\frac{100}{\sqrt{3\left(\bar{i}+\bar{j}+\bar{k}\right)}}$ (d) $\frac{100}{\sqrt{3\left(\bar{i}+\bar{j}-\bar{k}\right)}}$

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (b) : Given, F = 100 N

Point A(0, 0, 0) and B(1, 1, 1)

Unit vector AB $=\frac{\hat{i}+\hat{j}+\hat{k}}{\sqrt{3}}$

The force vector is given by –

$$\vec{F}=100\left(\frac{\hat{i}+\hat{j}+\hat{k}}{\sqrt{3}}\right)$$

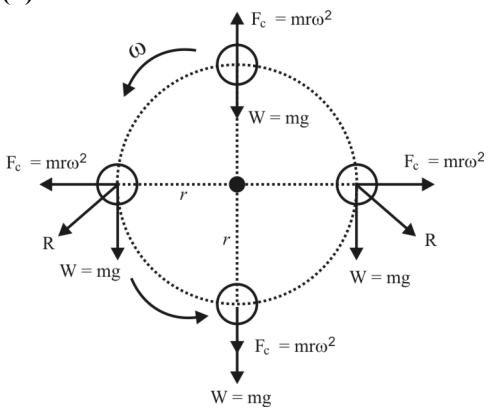
$$\boxed{\vec{F}=\frac{100}{\sqrt{3}}\left(\hat{i}+\hat{j}+\hat{k}\right)}$$

36. A stone of mass m at the end of a string of length *l* is whirled in a vertical circle at a constant speed. The tension in the string will be maximum when the stone is-

(a) At the top of the circle
(b) Half-way down from the top
(c) Quarter-was down from the top
(d) At the bottom of the circle

ISRO Scientist/Engineer 2006
ISRO Scientist/Engineer 2008
GPSC Executive Engg. 23.12.2018
GATE 1994

Ans. (d) :



From this fig.

At bottom the tension in string will be maximum because of both weight of stone and centrifugal force acting in downward direction

$T_{bottom} = mg + mr\omega^2$

At the top of circle the tension in string will be

$T_{Top} = mr\omega^2 - mg$ $\rightarrow$ (minimum)

37. The product of mass and acceleration of the fluid is

(a) Gravity force (b) Viscous force
(c) Inertia force (d) Elastic force

TNCSC AE 2020

Ans. (c) : Inertia force–The inertia force acting on a fluid is equal in magnitude to the mass of the element multiplied by its acceleration.

38. A force which is gradually applied and does NOT change in magnitude and direction with respect to time is called.

(a) dynamic load (b) pressing load
(c) static load (d) variable load

UPRVUNL AE 05.07.2021

Ans. (c) : A force which is gradually applied and does not change in magnitude and direction with respect to time is called static load.

39. When number of forces act simultaneously on a particle, then the resultant of these forces will have the same effect as produced by the all the forces. This is known as the principle of _____

(a) Physical independence of forces
(b) resolution of forces
(c) weight of forces
(d) transmissibility of forces

UPRVUNL AE 05.07.2021

Ans. (b) : The physical Independence of principle-It states that the effect of force on a body is not affected by the presence of other forces.

Principle of Resolution- It states, "The algebraic sum of the resolved parts of a number of forces in a given direction is equal to the resolved part of their resultant in the same direction".

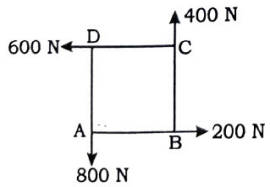
40. If three _____forces are acting on a body and the body is in equilibrium, then the resultant of two forces should be equal and opposite to the third.

(a) non coplanar and non concurrent
(b) parallel and coplanar
(c) concurrent
(d) non concurrent and coplanar

HPPSC Workshop Suptd. 08.07.02021

Ans. (c) : If three concurrent forces are acting on a body and the body is in equilibrium, then the resultant of two forces should be equal and opposite to the third.

41. Four forces having magnitudes of 200 N, 400 N, 600 N and 800 N respectively acting along four sides (1m each) of a square ABCD as shown in Figure. Determine the magnitude and direction of the resultant force from A along the line AB.



Search on Telegram @apna_pdf

(a) $400\sqrt{3}$N, 3.2m from A

(b) $400\sqrt{2}$N, 2.5m from A

(c) $300\sqrt{2}$N, 2m from A

(d) $300\sqrt{3}$N, 2.5m from A

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : $F_x = 600 - 200\ (\leftarrow)$

$F_x = 400$ N $(\leftarrow)$

$F_y = 800 - 400\ (\downarrow)$

$F_y = 400$ N $(\downarrow)$

Resultant force,

$$F_R = \sqrt{F_x^2 + F_y^2}$$

$$= \sqrt{(400)^2 + (400)^2}$$

$$\boxed{F_R = 400\sqrt{2}\ \text{N}}$$

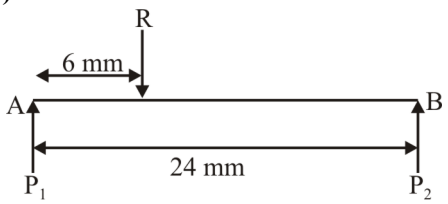
42. Two like parallel forces are acting at a distance of 24 mm apart and their resultant is 20 N. If the line of action of the resultant is 6 mm from any given force, the two forces are

(a) 15 N and 5 N (b) 20 N and 5 N

(c) 15 and 15 N (d) None of these

GPSC Executive Engineer 23.12.2018

Ans. (a) :



The resultant of P_1 & P_2 is R = 20N

Taking Moment about A,

$R \times 6 = P_2 \times 24$

$20 \times 6 = P_2 \times 24$

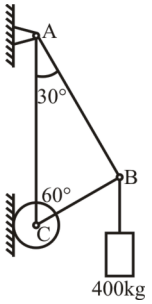
$\boxed{P_2 = 5\text{N}}$

$P_1 + P_2 = R$

$P_1 = 20 - 5$

$\boxed{P_1 = 15\ \text{N}}$

43. Considering g = 10 m/s^2, force in member AC of loaded truss is:

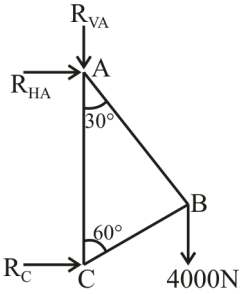


(a) 2000N compression (b) 2000N tension

(c) 1000N compression (d) 1000N tension

AAI Jr. Executive 26.03.2021

Ans. (d) :



$$\left[\text{From figure } \frac{BC}{AC} = \cos 60° = \frac{1}{2}\right]$$

$\Sigma F_x = 0 \Rightarrow R_C \times R_{HA} = 0$

$\Sigma F_y = 0 \quad R_{VA} = -4000$ N

Take moment about point A,

$\Sigma M_A = 0$

$\Rightarrow \quad R_C \times AC = 4000 \times BC\sin 60°$

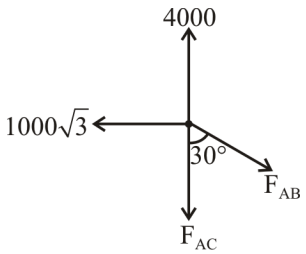
$$R_C = 4000 \times \frac{\sqrt{3}}{2} \times \frac{BC}{AC}$$

$$= 4000 \times \frac{\sqrt{3}}{2} \times \frac{1}{2}$$

$$= 1000\sqrt{3}\ \text{N}$$

So, $R_{HA} = -1000\sqrt{3}$ N

At, joint A



$\therefore \quad 1000\sqrt{3} = F_{AB}\sin 30° \Rightarrow F_{AB} = 2000\sqrt{3}$ N

So, $4000 = F_{AC} + F_{AB}\cos 30°$

$4000 = F_{AC} + 2000\sqrt{3}\cos 30°$

$\Rightarrow \quad F_{AC} = 1000$ N (Tension)

44. Which among the following is a unit of Force?

(a) Slug (b) Henry

(c) Pascal (d) Radian

APPSC Poly Lect. Automobile Engg., 2020

Ans. (a)

Quantity	Unit
Force	Slug
Inductance	Henry
Pressure	Pascal
Angle	Radian

45. Which of the following principles states that the resultant force acting on a body together with reversed effective force or inertial force are in equilibrium?

Search on Telegram @apna_pdf

(a) Law of Parallelogram
(b) Newton's first Law
(c) Pascal's Law
(d) D-Alembert's Law

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : D-Alembert's Principle– D-Alembert's principle states that the resultant force acting on a body together with the reversed effective force are equilibrium consider a rigid body acted upon by a system of forces. The system may be reduced to a single resultant force (P) acting on the body whose magnitude is given by the product of the mass of the body (m) and linear acceteration (a) of the centre of mass of the body.

According to Newton's second law of motion.

$P = ma$

$P - ma = 0$

$\boxed{P + P_1 = 0}$

46. The dimensional formula $ML^2 T^{-3}$ represents

(a) Momentum (b) Work
(c) Force (d) Power

HPPSC Poly. Lect. 05.07.2021

Ans. (d) :

47. Varignon's theorem is used to find

(a) direction of the resultant force
(b) location of the resultant force
(c) magnitude of the resultant force
(d) nature of the resultant force

Assam PSC AE (IWT) 14.03.2021

Ans. (b) : Varignon's theorem is used to find location of the resultant force.

Varignon's Theorem–Moment of a force about any point is equal to the sum of the moments of the components of that force about the same point.

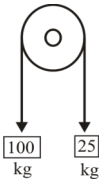
48. A rope is draped over a pulley which is freely rotating. One end of the rope is a 100 kg mass and on the other end is a 25 kg mass. Neglecting the mass of the pulley and friction, the tension in the rope is :

(a) 1000 N (b) 600 N
(c) 392 N (d) 1150 N

CGPSC AE 15.01.2021

Ans. (c) : Let a be the acceleration,

$100g - T = 100\,a$



$T = 100\,(g - a)$ ...(i)

Similarly, For 25 kg

$T = 25\,(g + a)$ ...(ii)

From (i) & (ii)

$100\,(g - a) = 25\,(g + a)$

$3g = 5a \Rightarrow a = \frac{3}{5}g$

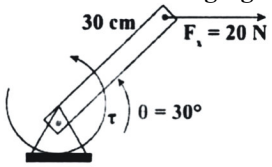
From eq. (ii)

$T = 25\,(a + g)$

$= 25\left(\frac{3}{5}g + g\right) \qquad [\because g = 9.81 m/s^2]$

$= 392.4$ N

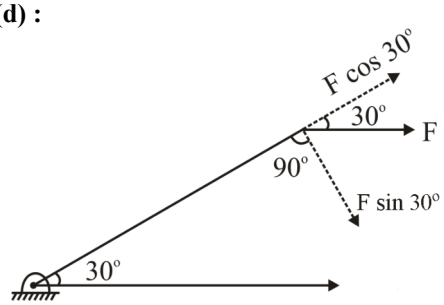
49. Calculate the resisting torque for static equilibrium in the following figure:



(a) 100 N-cm (b) 150 N-cm
(c) 200 N-cm (d) 300 N-cm

Gujarat PSC AE 2019

Ans : (d) :



$T = F \sin 30^\circ \times 30$

$= 20 \times \sin 30^\circ \times 30$

$= 300$ N-cm

50. Three forces P, Q and R are acting concurrently. The included angles are α, β and γ. According to Lami's theorem

(a) $\frac{P}{\sin\alpha} = \frac{Q}{\sin\beta} = \frac{R}{\sin\gamma}$

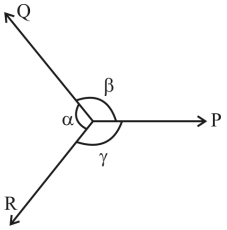
(b) $\frac{P}{\cos\alpha} = \frac{Q}{\cos\beta} = \frac{R}{\cos\gamma}$

(c) $\frac{P}{\tan\alpha} = \frac{Q}{\tan\beta} = \frac{R}{\tan\gamma}$

(d) $\frac{\sin\alpha}{P} = \frac{\sin\beta}{Q} = \frac{\sin\gamma}{R}$

HPPSC AE 2018
(CGPSC Polytechnic Lecturer 2017)

Ans. (a) : Lami's Theorem–"If a body is in equilibrium under the action of three forces, then each force is proportional to the sine of the angle between the other two forces"



$\frac{P}{\sin\alpha} = \frac{R}{\sin\beta} = \frac{Q}{\sin\gamma}$

Search on Telegram @apna_pdf

51. Tension in the cable supporting a lift of weight 'W' and having an acceleration of 'a' while going upward is (g is acceleration due to gravity)

(a) $W\left(1+\frac{a}{g}\right)$

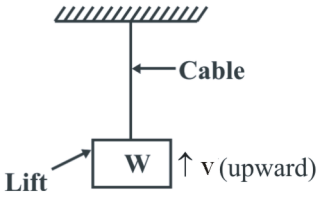
(b) $W\left(1-\frac{a}{g}\right)$

(c) $W\left(2+\frac{a}{g}\right)$

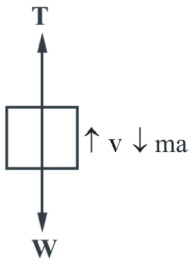
(d) $W\left(1+\frac{2a}{g}\right)$

GPSC Engg. Class-II Pre 19.01.2020
ISRO Scientist/Engineer 24.05.2014

Ans. (a) :



FBD,

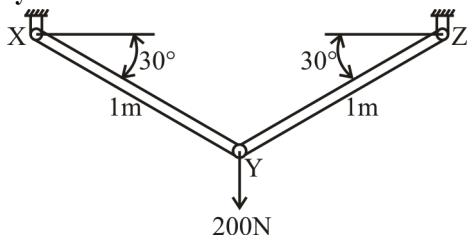


$T = W + ma \qquad \left[\because W = mg \text{ or } m = \frac{W}{g}\right]$

$= W + \frac{W}{g}a$

$T = W\left(1+\frac{a}{g}\right)$

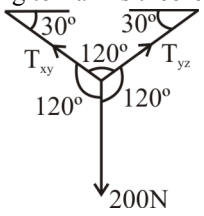
52. Two steel trusses, XY and YZ of identical size supports a load of 200 N as shown in fig. The length of the truss in 1m. The force in the truss xy in N is



(a) 100 N (b) 200 N
(c) 150 N (d) 50 N

ISRO Scientist/Engineer 12.01.2020

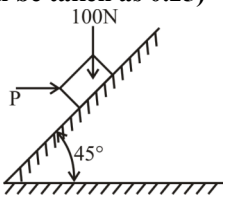
Ans. (b) : According to Lami's theorem



$\frac{T_{xy}}{\sin 120^\circ} = \frac{T_{yz}}{\sin 120^\circ} = \frac{200}{\sin 120^\circ}$

$T_{xy} = T_{yz} = 200$ N

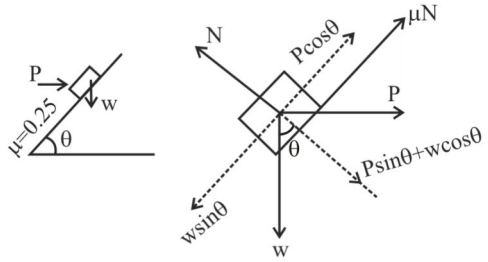
53. A block weighing 100 N is resting on a plane inclined with horizontal as shown in Fig. What horizontal force P is necessary to hold the body from sliding down the plane? (Coefficient of friction can be taken as 0.25)



(a) 30 N (b) 120 N
(c) 60 N (d) 15 N

ISRO Scientist/Engineer 12.01.2020

Ans. (c) :



F.B.D of block

$\Sigma F_y = 0$

$N = w\cos\theta + P\sin\theta$

$\Sigma F_x = 0$

$w\sin\theta = P\cos\theta + \mu N$

$w\sin\theta = P\cos\theta + \mu(w\cos\theta + P\sin\theta)$

$w\sin\theta - \mu w\cos\theta = P\cos\theta + \mu P\sin\theta$

$P = \frac{w(\sin\theta - \mu\cos\theta)}{\cos\theta + \mu\sin\theta}$

$P = \frac{100\times(\sin 45^\circ - 0.25\times\cos 45^\circ)}{\cos 45^\circ + 0.25\times\sin 45^\circ} = 60\text{N}$

54. A tension in a cable supporting a lift

(a) is less when the lift is moving downward
(b) is less when the lift is moving upward
(c) is more when the lift is moving downward
(d) remains the same whether the lift is moving upward or downward

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : A tension in a cable supporting a lift is less when the lift is moving downward.

Search on Telegram @apna_pdf

55. A point on a cricket bat, if hits the ball at, producing no jerk hand is called

(a) point of suspension
(b) center of percussion
(c) center of gravity
(d) mass center

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (b) : A point on a cricket bat, if hits the ball at, producing no jerk at hand is called center of percussion.

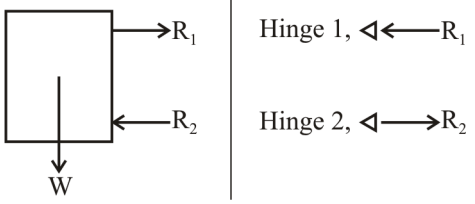
56. The vertical door of weight W is fixed on a wall by two hinges near the top and bottom of the door. Equilibrium condition implies that

(a) top hinge tends to come out of the wall; nothing happens to the bottom hinge
(b) top hinge comes out of the wall; bottom hinge gets pushed in to the wall
(c) both the hinges tend to come out of the wall
(d) bottom hinge tends to come out of the wall; nothing happens to the top hinge

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (b) : Top hinge comes out of the wall bottom hinge gets pushed into the wall.

FBD for Door | **FBD for Hinge**

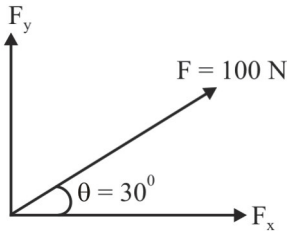


57. A force of 100 N is acting at a point making an angle of 30^0 with horizontal. Component of this force along Y-direction will be

(a) 50 N (b) 100 N
(c) 126 N (d) 86.6 N

MPSC Lect. (Prod.) 2018

Ans. (a)



$F_x = F \cos 30^0 = 100 \times \cos 30^0 = 86.60$ N

$F_y = F \sin 30^0 = 100 \times \sin 30^0 = 50$ N

58. If a body is subjected to three forces, then the body will be in equilibrium if the:

(a) resultant of any two forces is equal, collinear and acts in the same direction as that of the third force
(b) resultant of any two forces is equal, collinear and acts in the direction opposite to that of the third force
(c) vertical component of one force is equal to the sum of the horizontal components of the other two forces
(d) horizontal component of one force is equal to the sum of the vertical components of the other two forces

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : If a body is subjected to three forces, then the body will be in equilibrium if the resultant of any two forces is equal, collinear and acts in the direction opposite to that of third forces.

59. In free body diagrams, the Principle of transmissibility states that the force acting on the body is a:

(a) sliding vector (b) unit vector
(c) wedging vector (d) rolling vector

CIL MT 27.02.2020

Ans. (a) : Principle of transmissibility states that the force acting on the body is a sliding vector. That is it can be applied at any point of the body. It will give the same effect as it applied at any point other that the specific point.

60. Which of the following is not a vector quantity?

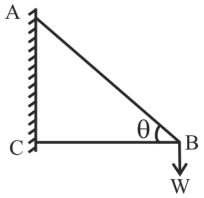
(a) Time (b) Velocity
(c) Acceleration (d) Force

APGCL AM, 2021
J&K PSC Civil Services Pre, 2010

Ans. (a) :

Vector: The physical quantity for which to define both magnitude and direction are required.
Examples: Velocity, Acceleration, force, displacement.
Scalar: The quantity for which to define only magnitude as required.
Examples: pressure, time, distance, speed etc.

61. The force induced in the string BC due to load 'W' as shown in the below figure is



(a) W sin θ (b) W cos θ
(c) W tan θ (d) W cot θ

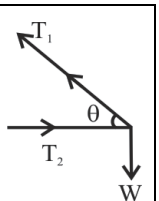
APGCL AM, 2021

Ans. (d) :

$\Sigma F_v = 0 \Rightarrow T_1 \sin\theta = W \Rightarrow T_1 = \dfrac{W}{\sin\theta}$

$\Sigma F_H = 0 \Rightarrow T_1 \cos\theta = T_2$

$\dfrac{W}{\sin\theta}.\cos\theta = T_2 \Rightarrow \boxed{T_2 = W\cot\theta}$



Search on Telegram @apna_pdf

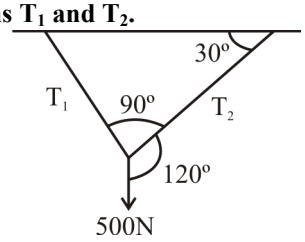
62. The resultant force acting in the couple is

(a) zero
(b) infinite
(c) twice the magnitude of single force
(d) half the magnitude of single force

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : A couple consists of two parallel forces that are equal in magnitude opposite in direction and do not chase any line of action.
It does not produce any translation, it only produce rotation.
The resultant force of a couple is zero.
But the resultant of a couple is not zero it is a pure moment.

63. A weight of 500 N is supported by two metallic ropes as shown in the figure. Find the values of tensions T_1 and T_2.



(a) $T_1 = 353.5$ N and $T_2 = 250$ N
(b) $T_1 = 250$ N and $T_2 = 433$ N
(c) $T_1 = 433$ N and $T_2 = 250$ N
(d) $T_1 = 250$ N and $T_2 = 353.5$ N

Assam Engg. College AP/Lect. 18.01.2021
Karnataka PSC Lect., 27.05.2017
GATE 2015

Ans. (c) :
Apply Lami's theorem

$$\frac{T_1}{\sin 120^\circ} = \frac{T_2}{\sin 150^\circ} = \frac{500}{\sin 90^\circ}$$

$$T_1 = \frac{500 \sin 120^\circ}{\sin 90^\circ} = 433.01\text{N}$$

$$T_2 = \frac{500 \times \sin 150^\circ}{\sin 90^\circ} = 250\text{N}$$

64. A system of three forces acts on a body and keeps it in equilibrium the forces need to be :

(a) coplanar only
(b) concurrent only
(c) coplanar as well as concurrent
(d) coplanar but may or not be concurrent

HPPSC Poly. Lect. 05.07.2021
J & K PSC Screening, 2006

Ans. (c) : If three forces act on a body and keeps it in equilibrium, Forces must be coplanar as well as concurrent.

65. If the sum of all the forces acting on a body is zero, it may be concluded that the body

(a) must be in equilibrium
(b) cannot be in equilibrium
(c) may be in equilibrium provided the forces are concurrent
(d) may be in equilibrium provided the forces are parallel

VIZAG Steel MT 2015
TNPSC AE, 2008
UKPSC AE 2007 Paper -I

Ans. (c) : If the sum of all the forces acting on a body is zero, it may be concluded that the body may be in equilibrium provided the forces are concurrent.

66. D' Alembert's principle

(a) provides no special advantage on Newton's law
(b) is not applicable for kinetic problem
(c) is not dependent on inertial effect
(d) converts a kinetic problem into an equivalent static problem

TSPSC Managers, 2015

Ans. (d) : D'Alembert's principle- The vector sum of the external forces and the inertia forces acting on a moving system is zero. According to D' Alembert's principal F + (– ma) = 0 Where '–ma' is the inertia force.

67. The resultant of the two forces P and Q is R, if Q is doubled, the new resultant force is perpendicular to P, then :

(a) P = Q (b) Q = R
(c) Q = 2 R (d) P = 2 R

TSPSC Managers, 2015

Ans. (b) : Resultant

$$R^2 = P^2 + Q^2 + 2PQ\cos\theta$$

θ = Angle between P & Q

$$\tan\alpha = \frac{Q\sin\theta}{P + Q\cos\theta}$$, α is angle between P & R

$\because$ If Q is doubled, and if the angle between P & the new resultant (R) is 90° then,

$$\tan 90^\circ = \frac{(2Q)\sin\theta}{P + (2Q)\cos\theta}$$

$$(\text{infinity})\infty = \frac{2Q\sin\theta}{P + 2Q\cos\theta}$$

$$\frac{1}{0} = \frac{2Q\sin\theta}{P + 2Q\cos\theta}$$

$$P + 2Q\cos\theta = 0$$

$$P = -2Q\cos\theta$$

But $R^2 = P^2 + Q^2 + 2PQ\cos\theta$

$R^2 = P^2 + Q^2 - P^2$

$R^2 = Q^2$

$\boxed{R = Q}$

68. Two forces act at a point. The first force has X and Y components of 3N and –5N respectively. The resultant of these forces falls on the x-axis and has a magnitude of –4N. The X and Y components of the second force is:

(a) (–7, 5) (b) (–7, –5)
(c) (–7, 0) (d) (7, 0)

TSPSC Managers, 2015

Search on Telegram @apna_pdf

Ans. (a) : Let $\hat{i}$ and $\hat{j}$ be in the x and y directions, respectively,

$$\vec{F}_x = 3\hat{i} - 5\hat{j}$$

$$\vec{F}_y = \ell\hat{i} + y\hat{j}$$

$$\vec{F}_R = -4i$$

$$\vec{F}_x + \vec{F}_y = \vec{F}_R$$

$$+3\hat{i} - 5\hat{j} + \ell\hat{i} + y\hat{j} = -4\hat{i}$$

$$(3 + \ell)\hat{i} + (y - 5)\hat{j} = -4\hat{i}$$

$$3 + \ell = -4$$

$$\ell = -7$$

$$y - 5 = 0$$

$$y = +5$$

$$(\ell, y) = (-7, 5)$$

69. The number of independent scalar equations of equilibrium of a rigid body under concurrent force system is :

(a) 4 (b) 3

(c) 5 (d) 6

J&K PSC Civil Services Pre, 2013
TNPSC AE (Industries) 09.06.2013

Ans. (b) : If all forces meet at common point, called concurrent forces system and concurrent forces do not produce bending (try to rotate) about any these axis. Means, it should be in translatory equilibrium along all these axis. So, number of independent equation should be along three axes.

70. D'Alembert principle states that system of forces acting on a body is following type of equilibrium with the inertia force of the body :

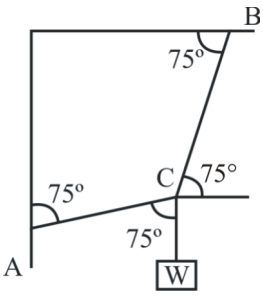
(a) static (b) dynamic

(c) both (d) none

J&K PSC Civil Services Pre, 2013

Ans. (a) : D'Alembert principle is used to convert dynamic equilibrium condition into static equilibrium with application of inertia force.

71. Two cables are tied together at C and loaded with a weight of 2000 N as shown in figure. The tension in the cable AC is

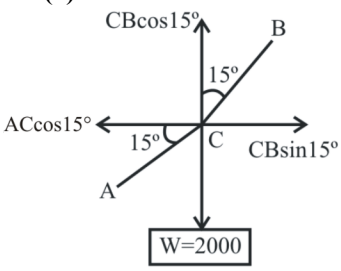


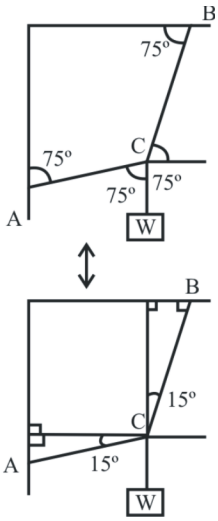
(a) 597.7 N (b) 298.35 N

(c) 1000 N (d) 1999 N

APPSC Poly. Lect. 2013

Ans. (a) :





We know that –

$\Sigma F_x = 0, \Sigma F_y = 0$

Then, $\Sigma F_x = 0$

$-CB\sin 15^\circ + AC\cos 15^\circ = 0$

$$AC = CB\frac{\sin 15^\circ}{\cos 15^\circ} = 0.2679\,CB$$

$\Sigma F_y = 0$

$ACsin15° + 2000 = CBcos15°$

$$AC(0.2588) + 2000 = 0.9659 \times \frac{AC}{0.2679}$$

$2000 = 3.6054AC - 0.2588AC$

$$AC = \frac{2000}{3.3466} = 597.62N$$

72. Vector equations of 3-dimensional system are

(a) $\Sigma F = 0, \Sigma M = 0$ (b) $\Sigma F = 0, \Sigma M \neq 0$

(c) $\Sigma F \neq 0, \Sigma M = 0$ (d) $\Sigma F \neq 0, \Sigma M \neq 0$

APPSC Poly. Lect. 2013

Ans. (a) : Vector equation of 3-dimensional system are- $\Sigma F_x = 0, \Sigma F_y = 0, \Sigma F_z = 0$ and $\Sigma M = 0$

73. According to Lami's theorem, the three forces

(a) must be equal

(b) must be at 120° to each other

(c) must be both of above

(d) may not be any of the two

APPSC Poly. Lect. 2013

Ans. (d) : According to Lami's theorem, the three forces must be equal, if the three forces acting at a point are in equilibrium then each force is proportional to the sine of the angle between the other two.

74. Two vectors are given by

$$\mathbf{P = 6\hat{i} + 10\hat{j} - 5\hat{k},\ Q = 5\hat{i} + 2\hat{j} + 10\hat{k}}$$

Which of the following is true for these vectors?

(a) Both the vectors are parallel

(b) Both the vectors are perpendicular to each other

Search on Telegram @apna_pdf

(c) Angle between the vectors is 30^0
(d) Angle between the vectors is 60^0

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given;

$$P = 6\hat{i} + 10\hat{j} - 5\hat{k}$$

$$Q = 5\hat{i} + 2\hat{j} + 10\hat{k}$$

$\because$ P.Q. = |P| |Q| cos θ

Let, θ = Angle between the two vector

$$\Rightarrow \cos\theta = \frac{P.Q}{|P||Q|} = \frac{30 + 20 - 50}{\sqrt{161} \times \sqrt{129}}$$

$$\Rightarrow \cos\theta = \frac{0}{\sqrt{161} \times \sqrt{129}} = 0 \qquad \Rightarrow \cos\theta = 0$$

$$\boxed{\theta = 90^0}$$

i.e., both the vectors are perpendicular each other.

75. An elevator has an upward acceleration of 1 m/s^2. What will be the force transmitted to the floor of the elevator by a man of weight 500 N travelling in the elevator? [g = 10 m/s^2]

(a) 550 N (b) 500 N
(c) 450 N (d) 400 N

APPSC Poly Lect. 13.03.2020

Ans. (a) : Given; g = 10 m/s^2, a = 1 m/sec^2

mg = 500 N

$$m = \frac{500}{g} = \frac{500}{10} = 50 \text{ kg}$$

Let,

Force transmitted to the floor = F

$\Sigma F = F - mg = ma$

$F = m(g+a)$

$F = 50 \times (10+1)$

$= 50 \times 11$

$$\boxed{F = 550 \text{ N}}$$

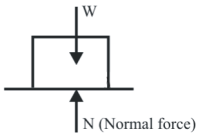
76. Normal force acts ……. to the direction of the surfaces in contact.

(a) Perpendicular (b) At and angle
(c) Tangential (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : Normal force acts perpendicular to the directions of the surface in contact.

According to Newton's 3rd law, Every action has equal and opposite reaction



W-weight of block-exerts force on surface, then Normal reaction is applied by surface on block.

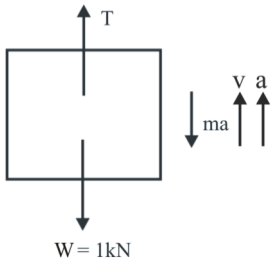
Normal reaction = N = W

77. An elevator weighing 1 kN attains an upward velocity of 4m/sec in 2 sec with uniform acceleration. The tension in the supporting cable will be:

(a) 1000 N (b) 800 N
(c) 1200 N (d) 2000 N

J & K PSC Screening, 2006

Ans. (c) : Given, W = mg = 1000



$$m = \frac{W}{g} = \frac{1000}{9.81} = 101.93 \text{kg}$$

According to Newton first law –

$v = u + at$

$4 = 0 + a \times 2$

$$\boxed{a = 2 \text{ m/s}^2}$$

Tension, $T = W + ma$

$= 1000 + 101.93 \times 2$

$$\boxed{T = 1203.8} \text{ N}$$

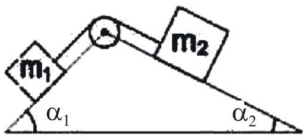
78. Two pieces of steel and brass of mass 2 kg and 1 kg respectively fall freely under the action of gravity from a tower. After a distance, the following will be identical.

(a) acceleration (b) momentum
(c) kinetic energy (d) potential energy

J & K PSC Screening, 2006

Ans. (a) : Two pieces of steel and brass of mass 2 kg and 1 kg respectively fall freely under the action of gravity from a tower. After a distance, the acceleration will be identical.

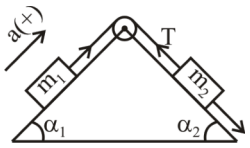
79. A frictionless double incline with angles α_1 and α_2 is shown in the figure below. It carries a set of sliding masses m_1 and m_2 that are connected with an inextensible string passing over a frictionless pulley. If $\alpha_2 = 30°$ and m_2 is twice that of mass m_1. Determine α_1 for equilibrium.



(a) 30° (b) 45°
(c) 60° (d) 75°
(e) 90°

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (e) :



$\Rightarrow$ $m_2 = 2m_1$

$\Rightarrow$ $\alpha_2 = 30°$

Search on Telegram @apna_pdf

$\alpha_1 = ?$

By balancing tension,

$m_1 \sin\alpha_1 = m_2 \sin\alpha_2$

So, $\sin\alpha_1 = \frac{1}{2} \times \frac{m_2}{m_1}$

$\sin\alpha_1 = 1$

$\alpha_1 = \sin^{-1}(1)$

$\boxed{\alpha_1 = 90°}$

80. The angle between two forces when the resultant is maximum and minimum respectively are-

(a) 0° and 180° (b) 180° and 0°

(c) 90° and 180° (d) 90° and 0°

GMB AAE 25.06.2017

Ans. (a) : The resultant force given as :

$$F = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos\theta}$$

When $\theta = 0$ then the force become maximum

$$F = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos\theta}$$

$$F = \sqrt{F_1^2 + F_2^2 + 2F_1F_2}$$

$$F = \sqrt{(F_1 + F_2)^2}$$

$$\boxed{F = F_1 + F_2}$$

When the $\theta = 180°$ then the force become minimum.

$$F = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos 180°}$$

$$F = \sqrt{F_1^2 + F_2^2 - 2F_1F_2}$$

$$F = \sqrt{(F_1 - F_2)^2}$$

$$\boxed{F = F_1 - F_2}$$

81. Two forces of 6 and 8 kg acting at right angles to each other, the resultant force will be

(a) 10 (b) 28

(c) 40 (d) 100

WBPSC AE, 2017

Ans. (a) : Given, $\theta = 90°$, $F_1 = 6$ kg, $F_2 = 8$ kg

We know that, $R = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos\theta}$

$$= \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos 90°}$$

$$= \sqrt{6^2 + 8^2}$$

$$= \sqrt{36 + 64}$$

$$= \sqrt{100} = 10\,\text{N}$$

82. The co-ordinate of the initial and terminal points of vector are (3, 1, – 2) and (4, – 7, 10). The magnitude of vector is approximately :

(a) 50 units (b) 8.1 units

(c) 14.5 units (d) 19.0 units

J&K PSC Civil Services Pre, 2010

Ans. (c) : Given-

Magnitude of vector =

$$\sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2}$$

$$= \sqrt{(3-4)^2 + (1-(-7))^2 + [(-2-10)]^2}$$

$$= \sqrt{1 + 64 + 144}$$

$$= \sqrt{65 + 144} = \sqrt{209} = 14.456 \text{ units}$$

83. The number of independent equations available from static equations of equilibrium for plane problem are

(a) 3 (b) 6

(c) 12 (d) 9

Haryana PSC Civil Services Pre, 2014

Ans. (a) : Equations of static balance.

(i) $\sum F_x = 0$

(ii) $\sum F_y = 0$

(iii) $\sum M_z = 0$

84. According to the law of equilibrium, two forces are said to be in equilibrium only if they are

(a) equal in magnitude and opposite in direction

(b) opposite in direction

(c) collinear in action

(d) Both (A) and (C)

Haryana PSC Civil Services Pre, 2014

Ans. (d) : Two forces are said to be equilibrium if they are equal and opposite and are collinear in line of action.

$F_1 = F_2$

85. The statement – "if three forces acting at a point can be represented in magnitude and direction by the sides of a triangle taken in order, the forces are in equilibrium"– is known as

(a) Lami's theorem

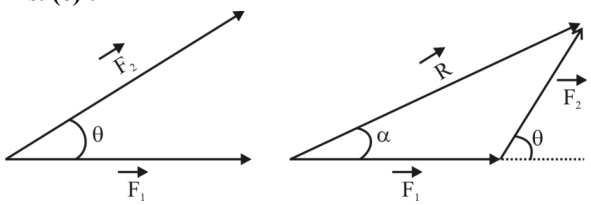
(b) Law of Polygon of forces

(c) Law of triangle of forces

(d) Newton's law of forces

Haryana PSC Civil Services Pre, 2014

Ans. (c) :



Law of triangle of forces- It states that three forces acting at a point will be in equilibrium. If it can be represented in magnitude and direction by the sides of triangle taken in order.

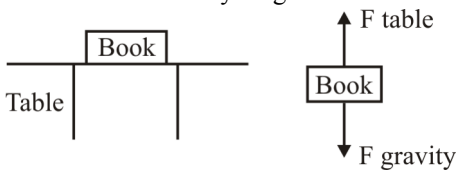
Search on Telegram @apna_pdf

86. Free body diagram of a body in a force system is

(a) Completely isolated from the system
(b) incompletely isolated from the system
(c) completely attached to the system
(d) incompletely attached to the system

Haryana PSC Civil Services Pre, 2014

Ans. (a) : Free Body Diagram- A diagram which shows a part of system separately (completely isolated from the system) indicating all the external forces acting on it, is called as a free body diagram.

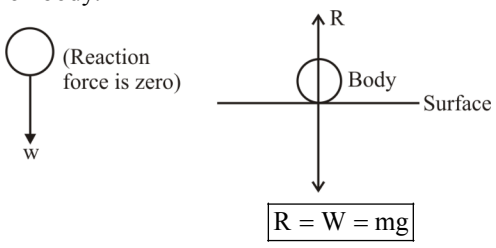


87. When a body falls freely under gravity it possesses

(a) maximum weight
(b) minimum weight
(c) no weight
(d) a weight depending upon velocity

Haryana PSC Civil Services Pre, 2014

Ans. (c) : Body falls freely under gravity posses no weight because there is no surface which gives reaction force on body.



$R = W = mg$

88. The method of splitting a single force into two perpendicular components along the x-axis and y-axis is called as

(a) Orthogonal resolution
(b) Perpendicular resolution
(c) Both (1) and (2)
(d) None of the above

Karnataka PSC Lect., 27.05.2017

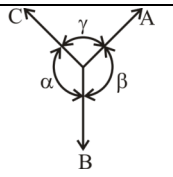
Ans (c) : The method of splitting a single force into two perpendicular components along the x-axis and y-axis is called as orthogonal resolution and perpendicular resolution.

89. A mass of 1 kg is attached to the middle of a rope, which is being pulled from both ends in the opposite directions. Taking g = 10 m/sec^2 the minimum pull required to completely straighten the rope will be :

(a) 5 N (b) 20 N
(c) 25 N (d) Infinite

MPPSC State Forest Service Exam, 2014

Ans. (d) : As we know,
From Lami's theorem,



$$\Rightarrow \quad \frac{A}{\sin\alpha} = \frac{B}{\sin\gamma} = \frac{C}{\sin\beta}$$

So, $\alpha = 90°, \beta = 90°, \gamma = 180°$

$$\frac{A}{\sin 90°} = \frac{B}{\sin 180°} = \frac{C}{\sin 90°}$$

$$\frac{A}{1} = \frac{B}{0} = \frac{C}{1}$$

$$\boxed{A = C = \infty}$$

90. The conditions of equilibrium for non-concurrent coplanar force systems are.

(a) $\Sigma F_x = 0, \Sigma F_y = 0$
(b) $\Sigma F_x = 0, \Sigma F_y = 0, \Sigma F_z = 0$
(c) $\Sigma F_x = 0, \Sigma F_y = 0, \Sigma M_z = 0$
(d) $\Sigma F_x = 0, \Sigma F_y = 0, \Sigma F_z = 0, \Sigma M_x = 0, \Sigma M_y = 0, \Sigma M_z = 0$

MPPSC State Forest Service Exam, 2014
UKPSC AE 2012 Paper-I
UKPSC AE 2007 Paper -I

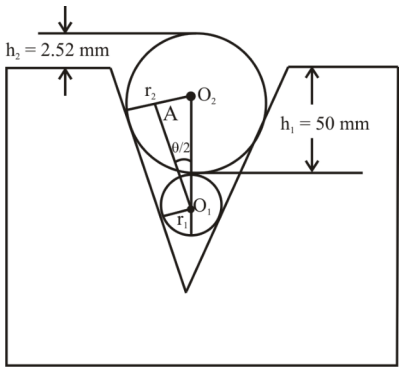
Ans. (c) : There are three equilibrium conditions that can be used for non-concurrent, non-parallel force system.
The sum of all forces, in the x-direction or horizontal is zero ($\Sigma F_x = 0$).
The sum of all forces in y-direction is zero ($\Sigma F_y = 0$).
The sum of moment at any point 'O' is zero ($\Sigma M = 0$).

91. Balls of diameter 30 mm and 15 mm were used to measure the taper of gauge. During inspection, the ball of 30 mm diameter was penetrate 2.5 mm above the top surface of the ring. This surface was located at a of 50 mm from the top of the 15 mm diameter ball. The taper as approximately

(a) 12^0 (b) 14^0
(c) 17^0 (d) 20^0

TRB Asstt. Prof., 2012

Ans. (d) :



$$\sin\frac{\theta}{2} = \frac{O_2A}{O_1O_2}$$

Search on Telegram @apna_pdf

$$\sin\frac{\theta}{2}=\frac{r_2-r_1}{h_1+r_1-h_2-r_2}$$

$$\sin\frac{\theta}{2}=\frac{15-7.5}{50+7.5-2.5-15}$$

$$\sin\frac{\theta}{2}=\frac{7.5}{40}$$

$$\frac{\theta}{2}=\sin^{-1}\left(\frac{7.5}{40}\right)$$

$$\boxed{\theta=21.6^\circ}$$

92. A free body diagram is a diagram :

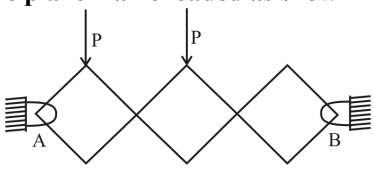
(a) drawn by free hand
(b) represents a floating body
(c) separating the body from its surroundings and replacing with force vector
(d) All of these

KPSC ADF 2015

Ans. (d) : A free body diagram is a diagram–

- Drawn by free hand
- Represents a floating body
- Separating the body from its surroundings and replacing with force vector.

93. The horizontal component of the reaction at A of the plane frame loaded as shown in figure is

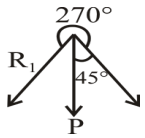


(a) 2P (b) P

(c) $\frac{P}{2}$ (d) $\frac{P}{3}$

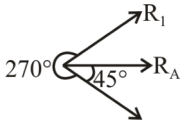
OPSC Civil Services Pre 2006

Ans. (b) :



$$\frac{R_1}{\sin 45^\circ}=\frac{P}{\sin 270^\circ}$$

$$R_1=\frac{P}{\sqrt{2}}$$

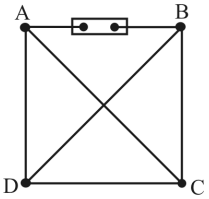


$$\frac{R_A}{\sin 270^\circ}=\frac{R_1}{\sin 45^\circ}$$

$$R_A=-\left(-\frac{P}{\sqrt{2}}\right)\times\sqrt{2}$$

$$\boxed{R_A=P}$$

94. Referring to the square frame as shown in figure, a tensile force P is produced in the bar AB by tightening a turn-buckle. The force produced in each of the members AC or BD is

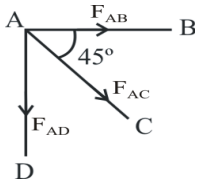


(a) $\frac{P}{\sqrt{2}}$ (b) P

(c) $\sqrt{2}P$ (d) 2P

OPSC Civil Services Pre 2006

Ans. (c) :



At joint A

$F_{AC}\cos 45 = F_{AB}$

$$F_{AC}=\frac{P}{\cos 45}=\sqrt{2}P=F_{QD}$$

95. A heavy spherical ball of weight W rests on a V- shaped trough, whose sides are inclined at angles α and β to the horizontal. The contact pressure on the two sides of the trough are

(a) $\frac{W\cos\beta}{\cos(\alpha+\beta)}$ and $\frac{W\sin\alpha}{\cos(\alpha+\beta)}$

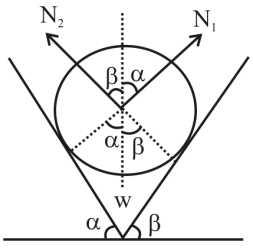
(b) $\frac{W\sin\beta}{\sin(\alpha+\beta)}$ and $\frac{W\sin\alpha}{\sin(\alpha+\beta)}$

(c) $\frac{W\cos\beta}{\cos(\alpha+\beta)}$ and $\frac{W\cos\alpha}{\cos(\alpha+\beta)}$

(d) $\frac{W\cos\beta}{\sin(\alpha+\beta)}$ and $\frac{W\cos\alpha}{\sin(\alpha+\beta)}$

OPSC Civil Services Pre 2006

Ans. (b) :



Apply Lami's theorem

$$\frac{W}{\sin(\alpha+\beta)}=\frac{N_1}{\sin(180-\beta)}=\frac{N_2}{\sin(180-\alpha)}$$

$$N_1=\frac{W\sin\beta}{\sin(\alpha+\beta)};N_2=\frac{W\sin\alpha}{\sin(\alpha+\beta)}$$

Search on Telegram @apna_pdf

96. What is one dyne equal to?

(a) 10^{-3} N (b) 10^{-4} N

(c) 10^{-5} N (d) 10^{-6} N

KPCL AE 2016

Ans. (c) : 1 N = 10^5 dyne

1 dyne = 10^{-5} N

97. What is the name of the force by which a body is attracted towards the earth?

(a) Center of gravity (b) Weight

(c) Mass (d) Energy

KPCL AE 2016

Ans. (b) : The force of gravity with which a body is attracted towards the centre of the earth is called the weight of the body and it is equal to the product of mass and acceleration due to gravity offered by the earth.

Weight (w) = mg

98. The ratio of load lifted to the effort applied is known as_____

(a) Lift ratio (b) Mechanical advantage

(c) Lift advantage (d) Mechanical ratio

KPCL AE 2016

Ans. (b) : The ratio of weight (load) lifted by a machine to the force (effort) applied on a machine is called mechanical advantage of the machine.

99. If a given system of concurrent forces have ∑H = 0, but ∑V # 0, then resultant of the system can be-

(a) Zero

(b) A force vertically upward or downward

(c) A force horizontally leftward or rightward

(d) Indeterminate

WBPSC AE 2003

Ans. (b) : Resultant– Resultant of a force system is a force or a couple that will have the same effect to the body both in translation and rotation, if all the forces are removed and replaced by the resultant.

R_x → The x – component of the resultant is equal to the sum of forces in the x-direction.

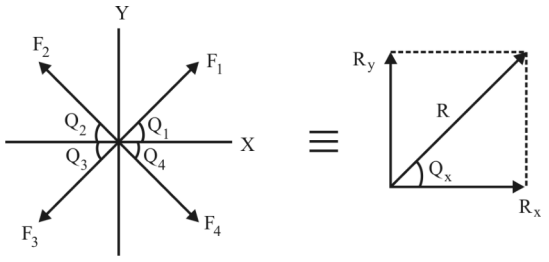
R_y → The y – component of the resultant is equal to the sum of forces in y-direction.

R_z → The z- component of the resultant is equal to the sum of forces is z-direction.

$$R_x = \Sigma F_x = F_{x_1} + F_{x_2} + F_{x_3} + ...$$

$$R_y = \sum F_y = F_{y_1} + F_{y_2} + F_{y_3} + ...$$

$$R_z = \sum F_z = F_{z_1} + F_{z_2} + F_{z_3} + ...$$



$R_x = \Sigma F_x$ $R_y = \Sigma F_4$

$$R = \sqrt{R_x^2 + R_y^2} \qquad \because \Sigma H = 0 = \Sigma F_x$$

$$= \sqrt{0 + R_y^2}$$

$$\boxed{R = R_y}$$

So, the resultant of the system can be a force vertically upward or downward.

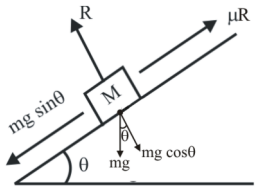
100. A block of mass M is moving down an inclined plane having coefficient of friction equal to $\frac{1}{3}\tan\theta$ where θ is the angle of inclination of the plane with the horizontal. The centre of mass of the block will have uniform acceleration equal to-

(a) $\frac{2}{3}g\cos\theta$ (b) $\frac{2}{3}g\sin\theta$

(c) $g\sin\theta$ (d) $g\cos\theta$

WBPSC AE 2003

Ans. (b) :



$$\mu = \frac{1}{3}\tan\theta$$

$R = mg\cos\theta$

F_f = friction force

$$\because \quad F_f = \frac{1}{3}\tan\theta \times mg\cos\theta$$

$$= \frac{1}{3}mg\sin\theta$$

uniform acceleration

$$F = ma = mg\sin\theta - \mu R$$

$$= mg\sin\theta - \frac{1}{3}mg\sin\theta$$

$$= mg\sin\theta\left(1 - \frac{1}{3}\right)$$

$$ma = \frac{2mg\sin\theta}{3}$$

$$\boxed{a = \frac{2}{3}g\sin\theta}$$

101. The force polygon for coplanar concurrent forces

(a) must close

(b) must not close

(c) may or may not close

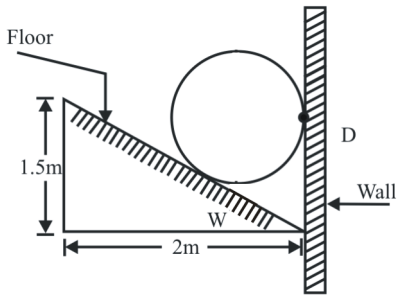
(d) any of the above

WBPSC AE 2008

Ans. (a) : For equilibrium force polygon for coplanar concurrent forces must be closed.

Search on Telegram @apna_pdf

102.

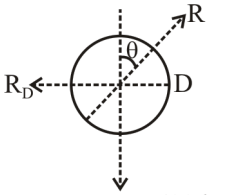


A smooth cylinder of weight 600 kN is resting on a smooth wall and floor as shown above. The reaction at D is :

(a) 300 kN (b) 450 kN
(c) 600 kN (d) 800 kN

UPSC JWM Advt. No.-52/2010

Ans. (b) :



$$\frac{600}{\sin(90+\theta)} = \frac{R_D}{\sin(180-\theta)}$$

$$\frac{\sin\theta}{\cos\theta} \times 600 = R_D$$

$$R_D = 600\tan\theta$$

$$= 600 \times \frac{1.5}{2} = 450\,\text{kN}$$

103. The forces are

1. Coplanar if the lines of action lie in a single plane.
2. Non-concurrent if the lines of action lie in different planes.
3. Concurrent if the lines of action meet at a single point.
4. Collinear if the lines of action are same.

Which of these statements are correct?

(a) 1, 2, 3 and 4 (b) 1, 3 and 4 only
(c) 2, 3 and 4 only (d) 1, 2 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (b) : Explanation :

- The forces are coplanar if the lines of action lies in a single plane.
- The forces are concurrent if the lines of action meet at a single point.
- The forces are collinear if the lines of action are same.

104. According to the D' Alembert's principle

(a) $\Sigma F - I\alpha = 0$ (b) $\Sigma F - ma = 0$
(c) $\Sigma T - I\alpha = 0$ (d) $\Sigma T - F - ma = 0$

UPSC JWM Advt. No.-52/2010

Ans. (b) : Explanation : According to D'Alembert Principle-

"For any body, the algebraic sum of externally applied forces and the forces resisting motion in any given direction is zero."

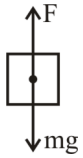
Hence, $\boxed{\Sigma F - ma = 0}$

105. A 500-kg elevator starts from rest and travels upwards with a constant acceleration of $a_c = 2$ m/s^2. What is the power output of the motor when t = 3 sec? (Take g = 10 m/s^2)

(a) 18 kW (b) 30 kW
(c) 36 kW (d) 54 kW

UPSC JWM Advt. No.-50/2010

Ans. (c) : Given, m = 500 kg, $a_c = 2$ m/s^2
t = 3 sec, g = 10 m/s^2, P = ?



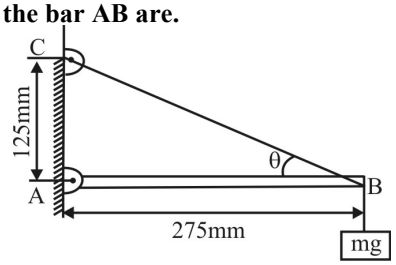
F-mg = ma
F = m(g + a)
= 500(10 + 2)
= 6000 N

Power (P) = F.v

$\Rightarrow$ v = u + at $\quad \therefore$ u = 0
= 0 + 2 × 3
v = 6 m/s

Power (P) = 6000 × 6 = 36000 W = 36 kW

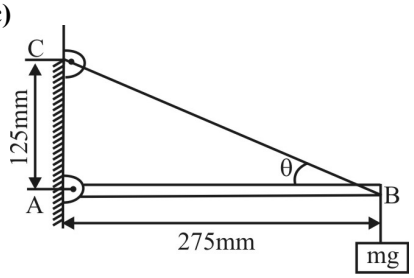
106. A mass of 35 kg is suspended from a weightless bar AB which is supported by a cable CB and a pin as shown in Figure. The pin reactions at A on the bar AB are.



(a) $R_x = 343.4$ N. $R_y = 755/4$ N
(b) $R_x = 755.4$ N. $R_y = 343/4$ N
(c) $R_x = 755.4$ N. $R_y = 0$
(d) $R_x = 343.4$ N. $R_y = 0$

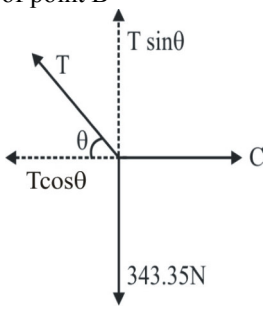
UPRVUNL AE 21.08.2016
ISRO Scientist/Engineer 11.10.2015
GATE-1997

Ans. : (c)



Search on Telegram @apna_pdf

for equilibrium of point B



$T \sin\theta = 343.35$ N ..... (i)

$T \cos\theta = C$ .....(ii)

From equation (i) and (ii)

$$\tan\theta = \frac{343.35}{C}$$

$$C = \frac{343.35}{\tan\theta}$$

$$\tan\theta = \frac{125}{275}$$

$$C = \frac{343.35 \times 275}{125}$$

$C = 755.4$ N

$R_x = R_c = 755.4$ N

Reaction C and A both are same

$R_y = 0$

107. An electric lift is moving downwards with an acceleration of 3g/4. The reaction between a passenger in the lift and its floor is equal to

(a) 4/3 of the passenger's weight
(b) 1/3 of the passenger's weight
(c) 2/3 of the passenger's weight
(d) 1/4 of the passenger's weight

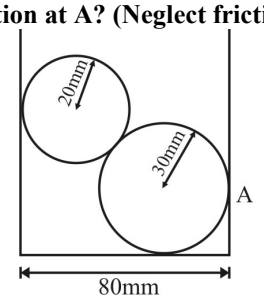
UPRVUNL AE 21.08.2016

Ans. : (d) Weight of passenger W = mg N

when lift is moving downward with an acceleration $\frac{3}{4}g$ then the working gravity accleration $= g - \frac{3}{4}g = \frac{g}{4}$

Now weight of passenger $= m \times \frac{g}{4} = \frac{mg}{4}$

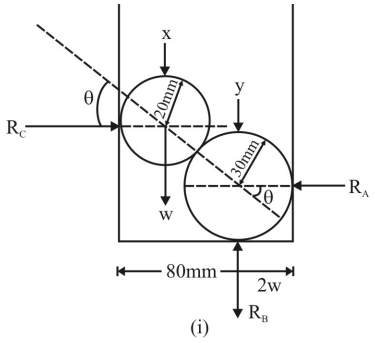
108. Two cylinders are kept in a container as shown in Figure. Top cylinder has a weight W and bottom cylinder has a weight of 2 W. What is the reaction at A? (Neglect friction)



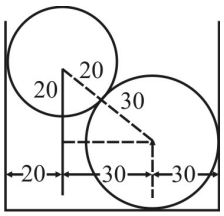
(a) 3 W (b) 1.75 W
(c) 2.8 W (d) 2.5 W

UPRVUNL AE 21.08.2016
CSE Pre-2005

Ans. : (*)

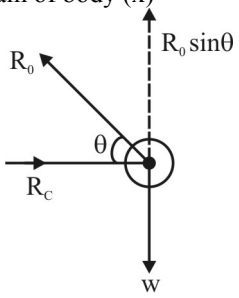


(i)



(ii)

Free body diagram of body (x)

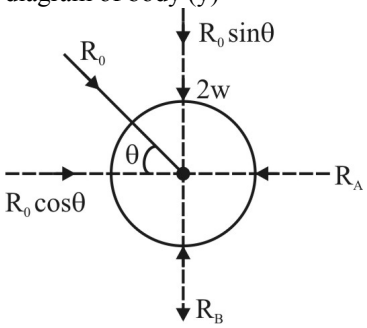


$W = R_0 \sin\theta$

$$R_0 = \frac{W}{\sin\theta} \qquad \therefore \sin\theta = \frac{4}{5}$$

$$R_0 = \frac{5W}{4}$$

Free body diagram of body (y)



$R_A = R_0 \cos\theta$

$$R_A = \frac{W}{\sin\theta} \times \cos\theta$$

$R_A = W \cot\theta$

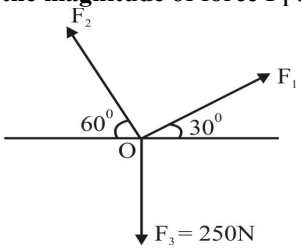
$$R_A = \frac{3W}{4}$$

$R_A = 0.75$ W

Note : All option given is wrong.

Search on Telegram @apna_pdf

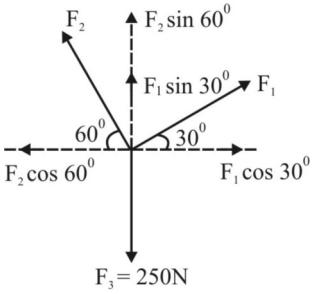
109. Three forces F_1, F_2 and F_3 are acting on a body as shown in figure and the body is in equilibrium. If the magnitude of force F_1 is 250 N. find the magnitude of force F_1 and F_2



(a) $F_1 = 85$ N and $F_2 = 125$ N
(b) $F_1 = 125$ N and $F_2 = 256.6$ N
(c) $F_1 = 125$ N and $F_2 = 215.6$ N
(d) $F_1 = 95$ N and $F_2 = 215.6$ N

UPRVUNL AE 21.08.2016

Ans. : (c)



$\Sigma F_y = 0$

$F_1 \sin 30° = F_3 - F_2 \sin 60°$

$$\frac{F_1}{2} + \frac{F_2\sqrt{3}}{2} = F_3 \quad \text{..... (i)}$$

$\Sigma F_x = 0$

$F_2 \cos 60° = F_1 \cos 30°$

$$\frac{F_2 \cos 60°}{\cos 30° \times 2} + \frac{F_2\sqrt{3}}{2} = 250$$

$F_2 = 215.6$ N

$F_1 = 125$ N

110. The free-body diagram of a satellite rotating about the earth will show the satellite isolated from its surroundings and _____

(a) Its velocity shown on it
(b) Only the force of gravity acting on it
(c) No force acting on it
(d) The force of gravity and centrifugal force acting on it

UPRVUNL AE 21.08.2016

Ans. : (d) The free-body diagram of a satellite rotating about the earth will show the satellite isolated from its surroundings and the force of gravity and centrifugal force acting on it.

111. A force F acting on a rigid body at a point P can be replaced by a force of equal magnitude and in the same direction at a point Q on the body together with a moment.

(a) Equal in magnitude to PQ times F, acting normal to the plane of F and PQ
(b) Given by F×QP
(c) Given by F×PQ
(d) Equal in magnitude to F times the distance moved in the lines of action of the force, acting in the plane of PQ and F

UPRVUNL AE 21.08.2016

Ans. : (b) A force F acting on a rigid body at a point P can be replaced by a force of equal magnitude and in the same distance at a point Q on the body together with a moment given by F × QP.

112. Force acting on a rope in a tug of war, is an example of :

(a) Collinear force
(b) Coplanar force
(c) Coplanar concurrent force
(d) Coplanar non-concurrent force

UPRVUNL AE 05.07.2021
UPRVUNL AE 2014

Ans : (a) Force acting on a rope in a tug of war, is an example of collinear force.

113. Two equal forces are acting at a point with an angle of 60^0 between them. The magnitude of each force, if the resultant force is 36 N, is :

(a) 15.63 N (b) 25.12 N
(c) 20.78 N (d) 17.89 N

UPRVUNL AE 2014

Ans : (c) Let P is the force acting

Resultant $R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$

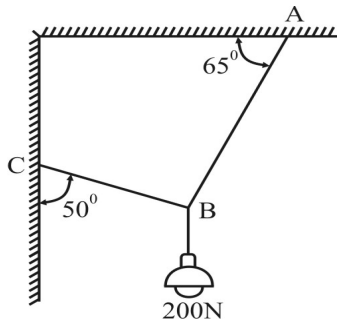
$$36 = \sqrt{P^2 + P^2 + 2P^2\cos 60^0} \qquad \{P = Q\}$$

$$36 = \sqrt{2P^2 + P^2}$$

$36 = \sqrt{3}\,P$

$P = 20.78$N

114. An electric light fixture weighing 200 N is supported (as shown in figure). Determine tensile force in wire BC.

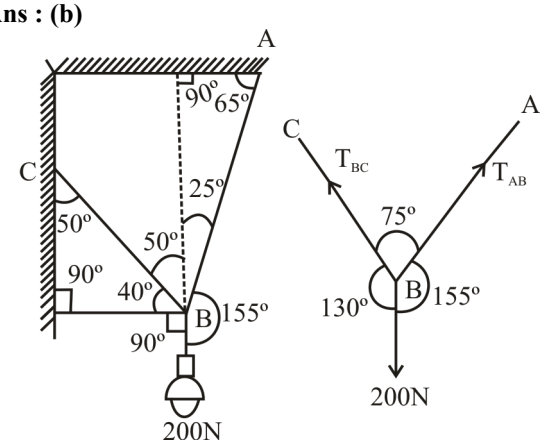


(a) 20N (b) 87.5 N
(c)158.6 N (d) 120 N

UPRVUNL AE 2014

Search on Telegram @apna_pdf

Ans : (b)



$$\frac{T_{BC}}{\sin 155^0} = \frac{W}{\sin 75^0}$$

$$T_{BC} = \frac{200}{\sin 75^o} \times \sin 155^0$$

$$\boxed{T_{BC} = 87.5N}$$

115. The principal compression member in a crane is called as

(a) boom (b) post

(c) stanchion (d) strut

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Boom – It is a principal compression member in a crane.

Post – It is a compression member in small structure with no roof.

Stanchion – A structural steel member usually larger than a strut, whose main function is to withstand axial compressive force.

Strut – It is one inclined member subjected to the axial load and supported by hinged or pin jointed support at both the ends.

116. In a system of coplanar parallel forces

(a) a resultant force exists

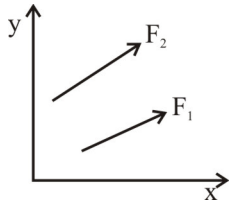
(b) a resultant force does not exist

(c) a resultant couple always exists

(d) a resultant couple can never exist

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : Coplanar forces-



- Line of action of all forces lying on single plane.
- Static equilibrium equation,

$\Sigma F_x = 0, \Sigma F_y = 0, \Sigma F_z = 0$

117. A rope runs over a freely rotating frictionless pulley and two masses of 20 kg and 120 kg are hanging vertically from its two ends. The tension in the rope is

(a) less than 200N and more than 30 N

(b) More than 335 N and less than 338 N

(c) Exactly 100 kgf = 981 N

(d) Exactly 100 kgf = 1373.4 N

GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : Given, $m_1 = 20$ kg, $m_2 = 120$ kg

Lets T is the tension on tight side.

Balancing the force, we get.

$$T = (m_2 - m_1) \times g$$

$$T = (120 - 20) \times g = 100 \text{ kgf} = 981 \text{ N}$$

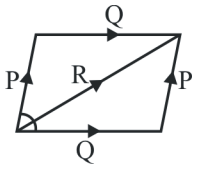
118. The resultant of two forces acting at 60° is 7 N and when acting at right angles is $\sqrt{34}$ N. The forces are

(a) 25 N and 9 N (b) 3 N and $\sqrt{5}$ N

(c) 3 N and 5 N (d) $\sqrt{3}$ N and $\sqrt{5}$ N

ISRO Scientist/Engineer 07.05.2017

Ans. (c) : By Parallelogram Method–



$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$$

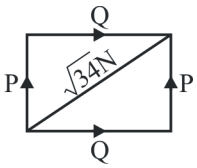
$$7 = \sqrt{P^2 + Q^2 + 2PQ\cos 60}$$

$$= \sqrt{P^2 + Q^2 + 2PQ \times \frac{1}{2}}$$

$$7 = \sqrt{P^2 + Q^2 + PQ}$$

$$49 = P^2 + Q^2 + PQ \quad .....(1)$$

When two forces acting at right angles with resultant if $\sqrt{34}$N.



$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$$

$$= \sqrt{P^2 + Q^2 + 2PQ\cos 90°}$$

$$\sqrt{34} = \sqrt{P^2 + Q^2}$$

$$34 = P^2 + Q^2 \quad .....(2) \quad \text{['Squaring both side']}$$

From equation (1),

$$49 = P^2 + Q^2 + PQ$$

$$49 = 34 + PQ$$

$$PQ = 49 - 34 = 15$$

$$PQ = 15$$

$$P = 3N, Q = 5N.$$

So, product of two forces is 15. Hence correct option is (c).

Search on Telegram @apna_pdf

119. Two equal forces are acting at a point with an angle of 60° between them. If the resultant force is equal to $60\sqrt{3}$, what is the magnitude of each force?

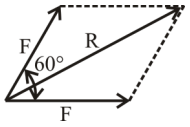
(a) 30 (b) 50
(c) 40 (d) 60

ISRO Scientist/Engineer 03.07.2016

Ans. (d) : Let two equal forces

$F_1 = F_2 = F$

By parallelogram method,



$$R = \sqrt{F^2 + F^2 + 2FF\cos 60°}$$

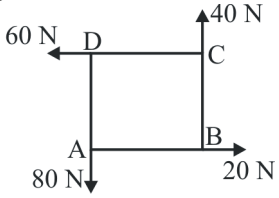
$$60\sqrt{3} = \sqrt{F^2 + F^2 + 2F^2 \times \frac{1}{2}}$$

$$60\sqrt{3} = \sqrt{3F^2}$$

$$F\sqrt{3} = 60\sqrt{3}$$

$$\boxed{F = 60}$$

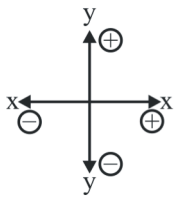
120. Four forces of magnitudes 20 N, 40N, 60 N and 80 N are acting respectively along the four sides of a square ABCD as shown in figure. The magnitude of resultant is

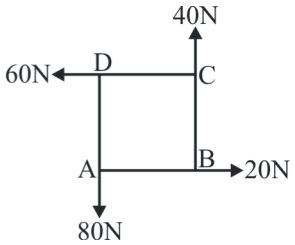


(a) $40\sqrt{2}$ N (b) $50\sqrt{2}$ N
(c) $45\sqrt{2}$ N (d) $60\sqrt{2}$ N

ISRO Scientist/Engineer 03.07.2016

Ans. (a) :





Net horizontal force $\sum H = 0$

$F_H = -60 + 20$

$= -40N$

Net vertical force $\sum V = 0$

$F_V = 40 - 80 = -40N$

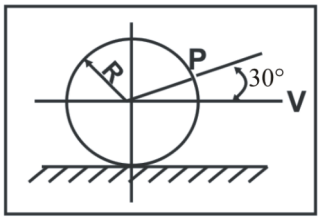
Magnitude of resultant 'F' is

$$F = \sqrt{(F_V)^2 + (F_H)^2}$$

$$= \sqrt{(-40)^2 + (-40)^2}$$

$$= 40\sqrt{2}N$$

121. A circular disc of radius R rolls without slipping at a velocity V. The magnitude of the velocity at point P shown in the figure is



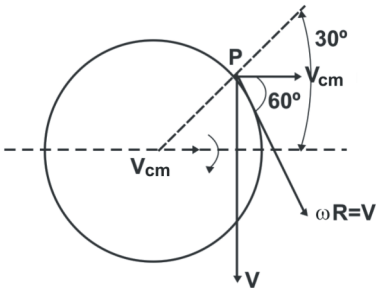
(a) $\sqrt{3}V$ (b) $\sqrt{3}/2V$
(c) $V/2$ (d) $\sqrt{2}V$

ISRO Scientist/Engineer 2012
GATE 2008

Ans. (a) : Given,

Circular disc of Radius = R

Velocity = V [∵ without slipping]



$V_{cm} = R\omega =$

$\theta = 60°$

Magnitude of velocity at point. 'P'.

$$= \sqrt{(V\sin\theta)^2 + (V + V\cos\theta)^2}$$

$$= \sqrt{(V \times \sin 60°)^2 + V^2(1 + \cos 60°)^2}$$

$$= \sqrt{\left(V \times \frac{\sqrt{3}}{2}\right)^2 + V^2\left(1 + \frac{1}{2}\right)^2}$$

$$= \sqrt{V^2 \times \frac{3}{4} + V^2\left(\frac{3}{2}\right)^2}$$

$$V_P = \sqrt{V^2\left[\frac{3}{4} + \frac{9}{4}\right]}$$

$$= V\sqrt{\frac{12}{4}}$$

$$V_P = V\sqrt{3}$$

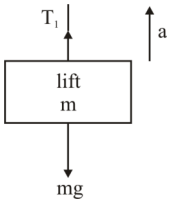
122. The tension in the cable supporting a lift moving upwards is twice the tension when the lift moves downwards. What is the acceleration of the lift?

(a) g/4 (b) g/3
(c) g/2 (d) g

ISRO Scientist/Engineer 2011
ISRO Scientist/Engineer 2010
TNPSC AE 2014
Vizag Steel (MT) 2017

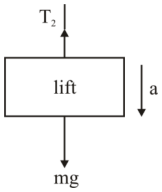
Search on Telegram @apna_pdf

Ans. (b) : Case - I



Then, $T_1 - mg = ma$ ...(1)

Case - II



$mg - T_2 = ma$ ...(2)

Given that

$T_1 = 2\,T_2$

From equation (1) and (2)

$mg - T_2 = 2T_2 - mg$

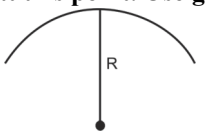
$3\,T_2 = 2\,mg$

$$\boxed{T_2 = \frac{2}{3}mg}$$

Putting the value of T_2 in equation (2)

$$mg - \frac{2}{3}mg = ma \qquad \boxed{a = \frac{g}{3}}$$

123. When a jet plane flying at 300 m/s is at the very top of its trajectory, the apparent weight of a passenger is one half of other actual weight. Find the radius of curvature R of the flight path at this point. Use g = 10 m/s^2



(a) 22 km (b) 18 km

(c) 30 km (d) 16 km

ISRO Scientist/Engineer 2011

Ans. (b) : V = 300 m/s

Let actual weight of passenger is = W

And apparent weight of passenger is = W'

So, balanced

$W' = W - M\omega^2 R$

$$= W - \frac{Mv^2}{R}$$

$$W' = \frac{W}{2} \qquad \text{(given)}$$

$$\frac{W}{2} = W - \frac{Wv^2}{Rg}$$

$$1 - \frac{v^2}{Rg} = \frac{1}{2}$$

$$\frac{v^2}{Rg} = \frac{1}{2}$$

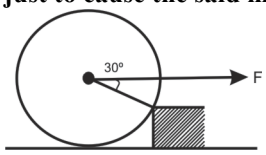
$$R = \frac{2v^2}{g}$$

$$= \frac{2\times(300)^2}{10}$$

R = 18000 m

= 18 km

124. A roller of weight W is rolled over the wooden block shown in the given figure. The pull required just to cause the said motion is



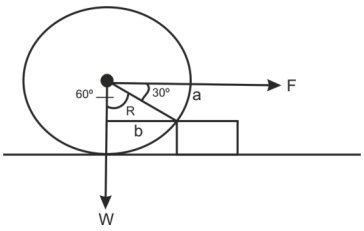
(a) W/2 (b) $\sqrt{3}$W

(c) W (d) 2W

UPPSC AE 12.04.2016 Paper-I

ISRO Scientist/Engineer 2009

Ans. (b) :



Resolving component

a = R cos 60°

b = R cos 30°

Taking moment at corner of wooden block

$\sum M = 0$

W × b = F × a

$$F = W\frac{b}{a}$$

$$= \frac{W\cos 30°}{\cos 60°}$$

$$F = W\sqrt{3}$$

125. An electric lift is moving downward with an acceleration of g/3, the vertical force between a passenger in the lift and its floor is equal to

(a) 3/4 of the passenger's weight

(b) 2/3 of the passenger's weight

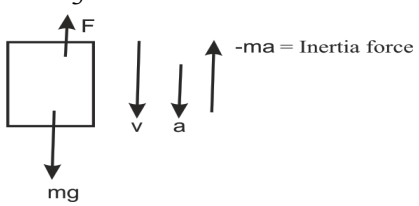
(c) Passenger's weight

(d) 4/3 of the passenger's weight

APPSC AEE 2012

ISRO Scientist/Engineer 2009

Ans. (b) : $a = \frac{g}{3}$ (downward given)



Search on Telegram @apna_pdf

Vertical force on the floor
= mg - ma
= m (g - a)
$= m\left(g - \frac{g}{3}\right)$
$= \frac{2mg}{3}$

126. A body of mass 10 kg moving with a velocity of 1 m/s is acted upon by a force of 50 N for two seconds. The final velocity of the body is

(a) 22 m/sec (b) 1 m/sec
(c) $\sqrt{21}$ m/sec (d) 11 m/sec

ISRO Scientist/Engineer 2009

Ans. (d) : m = 10kg, u = 1 m/s, F = 50 N, t = 2s

$a = \frac{50}{10} = 5m/s^2$
$F = ma$
$v = u + at$
$= 1 + 5\times2$
$= 11$ m/s

127. Ratio of the radii of the planets P_1 and P_2 is k and ratio of the acceleration due to gravity on them is s. Ratio of escape velocities from them will be

(a) ks (b) $\sqrt{ks}$
(c) $\sqrt{\frac{k}{s}}$ (d) $\sqrt{\frac{s}{k}}$

ISRO Scientist/Engineer 2008

Ans. (b) : The escape velocity is maximum velocity required to leave planet. It must overcome the pull of gravity. The formula of escape velocity contain a constant G which is called the "Universal gravitational constant". The unit of escape velocity is m/sec (m/s).

$$V_{esc} = \sqrt{\frac{2GM}{R}} \text{ where } g = \frac{GM}{R^2}$$

So we get $V_{esc} = \sqrt{\frac{2gR^2M}{MR}} = \sqrt{2gR}$

Ratio of escape velocity is given as

[Given, $\frac{R_1}{R_2} = k, \frac{g_1}{g_2} = s$]

$$\frac{V_1}{V_2} = \sqrt{\frac{g_1R_1}{g_2R_2}} = \sqrt{sk}$$

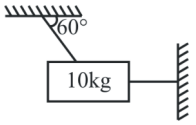
128. Which of the following is not a scalar quantity

(a) Time (b) Mass
(c) Volume (d) acceleration

ISRO Scientist/Engineer 2007
(KPSC AE 2015)

Ans. (d) : Acceleration has magnitude as well as direction, so it is a vector quantity.

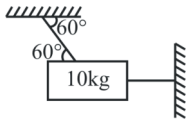
129. A 10 kg mass is hung from 2 light, inextensible strings as shown. The tension in the horizontal string is nearly



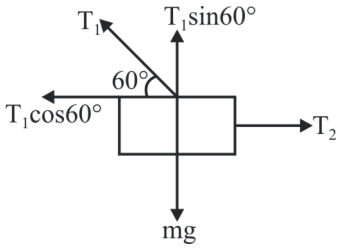
(a) 49 N (b) 57 N
(c) 100 N (d) 0 N

ISRO Scientist/Engineer 03.07.2016

Ans. (b)



FBD–



$\because$ $T_1\sin60° = mg$

$T_1 \times \frac{\sqrt{3}}{2} = 10 \times 9.81$

$T_1 = \frac{20\times9.81}{\sqrt{3}}$

Also, $T_1\cos60° = T_2$

$T_2 = \frac{20\times9.81}{\sqrt{3}} \times \frac{1}{2}$

$T_2 = \frac{10\times9.81}{\sqrt{3}}$

$T_2 = 56.63$ N

Tension in the Horizontal string $T_2 = 57$ N

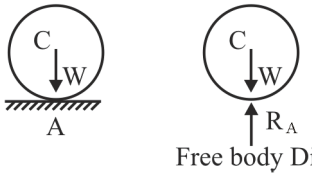
130. The free body diagram of a body is a diagram showing

(a) All the forces, including the reactions at the supports or surfaces
(b) The forces, but not showing the reactions at the supports or surfaces
(c) All the forces and the supports or surfaces
(d) Only the reactions at the supports or surfaces of the body

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (a) : To clearly identify the various forces acting on a body in equilibrium we have to draw its free-body diagram. Only then, we can write the equilibrium equation of the body.

To draw the free body diagram of a body we remove all the supports (like wall floor, hinge, or any other body) and replace them by the reactions which these supports exert on body.



Search on Telegram @apna_pdf

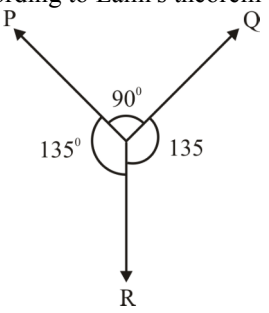
131. If three forces P, Q and R keep a body in equilibrium, the angle between P & Q is 90^0 and R is acting vertically downward, then magnitude of forces R and Q respectively in terms of P will be

(a) $\frac{P}{\sqrt{2}}, \sqrt{2}P$ (b) $\sqrt{2}P, \frac{P}{\sqrt{2}}$

(c) $P, \sqrt{2}P$ (d) $\sqrt{2}P, P$

APPSC AEE Screening Test 2016

Ans. (d) : According to Lami's theorem



$$\frac{P}{\sin 135^0} = \frac{Q}{\sin 135^0} = \frac{R}{\sin 90^0}$$

From,

$$\frac{P}{\sin 135^0} = \frac{R}{\sin 90^0}$$

$$\frac{P}{\frac{1}{\sqrt{2}}} = R \Rightarrow \boxed{R = \sqrt{2}P}$$

From,

$$\frac{Q}{\sin 135^0} = \frac{P}{\sin 135^0}$$

$$\boxed{Q = P}$$

132. A rigid body will be in equilibrium under the action of two forces only when:

(a) Forces have same magnitude, same line of action and same sense

(b) Forces have same magnitude and same line of action

(c) Forces have same magnitude, same line of action and opposite sense

(d) Forces have same magnitude

UPRVUNL AE 07.10.2016

Ans. (c) : A rigid body will be in equilibrium under the action of two forces only when forces have same magnitude, same line of action and opposite sense.

133. The resultant of two force A and B is perpendicular to A, the angle between the force A and B will be:

(a) $\theta = \cos^{-1}\left(\frac{A}{B}\right)$ (b) $\theta = \cos^{-1}\left(\frac{B}{A}\right)$

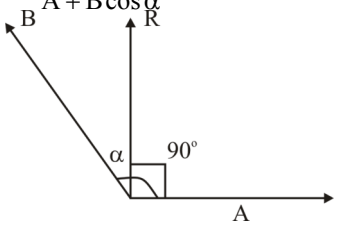
(c) $\theta = \cos^{-1}\left(-\frac{B}{A}\right)$ (d) $\theta = \cos^{-1}\left(-\frac{A}{B}\right)$

(e) $\theta = \tan^{-1}\left(\frac{B}{A}\right)$

CGPSC AE 25.02.2018

Ans. (d) : We know that-

$$\tan\theta = \frac{B\sin\alpha}{A + B\cos\alpha} \qquad \text{Given, } \theta = 90$$



$$\tan 90^o = \frac{B\sin\alpha}{A + B\cos\alpha}$$

$$\frac{1}{0} = \frac{B\sin\alpha}{A + B\cos\alpha}$$

$$A + B\cos\alpha = 0$$

$$A = -B\cos\alpha$$

$$\alpha = \cos^{-1}\left[-\frac{A}{B}\right]$$

134. Concurrent forces 2, $\sqrt{3}$, 5, $\sqrt{3}$ and 2 kN act at one of the angular points of a regular hexagon towards the remaining five angular points. Determine the magnitude and direction of the resultant force.

(a) R = 10 kN; $\alpha = 0^o$

(b) R = 12 kN; $\alpha = 180^o$

(c) R = 10 kN; $\alpha = 60^o$

(d) R = 20 kN; $\alpha = 0^o$

(e) R = 10 kN; $\alpha = 90^o$

CGPSC AE 26.04.2014 Shift-I

Ans. (c) : Resolving all forces horizontally

$$\sum H = 2\cos 0^o + \sqrt{3}\cos 30^o + 5\cos 60^o + \sqrt{3}\cos 90^o + 2\cos 120^o$$

$$= 2 + \left(\sqrt{3} \times \frac{\sqrt{3}}{2}\right) + 5\left(\frac{1}{2}\right) + \left(\sqrt{3} \times 0\right) + 2 \times \left(-\frac{1}{2}\right)$$

$$= 5 \text{ kN}$$

Resolving all forces vertically

$$\sum V = 2\sin 0^o + \sqrt{3}\sin 30^o + 5\sin 60^o + \sqrt{3}\sin 90^o + 2\sin 120^o$$

$$= 0 + \frac{\sqrt{3}}{2} + \frac{5\sqrt{3}}{2} + \sqrt{3} + \left(2 \times \frac{\sqrt{3}}{2}\right)$$

$$= 8.66 \text{ kN}$$

The magnitude of the resultant forces

$$R = \sqrt{(\sum H)^2 + (\sum V)^2}$$

$$= \sqrt{(5)^2 + (8.66)^2}$$

$$= 9.99$$

$$\simeq 10kN$$

Direction of the resultant force

$$\tan\theta = \frac{\sum V}{\sum H} = \frac{9.99}{8.66} = 1.732$$

$$\theta = 59.99 \simeq 60^o$$

135. A particle in equilibrium cannot have

(a) Linear motion with constant speed

(b) Constant velocity

(c) Zero acceleration

Search on Telegram @apna_pdf

(d) Zero velocity
(e) Curvilinear motion with constant speed

CGPSC AE 26.04.2014 Shift-I

Ans. (e) : A particle is said to be in equilibrium if the net force acting on the particle is zero. By Newton's second law, the acceleration of such objects will be zero.
As a result, either the body is at rest (i.e. zero velocity) or it is moving with a constant velocity (i.e. with constant speed in a straight line).

136. The force applied on a body of mass 100 kg to produce an acceleration of 5 m/s^2 is
(a) 20 N (b) 100 N
(c) 500 N (d) None of these

Vizag Steel (MT) 2017

Ans. (c) : $F = ma$
$= 100 \times 5$
$= 500$ N

137. Two parallel forces 100 kN and 75 kN act on a body and have resultant of 25 kN. Then, the two forces are
(a) Like parallel forces
(b) Unlike parallel forces
(c) Concurrent forces
(d) None of the above

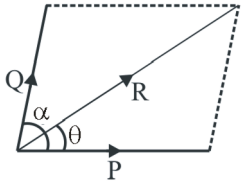
Gujarat PSC AE 2019

Ans : (b) : We know that,
$R^2 = P^2 + Q^2 + 2PQ\cos\theta$
Given, $P = 100$ kN, $Q = -75$ kN (Assume)
$R^2 = (100)^2 + (-75)^2 + 2 \times 100 \times (-75) \times \cos 0^o$
$R^2 = 625$
$R = \sqrt{625}$
$\boxed{R = 25 \text{ kN}}$
Hence, the two forces are unlike parallel forces.

138. The angle between two forces P and Q is α The resultant of these forces is
(a) $\sqrt{P^2 + Q^2 + 2PQ\sin\alpha}$
(b) $\sqrt{P^2 + Q^2 + 2PQ\cos\alpha}$
(c) $\sqrt{P^2 + Q^2}$
(d) $\sqrt{P^2 + Q^2 - 2PQ\cos\alpha}$

UPPSC AE 12.04.2016 Paper-I
TNPSC ACF 2012

Ans : (b) Parallelogram Law of Forces:- It states that if two forces, acting simultaneously on a particle, be represented in magnitude and direction by the two adjacent side of a parallelogram, then their resultant may be represented in magnitude and direction by the diagonal of a parallelogram which passes through their points of intersection.



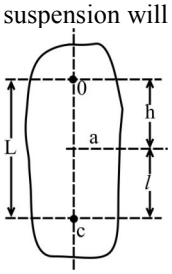
$R = \sqrt{P^2 + Q^2 + 2PQ\cos\alpha}$

$\tan\theta = \dfrac{Q\sin\alpha}{P + Q\cos\alpha}$
$\theta \rightarrow$ Angle make by Resultant force R from P.

139. If a suspended body is struck at the centre of percussion, then the pressure on the axis passing through the point of suspension will be:
(a) Maximum (b) Minimum
(c) Zero (d) Infinity

HPPSC W.S. Poly. 2016

Ans : (c) If a suspended body is struck at the centre of percussion, then the pressure on the axis passing through the point of suspension will be zero.

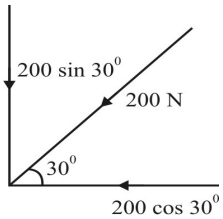


The centre of oscillation is termed as centre of percussion. It is defined as that point at which a blow may be struck on a suspended body so that the reaction at the support is zero.

140. The horizontal and vertical components of a force of 200 N acting on a body at an angle of 30° with the horizonatal is
(a) $100\sqrt{3}$ and 100 N
(b) $200\sqrt{3}$ N and 200 N
(c) $\dfrac{400}{\sqrt{3}}$ N and 400 N
(d) $300\sqrt{3}$ N and 300 N

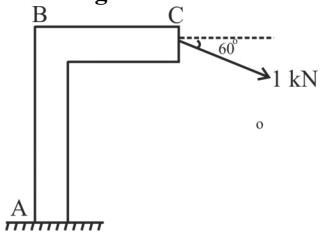
TSPSC AEE 2015

Ans : (a)



horizontal component $= 200 \cos 30°$
$F_H = 100\sqrt{3}$N
Vertical component $= 200 \sin 30°$
$F_v = 100$ N

141. What is the thrust at the point 'A' in the post shown in the figure?



Search on Telegram @apna_pdf

(a) 0.866 kN (b) 0.5 kN
(c) 1.388 kN (d) 1 kN

UPPSC AE 12.04.2016 Paper-I
CSE Pre-2004

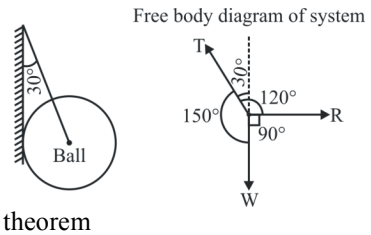
Ans : (a) Thrust at the point A= Vertical component of force 1kN
Thrust force = 1 sin 60°
Thrust force = 0.866kN

142. A ball of weight 100N is tied to a smooth wall by a cord making an angle of 30° to the wall. The tension in the cord is

(a) 200N (b) $\frac{200}{\sqrt{3}}$N
(c) 100N (d) $50\sqrt{3}$N

ESE 2017

Ans. (b) :



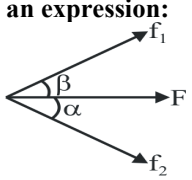
By Lami's theorem

$$\frac{T}{\sin 90°}=\frac{W}{\sin 120°}=\frac{R}{\sin 150°}$$

$$\frac{T}{\sin 90°}=\frac{W}{\sin 120°}=\frac{100}{\sqrt{3}/2}=\frac{200}{\sqrt{3}}$$

$$\boxed{T=\frac{200}{\sqrt{3}}N}$$

143. In a given figure, when angles β = α, then the components (f_1 and f_2) of force F on either side are given by an expression:



(a) $f_1=f_2=\frac{F\cos\alpha}{\sin(\alpha+\beta)}$

(b) $f_1=f_2=\frac{F\sin\alpha}{\sin(\alpha+\beta)}$

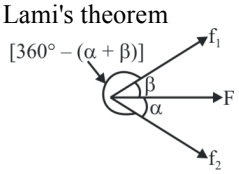
(c) $f_1=f_2=\frac{F\cos\alpha}{\cos(\alpha+\beta)}$

(d) $f_1=f_2=\frac{F\sin\alpha}{\sin(\alpha)}$

(e) $f_1=f_2=\frac{F\sin\alpha}{\sin(\beta)}$

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : Using Lami's theorem



$$\frac{f_1}{\sin\alpha}=\frac{f_2}{\sin\beta}=\frac{F}{\sin\left[360°-(\alpha+\beta)\right]}$$

So, $f_1=-\frac{F\sin\alpha}{\sin(\alpha+\beta)}$

$f_2=-\frac{F\sin\beta}{\sin(\alpha+\beta)}$ $(\alpha=\beta)$

Then, $f_1=f_2=\frac{F\sin\alpha}{\sin(\alpha+\beta)}$

[–ve not considered in answer]

144. If the sum of all the forces acting on a moving object is zero, the object will

(a) continue moving with constant velocity
(b) accelerate uniformly
(c) change the direction of motion
(d) slow down and stop

UKPSC AE 2012 Paper-I

Ans. (a) : continue moving with constant velocity

145. Two equal and mutually perpendicular forces of magnitude 'P', are acting at a point. Their resultant force will be

(a) $P\sqrt{2}$, at an angle of 30° with the line of action of any one force.
(b) $P\sqrt{2}$, at an angle of 45° with the line of action of each force.
(c) $P\sqrt{2}$, at an angle of 45° with the line of action of each force.
(d) Zero

UKPSC AE 2012 Paper-I

Ans. (b) : $P\sqrt{2}$, at an angle of 45° with the line of action of each force.

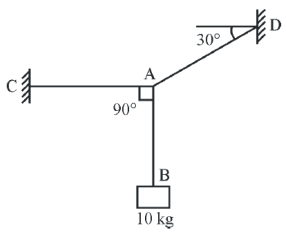
146. One end of an uniform ladder, of length L and weight W, rests against a rough vertical wall and the other end rests on rough horizontal ground. The coefficient of friction f is same at each end. The inclination of ladder when it is on the point of slipping is

(a) $\tan^{-1}\left(\frac{1-f^2}{2f}\right)$ (b) $\tan^{-1}\left(\frac{1+f^2}{2f}\right)$
(c) $\tan^{-1}\left(\frac{2f}{1+f^2}\right)$ (d) $\tan^{-1}\left(\frac{2f}{1-f^2}\right)$

UKPSC AE 2012 Paper-I

Ans. (a) : $\tan^{-1}\left(\frac{1-f^2}{2f}\right)$

147. In the following figure, the tension in the rope AC is

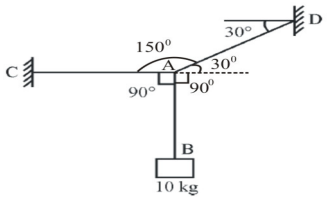


(a) 17.32 N (b) 56.60 N
(c) 169.90 N (d) 113.20 N

UKPSC AE 2012 Paper-I

Search on Telegram @apna_pdf

Ans. (c) :



From Lami's theorem

$$\frac{AC}{\sin 120} = \frac{AD}{\sin 90} = \frac{AB}{\sin 150}$$

$$\frac{AD}{\sin 90} = \frac{AB}{\sin 150} \Rightarrow \frac{AD}{1} = \frac{10}{0.5}$$

AD = 20 kg

$$\frac{AC}{\sin 120} = \frac{AD}{\sin 90}$$

AC = 20 × sin 120 = 20 × 0.860 kg

= 20 × 0.866 × 9.81 N

AC = 169.91 N

148. Two forces each equal to P/2 act at right angles. Their effect may be neutralized by a third force acting along their bisector in the opposite direction with a magnitude of

(a) P (b) P/2

(c) $\sqrt{2}$P (d) $\frac{P}{\sqrt{2}}$

UKPSC AE 2007 Paper -I

APPSC AEE Mains (Civil Mechanical) 2016

Ans. (d) : Given, $F_1 = F_2 = P/2$

Angle between forces is 90°

Resultant force, $F = \sqrt{F_1^2 + F_2^2 + 2F_1F_2\cos 90°}$

$$F = \sqrt{\left(\frac{P}{2}\right)^2 + \left(\frac{P}{2}\right)^2 + 0}$$

$$F = \sqrt{\frac{P^2}{2}}$$

$$\boxed{F = \frac{P}{\sqrt{2}}}$$

149. The resultant of forces $\vec{P} = -2\vec{i} - 3\vec{j}$ and $\vec{Q} = 3\vec{i} - 4\vec{j}$ will lie in (quadrants to be reckoned anticlockwise) quadrant

(a) first (b) second

(c) third (d) fourth

UKPSC AE 2007 Paper -I

Ans. (d) : Fourth

150. Polygon of forces is useful for computing the resultant of

(a) concurrent spatial forces

(b) coplanar parallel forces

(c) coplanar concurrent forces

(d) coplanar collinear forces

UKPSC AE 2007 Paper -I

Ans. (c) : Coplanar concurrent forces

151. The quantity whose dimensions are $M^2L^2T^{-3}$ could be the product of

(a) force and velocity (b) mass and power

(c) force and pressure (d) force and distance

UKPSC AE 2007 Paper -I

Ans. (b) : Dimension–

Product = Mass × Power

= M × power (P = F.v)

$$= M \times M \cdot \frac{L}{T^2} \cdot \frac{L}{T}$$

$$= M^2L^2T^{-3}$$

152. In case of concurrent coplanar forces, the condition of equilibrium is

(a) $\sum H = 0, \sum V = 0, \sum M = 0$

(b) $\sum H = 0, \sum V = 0$

(c) $\sum H = 0, \sum M = 0$

(d) $\sum V = 0, \sum M = 0$

UKPSC AE 2007 Paper -I

Ans. (b) : In case of concurrent coplanar forces, the condition of equilibrium is

$$\sum H = 0$$

$$\sum V = 0$$

153. If a body is in equilibrium then the following is true:

(a) There is no force acting on the body

(b) Resultant of all forces is zero but the moments of forces about any point is not zero

(c) The moments of the forces about any point is zero, but the resultant of all forces is not zero

(d) both (b) and (c)

UKPSC AE 2007 Paper -I

Ans. (d) : Both (b) and (c)

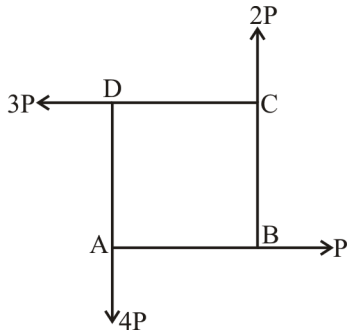
154. Four forces P, 2P, 3 P & 4P act along the sides of a square, taken in order. The resultant force is

(a) zero (b) $\sqrt{5}$P

(c) $2\sqrt{2}$P (d) 2P

UKPSC AE 2012 Paper-I

Ans. (c) :



Net horizontal force, ∑H = 0

$F_H = P - 3P = -2P$

Net vertical force, ∑V = 0

$F_V = 2P - 4P = -2P$

∵ Resultant force, $R = \sqrt{(F_H)^2 + (F_V)^2}$

$$= \sqrt{(-2P)^2 + (-2P)^2}$$

$$= \sqrt{4P^2 + 4P^2}$$

$$= \sqrt{8P^2}$$

$$= 2\sqrt{2}\,P$$

Search on Telegram @apna_pdf

155. According to the Newton's law of gravitation, the force of attraction, between the bodies of masses m_1 and m_2 situated at a distance 'd' apart, is given by

(a) $F = G\frac{m_1 m_2^2}{d^2}$ (b) $F = G\frac{m_1^2 m_2}{d^2}$

(c) $F = G\frac{m_1^2 m_2^2}{d^2}$ (d) $F = G\frac{m_1 m_2}{d^2}$

UKPSC AE 2012 Paper-I

Ans. (d) : According to the Newton's law of gravitation-

$$F = G\frac{m_1 m_2}{d^2}$$

156. An elevator weighing 10 kN attains an upward velocity of 4 m/s in 2 sec with uniform acceleration. The tension in the wire rope is nearly

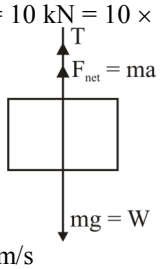
(a) 6 kN (b) 8 kN

(c) 10 kN (d) 12 kN

JWM 2017

Ans. (d) : Given,

Elevator weight W = 10 kN = 10×10^3 N



Upward force, v = 4m/s

Time, t = 2 sec

$v = u - at$

$u = 2 \times a \Rightarrow a = 2m/s^2$

$F_{net} \Rightarrow T - mg = ma$

$T = m(g + a)$

$$T = mg\left(1 + \frac{a}{g}\right)$$

$$= 10\left(1 + \frac{2}{9.81}\right)$$

Tension in wire, T = 12.03 kN

157. A force $\vec{F} = \left(10\hat{i} + 8\hat{j} - 5\hat{k}\right)$ act at a point P (2, 5,6). What will be the moment of the force about the point Q(3, 1, 4)?

(a) $-36\hat{i} + 15\hat{j} - 48\hat{k}$ (b) $18\hat{i} + 16\hat{j} - 37\hat{k}$

(c) $32\hat{i} - 31\hat{j} - 4\hat{k}$ (d) Zero

APPSC Poly Lect. 13.03.2020

Ans. (a) : We know that,

Moment = Force × perpendicular distance

Moment about Q = $\vec{F} \times \overrightarrow{PQ}$

$\overrightarrow{PQ}$ = Q – P. (vectors)

$= \left(3\hat{i} + \hat{j} + 4\hat{k}\right) - \left(2\hat{i} + 5\hat{j} + 6\hat{k}\right)$

$= \left(\hat{i} - 4\hat{j} - 2\hat{k}\right)$

Moment about Q = $\vec{F} \times \overrightarrow{PQ}$

$$\Rightarrow \vec{F} \times \overrightarrow{PQ} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 10 & 8 & -5 \\ 1 & -4 & -2 \end{vmatrix}$$

$$= \hat{i}(-16 - 20) - \hat{j}(-20 + 5) + \hat{k}(-40 - 8)$$

$$\vec{F} \times \overrightarrow{PQ} = -36\hat{i} + 15\hat{j} - 48\hat{k}$$

158. A moving fluid mass may be brought to a static equilibrium position by applying an imaginary inertia force of the same magnitude as that of the accelerating force but in the opposite direction. This is called

(a) Pascal's law

(b) Archimedes principle

(c) D-Alembert's principle

(d) None of the above

ISRO Scientist/Engineer 11.10.2015

Ans. (c) : D-Alembert's Principle–

- It states that under action of inertia force, and effective force, body will be in dynamic equilibrium.
- Purpose of D-Alembert's principle to convert a dynamic problem into static problem.
- Inertia force always acts opposite to direction of acceleration and not opposite to direction of motion.

159. How many equations are used in the equilibrium of particle in space ?

(a) 2 (b) 5

(c) 4 (d) 3

TNPSC AE (Industries) 09.06.2013

Ans. (d) :

160. Two forces of 10N and 20N are acting at a point in such a way that both the forces are perpendicular to each other. What is the resultant of these forces ?

(a) 22.36 (b) 23.63

(c) 26.23 (d) 21.36

TNPSC AE (Industries) 09.06.2013

Ans. (a) : Given, P = 10, Q = 20 and θ = 90°

$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta}$$

$$R = \sqrt{10^2 + 20^2 + 2 \times 10 \times 20 \times \cos 90°}$$

$$= \sqrt{500}$$

$$\boxed{R = 22.36\,N}$$

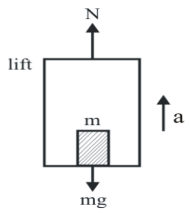
161. A body of mass 10 kg is placed in a lift moving upward with an acceleration of 2 m/s^2. What is the apparent weight of body for g = 9 m/s^2?

(a) 90 N (b) 70 N

(c) 110 N (d) 105 N

UPSC JWM Adv. No-16/2009

Ans. (c) :



Search on Telegram @apna_pdf

$\therefore$ Apparent Weight (N) = ma + mg
= m (a + g)
= 10 (2 + g)
= 10 × 11
= 110 N

162. If a number of forces are acting at a point, their resultant is given by

(a) $(\Sigma V)^2 + |\Sigma H|^2$

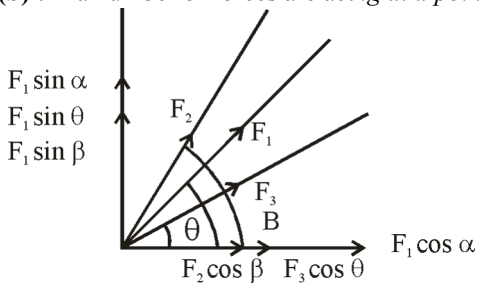
(b) $\sqrt{(\Sigma V)^2 + (\Sigma H)^2}$

(c) $(\Sigma V)^2 . (\Sigma H)^2 . 2(\Sigma V \| \Sigma H)$

(d) $\sqrt{(\Sigma V)^2 - (\Sigma H)^2 . 2(\Sigma V)(\Sigma H)}$

TNPSC ACF 2012

Ans. (b) : If a number of forces are act*ng at a poing*



Summation of all horizontal component
Vertical component
$\Sigma H = F_2 \cos\beta + F_3 \cos\theta + F_1 \cos\alpha$
$\Sigma V = F_1 \sin\alpha + F_3 \sin\theta + F_2 \sin\beta$
Resultant R = $\sqrt{(\Sigma V)^2 + (\Sigma H)^2}$

163. How can the resultant of two forces P and Q (such that P > Q) acting along the same straight line but in opposite direction, be given as?

(a) P + Q (b) P – Q
(c) P/Q (d) Q/P

VIZAG STEEL MT 2011

Ans. (b) : Solution

$R = \sqrt{P^2 + Q^2 + 2PQ\cos 180^\circ}$
$= \sqrt{P^2 + Q^2 - 2PQ}$
$= \sqrt{(P - Q)^2}$

164. One kgf/cm^2 when converted in SI units is

(a) 0.0981 MPa (b) 0.981 Pa
(c) 10^4 Pa (d) 1 P

APPSC AEE 2012

Ans. (a) : 1 kgf/cm^2 = 1 × 9.81 × 10^4
= 0.0981 × 10^6 Pa
1 kgf/cm^2 = 0.0981 MPa

165. Two bodies of different masses M_A and M_B are dropped from two different heights a and b respectively. The ratio of the time taken by the two, to drop through these distances in vacuum will be:

(a) a : b (b) b : a
(c) $\sqrt{a} : \sqrt{b}$ (d) $a^2 : b^2$

PTCUL AE 25.06.2017

Ans. (c) : During falling of bodies, a = g
v = u + gt
For initial velocity, u = 0
v = gt
$t \propto v$
$t \propto \sqrt{2gh} \propto \sqrt{h}$
Bodies dropped from height 'a' and 'b' for masses M_A and M_B respectively

$$\frac{t_A}{t_B} = \sqrt{\frac{a}{b}}$$

166. Two forces P and $P\sqrt{2}$ act on a particle in directions inclined at an angle of 135° to each other. Find the magnitude of the resultant.

(a) P (b) $P\sqrt{2}$
(c) 5P (d) None of these

PTCUL AE 25.06.2017

Ans. (a) : Resultant force,

$$R^2 = P^2 + \left(P\sqrt{2}\right)^2 + 2(P)\left(P\sqrt{2}\right)\cos 135^\circ$$
$$R^2 = P^2 + 2P^2 + 2\sqrt{2}\,P^2 \cos 135^\circ$$
$$R^2 = P^2 + 2P^2 - 2P^2$$
$$R^2 = P^2$$

Resultant, R = P

167. When two bodies of mass M and 2M are connected by light inextensible string and pass over smooth pulley with mass M on left side, then

(a) Tension in both sides of strings will be equal
(b) Tension in the left part of string will be twice than that in right part
(c) Tension in the left part of string will be half of that in right part
(d) None of the above

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (a) :

168. In rigid body mechanics, equilibrium should satisfy with respect to

(a) Only forces (b) Both forces and moments
(c) Energy (d) Geometry

TANGEDCO AE 2015

Ans. (b) : In rigid bodies for equilibrium condition body should satisfy equation of forces of forces and moments both.

$\Sigma F_x = \Sigma F_y = \Sigma F_z = 0$
$\Sigma M_x = \Sigma M_y = \Sigma M_z = 0$

169. The theorem used for equilibrium of particle applied with three concurrent coplanar forces is

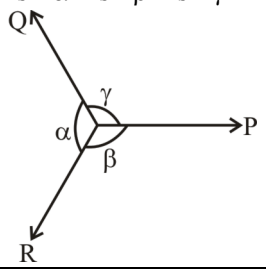
(a) Varignon's theorem
(b) Parallelogram theorem
(c) Lami's theorem
(d) Pythagoras theorem

TANGEDCO AE 2015

Search on Telegram @apna_pdf

Ans. (c) : Lami's theorem– When three concurrent coplanar forces are acting and in equilibrium, then each force is proportional to the sine of the angle between the other two forces.

Mathematically, $\frac{P}{\sin\alpha} = \frac{Q}{\sin\beta} = \frac{R}{\sin\gamma}$



170. Condition of static equilibrium of a planner force system is written as

(a) $\sum F = 0$ (b) $\sum M = 0$

(c) $\sum F = 0$ and $\sum M = 0$ (d) none of these

VIZAG Steel MT 2015

Ans. (c) : $\Sigma F = 0$ and $\Sigma M = 0$

171. Consider the following statements for system of forces:

1. **Two or more forces that act at the same point are called coplanar forces.**
2. **Two or more forces whose directed arrows lie in same plane are called concurrent forces.**
3. **Varignon's theorem states that the moment of several concurrent coplanar forces about any point O in their plane equals the moment of their resultant about the point O'.**
4. **Lami's theorem states that if a body is in equilibrium under the action of three forces, each force is proportional to the sine of angle between the other forces.**

Which of the above statements are correct?

(a) 1, 2 and 4 only (b) 1 and 4 only

(c) 3 and 4 only (d) 1, 2 and 3 only

ESE 18.07.2021

Ans. (c) : The correct statements are-

- Varignon's theorem states that the moment of several concurrent coplanar forces about any point O in their plane equals the moment of their resultant about the point O'.
- Lami's theorem states that if a body is in equilibrium under the action of three forces, each force is proportional to the sine of angle between the other forces.

2. Moments and Couples

172. When trying to turn a key into a lock, the following is applied :

(a) Coplanar force (b) Lever

(c) Moment (d) Couple

HPPSC W.S. Poly. 2016

Assam PSC CCE Pre 2015

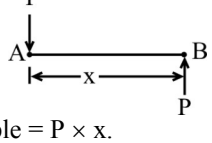
UKPSC AE-2013, Paper-I

J & K PSC Screening, 2006

GWSSB AAE, 27.12.2015

Ans : (d) When trying to turn a key into a lock, the couple is applied.

Couple:- The two equal and opposite forces, whose line of action are different, form a couple.



Moment of a couple = P × x.

173. A couple produces

(a) translatory motion

(b) rotational motion

(c) combined translatory and rotational motions

(d) none of these

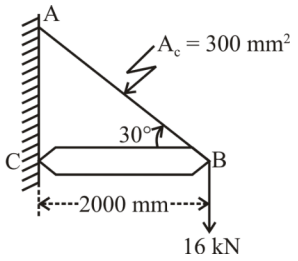
TNPSC ACF 2012

TNPSC AE, 2008

UKPSC AE 2007 Paper -I

Ans. (b) : A couple consists of two parallel forces that are equal in magnitude, opposite in sense and do not share a line of action. It does not produce any translating but only rotational motion.

174. A Jib crane consists of a rigid beam BC supported by an elastic rod AB and hinged at C. Determine the deflection of the point B when a load of 16 kN is applied. Take E = 200 GPa. Area of cross section (A_c) of elastic rod AB is 300 mm^2

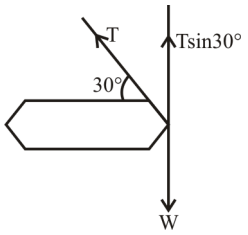


(a) 1.23 mm (b) 4.56 mm

(c) 2.46 mm (d) 5.23 mm

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) :



$$\ell_{AB} = \frac{2000}{\cos 30} = 2309.40\,\text{mm}$$

$F_y = 0$

$T\sin 30° = W$

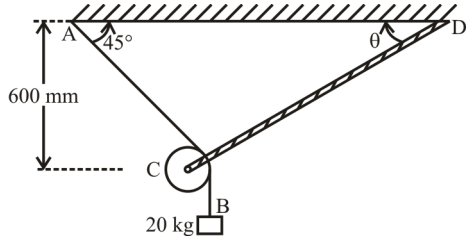
$T = 16 \times 2 = 32$ kN

$$\delta L = \frac{T\ell_{AB}}{AE} = \frac{32\times10^3\times2309.40}{300\times200\times10^3}$$

$\delta L = 1.23$ mm

Search on Telegram @apna_pdf

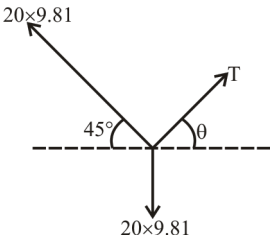
175. A load of 20 kg is supported as shown in fig. Assuming the pulley to be ideal and the equilibrium configuration as shown in figure, determine the tension in cable CD



(a) 250 N (b) 200.4 N
(c) 150.2 N (d) 100 N

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) :



$\sum F_x = 0$

$20 \times 9.81 \times \cos 45° = T\cos\theta$

$T\cos\theta = 138.73$ N .....(i)

And $\sum F_v = 0$

$T\sin\theta = 20 \times 9.81 - (20 \times 9.81 \times \sin 45°)$

$= 20 \times 9.81 (1 - \sin 45°)$

$T\sin\theta = 57.4656$ .....(ii)

Squaring and adding equations (i) and (ii) we get,

$T^2 = 138.73^2 + 57.4656^2$

$\boxed{T = 150.16\,N}$

176. For a many-particle system with particles interacting with each other, the conservation of angular momentum requires that the force of interaction between two particles should be

(a) equal and opposite
(b) equal, opposite and attractive
(c) equal, opposite and along the line joining the two particle
(d) equal, opposite along the line joining the two particles and keeps the distance between them fixed

TSPSC Manager (Engg.) HMWSSB 12.11.2020

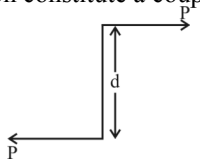
Ans. (c) : Equal opposite and along the line joining the two particle.

177. Two non-collinear parallel equal forces acting in opposite direction

(a) balance each other
(b) constitute a moment
(c) constitute a couple
(d) constitute a moment of couple

TNPSC AE 2019
CGPSC Poly. Lect. 22.05.2016

Ans. (c) : Two non-collinear parallel equal force acting in opposite direction constitute a couple.



C = P × d (clock-wise)

178. The tendency of rotation of the body along any axis is also called

(a) moment of inertia (b) moment of couple
(c) torque (d) force

Assam PSC AE (PHED), 18.10.2020

Ans. (c) : The tendency of rotation of the body along any axis also called the torque. It is the moment of the force acting perpendicular to the direction of the axis of rotation.
That is the moment is the cross product of the force and the distance between the axis and the point of action.

179. In the impact problem the following conditions must always be satisfied:

(a) the total kinetic energy remains unchanged
(b) the total linear momentum remains unchanged
(c) the magnitude of the total linear momentum is multiplied by the co-efficient of restitution
(d) none of the above

J&K PSC Civil Services Pre, 2013

Ans. (b) : During impact or collision only linear momentum remain unchanged.

180. Impulse gives a measure of the product of

(a) Force and velocity
(b) Force and acceleration
(c) Force and displacement
(d) Force and time

TSPSC AEE 2017

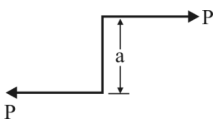
Ans. (d) : The impulse experienced by the object equals the change in momentum of the object.
Impulse = F.t
F.t = m.Δv (Product of force × time)

181. A…….. is formed by two equal magnitude and opposite direction forces displaced by perpendicular distance.

(a) Bending moment (b) Couple
(c) Shear moment (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) :



A couple is formed by two equal magnitude and opposite direction forces displaced by perpendicular distance.

$\boxed{\text{Couple} = P \times a}$ N.m

182. The unit of couple is :

(a) kN (b) kN / m
(c) kN . m (d) kN/m^2

GMB AAE 25.06.2017

Search on Telegram @apna_pdf

Ans. (c) : The moment of a couple is equal to the product of either force and the perpendicular distance between the line of action of both forces.
SI. unit of moment of couple is N.m

183. Dimensions for moment of momentum are :
(a) $M L^2 T^{-1}$ (b) MT^{-1}
(c) $M L^2 T^{-3}$ (d) MT^{-3}

J&K PSC Civil Services Pre, 2010

Ans. (a) : Angular momentum = $\vec{r} \times \vec{p} = I\omega$
Dimension = ML^2T^{-1}
S. I. unit = kgm^2S^{-1}

184. A zero torque acting on a system result in conservation of
(a) angular momentum (b) linear momentum
(c) angular velocity (d) energy

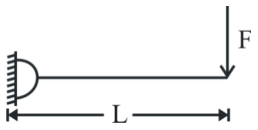
Haryana PSC Civil Services Pre, 2014

Ans. (a) : Conservation of angular momentum-
If external torque is absent in any system then angular momentum is conserved for that system.
If $T_{external} = 0$
then $\frac{d}{dt}(mvr) = 0$
Then $\boxed{\frac{d}{dt}(J) = 0}$
J = Angular Momentum (mvr)

185. What is the moment of force?
(a) moment of force is the sum of a force and its distance from an axis
(b) moment of force is the product of a force and its distance from an axis
(c) moment of force is the first derivative of force with respect to its axis
(d) none of these

KPCL AE 2016

Ans. (b) : The moment of force acting about a point or axis is found by multiplying the force (F) by the perpendicular distance from the axis (L), called the lever arm.
Moment = Perpendicular distance × Force
$M = L \times F$



186. The statement that "the moment of any force is equal to the algebric sum of the moments of the components of that force" is known as
(a) Varingon's theorem
(b) Principle of Moments
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (c) : The principle of moments, also known as varignon's theorem, states that the moment of any force is equal to the algebric sum of the moment of the components of that force.

187. The action of a couple on a body .....if we change both the magnitudes of the forces and the arm of the couple in such a way that the moment of the couple
(a) does not change (b) always change
(c) becomes zero (d) can not be determined

HPPSC Asstt. Prof. 29.10.2016

Ans. (a) : The action of a couple on a body does not change if we change both the magnitudes of the forces and the arm of the couple in such a way that the moment of the couple remains unchanged.

188. A flat road has a curve segment with a radius of 105 m. While negotiating this curve, a vehicle slipped on its tyres as well as tried to roll over at a particular speed. This speed assuming a friction coefficient of 0.4 is :
(a) 18 m/s (b) 25 m/s
(c) 32 m/s (d) 20 m/s

UPRVUNL AE 2014

Ans : (d) Given that, $\mu = 0.4$ and curve radius = 105m
When the wheel goes under pure rolling Frictional force = Centrifugal force

$$\mu \times m \times g = \frac{mv^2}{r}$$

$$v = \sqrt{\mu gr}$$

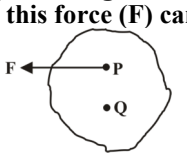
$$v = \sqrt{\mu gr} = \sqrt{0.4 \times 9.81 \times 105} = 20.29 m/s$$

189. The algebraic sum of moments of two unlike parallel forces about any point in their plane will be
(a) Zero (b) Constant
(c) Always anticlockwise (d) Always clockwise

APPSC AEE Screening Test 2016

Ans. (b) : The algebraic sum of their moments about any point in their plane is constant and it is equal to the moment of a couple.

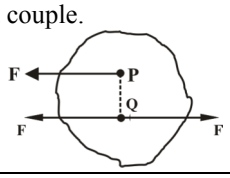
190. If a force (F) is acting on a rigid body at any point P, then this force (F) can be replaced by:

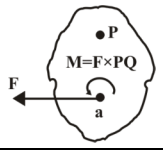


(a) An equal, opposite and parallel force (F) applied at point Q together with a couple
(b) An equal, parallel and same sense force (F) at point Q together with a couple
(c) A moment at point Q only
(d) An equal, opposite and parallel force (F) only at point Q

UPRVUNL AE 07.10.2016

Ans. (b) : If a force (F) is acting on a rigid body at any point P, then this force (F) can be replaced by an equal, parallel and same sense force (F) at point Q together with a couple.





Search on Telegram @apna_pdf

191. A 12 kN force produces a moment of 96 kN-m then, the moment arm is

(a) 2 m (b) 4 m
(c) 6 m (d) 8 m

TSPSC AEE 2015

Ans : (d) Given, F = 12 kN
T = 96 kN -m
We know that, $T = F \times d$

$$d = \frac{T}{F} = \frac{96}{12} = 8\,m$$

192. Which of the following statement is correct?

(a) the algebraic sum of the forces constituting the couple is zero
(b) the algebraic sum of the force, constituting the couple, about any point is same
(c) a couple cannot be balanced by a single force but can be balanced only by a couple of opposite sense
(d) all statements

TSPSC AEE 2015
UKPSC AE 2007 Paper -I

Ans. (d) : All statements are correct.

193. Varignon's theorem is related to

(a) Principle of moments
(b) Principle of momentum
(c) Principle of force
(d) Principle of inertia

UKPSC AE 2012 Paper-I

Ans. (a) : Principle of moments

194. The dimensions of angular velocity are given by

(a) $M^0L^1T^{-1}$ (b) $M^0L^2T^{-1}$
(c) $M^0L^0T^{-2}$ (d) $M^0L^0T^{-1}$

UKPSC AE 2007 Paper -I

Ans. (d) : $M^0L^0T^{-1}$

195. Opening a Limca bottle is due to

(a) moment (b) couple
(c) torque (d) parallel forces

UKPSC AE 2007 Paper -I

Ans. (a) : Moment

196. Cycle pedalling is an example of

(a) couple
(b) moment
(c) two equal and opposite forces
(d) two unequal parallel forces

UKPSC AE 2007 Paper -I

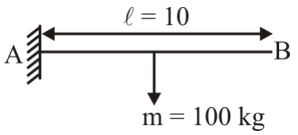
Ans. (a) : Couple

197. The length of the rod is 10 meter and its weight is 100 kg. One of its end is fixed in the wall. The moment about the fixed end of the rod will be :

(a) 1000 Nm (b) 9810 Nm
(c) 4905 Nm (d) 500 Nm

TNPSC AE (Industries) 09.06.2013

Ans. (c) :



Given,
$\ell = 10$ m
m = 100 kg
Moment about fixed end (i.e. point A),

$$M = 100 \times 9.81 \times \frac{10}{2}$$

$$\boxed{M = 4905\ N - m}$$

198. While a human walking on a smooth floor surface, what kind of reactions are produced under his foot ?

(a) Horizontal reaction
(b) Vertical reaction
(c) Horizontal and vertical reactions
(d) No reaction

TNPSC AE (Industries) 09.06.2013

Ans. (b) : Human walking on a smooth floor surface, vertical reactions are produced under his foot.

3. Friction

199. The coefficient of friction depends on :

(a) nature of surface (b) shape of surfaces
(c) strength of surfaces (d) area of contact

Vizag Steel (MT) 2017
GWSSB DEE 07.04.2016
GPSC Poly. Lect. 07.07.2016
GWSSB AAE, 27.12.2015
UKPSC AE 2007 Paper-I
GPSC Poly. Lect. 07.12.2014
GWSSB DEE 07.07.2016

Ans. (a) : The coefficient of friction depends on nature of surface.

200. Static friction is always ____ dynamic friction

(a) Equal to (b) Less than
(c) Greater than (d) (A) and (B) both

GMB AAE 25.06.2017
TNPSC AE, 2008
UKPSC AE 2012 Paper-I
GPSC Poly. Lect. 07.12.2014

Ans. (c) : Static friction- The static friction is the frictional force develops between mating surface when subjected to external force but there is no relative motion between them.

$(\mu_s > \mu_k)$ ——— always

Dynamic or Kinetic Friction- Kinetic Friction is the force that resists the relative movement of the surface when they are in motion.

They static friction between two surface is always higher than the kinetic friction.

201. A body of weight W is placed on an inclined plane. The angle made by the inclined plane with horizontal, when the body is on the point of moving down is called

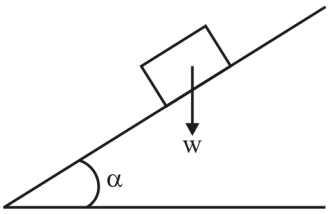
(a) angle of inclination
(b) angle of repose
(c) angle of friction
(d) angle of limiting friction

Vizag Steel (MT) 2017

Search on Telegram @apna_pdf

Haryana PSC Civil Services Pre, 2014
TNPSC ACF 2012

Ans. (b)



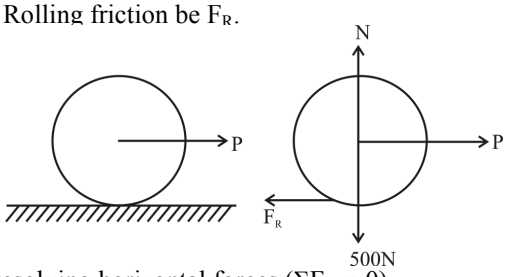
Angle of repose-
It is the angle of inclination from horizontal plane at which body starts moving down (sliding) or impending motion.

202. A steel wheel of 600 mm diameter is on a horizontal steel rail. It carries a load of 500N. The coefficient of rolling resistance is 0.3. The force in Newton, necessary to roll the wheel along the rail is

(a) 0.5 (b) 5
(c) 1.5 (d) 150

Karnataka PSC Lect., 27.05.2017
OPSC Civil Services Pre-2011
GATE 2000

Ans (a) : Diameter of wheel (d) = 600 mm
r = 300 mm
Load (W) = 500N
Coefficient of rolling resistance
(μ_R) = 0.3
Let, Rolling friction be F_R.



By resolving horizontal forces ($\Sigma F_H = 0$)
$P - F_R = 0$
$P = F_R$ ……(i)
By resolving vertical force ($\Sigma F_v = 0$)

Rolling friction, $F_R = \frac{W \times \mu_R}{r}$

$$F_R = \frac{500 \times 0.3}{300} = 0.5N$$

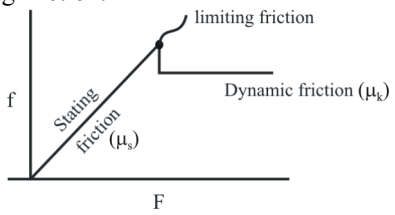
Now, from equation (i)
P = 0.5 N

203. Maximum value of frictional force acting on a body, when the body is just about to start is called :

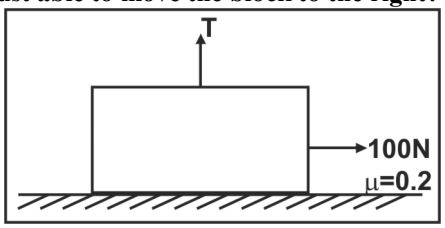
(a) limiting friction (b) static friction
(c) dynamic friction (d) none of these

MECON MT 2019
HPPSC Asstt. Prof. 29.10.2016
HPPSC Lect. (Auto) 23.04.2016
UKPSC AE 2012 Paper-I
VIZAG Steel MT 2011
UKPSC AE 2007 Paper-I

Ans. (a) : Limiting friction– The maximum friction that can be generated between two static surfaces in contact with each other. Once a force applied to the surfaces exceeds the limiting friction, motion will occur. For two dry surfaces, the limiting friction is a product of the normal reaction force and the coefficient of limiting friction.



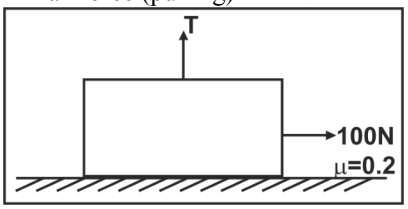
204. A block weighting 981 N is resting on Horizontal surface. The co-efficient of friction between the block and horizontal surface is μ = 0.2. A vertical cable attached to block provides partial support as shown. A man can pull horizontally with a force of 100N. What will be the tension (T) (in N) in the cable if the man is just able to move the block to the right?



(a) 176.2 (b) 196.0
(c) 481.0 (d) 981.0

ISRO Scientist/Engineer 2012
OPSC Civil Services Pre. 2011
GATE 2009

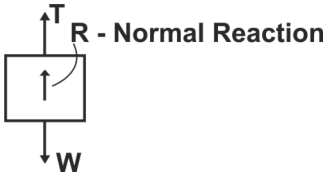
Ans. (c) : Given W = 981 N
μ = 0.2
A man force (pulling)



Let the normal Reaction at bottom of Block is R
∴ F = μR [By pulling force (man)]
100 N = μR

$$R = \frac{100}{0.2} = 500N$$

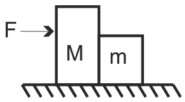
FBD, **Block**



T + R = W
T = W - R = 981 - 500
= 481 N.

Search on Telegram @apna_pdf

205. Two blocks with masses M and m are in contact with each other and are resting on a horizontal frictionless floor. When horizontal force F is applied to the heavier, the blocks accelerate to the right. The force between the two blocks are



(a) $\frac{mF}{(M+m)}$ (b) $\frac{MF}{m}$

(c) $\frac{mF}{M}$ (d) $(M+m)\frac{F}{m}$

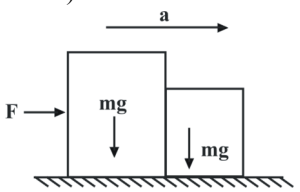
ISRO Scientist/Engineer 2011
ISRO Scientist/Engineer 2008
MPPSC AE 08.11.2015

Ans. (a) : Force between two block = ?
Let force between two blocks = F'

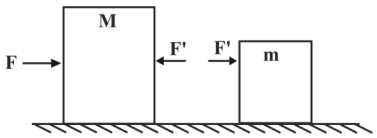
$F' = ma$ ...(1)

$F = (M + m)\, a$

$a = \frac{F}{(M+m)}$



Using FBD



Put value of a in equation (1)

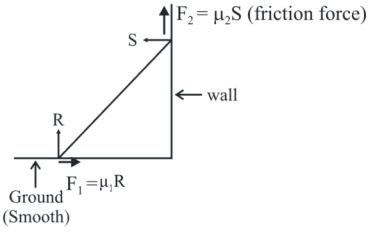
$F' = \frac{mF}{m+M}$

206. On a ladder resting on a smooth ground and leaning against rough vertical wall, the force of friction acts

(a) upward at its upper end
(b) towards the wall at the upper end
(c) towards the wall at lower end
(d) downward at its upper end

CGPSC AE 15.01.2021
BPSC Poly. Lect. 2016
TNPSC AE 2018
UKPSC AE 2007 Paper -I

Ans : (a)



for smooth ground
$\mu_1 = 0$
on a ladder resting on a smooth ground and leaning against rough vertical wall, the force of friction acts towards the wall at the upper end.

207. A rectangular block of mass 100 kg rests on a rough horizontal floor having co-efficient of friction 0.25. The minimum force required to move the block is _____.

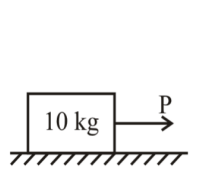
(a) 2452.5 N (b) 245.25 N
(c) 2.4525 N (d) 24.525 N

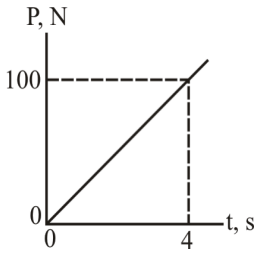
VIZAG Steel MT 24.01.2021, Shift-I

Ans. (b) : Given,
m = 100 kg
$\mu = 0.25$
Minimum force required, $F = \mu R$

$F = \mu mg$
$= 0.25 \times 100 \times 9.81$
$= 245.25$ N

208. A wooden block of mass 10 kg is at rest initially as shown in the figure. A linearly time varying force is applied. The static and kinematic coefficients of friction are 0.6 and 0.4, respectively. The velocity of the block at t = 4s in m/s will be:

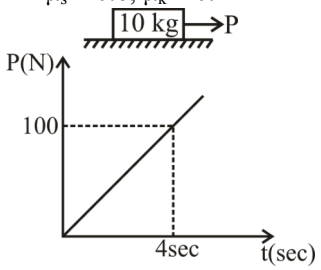




(a) 6.4 (b) 0
(c) 7.5 (d) 5

AAI Jr. Executive 26.03.2021

Ans. (a) : Given, m = 10 kg
$\mu_s = 0.6$, $\mu_k = 0.4$



Static friction force, $= \mu_s N$
$= 0.6 \times mg$
$= 0.6 \times 100 = 60$ N

Applied force at any 't' time $= \frac{100}{4} \times t = 25t$

Body will start motion when applied force is greater than 60 N i.e.,

$25t > 60$

$t > \frac{60}{25}$

$t > 2.4$ sec

Search on Telegram @apna_pdf

Now, from Newton's 2nd law of motion,

$$F_{net} = m\frac{dv}{dt}$$

$\Rightarrow$ $F_{net} = F_{app}$ – Kinetic friction [As body is moving after 2.4 sec]

$F_{net} = F_{app} - F_k$

$= 25t - \mu_k N$

$= 25t - 0.4 \times 100 = 25t - 40$

Thus, $25t - 40 = 10\frac{dv}{dt}$

Velocity at t = 4 sec

$$\int_{2.4}^{4}(2.5t+4)dt = \int_{0}^{v} dv$$

$$\left[2.5\frac{t^2}{2} - 4t\right]_{2.4}^{4} = v - 0$$

$v = 1.25\,(4^2 - 2.4^2) - 4 \times (4 - 2.4)$

$v = 6.4$ m/s

209. A force F, with magnitude 1N, is acting in XY-plane at a point (2 m, 4 m). It makes an angle of θ = 60° with the positive direction of x-axis. Torque of this force about the origin in Nm is:

(a) $-0.27\hat{k}$ (b) $0.27\hat{i}$

(c) $-0.27\hat{i}$ (d) $0.27\hat{k}$

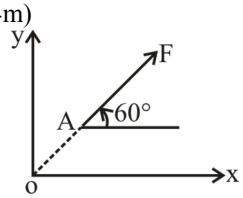
AAI Jr. Executive 26.03.2021

Ans. (a) : Given,

F = 1N (in x-y plane)

θ = 60° (wrt x-axis)

A(2m, 4m)



$\vec{F} = 1(\cos 60°\hat{i} + \sin 60°\hat{j})$

$\vec{F} = \left(\frac{1}{2}\hat{i} + \frac{\sqrt{3}}{2}\hat{j}\right)$

Now, position vector of point A (2m, 4m)

$\vec{r} = 2\hat{i} + 4\hat{j}$

Torque about origin, $= \vec{r} \times \vec{F}$

$$= (2\hat{i} + 4\hat{j}) \times \left(\frac{1}{2}\hat{i} + \frac{\sqrt{3}}{2}\hat{j}\right)$$

$$\Rightarrow \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 4 & 0 \\ \frac{1}{2} & \frac{\sqrt{3}}{2} & 0 \end{vmatrix}$$

$\Rightarrow$ $\hat{i}(0-0) - \hat{j}(0-0) + \hat{k}(\sqrt{3}-2)$

$\Rightarrow$ $(\sqrt{3}-2)\hat{k}$

$\Rightarrow$ $-0.27\hat{k}$

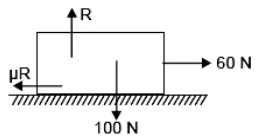
210. A body of weight 100 N is placed on a rough horizontal plane. What is the coefficient of friction if a horizontal force of 60 N just causes the body to slide over the horizontal plane?

(a) 0.4 (b) 0.5

(c) 0.6 (d) 0.9

ESE 18.07.2021

Ans. (c) :



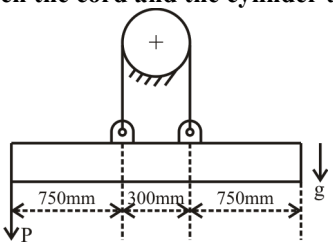
R = 100 N

Friction force = μ × R

$\Rightarrow$ $60 = \mu \times 100$

$\Rightarrow$ $\mu = 0.6$

211. A uniform beam of mass density 74 kg/m and length 1.8 m is suspended symmetrically as shown in Fig. Calculate the maximum force P that can be supported without tipping the beam. Take the coefficient of static friction between the cord and the cylinder to be 7/22



(a) 100.7 N (b) 200.9 N

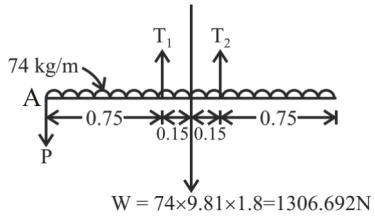
(c) 150.8 N (d) 50.2 N

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : Assume beam as UDL beam,

$$\mu = \frac{7}{22}$$

Angle of center, θ = π



For obtaining maximum force, $T_1 > T_2$

So, $\frac{T_1}{T_2} = e^{\mu\theta} = e^{\frac{7}{22}\cdot\pi} = e^1 = 2.718$

$\Sigma F_v = 0$

$T_1 + T_2 = P + W = P + 1306.692$

$P = 3.718T_2 - 1306.692$ .....(i)

$\Sigma M_A = 0$,

$-T_1 \times 0.75 - T_2 \times 1.05 + 1306.692 \times 0.9 = 0$

$\Sigma M = 0$,

$2.718T_2 \times 0.75 + T_2 \times 1.05 = 1176.0228$

$$T_2 = \frac{1176.0228}{3.0885} = 380.7747\,N$$

Search on Telegram @apna_pdf

$T_1 = 2.718T_2 = 1034.945$ N

From (i)

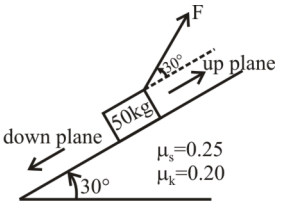
$P = 109.028$ N

If $g = 10$ m/sec^2

$\boxed{P = 111.1417\,N}$

So, option (a) $P \approx 100.7$ N

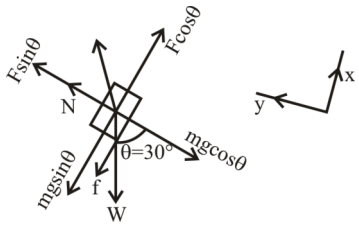
212. A force F is used to pull a 50 kg block, as shown in figure. Determine the magnitude and direction of the friction force when F = 400 N



(a) 45 N up the plane
(b) 80 N up the plane
(c) 45 N down the plane
(d) 80 N down the plane

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) :



$\sum F_y = 0$

$F\sin\theta + N = mg\cos\theta$

$N = 50 \times 10 \times \cos30° - 400 \times \sin30°$

$N = 233$ N

If (a) $F\cos\theta > mg\sin\theta + f_s$

Then the friction will be kinetic friction

(b) $F\cos\theta \le mg\sin\theta + f_s$

Then the friction will be static friction

Static friction force, $F_s = \mu_s N = 0.25 \times 233$

$= 58.25$ N

Kinetic friction force, $F_x = \mu_k N = 0.2 \times 233 = 46.6$ N

Net force along the inclined plane

$= F\cos30° - W\sin30°$

$$400\frac{\sqrt{3}}{2} - 500 \times \frac{1}{2} = 96.4\,N$$

Hence the friction will be kinetic friction and its value will be 46.6 N down the plane.

213. A sphere of mass m rolls without slipping on an inclined plane of inclination θ. Which of the following conditions should be satisfied for pure rolling?

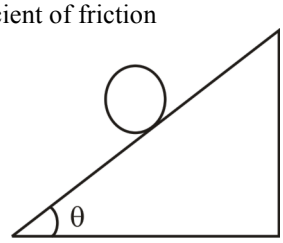
(a) $\mu < \frac{1}{7}\tan\theta$ (b) $\mu > \frac{2}{7}\tan\theta$

(c) $\mu > \frac{5}{7}\tan\theta$ (d) $\mu > \frac{3}{7}\tan\theta$

CGPSC AE 15.01.2021

Ans. (b) : Given, A sphere of mass m rolls without slipping down on inclined plane of angle of inclination θ.

Now, Coefficient of friction



$$\mu > \frac{\tan\theta}{1+\frac{R^2}{k^2}} \quad \text{... (i)}$$

where k is Radius of gyration,

Moment of Inertia of sphere.

$$I = \frac{2}{5}mR^2 = mk^2$$

$$k^2 = \frac{2}{5}R^2 \quad \text{... (ii)}$$

From (i) & (ii)

$$\mu > \frac{\tan\theta}{1+\frac{R^2}{\frac{2}{5}R^2}}$$

$$\boxed{\mu > \frac{2}{7}\tan\theta}$$

214. A box weight 1000 N is placed on the ground. The coefficient of friction between the box and the ground is 0.5. When the box is pulled by a 100 N horizontal force, the frictional force developed between the box and the ground at impending motion is

(a) 50 N (b) 75 N
(c) 100 N (d) 500

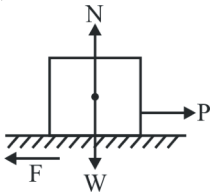
ESE 2018

Ans. (c) : Given,

$W = 1000$ N

$\mu = 0.5$

$P = 100$ N



Frictional force (F) = μN

$= 0.5 \times 1000$ ($\because$ N = W)

$= 500$ N

Since applied force (100N) is less than limiting friction, body will be at rest. As long as the body, is at rest

$F = P = 100$ N

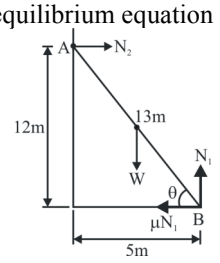
215. A 13 m long ladder is placed against a smooth vertical wall with its lower end 5 m from the wall. What should be the coefficient of friction between the ladder and the floor so that the ladder remains in equilibrium?

Search on Telegram @apna_pdf

(a) 0.29 (b) 0.25
(c) 0.21 (d) 0.11

ESE 2018

Ans. (c) : Using equilibrium equation



$N_2 = \mu N_1$

$N_1 = W$ ($\because \mu_2 N_2 = 0$) Because wall is smooth

Taking moment about A

$W \times 2.5 + \mu_1 N_1 \times 12 = N_1 \times 5$

$\mu_1 = 0.208$

$\mu_1 \Rightarrow 0.21$

216. A body of weight 50 N is kept on a plane inclined at an angle of 30° to the horizontal. It is in limiting equilibrium. The coefficient of friction is equal to-

(a) $\frac{1}{\sqrt{3}}$ (b) $\sqrt{3}$

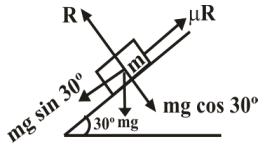
(c) $\frac{1}{50\sqrt{3}}$ (d) $\frac{\sqrt{3}}{5}$

RPSC AE 2018

Ans. (a) : Given:

$mg = 50$ N

$\theta = 30°$



For limiting equilibrium

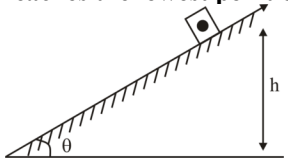
$mg \sin 30° = \mu \times R$

$mg \sin 30° = \mu \times mg \cos 30°$

$\mu = \tan 30°$

$\mu = \frac{1}{\sqrt{3}}$

217. A block of mass (m) slides down an inclined plane (coefficient of friction = μ) from the rest as in figure. What will be the velocity of block when it reaches the lowest point of plane?



(a) $2gh(1 - \mu \cot\theta)$ (b) $\sqrt{2gh(1-\mu\cot\theta)}$

(c) $\sqrt{2gh\mu(1-\cot\theta)}$ (d) $\sqrt{2gh(1-\mu\sin\theta)}$

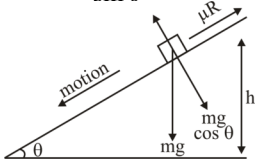
(e) $\sqrt{2gh(\mu-\tan\theta)}$

CGPSC AE 25.02.2018

Ans. (b) : Kinetic energy at lowest point on inclined plane of the block is

$\therefore \frac{1}{2}mv^2 = mgh$ – Energy loss due to friction

$= mgh - \mu R \times \frac{h}{\sin\theta}$

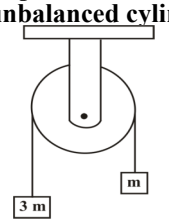


$= mgh - \mu \times mg\cos\theta \times \frac{h}{\sin\theta}$

$v = \sqrt{2gh[1-\mu\cot\theta]}$

$\frac{h}{\sin\theta}$ is distance covered by block during motion on inclined plane.

218. What is the minimum coefficient (μ) of friction between the rope and the fixed shaft which will prevent the unbalanced cylinder from moving?

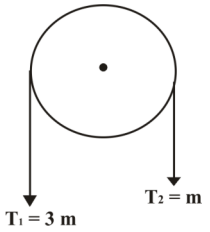


(a) $\mu = 0.333$ (b) $\mu = 0.350$

(c) $\mu = 0.253$ (d) $\mu = 0.372$

APPSC AEE SCREENING 17.02.2019

Ans. (b) :



$\frac{T_1}{T_2} = e^{\mu\theta}$

θ is angle of contact between rope and cylinder

$\theta = \pi$ radian

$\frac{3m}{m} = e^{\mu\pi}$

$3 = e^{\mu\pi}$

$1.098 = \mu\pi$

$\mu = 0.349$

≈ 0.35

219. Limiting friction depends upon

(a) Materials of the body in contact

(b) Weight of the body to be moved

(c) Roughness of surface of contact of the two bodies

(d) All of the above

Gujarat PSC AE 2019

Ans : (d) : Limiting Friction- The maximum value of frictional force, which comes into play when a body just begins to slide over the surface of the other body, is known as limiting friction. Limiting friction depends upon

Search on Telegram @apna_pdf

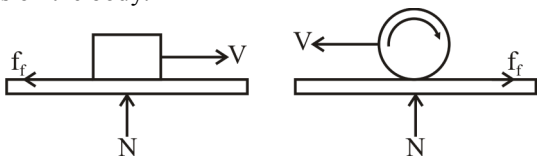
- Materials of the body in contact.
- Weight of the body to be moved.
- Roughness of surface of contact of the two bodies.

220. The energy dissipated during a full cycle of motion by dry friction damping in terms of maximum amplitude (A) and friction force (μN) is:

(a) 1μNA (b) 2μNA
(c) 4μNA (d) 3μNA

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (c) : Dry Friction Damping (or) Coulomb Damping– Dry friction damping occurs at the interface between two bodies in relative motion with contact. As indicated in fig., the friction force opposes the relative velocity direction and depends on the normal force that acts on the body.



Note– The following characteristics of a system with coulomb damping–

- The equation of motion is nonlinear with coulomb damping.
- The natural frequency of system is unchanged with the addition of coulomb damping.
- The motion is periodic with coulomb damping.
- The system comes to rest after some time with coulomb damping.
- The amplitude reduced linearly with coulomb damping.

The energy dissipated by dry friction damping in a full cycle of motion is

$$\boxed{\Delta w = 4\mu NA}$$

Where, $$A = \frac{F_o}{K}\left[\frac{1-\left(\frac{4\mu N}{\pi F_o}\right)^2}{\left(1-\left(\omega/\omega_n\right)^2\right)^2}\right]^{1/2}$$

221. For moderate speeds, the force of friction of kinetic friction remains constant. But it _____ slightly with the _____ of speed.

(a) decreases, increase
(b) decreases, decrease
(c) increases, increases
(d) increases, decrease

VIZAG Steel MT 24.01.2021

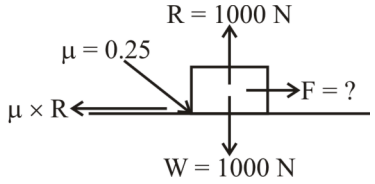
Ans. (a) : The magnitude of the kinetic friction bears a constant ratio to normal reaction between the two surfaces. But this ratio is slightly less than that in the case of limiting friction. For moderate speed, the force of friction remains constant. But it decreases slightly with the increase of speed.

222. A body of weight 1000 N is resting on a rough horizontal surface having a coefficient of friction as 0.25. The magnitude of the force required to move the body horizontally is ___.

(a) 2000 N (b) 250 N
(c) 500 N (d) 1000 N

VIZAG MT, 14.12.2020

Ans. (b) :



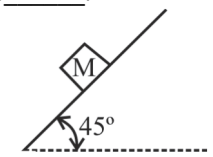
Force required to move body,

$F = \mu R$

$= 0.25 \times 1000$

$$\boxed{F = 250\,N}$$

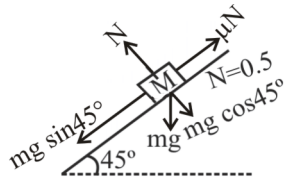
223. A body of mass (M) 10 kg is initially stationary on a 45° inclined plane as shown in figure. The coefficient of dynamic friction between the body and the plane is 0.5. The body slides down the plane and attains a velocity of 20 m/s. The distance travelled (in m) by the body along the plane is_____.



(a) 45 (b) 80
(c) 78.76 (d) 57.76

Assam Engg. College AP/Lect. 18.01.2021
UPPSC AE Paper-I 13.12.2020
GATE 2015

Ans. (d) :



Balancing forces along the inclined plane

$mg\sin 45 - \mu N = ma$

$$a = \frac{mg\sin 45 - 0.5 \times mg\cos 45}{m}$$

$$a = \frac{(9.81 - 0.5 \times 9.81) \times 1}{\sqrt{2}}$$

$$\boxed{a = 3.468\,m/s^2}$$

Distance traveled along the plane

$v^2 = u^2 + 2as$

$(20)^2 = 0 + 2 \times 3.468$

$$s = \frac{20^2}{2 \times 3.468}$$

$s = 57.67$ m

224. A block of mass 5 kg slides down from rest along a frictionless inclined plane that makes an angle of 30^0 with horizontal. What will be the speed of the block after it converse a distance of 3.6 m along the plane? [g = 10 m/s^2]

Search on Telegram @apna_pdf

(a) 5 m/s (b) 6 m/s
(c) 7 m/s (d) 8 m/s

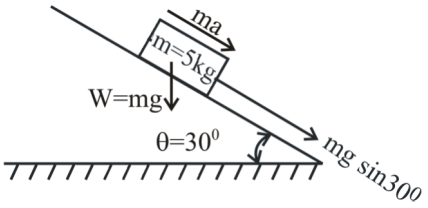
APPSC Poly Lect. 13.03.2020

Ans. (b) : Given, $g = 10\ m/s^2$

distance (s) = 3.6 m

m = 5 kg

initial velocity (u) = 0



At equilibrium condition –

$\Sigma F = ma$

$mg.\sin 30^0 - \mu R = ma$

$mg.\sin 30^0 = ma \qquad (\because \mu = 0)$

$$\Rightarrow a = g\sin 30^0 = 10 \times \frac{1}{2}$$

$$\boxed{a = 5\ m/s^2}$$

$\because v^2 = u^2 + 2as \quad = (0)^2 + 2 \times 5 \times 3.6$

$= v^2 = 2 \times 5 \times 3.6$

$= v^2 = 36$

$v = 6$ m/s

225. The maximum angle of inclination of the plane (with horizontal) at which a body remains in equilibrium under the action of friction only is termed as

(a) Angle of wedge
(b) Angle of equilibrium
(c) Angle of repose
(d) All the given answers

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : The maximum inclination of the plane at which a body can remain in equilibrium, over the plane entirely by the assistance of friction is called the Angle of Repose.

Angle of repose = Angle of limiting friction

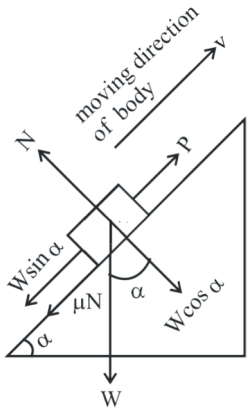
226. A body of weight W is required to move up on rough inclined plane whose angle of inclination with horizontal is α. The effort applied parallel to the plane is given by

(a) $P = W \tan \alpha$
(b) $P = W \tan (\alpha + \phi)$
(c) $P = W (\sin \alpha + \mu \cos \alpha)$
(d) $P = W (\cos \alpha + \mu \sin \alpha)$

Where $\mu = \tan \phi$ = coefficient of friction.

TNPSC AE, 2008

Ans. (c) :



N = Normal reaction

α = angle of inclination

P = Applied effort

μ = Coefficient of friction

Given,

W = Weight of the body

∴ Normal reaction on body

$N = W \cos \alpha$ ..... (i)

Now force balance along parallel to the inclined plane -

$P = W \sin \alpha + \mu N$ ..... (ii)

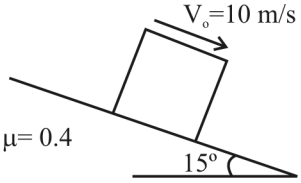
From equation (i) and (ii)

$P = W \sin \alpha + \mu W \cos \alpha$

$\Rightarrow P = W (\sin \alpha + \mu \cos \alpha)$

$P = W (\sin \alpha + \mu \cos \alpha)$

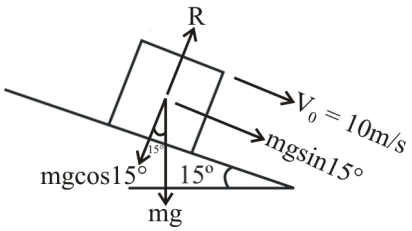
227. The 50 kg crate shown in figure down an incline with an initial velocity 10 m/s. The normal reaction of crate



(a) 233.80 N (b) 133.42 N
(c) 473.80 N (d) 500 N

APPSC Poly. Lect. 2013

Ans. (c) :



m = 50 kg, g = 9.81 m/s, μ = 0.4

Normal reaction ⇒ R = mgcos15°

= 50 × 9.81 × cos15°

= 473.78 N

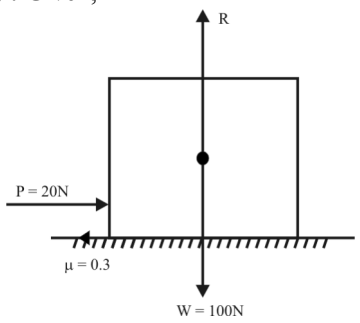
228. A block weighing 100 N is resting on a surface. The coefficient of friction between the block and surface is 0.3. A horizontal force of 20N is applied on the block. What is the magnitude of force of friction acting on the block?

Search on Telegram @apna_pdf

(a) 30 N (b) 100 N
(c) 50 N (d) 20 N

RPSC AEN Pre-2013

Ans. (d) : Given,



Friction force –

$F = \mu R$

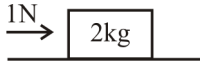
$= 0.3 \times 100 = 30$ N

Here, Applied force on block (P = 20N) less than friction force (F = 30N), So answer will be F = 20 N

229. A 2 kg block is resting on a rough surface with 0.1 coefficient of friction. A force of 1N is applied to the block as shown in figure. The friction force is-

(a) zero (b) 1N
(c) 1.96 N (d) 1.20 N

Ans. (b) :

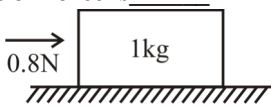


Limiting friction force between block and the surface is $2 \times 0.1 \times 9.8 = 1.96$ N

But applied force is 1N

Which is less than limiting friction, therefore the force of friction is 1N.

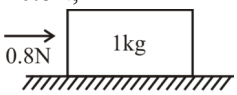
230. A 1 kg block is resting on a surface with co-efficient of friction μ = 0.1. A force 0.8 N is applied to the block as shown in the figure. The friction force is_____



(a) Zero (b) 0.8 N
(c) 0.89 N (d) 1.2 N

TSPSC AEE 2017
GATE 2011

Ans. (b) : μ = 0.1, P = 0.8N,



$F_r = \mu_s N$

$N = 9.81$N

$F_r = \mu_s N$

$= 0.1 \times 9.81$

$= 0.981$ N

$\because$ Applied force $< \mu_s N$

Then the friction force developed on the surface of block is equal to the applied force i.e equal to 0.8 N.

231. A tail stock of lathe weighs 120 kgf and the coefficient of friction as its slides is 0.12. The horizontal force (in kgf) required to slide the tail stock would be:

(a) 1000 (b) 14.4
(c) 120.12 (d) 120

GPSC Asstt. Prof. 28.08.2016

Ans. (b) : We know that,

Frictional force (F) = μN

$F = 0.12 \times 120$ kgf

$= 14.4$ kgf

232. It the angle of friction is zero a body will experience

(a) infinite friction
(b) zero friction
(c) force of friction acting normal to the plane
(d) None of the above

WBPSC AE, 2017

Ans. (b) : Given, Angle of friction, (ϕ) = 0

So, $\tan\phi = \mu$

$\mu = \tan 0°$

$\mu = 0$

233. The slope on the road generally provided on the curve is known as

(a) Angle of repose (b) angle of friction
(c) Angle of banking (d) Angle or reaction

WBPSC AE, 2017

Ans. (c) : Angle of banking

234. A crate weighing 40 kg rests on a cart moving with an acceleration. The coefficient of friction between the cart the crate is 0.5. The maximum value of acceleration of the cart, so that the crate does not slip along the cart, is

(a) 0.25 m/sec^2 (b) 2.45 m/sec^2
(c) 4.90 m/sec^2 (d) 1.225 m/sec^2

WBPSC AE, 2017

Ans. (c) : We know that,

Force = Force due to friction

$ma = \mu mg$

$a = \mu g$

$= 0.5 \times 9.81 = 4.905$ m/s^2

235. The coefficient of friction between pulley and belt is reduced to half. If the initial ratio of tension in belt is 5, then the new value will be

(a) 2 (b) 2.236
(c) 4.47 (d) 3.64

WBPSC AE, 2017

Ans. (b) : Given, $\mu_1 = \mu$, $\mu_2 = \frac{\mu}{2}$

$$\frac{T_1}{T_2} = 5$$

We know that, $\frac{T_1}{T_2} = e^{\mu_1\theta}$

or $e^{\mu\theta} = 5$

Search on Telegram @apna_pdf

New value,

$$\left(\frac{T_1}{T_2}\right)_{new} = e^{\mu_2\theta}$$

$$\left(\frac{T_1}{T_2}\right)_{new} = e^{\frac{\mu}{2}\theta}$$

$$\left(\frac{T_1}{T_2}\right)^2_{new} = \left(e^{\frac{\mu}{2}\theta}\right)^2 \quad \text{[Taking both side square]}$$

$$= e^{\mu\theta}$$

$$\left(\frac{T_1}{T_2}\right)_{new} = \sqrt{5} = 2.236$$

236. A body of weight 600 N is placed on a horizontal surface which tend to move when a horizontal force of $200\sqrt{3}$ N is applied. The angle of friction is :

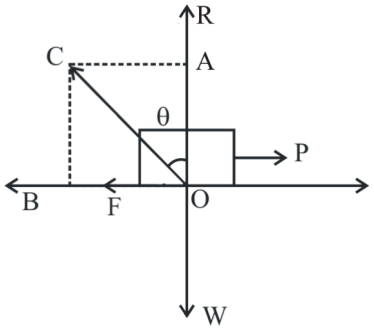
(a) 30º (b) 45º
(c) 60º (d) 90º

J&K PSC Civil Services Pre, 2010

Ans. (a) : Weight (w) = 600 N = R

Horizontal force (P) = $200\sqrt{3}$ = F (Friction force)

= (Body tends to move)



ΔAOC, $\tan\theta = \frac{AC}{OA} = \frac{P}{R}$

$$\frac{200\sqrt{3}}{600} = \frac{\sqrt{3}}{3}$$

$$= \frac{1}{\sqrt{3}}$$

$$\mu = \tan\theta = \frac{1}{\sqrt{3}}$$

$$\boxed{\theta = 30^0}$$

237. A sphere of mass m and radius R is rolling without slipping on a horizontal rough surface. If the acceleration of the mass centre of the sphere be a, the magnitude of the friction force.

(a) $\frac{1}{5}ma$ (b) $\frac{2}{5}ma$
(c) $\frac{3}{5}ma$ (d) $\frac{4}{5}ma$

WBPSC AE, 2007

Ans. (b) : We know that,

Torque (T) = $I\alpha$

$$F_f \cdot R = \frac{2}{5}mR^2 \times \left(\frac{a}{R}\right) \qquad \left[\alpha = \frac{a}{R}\right]$$

$$F_f = \frac{2}{5}ma$$

238. If the friction force or sliding velocity varies as a function of distance or time and produces oscillations, it is called a…

(a) Cold weld
(b) Adhesion
(c) Stick-slip phenomenon
(d) Ploughing of hard asperity

MPSC Dy. Engg. (GWD) 19.05.2013

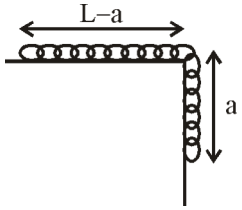
Ans. (c) : If the friction force or sliding velocity varies as a function of distance or time and produces oscillations, it is called a stick-slip phenomenon.

239. A flexible but inextensible chain of length 'L' and weight 'wL' is held on frictionless table with an initial overhang of length 'a'. The velocity 'v' with which the chain will leave the table if released is

(a) $\frac{g}{L}\sqrt{L^2 - a^2}$ (b) $\frac{g}{L}\sqrt{L^2 + a^2}$
(c) $\sqrt{\frac{g}{L}\left(L^2 - a^2\right)}$ (d) $\sqrt{\frac{g}{L}\left(L^2 + a^2\right)}$

OPSC Civil Services Pre 2006

Ans. (c) :



Initial P.E. for the above position = $W.a.\frac{a}{2}$

Final P.E. for the chain = $W.L.\frac{L}{2} = W\left(\frac{L^2}{2}\right)$

Change in K.E. of chain = change in P.E.

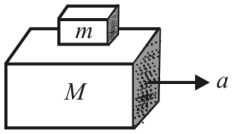
$$\frac{1}{2}mv^2 = W\left(\frac{L^2}{2}\right) - W\left(\frac{a^2}{2}\right)$$

$$\frac{1}{2}\frac{WL}{g}v^2 = \frac{W}{2}\left(L^2 - a^2\right)$$

$$\boxed{v = \sqrt{\frac{g}{L}\left(L^2 - a^2\right)}}$$

240. A block of mass M, supporting another block of mass m, is moved horizontally with an increasing acceleration from zero. If μ is the coefficient of static friction between the block, the acceleration a at with the upper block slips on the lower block is –

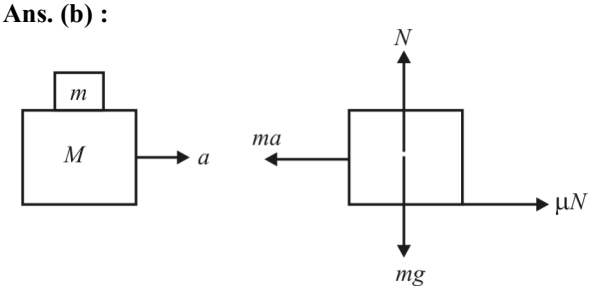
Search on Telegram @apna_pdf



(a) μm/g (b) μg
(c) −μmM /(m + M) (d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (b) :



For smaller body.

N = mg

ma = μN

ma = mg μ

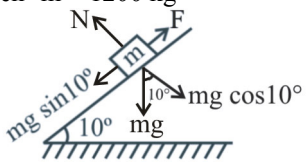
a = μg

241. A body with mass 1200 kg is located on a 10 degrees inclined plane. What is the pulling force without friction?

(a) 2044 N (b) 1200 N
(c) 120 N (d) None of these

KPCL AE 2016

Ans. (a) : Given- m = 1200 kg



F = mg sin 10° [without friction μ = 0]

= 1200 × 9.81 sin 10°

F = 2044.186 N

242. Which of the following is the friction that occurs when two objects are moving relative to each other and rub together

(a) Kinetic friction (b) Static friction
(c) Internal friction (d) None of these

KPCL AE 2016

Ans. (a) : Kinetic friction- The friction that occurs when two objects are moving relative to each other and rub together.

243. Which of the following occurs when surfaces in contact move relative to each other?

(a) the friction between the two surfaces converts kinetic energy into electrical energy
(b) the friction between the two surfaces converts kinetic energy into magnetic energy
(c) the friction between the two surfaces converts kinetic energy into thermal energy
(d) the friction between the two surfaces converts magnetic energy into electrical energy

KPCL AE 2016

Ans. (c) : When surfaces in contact move relative to each other the friction between the two surface convert kinetic energy into thermal energy.

244. What is the rolling resistance to the truck whose weight is 72,000 N and its co-efficient of rolling resistance is 0.019?

(a) 7200 N (b) 1900 N
(c) 1368 N (d) None of these

KPCL AE 2016

Ans. (c) : Given- Truck weight = 72000 N

Coefficient of rolling = 0.019

Rolling resistance = Coefficient of rolling × Weight

Rolling resistance = 0.019 × 72000

= 1368 N

245. The friction experienced by a body when it is in motion is called_____

(a) Body friction (b) Dynamic friction
(c) Angular friction (d) None of these

KPCL AE 2016

Ans. (b) : Dynamic friction is the force of friction experienced by a body when it is motion dynamic friction is the value of frictional force after slipping has occurred.

246. Which of the following statements is true?

(a) Dynamic friction is always less than static friction
(b) Dynamic friction is always greater than static friction
(c) Dynamic friction is always same as static friction
(d) Dynamic friction is double the static friction

KPCL AE 2016

Ans. (a) : Since the value of (F) in dynamic friction is little lesser than in static friction, the ratio F/N and hence, the coefficient of dynamic friction will also be a little lesser than static friction kinetic friction (also referred to a dynamic friction) is the force that resist the relative movement of the surfaces once they are in motion. The static friction between two surfaces is always higher than the kinetic friction.

$F_k < F_s$

$\mu_k < \mu_s$

247. When the two surfaces in contact have a minute thin layer of lubricant between them, it is known as .....friction.

(a) film (b) skin or greasy
(c) dry (d) solid

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) : When the two surfaces in contact have a minute thin layer of lubricant between them, it is known as skin or greasy friction.

248. A car travelling at a speed of 60 km/hour is braked and comes to rest 6 seconds after the brakes are applied. The minimum coefficient of friction between the wheels and the road would be :

(a) 0.107 (b) 0.283
(c) 0.3 (d) 0.417

MPSC Poly. Lect. 2014

Search on Telegram @apna_pdf

Ans. (b) : Given

Initial velocity u = 60 km/hr

$= 60 \times \frac{5}{18} = 16.667 \text{m/s}$

$v = u - at$

$v = 16.667 - a \times 6$

$a = \frac{16.667}{6}$

$a = 2.777 \text{ m/s}^2$

we know that $a = \mu g$

$\mu = \frac{a}{g} = \frac{2.777}{9.81} = 0.283$

249. A body of weight 120 N rests on a rough horizontal plane. The coefficient of friction between the body and the plane is 0.3. The frictional force to be overcome for impending motion will be

(a) 30 N (b) 400 N

(c) 300 N (d) 36 N

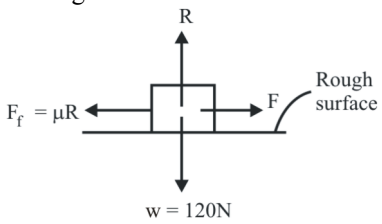
WBPSC AE 2003

Ans. (d) : F_f = friction force

F = applied effort

R = Normal force

w = Weight



$\because$ $R = w$ & $F = \mu R$ $\mu = 0.3$

$\Rightarrow$ friction force $(F_f) = \mu R = \mu w = 0.3 \times 120 = 36N$

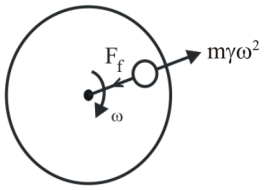
250. A small coin is placed at a distance γ from the centre of a gramophone record. The rotational speed of the record is gradually increased. If the coefficient of friction between the coin and the record is μ, the minimum angular velocity of the record for which the coin will fly off is given by

(a) $\sqrt{\frac{2\mu g}{\gamma}}$ (b) $\sqrt{\frac{\mu g}{2\gamma}}$

(c) $\sqrt{\frac{\mu g}{\gamma}}$ (d) $2\sqrt{\frac{\mu g}{\gamma}}$

WBPSC AE 2003

Ans. (c) :



Coin is at 'γ' distance from centre of gramophone $F_f = \mu mg$, F_{cf} = centrifugal force

Friction force = Centrifugal force

$F_f = F_{cf}$

$\mu mg = m\gamma\omega^2$

$\omega = \sqrt{\frac{\mu g}{\gamma}}$

251. What is Coulomb friction?

(a) it is the friction between solids and liquids

(b) it is the friction between bodies having relative motion

(c) it is the friction between two dry surfaces

(d) None of the above

WBPSC AE 2008

Ans. (c) : Coulomb law of friction :– This law states that for two dry solid surfaces sliding against one another the magnitude of kinetic friction exerted through the surface is independent of the magnitude of velocity of the slipping of the surface against each other.

252. A 50-kg box rests on horizontal floor for which coefficient of friction is 0.3. If the box is subjected to a horizontal towing force of 400 N, what is its velocity after 5 sec from rest? (Take g = 10 m/s^2)

(a) 40 m/s (b) 30 m/s

(c) 27.5 m/s (d) 25 m/s

UPSC JWM Advt. No.-50/2010

Ans. (d) : Given, F = 400 N, μ = 0.3, time (t) = 5 sec

We know that,

$F_s = \mu \cdot N = 0.3 \times 50 \times 10$

$= 150 \text{ N}$

FBD of block –

$\sum F_{net} = ma$ or $F - \mu N = ma$

$250 = ma$

$a = \frac{250}{50} = 5 \text{m/s}^2$

$\Rightarrow$ $v = u + at$

$v = 0 + 5 \times 5 = 25 \text{ m/s}$

253. Which of the following is NOT one of the laws of limiting friction?

(a) The force of friction is tangential or parallel to the surfaces in contact

(b) It is dependent on the size or area of the surfaces in contact

(c) The magnitude of the limiting frictional force depends upon the nature of material of the surface in contact and on their roughness or smoothness

(d) Direction of force of friction is opposite to the direction in which the body would start moving on applying the force

JUVNL AEE (GTO) 05.03.2017

Ans. (b) : When a body just begins to slide over the surface of the other body is known as limiting friction.

Magnitude of friction force $F = \mu R_N$

Search on Telegram @apna_pdf

Friction force does not depend on size or area of surface contact friction depend on smoothness and roughness of the surface.

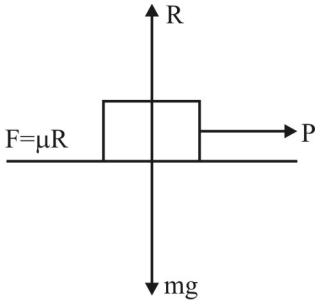
254. Which of the following statements regarding laws govern the friction between dry surfaces are correct?

1. **The friction force is dependent on the velocity of sliding.**
2. **The friction force is directly proportional to the normal force.**
3. **The friction force is dependent on the materials of the contact surfaces.**
4. **The friction force is dependent on the area of contact surfaces.**

(a) 2, 3 and 4 (b) 2 and 4
(c) 1, 2, 3 and 4 (d) 2 and 3

UPRVUNL AE 21.08.2016

Ans. : (d)



F = μR
μ = Coefficient of friction
R = Normal reaction
(i) The friction force is directly proportional to the normal force
(ii) The friction force is dependent on the materials of the contact surfaces.

255. The value of angle of repose is the same as the value of _____

(a) Limiting angle of friction
(b) Coefficient of friction
(c) Static friction
(d) normal reaction between the contact surface

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Limiting friction – The maximum value of static friction upto which body does not move and the angle which it makes with horizontal is called angle of limiting friction.

Angle of repose – It is the angle of the inclined plane with horizontal such that a body placed on it is just begins to slide.

In limiting condition –

$F = mg \sin \alpha$

$R = mg \cos \alpha$

Where, α = angle of repose

So, $\frac{F}{R} = \tan \alpha$

$\therefore \frac{F}{R} = \mu_s = \tan \theta = \tan \alpha \quad (\because \tan \theta = \mu_s)$

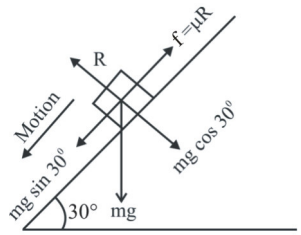
or $\boxed{\theta = \alpha}$

256. A body is resting on a plane inclined at angle of 30^0 to horizontal. What force would be required to slide it down, if the coefficient of friction between body and plane is 0.3?

(a) 5kg (b) 1 kg
(c) zero (d) 0.5 kg

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c) Force required to slide body down if



$R = mg \cdot \cos 30$

$mg \cdot \sin 30 = mg \times 0.5 = 0.5\ mg$ .....(1)

$f = \mu mg \cdot \cos 30° = 0.3 \times \frac{\sqrt{3}}{2} \times mg$

$= 0.259\ mg$ .....(2)

It means, $f < mg \cdot \sin 30°$

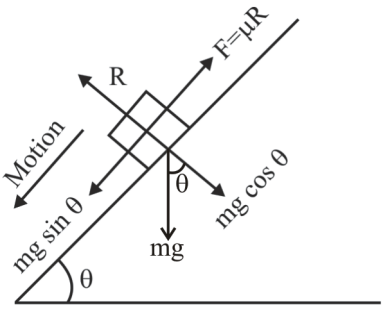
So no force will be required to slide body downward.

257. When a body slides down a surface inclined θ to horizontal, the acceleration *(f)* of the body is given by-

(a) $f = g$ (b) $f = g \cos\theta$
(c) $f = g \tan\theta$ (d) $f = g \sin\theta$

ISRO Scientist/Engineer (RAC) 29.11.2015
Haryana PSC Civil Services Pre 2014

Ans : (d)



using second law of motion

$F = (mg \sin\theta - \mu\ mg \cos\theta)$

$mf = mg\ [\sin\theta - \mu \cos\theta]$

$f = g\ [\sin\theta - \mu \cos\theta]$

but coefficient of friction μ not given and assume to be surface is smooth

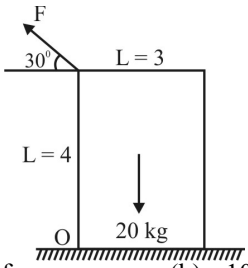
so

$\mu = 0$

$f = g \sin\theta$

258. A block (of cross section 4 × 3 m size) of 20 kg mass rests on a flat horizontal surface as shown in figure below. If the coefficient of friction between the block and the surface is $\frac{1}{4}$, the force 'F' which will cause block to move is approximately given by

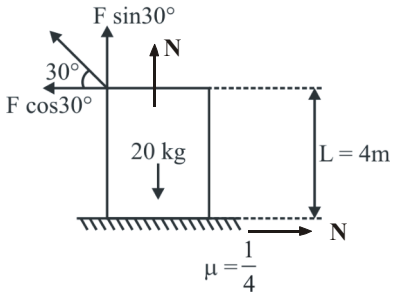
Search on Telegram @apna_pdf



(a) 20 kgf (b) 10 kgf
(c) 5 kgf (d) 8.7 kgf

ISRO Scientist/Engineer 17.12.2017

Ans. (c) :



Given,

$m = 20$ kg $\quad \mu = \frac{1}{4}$

$N = mg - F\sin 30°$

$= 20\times 10 - F\frac{1}{2}$

$= 200 - \frac{F}{2}$

Friction force $(f) = \mu N = \frac{1}{4}\left(200 - \frac{F}{2}\right)$

Condition for block to move

$F\cos 30° > f$

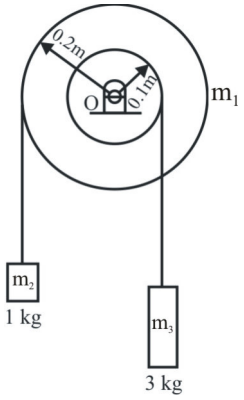
$\frac{F\sqrt{3}}{2} > 50 - \frac{F}{8}$

$F\left(\frac{\sqrt{3}}{2} + \frac{1}{8}\right) > 50$

$F > 50.45$ N

$F > 5.04$ kgf

259. The pulley system shown in figure has a mass of 1.5 kg and a radius of gyration of 0.2 m. The angular acceleration of the pulleys, when the suspended masses are released is

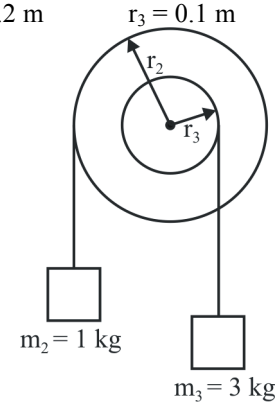


(a) 5 rad/sec^2 (b) 10/1.3 rad/sec^2
(c) 15/1.3 rad/sec^2 (d) 10 rad/ sec^2

ISRO Scientist/Engineer 17.12.2017

Ans. (b) : Given,

$m_1 = 1.5$ kg $\quad k = 0.2$ m
$m_2 = 1$ kg $\quad m_3 = 3$kg
$r_2 = 0.2$ m $\quad r_3 = 0.1$ m



$I_1 = m_1k^2 = 1.5 \times 0.2^2 = 0.06$

$I_2 = m_2r_2^2 = 1 \times 0.2^2 = 0.04$

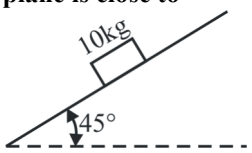
$I_3 = m_3r_3^2 = 3 \times 0.1^2 = 0.03$

$(I_1 + I_2 + I_3)\,\alpha = m_3gr_3 - m_2gr_2$

$(0.06 + 0.04 + 0.03)\,\alpha = 3 \times 10 \times 0.1 - 1 \times 10 \times 0.2$

$\alpha = \frac{1}{0.13} = \frac{10}{1.3}$ rad/sec^2

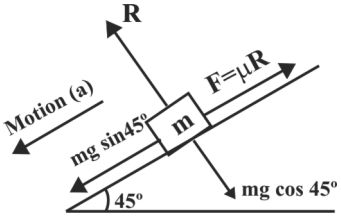
260. A body of mass 10 kg is initially stationary on a 45° inclined plane as shown in figure. The coefficient of dynamic friction between the body and the plane is 0.3. The body slides down the plane and attains a velocity of 20 m/s. The distance travelled (in meter) by the body along the plane is close to



(a) 4.8 (b) 98
(c) 41 (d) 9.8

ISRO Scientist/Engineer 07.05.2017

Ans. (c) :



From FBD for mass m is given above.

Equating the net forces along the plane, we have

$ma = mg\sin 45 - \mu(mg\cos 45°)$

$a = 9.81\times\frac{1}{\sqrt{2}}[1 - 0.3]$

Search on Telegram @apna_pdf

$$a = 9.81 \times \frac{1}{\sqrt{2}} \times 0.7$$

$a = 4.85$ m/s^2

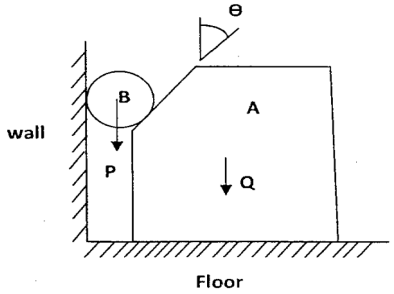
Using equation of motion

$v^2 = u^2 + 2as$

$20^2 = 0^2 + 2 \times 4.85 \times s$

$s = 41.2$ m

261. A solid block 'A' weighing 'Q' kg is resting on a flat floor. A smooth cylinder 'B' weighing 'p' kg, is placed between the solid A and the vertical wall as shown in fig. The friction between the cylinder, wall and the block A is negligible. The co-efficient of friction between the block A and floor is μ. The minimum weight P required to disturb the block A is

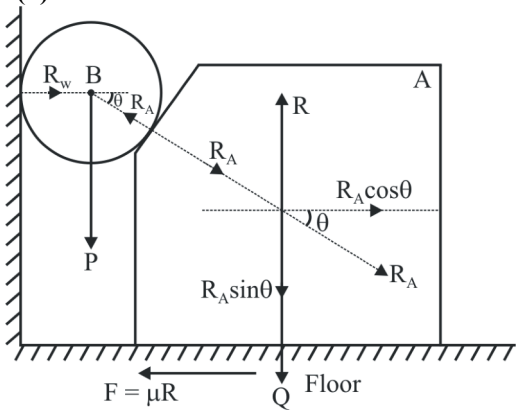


(a) $\frac{Q(1-\tan\theta)}{\mu\tan\theta}$ (b) $\frac{\mu Q\tan\theta}{(1-\mu\tan\theta)}$

(c) $\mu Q\cos\theta$ (d) $\frac{\mu Q}{\cos\theta}$

ISRO Scientist/Engineer 12.05.2013

Ans. (b) :



Using FBD –

$P = R_A \sin\theta$

$R_A = \frac{P}{\sin\theta}$

$R = R_A \sin\theta + Q$

$F = \mu R = \mu[P + Q] = \frac{P}{\tan\theta}$

$P = \mu P \tan\theta + \mu Q \tan\theta$

So arrange above equation we get

$$\boxed{P = \frac{\mu Q\tan\theta}{(1-\mu\tan\theta)}}$$

262. Angle of friction is :

(a) Angle made by resultant reaction with horizontal

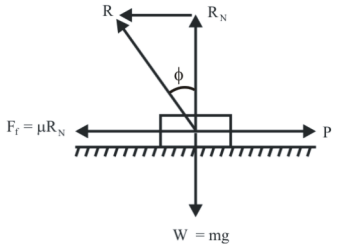
(b) Angle made by resultant reaction with normal

(c) Angle made by normal reaction with force of friction.

(d) None of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : Angle of friction- Angle made by the resultant of normal reaction and limiting friction with the normal reaction is called angle of friction.

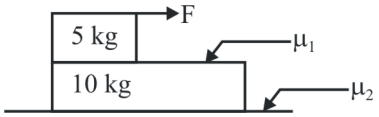


$$\tan\phi = \frac{F_f}{R_N} = \frac{\mu R_N}{R_N}$$

$\tan\phi = \mu$

Friction angle $\boxed{\phi = \tan^{-1}\mu}$

263. In the figure shown, the minimum ratio of μ_1/μ_2 so that the masses move together with the application of force F is

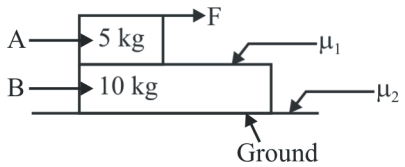


(a) 5 (b) 2

(c) 4 (d) 3

ISRO Scientist/Engineer 03.07.2016

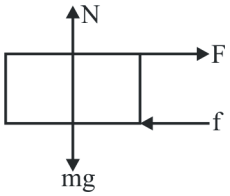
Ans. (d) :



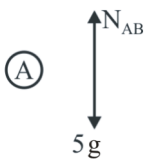
FBD (Free Body Diagram)–

For block 'A'

m = 5 kg



Frictional force– $\boxed{F_f = \mu N}$



Search on Telegram @apna_pdf

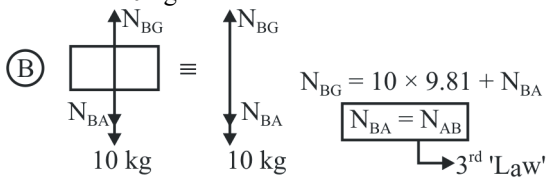
$N = mg$

$N = 5 \times 9.81$ "Newton"

$F_{fA} = \mu_1 \times 5 \times 9.81$ 'N' .....(1)

For Block 'B'–

$m = 10$ kg



$N_{BG} = 10 \times 9.81 + 5 \times 9.81$

$N_{BG} = 15 \times 9.81$

$F_{fB} = \mu_2 \times 15 \times 9.81$ .....(2)

So, applied force (F)–

Then, $\boxed{F_{fB} = F_{fA} = F}$ → Applied force on block A and B.

From equation (1) / (2)

$$\frac{F_{fA}}{F_{fB}} = \frac{\mu_1 \times 5 \times g}{\mu_2 \times 15 \times g}$$

$$\frac{F}{F} = \frac{\mu_1 \times 5}{\mu_2 \times 15}$$

$$1 = \frac{\mu_1}{3\mu_2}$$

$$\boxed{\frac{\mu_1}{\mu_2} = 3}$$

264. The maximum value of _____, which comes into play, when a body just begins to slide over the surface of other body, is known as _____.

(a) Kinetic friction, Limiting friction
(b) Dynamic friction, Limiting friction
(c) Solid friction, Limiting friction
(d) Boundary friction, Limiting friction
(e) Static friction, Limiting friction

(CGPSC Polytechnic Lecturer 2017)

Ans. (e) : The maximum value of static friction, which comes into play, when a body just begins to slide over the surface of the other body, is known as limiting friction.

Static Friction–The static friction is the frictional force that develops between mating surface when subjected to external force but there is no relative motion between them.

Dynamic Friction–The dynamic friction is the frictional force that develops between mating surface when subjected to external forces and there is relative motion between them. The dynamic friction is also known as kinematic friction.

Laws of Solid Friction [Static or Dynamic]

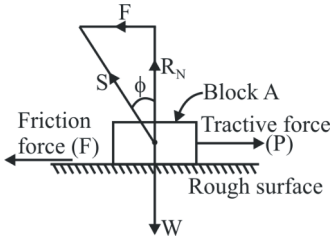
1. Friction acts tangential to the surface in contact and is in a direction opposite to that in which motion is to impend i.e. take place.
2. Friction force is maximum at the instant of impending motion. Its variation from zero to maximum value [Limiting friction] depends upon the resultant force tending to cause motion.
3. The magnitude of limiting friction bears a constant ratio to the normal reaction between the mating surface.
4. Limiting friction is independent of the area and shape of contact surface.
5. Limiting friction depends upon the nature (roughness or smoothness) of the surface in contact.
6. At low velocities between sliding surface, the friction force is practically independent of the velocity. However, slight reduction in friction occurs when the speed are high.

265. If F is the limiting friction and R_N is the normal reaction of the surfaces of contact of two bodies, then the coefficient of friction μ is expressed as:

(a) $\mu = R_N/F$ (b) $\mu = F/R_N$
(c) $\mu = 2F/R_N$ (d) $\mu = 0.5F/R_N$
(e) $\mu = 0.5R_N/F$

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) :



Where,

S = Total reaction with the normal reaction.

The ratio of friction force to normal reaction is called coefficient of friction (μ).

So, $\mu = \frac{F}{R_N}$

$\tan\phi = \mu = \frac{F}{R_N}$, $\phi \rightarrow$ Friction angle

266. The coefficient of rolling resistance is defined as the ratio between

(a) Rolling resistance to lateral load
(b) Lateral load to rolling resistance
(c) Rolling resistance to normal load
(d) Normal load to rolling resistance

TNPSC AE 2017

Ans. (c) : The coefficient of rolling resistance is defined as the ratio between Rolling resistance to normal load.

Rolling resistance coefficient (C_{rr}) = $\frac{F_R}{N}$

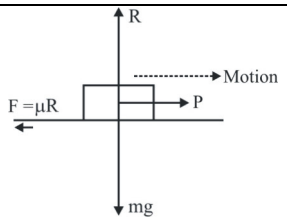
267. The coefficient of friction is the ratio of

(a) the normal reaction to the limiting force of friction
(b) The weight of the body to limiting force of friction
(c) the limiting force of friction to the normal reaction
(d) the weight of the body to the normal reaction

TSPSC AEE 2015
TRB Asstt. Prof., 2012

Ans : (c) The coefficient of friction is the ratio of the limiting force of friction to the normal reaction

Search on Telegram @apna_pdf



$F = \mu R$.

$$\mu = \frac{F}{R}$$

μ = Coefficient of friction.
F = Limiting force of friction
R = Normal reaction.

268. Which statement is wrong in wedge friction?
(a) To lift heavy block through small distances
(b) To lift heavy block through large force
(c) To slightly slide one end of the beam relative to another end
(d) Weight of wedge is neglected compared to weight to be lifted

TNPSC AE 2013

Ans. (b) : Wedge–
- Simple machines used to raise heavy loads.
- Force required to lift block is significantly less than block weight.
- Friction prevents wedge from sliding out.
- Minimum force D required to raise block.

269. A block resting on an inclined plane begins to slide down the plane when the angle of inclination is gradually increased to 30°. The coefficient of friction between the block and the plane is:-
(a) 0.50 (b) 0.578
(c) 0.72 (d) 0.866

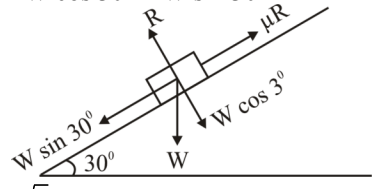
UKPSC AE-2013, Paper-I

Ans. (b) : From this figure.

$R = W \cos 30^o$

$\mu R = W \sin 30^o$

$\mu \times W \cos 30^o = W \sin 30^o$



$$\mu \times \frac{\sqrt{3}}{2} = \frac{1}{2}$$

$$\mu = 0.5773$$

270. When the applied force is less than the limiting frictional force, the body will:-
(a) Start moving (b) Remain at rest
(c) Slide backward (d) Skid

UKPSC AE-2013, Paper-I

Ans. (b) : When the applied force is less than the limiting frictional force, the body will remain at rest.

271. A 44 N block is thrust up a 30° inclined plane with an initial speed of 5 m/sec. It travels a distance of 1.5 m before it comes to rest. The frictional force acting upon it would be
(a) 18.3 N (b) 15.3 N
(c) 12.3 N (d) 9.3 N

UKPSC AE 2012 Paper-I

Ans. (b) : Given,
Wt. of block = 44 N, S = 1.5 m
initial speed, u = 5 m/s
final speed, v = 0

$v^2 = u^2 - 2as$ (Retardation)

$0 = (5)^2 - 2(a)(1.5)$

$a = 8.33 \text{ m/s}^2$

$$\text{Net force} = ma = \frac{W}{g} \times a$$

$$mg \sin 30^o + f_s = \frac{44}{9.81} \times 8.33$$

$22 + f_s = 37.37$

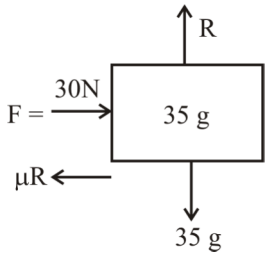
$f_s = 37.37 - 22$

friction force, $f_s = 15.37$ N

272. If a force of 30 N is required to move a mass of 35 kg on a flat surface horizontally at a constant velocity, what will be the coefficient of friction?
(a) 0.067 (b) 0.087
(c) 0.098 (d) 0.092

UKPSC AE 2012 Paper-I

Ans. (b) :



$R - 35\,g = 0$

$R = 35\,g$

$F = \mu R$

$$\mu = \frac{F}{R} = \frac{30}{35 \times 9.8} = 0.087$$

273. Two bodies of mass m and M are hung at the ends of a rope passing over a frictional pulley. The acceleration in which the heavier mass M comes down is given by the following:
(a) $\frac{g(M-m)}{M+m}$ (b) $\frac{g(M+m)}{M-m}$
(c) $\frac{gM}{M+m}$ (d) $\frac{g \times M}{M-m}$

UKPSC AE 2007 Paper -I

Ans. (a) : $\frac{g(M-m)}{M+m}$

274. Tangent of angle of friction is equal to
(a) kinetic friction
(b) limiting friction
(c) friction force
(d) coefficient of friction

UKPSC AE 2007 Paper -I

Ans. (d) : Coefficient of friction

Search on Telegram @apna_pdf

275. A body weight of 200 N is resting on a rough horizontal plane, and can be just moved by a force of 80 N applied horizontally. What will the value of the coefficient of friction?

(a) 0.4 (b) 0.5
(c) 0.3 (d) none of the above

UKPSC AE 2007 Paper -I

Ans. (a) : $F = \mu R$

$$\mu = \frac{80}{200} = 0.4$$

276. Frictional force is independent of..

(a) Sliding speed
(b) area of contacting surfaces
(c) normal load
(d) both (a) & (b)

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : Friction force $F_f = \mu N$

μ = coefficient of friction $F_f \propto N$

N = Normal load.

So, Friction force is independent of sliding speed & area of contacting surfaces.

277. .....provides complete restraint against transverse or longitudinal motion and against rotation.

(a) A frictionless bearing
(b) An ideal clamped support
(c) A weightless flexible string
(d) A frictionless pin joint

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) : An ideal clamped support provides complete restraint against transverse or longitudinal motion and against rotation.

278. The coefficient of rolling resistance, for a steel wheel of 200 mm diameter which rolls on a horizontal steel roll, is 0.3 mm. The steel wheel carries a load of 600 N. The force necessary to roll the wheel along the rail is :

(a) 90 N (b) 180 N
(c) 90 kN (d) 270 N

UPRVUNL AE 2014

Ans : (*) Given, $\mu_r = 0.3$ mm
Diameter, d = 200 mm
Radius, r = 100 mm
Force necessary to roll the wheel along the rail,

$$F = \frac{\mu_r W}{R} = \frac{0.3 \times 600}{100}$$

$$\boxed{F = 1.8N}$$

Note-As per UPRVUNL, correct option is 'b' 180 N.

279. A heavy block of mass m is slowly placed on a conveyer belt moving with speed v. If coefficient of friction between block and the belts is μ, the block will slide on the belt through distance

(a) $\frac{v}{\mu g}$ (b) $\frac{v^2}{\sqrt{\mu g}}$
(c) $\left(\frac{v}{\mu g}\right)^2$ (d) $\frac{v^2}{2\mu g}$

ISRO Scientist/Engineer 2007

Ans. (d) : Retardation due to friction force = $-\mu g$

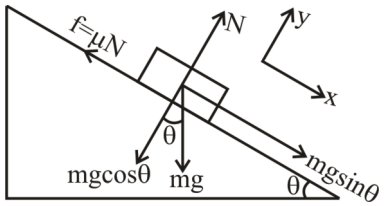
$$v^2 - u^2 = 2as$$
$$0 - u^2 = as$$
$$-u^2 = 2 \times -\mu gs$$
$$+u^2 = 2\mu gs$$
$$s = \frac{u^2}{2\mu g}$$

280. A body of weight 50 kN rests in limiting equilibrium on a rough plane, whose slope is 30°. The plane is raised to a slope of 45°. Find the value of coefficient of friction for equilibrium.

(a) 0.577 (b) 0.749
(c) 0.623 (d) 0.425

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (a) :



$\theta_1 = 30°$, W = 50 kN, $\theta_2 = 45°$

Consider when the slope of the plane 30°,

Sum of forces parallel to plane $\sum F_x = 0$

$$\mu N - W\sin 30° = 0 \quad .....(i)$$

Sum of forces perpendicular to plane $\sum F_y$

$$N - W\cos 30° = 0$$
$$N = W\cos 30° \quad .....(ii)$$

Putting the value of 'N' in equation (i) we get,

$$\mu W\cos 30° - W\sin 30° = 0$$
$$\mu\cos 30° - \sin 30° = 0$$

Dividing both the side by cosθ

$$\mu - \tan 30° = 0$$
$$\mu = \tan 30° = \frac{1}{\sqrt{3}} = 0.577$$

281. What is the friction experienced by a body when at rest known as?

(a) Static friction
(b) Dynamic friction
(c) Limiting friction
(d) Coefficient of friction

VIZAG STEEL MT 2011

Ans. (a) : Static friction is the friction experienced by a body when at rest.

282. A man is climbing up a ladder which is resting against a vertical wall. When he was exactly half way up, the ladder started slipping. The path traced by the man is

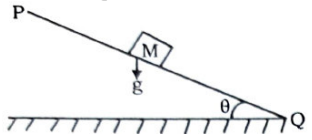
(a) Parabola (b) Circle
(c) Ellipse (d) Hyperbola

UPPSC AE 13.12.2020, Paper-I
ESE 2013

Ans. (b) : Circle

Search on Telegram @apna_pdf

283. A block of mass M is released from point P on a rough inclined plane with angle of inclination θ as shown in figure below. The coefficient of friction is μ. If μ < tan θ, then the time taken by the block to reach point Q on the inclined plane, where PQ = S is

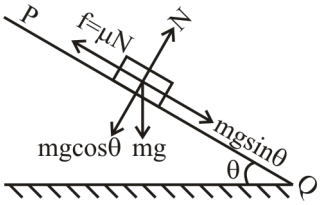


(a) $\sqrt{\frac{2S}{g\cos\theta(\tan\theta-\mu)}}$ (b) $\sqrt{\frac{2S}{g\cos\theta(\tan\theta+\mu)}}$

(c) $\sqrt{\frac{2S}{g\sin\theta(\tan\theta-\mu)}}$ (d) $\sqrt{\frac{2S}{g\sin\theta(\tan\theta+\mu)}}$

UPPSC AE 13.12.2020, Paper-I
GATE 2007

Ans. (a)



$N = mg\cos\theta$

$\mu N = mg\sin\theta$

From Newton's 2nd law

$F = ma = mg\sin\theta - \mu N$

$ma = mg\sin\theta - \mu mg\cos\theta$

$a = g\sin\theta - \mu g\cos\theta$

$S = ut + \frac{1}{2}at^2$

$S = 0 + \frac{1}{2}(g\sin\theta - \mu g\cos\theta)t^2$

$t = \sqrt{\frac{2S}{g\cos\theta(\tan\theta-\mu)}}$

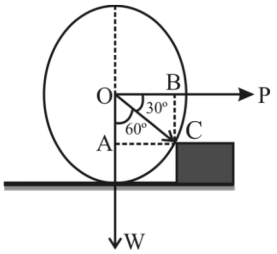
284. A roller of weight 500 N and radius 0.5 m is to be dragged over a small rectangular block by using a horizontal force P at the centre of the roller as shown in figure. The minimum magnitude of force P required for dragging the roller should be greater than

(a) 500 N (b) 400 N

(c) $500\sqrt{3}$ N (d) $500\sqrt{2}$ N

DRDO Scientists 2009

Ans. (c) :



W = weight of roller

P = horizontal force acting at the centre of roller

$OA = R\cos60^\circ$, $OB = R\cos30^\circ$

$\Sigma M_C = 0$

$\Rightarrow \quad P(OA) = W(OB)$

$P = 500\frac{\cos30^\circ}{\cos60^\circ} = 500\sqrt{3}$

285. Friction between two surfaces in contact depends on

(a) Bending moment
(b) Area of contact between the surfaces
(c) Energy possessed by the surfaces
(d) Equal and opposite normal reaction between surfaces

TANGEDCO AE 2015

Ans. (d) : Factors affecting sliding friction
1. The surface deformation of objects.
2. The roughness or smoothness of the surface of objects.
3. The original speed of either objects.
4. The size of object.
5. Amount of pressure on either object.

Friction force between two surface in contact depend on normal reaction and coefficient of friction between two surface and independent of surface area.

286. The tractive resistance during the propulsion of a wheeled vehicle depends on :

(a) Road resistance
(b) Aerodynamic resistance
(c) Gradient resistance
(d) All of these

OPSC AEE 2015 Paper-I

Ans : (d) The tractive resistance during the propulsion of a wheeled vehicle depends on:
(i) Road resistance
(ii) Aerodynamic resistance
(iii) Gradient resistance

4. Centroid, Centre of Gravity & Moment of Inertia

287. What is the unit of moment of inertia of an area.

(a) kg m^2 (b) kg m
(c) m^3 (d) m^4
(e) kg m^3

HPPSC Workshop Suptd. 08.07.2021
HPPSC AE (PWD) 10.09.2016
TNPSC ACF 2012
CGPSC AE 26.04.2014 Shift-I
AAI Jr. Executive 26.03.2021
UPRVUNL AE 05.07.2021

Ans. (d) : Units of the mass moment of inertia are kg-m^2, gram-cm^2.
Units of the area moment of inertia are m^4, mm^4.

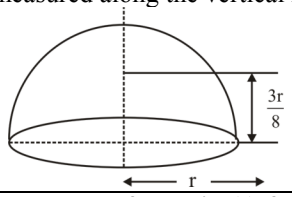
288. The C.G. of a solid hemisphere lies on the central radius

(a) at distance 3r/2 from the plane base
(b) at distance 3r/4 from the plane base
(c) at distance 3r/5 from the plane base
(d) at distance 3r/8 from the plane base

TNPSC AE 2019
Oil India Senior Officer 23.12.2020

Search on Telegram @apna_pdf

Ans. (d) : C.G. of hemisphere is at a distance of $\frac{3r}{8}$ from its base measured along the vertical radius.



289. A polar moment of Inertia (I) for hollow shaft with external diameter (D) and internal diameter (d) is given by:

(a) $\frac{32D^4}{\pi d^4}$ (b) $\frac{\pi\left(D^4-d^4\right)}{64}$

(c) $\frac{\pi\left(D^4-d^4\right)}{32}$ (d) $\frac{32\left(D^4-d^4\right)}{\pi}$

CIL MT 26.03.2017
(CGPSC Polytechnic Lecturer 2017)

Ans. (c) :

Polar moment of inertia of hollow haft = $\frac{\pi\left(D^4-d^4\right)}{32}$

290. Theorem of perpendicular axis is used in obtaining the moment of inertia of a

(a) triangular lamina (b) square lamina
(c) circular lamina (d) semicircular lamina

APPSC Poly. Lect. 2013

Ans. (a) : Theorem of perpendicular axis is used in obtaining the moment of inertia of a triangular lamina.

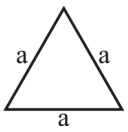
291. The centre of gravity of an equilateral triangle with each side (a) is

(a) $\frac{a\sqrt{3}}{2}$ (b) $\frac{a\sqrt{2}}{3}$

(c) $\frac{a}{2\sqrt{3}}$ (d) $\frac{a}{3\sqrt{2}}$

APPSC Poly. Lect. 2013

Ans. (c) : Centre of gravity of an equilateral triangle with each side (a) is,



Centre of Gravity of equilateral triangle = $\frac{a}{2\sqrt{3}}$

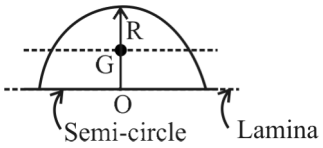
292. The distance of centroid of semi-circular lamina of radius R from the straight edge of this semi-circular lamina will be :

(a) $\frac{8R}{3\pi}$ (b) $\frac{4R}{3\pi}$

(c) $\frac{2R}{3\pi}$ (d) $\frac{R}{3\pi}$

APPSC Poly Lect. 13.03.2020
TNPSC ACF 2012
Oil India Senior Officer 23.12.2020

Ans. (b) :



Let, G = Centroid of semicircle

$\therefore$ Distance of the centroid 'G' = $\frac{4R}{3\pi}$

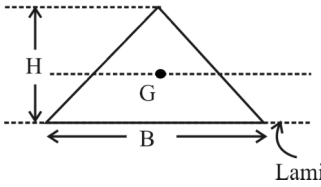
293. Moment of inertia (second moment of area) of triangular lamina about base and centroidal axis (parallel to base), respectively will be ___ and _____ . [B = length of base of triangular section, H = Height of triangular section]

(a) $\frac{BH^3}{3},\frac{BH^3}{36}$ (b) $\frac{BH^3}{36},\frac{BH^3}{12}$

(c) $\frac{BH^3}{12},\frac{BH^3}{36}$ (d) $\frac{BH^3}{3},\frac{BH^3}{12}$

APPSC Poly Lect. 13.03.2020

Ans. (c) :



Moment of inertia about base = $\frac{BH^3}{12}$(About lamina)

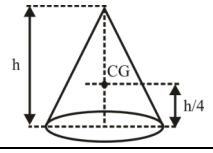
Moment of inertia about centroid axis = $\frac{BH^3}{36}$

294. The C.G. of a right circular solid cone of height h lies at _____ distance from the base.

(a) h/2 (b) h/3
(c) h/6 (d) h/4

CGPSC AE 15.01.2021

Ans. (d) : The C.G. of a right circular solid cone of height 'h' lies at h/4 distance from the base.



295. The mathematical definition of second moment of inertia with respect to x-axis of an area *dA* is:

(a) $I_x = r_s^2 A$ (b) $I_o = \int_A \rho^2 dA$

(c) $I_y = \int_A x^2 dA$ (d) $I_x = \int_A y^2 dA$

CGPSC AE 15.01.2021

Ans. (d) : Second moment of Inertia with respect to x-axis.

$$I_X = \int_A y^2 dA$$

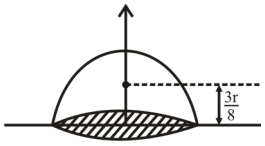
Search on Telegram @apna_pdf

296. The center of gravity of a solid hemisphere of radius r is at _____ distance from its diametral axis.

(a) 3r/4 (b) 3r/7
(c) 3r/8 (d) 7r/8

Oil India Senior Officer 23.12.2020

Ans. (c) : The center of gravity of a solid hemisphere of radius r is at 3r/8 distance from its diametral axis.



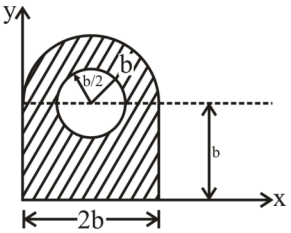
297. Unit of Area Moment of Inertia of a plane section is _____, where is "L" is the length unit.

(a) L^3 (b) L^6
(c) L^2 (d) L^4

HPPSC Workshop Suptd. 08.07.02021

Ans. (d) :

298. Determine the centroid (x_c, y_c) of the shaded area as shown in figure with respect to given coordinate axes

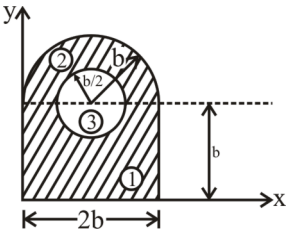


(a) $\left(b, \frac{28+3\pi}{3(8+\pi)}b\right)$ (b) $\left(\frac{b}{2}, \frac{12+2\pi}{4(2+\pi)}b\right)$

(c) $\left(b, \frac{5}{(8+\pi)}b\right)$ (d) $\left(b, \frac{1+2\pi}{2(8+\pi)}b\right)$

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (*) :



(1) → Rectangle (2b × b)

(2) → Semi-circle of radius (b)

(3) → Circle of radius $\left(\frac{b}{2}\right)$

$x_c = \frac{2b}{2} = b$ (from symmetricity)

$y_c = \frac{A_1y_1 + A_2y_2 - A_3y_3}{A_1 + A_2 - A_3}$

$\left[y_1 = \frac{b}{2}, y_2 = b + \frac{4b}{3\pi}, y_3 = b\right]$

$$= \frac{(2b \times b) \times \frac{b}{2} + \frac{\pi b^2}{2} \times \left(b + \frac{4b}{3\pi}\right) - \pi\left(\frac{b}{2}\right)^2 \times b}{2b \times b + \frac{\pi b^2}{2} - \pi\left(\frac{b}{2}\right)^2}$$

$$= \frac{b + \frac{\pi}{2}\left(b + \frac{4b}{3\pi}\right) - \frac{\pi}{4}b}{2 + \frac{\pi}{2} - \frac{\pi}{4}} = \frac{b + \frac{\pi b}{2} + \frac{\pi}{2} \times \frac{4b}{3\pi} - \frac{\pi b}{4}}{2 + \frac{\pi}{4}}$$

$$= \frac{b + \frac{\pi b}{4} + \frac{2b}{3}}{2 + \frac{\pi}{4}} = \frac{\frac{20b + 3\pi b}{12}}{\frac{8+\pi}{4}}$$

$y_c = \frac{(20+3\pi)b}{3(8+\pi)}$

Centroid of shaded region, $\left(b, \frac{(20+3\pi)b}{3(8+\pi)}\right)$

299. Polar moment of inertia of a square of side 6 cm is

(a) 108 cm^4 (b) 216 cm^4
(c) 432 cm^4 (d) 324 cm^4

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : Given,

side (a) = 6 cm

Polar moment of Inertia of square,

$$J = I_x + I_y$$

$$= \frac{a^4}{12} + \frac{a^4}{12}$$

$$= \frac{(6)^4}{12} + \frac{(6)^4}{12}$$

$J = 216\ cm^4$

300. Moment of inertia of a thin spherical shell of mass M and radius R, about its diameter is

(a) MR^2 (b) $\frac{MR^2}{2}$

(c) $\frac{2}{5}MR^2$ (d) $\frac{2}{3}MR^2$

UPPSC AE 13.12.2020, Paper-I

Ans. (d)

- Moment of inertia of a thin spherical shell of mass M and radius R, about its diameter is $\frac{2}{3}MR^2$.
- Moment of inertia of a solid sphere of mass M and radius R, about its diameter is $\frac{2}{5}MR^2$.

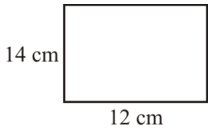
301. Moment of inertia of a rectangle of base 12 cm and height 14 cm about its base is

(a) 672 cm^4 (b) 2016 cm^4
(c) 914.67 cm^4 (d) 2744 cm^4

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Search on Telegram @apna_pdf

Ans. (*) :



Base = 12 cm
Height = 14 cm
Moment of Inertia of rectangle about centroidal axis,

$$I = \frac{bh^3}{12}$$

$$I = \frac{12(14)^3}{12}$$

$$\boxed{I = 2744 \text{ cm}^4}$$

Moment of inertia of rectangle about its base,

$$I_{base} = \frac{bh^3}{3} = \frac{12(14)^3}{3}$$

$$\boxed{I_{base} = 10976 \text{cm}^4}$$

Note-As per GPSC, given answer is 'b' option.

302. Polar moment of inertia (I_p), in cm^4, of a rectangular section having width, b = 2 cm and depth, d = 6 cm is :

(a) 40 (b) 20
(c) 8 (d) 80

OPSC AEE 2019 Paper-I

Ans : (a) :
Polar moment of inertia (J) = $I_x + I_y$

$$= \frac{bd^3}{12} + \frac{db^3}{12}$$

$$= \frac{2 \times 6^3}{12} + \frac{2^3 \times 6}{12}$$

$$= 40 \text{ cm}^4$$

303. Radius of gyration of a circular section with diameter D is

(a) $\frac{D}{2}$ (b) $\frac{D}{4}$
(c) $\frac{D}{3}$ (d) $\frac{D}{\sqrt{3}}$

APPSC AEE SCREENING 17.02.2019

Ans. (b) : For circular section $I = \frac{\pi}{64} D^4, A = \frac{\pi}{4} D^2$

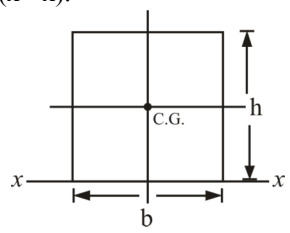
Radius of gyration $= k = \sqrt{\frac{I}{A}} = \sqrt{\frac{\frac{\pi}{64} D^4}{\frac{\pi}{4} D^2}} = \frac{D}{4}$

304. The moment of inertia of a rectangular section of base (b), height (h) about its base will be :

(a) $\frac{hb^3}{12}$ (b) $\frac{bh^3}{3}$
(c) $\frac{bh^3}{12}$ (d) $\frac{hb^3}{3}$
(e) $\frac{bh^3}{36}$

CGPSC AE 25.02.2018

Ans. (b) : Moment of inertia of a rectangular section about its base (x - x).



$$I_{x-x} = I_{CG} + Ax^2$$

$$I_{C.G.} = \frac{bh^3}{12}, A = b \times h, \; x = \frac{h}{2}$$

$$I_{x-x} = \frac{bh^3}{12} + b \times h \times \left(\frac{h}{2}\right)^2 = \frac{bh^3}{12} + \frac{bh^3}{4} = \frac{bh^3}{3}$$

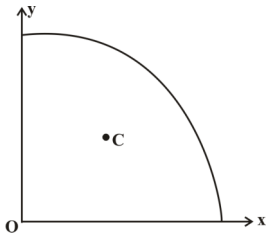
$$\boxed{I_{x-x} = \frac{bh^3}{3}}$$

305. Moment of inertia of a quarter circle (diameter = d) about its straight edge is given by :

(a) $\frac{\pi d^4}{64}$ (b) $\frac{\pi d^4}{128}$
(c) $\frac{\pi d^4}{256}$ (d) $\frac{\pi d^4}{512}$
(e) $\frac{\pi d^4}{32}$

CGPSC AE 25.02.2018

Ans. (c) :



$$I_{OX} = \frac{1}{4} \times \left[\frac{\pi d^4}{64}\right]$$

$$I_{OX} = \frac{\pi d^4}{256}$$

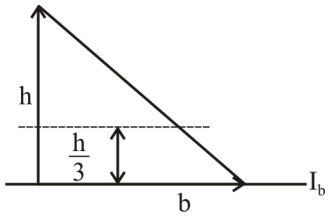
306. The moment of inertia of a triangular section with base b and height h about the base of the section will be

(a) $\frac{hb^3}{12}$ (b) $\frac{h^2b^2}{12}$
(c) $\frac{bh^2}{12}$ (d) $\frac{bh^3}{12}$
(e) none of the above

CGPSC AE 16.10.2016
MPSC HOD (Govt. Poly. Colleges) 04.10.2014
Oil India Senior Officer 23.12.2020

Search on Telegram @apna_pdf

Ans. (d) : As we know,



Moment of inertia when axis passes through centroid, is

$$= \frac{bh^3}{36}$$

& Moment of inertia when axis passing through base is,

$$= \frac{bh^3}{12}$$

307. The moments of inertia of a solid circular section of radius *r* and of a hollow circular section of radii *r* and *R*, each about their diameter axes are equal then.

(a) R = 2*r* (b) R = 1.414*r*
(c) R = 1.189*r* (d) R is nearly equal to *r*

J & K PSC Screening, 2006

Ans. (c) : Moment of inertia of solid circular section

$$I_1 = \frac{\pi d^4}{64}$$

$$= \frac{\pi \times (2r)^4}{64}$$

$$I_1 = \frac{\pi \times r^4}{4}$$

Moment of inertia of Hollow circular section

$$I_2 = \frac{\pi}{4}(R^4 - r^4)$$

$$I_1 = I_2$$

$$\frac{\pi}{4} r^4 = \frac{\pi}{4}(R^4 - r^4)$$

$$r^4 = R^4 - r^4$$

$$2r^4 = R^4$$

$$R = 2^{1/4} r \quad \Rightarrow \quad \boxed{R = 1.189r}$$

308. Moment of inertia of a triangular section of base (b) and height (h) about an axis passing through its vertex and parallel to the base, is _____ than that passing through its C.G. and parallel to the base.

(a) Nine times (b) Six times
(c) Four times (d) Two times

NPCIL ET, 2015

Ans. (a) : Moment of inertia about triangular's vertex $\left(I_{vertex} = \frac{bh^3}{4}\right)$

Moment of inertia about centroid of triangular section $\left(I_{centroid} = \frac{bh^3}{36}\right)$

Moment of inertia of about base of triangular $\left(I_{base} = \frac{bh^3}{12}\right)$

Moment of Inertia,

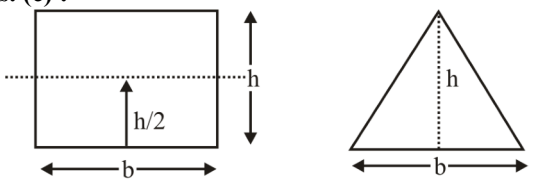
$$I_{vertex} = 9\ I_{centroid}$$

309. Ratio of moment of inertia of a rectangle and that of a triangle, having same base and height with respect to their bases will be:

(a) 2 : 1 (b) 3 : 1
(c) 4 : 1 (d) 1 : 2

Vadodara Muncipal Corp. DEE, 2018

Ans. (c) :



(I) (II)

According to Parallel Axis Theorem,

$$(I_I)_{base} = I_{CG} + Ah^2$$

$$(I_I)_{base} = \frac{bh^3}{12} + (b \times h) \times \left(\frac{h}{2}\right)^2$$

$$= \frac{bh^3}{12} + \frac{bh^3}{4}$$

$$= \frac{bh^3 + 3bh^3}{12}$$

$$= \frac{4bh^3}{12}$$

$$\boxed{(I_I)_{base} = \frac{bh^3}{3}}$$

$$(I_{II})_{about\ base} = \frac{bh^3}{12}$$

$$\frac{I_I}{I_{II}} = \frac{\frac{bh^3}{3}}{\frac{bh^3}{12}}$$

$$\boxed{\frac{(I_I)_{base}}{(I_{II})_{base}} = \frac{4}{1}}$$

310. The centre of percussion is

(a) same as centre of gravity
(b) The point in a body about which it can rotate horizontally and oscillates under the influence of gravity.
(c) the point of application of the resultant of all the forces tending to cause a body to rotate about a central axis.
(d) the metacentre of the body.

WBPSC AE, 2017

Ans. (c) : The centre of percussion is the point of application of the resultant of all the forces tending to cause a body to rotate about a central axis.

Search on Telegram @apna_pdf

311. The moment of inertia of a circular area of radius r with respect to a diametral axis is

(a) πr^2 (b) $\pi r^2/4$

(c) $\pi r^4/4$ (d) $\pi r^4/16$

WBPSC AE, 2017

Ans. (c) : We know that,

$$I_{\text{diametral axis}} = \frac{\pi d^4}{64} = \frac{\pi r^4}{4}$$

312. Centroid of a body is its :

(a) geometrical concentration

(b) mass concentration

(c) weight concentration

(d) density concentration

Haryana PSC Civil Services Pre, 2014

Ans. (a) :

Centroid – Geometrical concentration → Point about which whole geometry is distributed.

Centre of mass – Mass Concentration → Point at which whole mass is acting.

313. The mass moment of inertia of a thin circular disc about a diametral axis is $\frac{MR^2}{4}$, where M is the mass of circular disc & mass of a semicircular disc is m and radius R, then its mass moment of inertia about diametral axis is

(a) $\frac{mR^2}{4}$ (b) $\frac{mR^2}{8}$

(c) $\frac{mR^2}{16}$ (d) $\frac{mR^2}{32}$

WBPSC AE, 2007

Ans. (b) : MOI of circular disc

about diametrical axis = $\frac{mR^2}{4}$

MOI of semi circular plate

$$= \frac{mR^2}{4\times 2} = \frac{mR^2}{8}$$

314. A triangular sector of angle 60° is cut from a circle of radius r with its apex at the centre of the disc. The centre of gravity of the sector lies

(a) at the centre of the disc

(b) at the centre of the triangular sector

(c) somewhere in the disc

(d) Somewhere in the sector

Karnataka PSC AE, 10.09.2017

Ans. (c) : somewhere in the disc

315. A circular disc is to be made by using iron and aluminum, so that it acquires maximum moment of inertia about geometrical axis. It is possible with

(a) Iron at interior and aluminium surrounding it

(b) Aluminium at interior and iron surrounding it

(c) Using iron and aluminium layers in alternate order

(d) Sheet of iron is used at both external surface and aluminium sheet as internal layers

GPSC EE Pre, 28.01.2017

Ans. (b) : A disc is composed of rings and moment of inertia of disc can be using integral of moment of inertia of concentric elemental rings.

Moment of inertia of continuous body is found by using $I = \int R^2 dm$

For increasing the moment of inertia of a non-uniform disc, It is hence desired that the mass density is more in the interior parts of the disc.

316. Bifilar suspension method is used to find the :

(a) angular acceleration of the body

(b) moment of inertia of the body

(c) periodic time of the body

(d) frequency of vibration of the body

Punjab PSC SDE 12.02.2017

GPSC Lect. 23.10.2016

Ans. (b) : Bifilar suspension method is used to find the moment of inertia of the body.

317. Condition for stating that the centre of gravity of a body is completely determined is when:

(a) the body has (3 + 2) planes of symmetry

(b) the body has (3 + 1) planes of symmetry

(c) the body has (3 + 0) planes of symmetry

(d) the body has (3 – 2) planes of symmetry

HPPSC Asstt. Prof. 29.10.2016

Ans. (c) : Condition for stating that the centre of gravity of a body is completely determined is when the body has (3 + 0) planes of symmetry.

318. .....systems are used to determine the moment of inertia of irregular bodies.

(a) Multifilar (b) Unifilar

(c) Multistar (d) Tristar

HPPSC Asstt. Prof. 29.10.2016

Ans. (a) : Multifilar systems are used to determine the moment of inertia of irregular bodies.

319. The centre of gravity of a quadrant of a circle of radius R lies along its central radius at an approximate distance of–

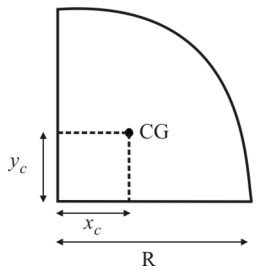
(a) 0.3 R (b) 0.44 R

(c) 0.6 R (d) 0.5 R

Karnataka PSC AE (WRD) 31.07.2021

WBPSC AE 2003

Ans. (b) :



∵ Centre of gravity (CG) of a quadrant of circle of radius R is $\Rightarrow \frac{4R}{3\pi}$.

$$y_c = x_c = \frac{4R}{3\pi}$$

$$= 0.424R$$

Search on Telegram @apna_pdf

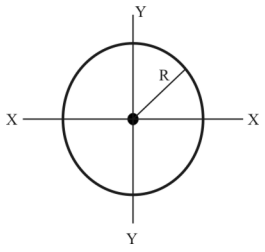
320. The moment of inertia of a uniform circular disc of mass M and radius R about any of its diameters is $\frac{1}{4}MR^2$. What is the moment of inertia of the disc about an axis passing through its centre and normal to the disc?

(a) MR^2 (b) $\frac{1}{2}MR^2$

(c) $\frac{3}{2}MR^2$ (d) $2\,MR^2$

WBPSC AE 2003

Ans. (b) :



MOI about its diameter –

$$I_{X-X} = I_{Y-Y} = \frac{MR^2}{4}$$

$\therefore$ MOI about its Z-axis or normal to the disc passing through centre.

$$I_{Z-Z} = I_{X-X} + I_{Y-Y} = \frac{MR^2}{4} + \frac{MR^2}{4}$$

$$I_{Z-Z} = \frac{2MR^2}{4}$$

$$\boxed{I_{Z-Z} = \frac{MR^2}{2}}$$

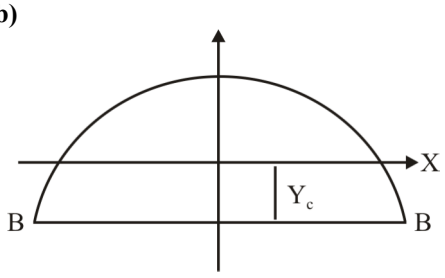
321. Moment of inertia of a semicircle about is x-axis is given by

(a) $0.22\ r^3$ (b) $0.11\ r^4$

(c) $0.14\ r^4$ (d) $0.2\ r^4$

APPSC AEE 04.12.2012
WBPSC AE 2008

Ans. (b)



Moment of inertia about BB (I_{BB}) = $\frac{\pi r^4}{8}$

Moment of inertia about x – axis (I_{x-x}) –

using parallel axis theorem

$I_{BB} = I_{x-x} + Ay_e^2$

$I_{xx} = I_{BB} - Ay_e^2$

$$= \frac{\pi r^4}{8} - \frac{\pi r^2}{2}\left(\frac{4r}{3\pi}\right)^2$$

$$= \frac{\pi r^4}{8} - \frac{8r^4}{9\pi}$$

$$= \frac{\left(9\pi^2 - 64\right)r^4}{72\pi}$$

$$\boxed{I_{xx} = 0.11\ r^4}$$

322. Regarding "'Polar moment of inertia" which of the following statement is correct?

(a) It is the moment of inertia for an area with respect to a line or axis perpendicular to the plane of the area

(b) It is the moment of inertia for an area with respect to a line or axis perpendicular to the plane of the area

(c) It is applicable to masses whereas moment of inertia is applicable to areas only

(d) It is the moment of inertia for an area with respect to a line or axis parallel to centroidal axis

WBPSC AE 2008

Ans. (b) : Polar moment of inertia it is the moment of inertia for an area with respect to a line or axis perpendicular to the plane of the area.

323. The moment of a lamina about any axis in the plane of the lamina equals the sum of moment of inertia about a parallel area of centroid axis in the plane of lamina and the product of the lamina the and square of the distance between the two axes.

The above theorem is known as

(a) theorem of parallel axes

(b) theorem of perpendicular axes

(c) three moments theorem

(d) none of the above

WBPSC AE 2008

Ans. (a) :

324. The moment of inertia about a principal axis is called

(a) mass moment of inertia

(b) second moment of inertia

(c) principal moment of inertia

(d) any of the above

WBPSC AE 2008

Ans. (c) : The moment of inertia about a principal axis is called principal moment of inertia.

325. Moment of inertia of a rectangle about its x-x-axis is given by

(a) $\frac{bd^3}{12}$

(b) $\frac{db^3}{12}$

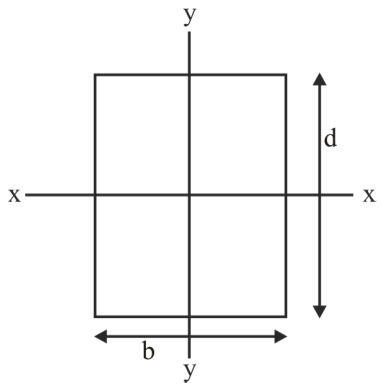
(c) $\frac{bd^2}{6}$

(d) $\frac{bd^3}{6^3}$ where b is the breadth of a rectangle

WBPSC AE 2008

Search on Telegram @apna_pdf

Ans. (a)



$$I_{x-x} = \frac{bd^3}{12} \text{ -----(1)}$$

$$I_{y-y} = \frac{db^3}{12} \text{ -----(2)}$$

326. .....of a body is defined as the distance from the reference axis at which the given area is assumed to be compressed and kept at thin strip, such that there is no change in its moment of inertia.

(a) Neutral axis
(b) Gyroscopic distance
(c) Second moment of area
(d) Radius of Gyration

HPPSC AE (PWD) 10.09.2016

Ans. (d) : Radius of Gyration- Radius of gyration of a body is defined as the distance from the reference axis at which the given area is assumed to be compressed that kept as thin strip such that there is no change in its moment of inertia.

$I = mk^2$

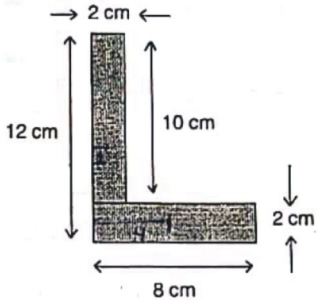
Where, I = Moment of inertia

m = mass of the body

According to the radius of gyration is

$$k = \sqrt{\frac{I}{m}}$$

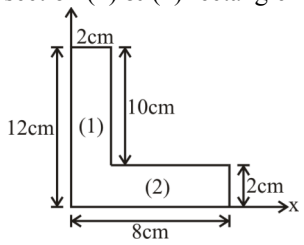
327. Find the centre of gravity of the L-section shown in figure



(a) 4.33 cm from the bottom line of the L-section and 2.33 cm from the left of the L-section
(b) 4.33 cm from the top of the L-section and 2.33 cm from the right of the L-section
(c) 3.33 cm from the bottom line of the L-section and 2.33 cm from the left of the L-section
(d) 4.33 cm from the bottom line of the L-section and 3.33 cm from the left of the L-section
(e) None of these

CGPSC AE 16.10.2016

Ans. (a) : Let section (1) & (2) rectangle



For (1)

$a_1 = 10 \times 2 = 20 \text{ cm}^2$

$y_1 = 5 + 2 = 7 \text{ cm}$

$x_1 = 1 \text{ cm}$

For (2)

$a_2 = 8 \times 2 = 16 \text{ cm}^2$

$x_2 = 4 \text{ cm}, y_2 = 1 \text{ cm}$

$$\bar{x} = \frac{a_1x_1 + a_2x_2}{a_1 + a_2} = \frac{20\times1 + 4\times16}{20+16} = 2.33\text{cm}$$

$$\bar{y} = \frac{a_1y_1 + a_2y_2}{a_1 + a_2} = \frac{20\times7 + 1\times16}{20+16} = 4.33\text{cm}$$

328. One of the requirements for "dynamic equivalence" is :

(a) Mass of the model must be twice that of the original body
(b) Mass moment of inertia must equal that of the original body
(c) Centre of gravity must be displaced
(d) Mass moment of inertia must be half that of the original body.

UPSC JWM Advt. No.-52/2010

Ans. (b) : Explanation : Dynamic equivalence is the mass moment of inertia must equal to that of the original body.

329. The product of a given area and its centroidal distance from a point is:

(a) Mass moment of inertia
(b) First moment of area
(c) Area moment of inertia
(d) Centroid

JUVNL AEE (GTO) 05.03.2017

Ans. (b) : First moment of area is commonly used to determine the centroid of an area.

It is a calculated as the summation of the product of each area and its distance from the axis.

First moment of area = $\Sigma A.d$

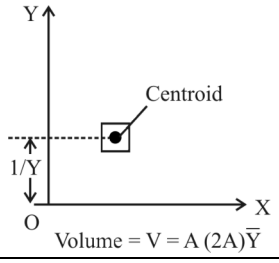
330. The volume of the solid generated by rotating any plane figure about a non-intersecting axis in its plane is equal to the product of the area A of the figure and the distance travelled by its centroid. This is known as

(a) 2nd Pappus–Guldinus Theorem
(b) Varignon's Theorem
(c) Three Force Theorem
(d) 1st Pappus–Guldinus Theorem

JUVNL AEE (GTO) 05.03.2017

Search on Telegram @apna_pdf

Ans. (a) : The Pappus's theorem can also be used in reverse to find the centroid of a curve or figure.

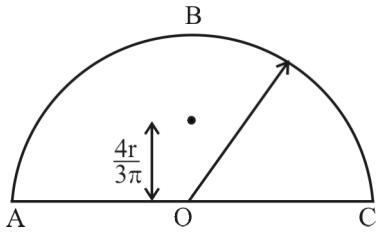


331. What is the moment of inertia of a semicircular lamina with the base horizontal about the centroidal axis parallel to x-axis, if the radius is R.

(a) $0.10976\ R^4$ (b) $0.2084\ R^4$
(c) $0.23\ R^4$ (d) $0.3142\ R^4$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Moment of inertia of a semicircular section–



We know that,
MOI of semicircular section about base AC is equal to half of the MOI of circular section about AC.

$$I_{AC} = \frac{1}{2} \times \frac{\pi}{64} \times d^4 = 0.393 r^4$$

We also know that area of semicircular section

$$a = \frac{1}{2} \times \pi r^2 = \frac{\pi r^2}{2}$$

and distance between centre of gravity of the section and the base, AC = $h = \frac{4r}{3\pi}$

MOI of the section through its C.G. and parallel to x-x axis is,

$$I_G = I_{AC} - ah^2$$

$$= \left[\frac{\pi}{8} \times r^4\right] - \left[\frac{\pi r^2}{2} \times \left(\frac{4r}{3\pi}\right)^2\right]$$

$$= \left[\frac{\pi}{8} r^4\right] - \left[\frac{8}{9\pi} r^4\right]$$

$$\boxed{I_G = 0.1097 R^4}$$

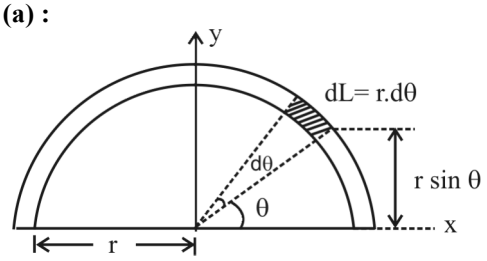
Note : The MOI about y-y axis will be the same as that about base AC i.e $0.393\ r^4$

332. The centre of gravity of a semi circular arc of radius 'r' is on the central radius from the base diameter at a distance of

(a) $2r/\pi$ (b) $3r/\pi$
(c) $4r/\pi$ (d) r/π

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



$$\bar{y} = \int \frac{y.dL}{dL}$$

$$\bar{y} = \frac{\int_0^{\pi} (r.\sin\theta)(r.d\theta)}{\int_0^{\pi} r.d\theta}$$

$$\bar{y} = \frac{r^2 \int_0^{\pi} \sin\theta.d\theta}{\int_0^{\pi} r.d\theta} = \frac{r[-\cos\theta]_0^{\pi}}{[\theta]_0^{\pi}}$$

$$\bar{y} = \frac{-r[\cos\theta]_0^{\pi}}{\pi - 0} = \frac{-r[\cos\pi - \cos\theta]}{\pi} = \frac{-r(-1-1)}{\pi}$$

$$\boxed{\bar{y} = \frac{2r}{\pi}}$$

Alternatively, we can solve it by Pappus-Guldinus equation

$$\bar{y} = \frac{\text{surface area of sphere}}{2\pi \times \text{length of arc}} = \frac{4\pi r^2}{2\pi \times \pi r} = \frac{2r}{\pi}$$

Note : Centroid of semicircular area = $\frac{4r}{3\pi}$

333. If the moments of inertia of a section about its orthogonal axes are 1×10^6 and 2×10^6 and its area is 100 units, its polar moment of inertia is

(a) 3×10^6 (b) 3.1×10^6
(c) 5×10^6 (d) 4×10^6

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Given
$I_{xx} = 1 \times 10^6$
$I_{yy} = 2 \times 10^6$
A = 100 units
Polar moment of inertia = $I_{xx} + I_{yy}$
$= 1 \times 10^6 + 2 \times 10^6$
$= 3 \times 10^6$

334. Moment of inertia (about its neutral axis) of hollow rectangular section with overall width and depth as B and D and hollow rectangular hole as b and d is

(a) $1/16\ (BD^3 - bd^3)$ (b) $1/32(BD^3 - bd^3)$
(c) $(BD^3 - bd^3)$ (d) $1/12(BD^3 - bd^3)$

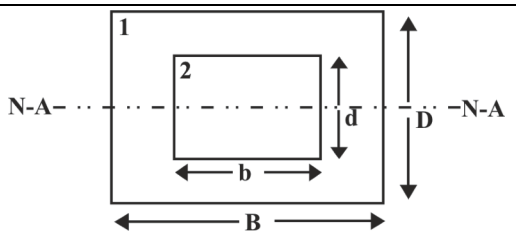
ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (d) : $I_{N\text{-}A} = I_1 - I_2$

$$[I_{N-A}]_1 = \frac{BD^3}{12}$$

$$[I_{N-A}]_2 = \frac{bd^3}{12}$$

Search on Telegram @apna_pdf



$$I_{N-A} = \frac{(BD^3 - bd^3)}{12}$$

335. According to theorem of perpendicular axes, if I_{xx} and I_{yy} be the M.I. of a lamina about *xx* and *yy* axis, then M.I. of the lamina about axis *zz*, which is perpendicular to *xx* and *yy*, equal to

(a) $I_{xx} \times I_{yy}$ (b) $I_{xx} + I_{yy}$

(c) $\frac{I_{xx}}{I_{yy}}$ (d) $\frac{I_{yy}}{I_{xx}}$

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (b) Theorem of perpendicular axis -

$I_{ZZ} = I_{XX} + I_{YY}$

336. Moment of inertia of a square of side d about the diagonal is-

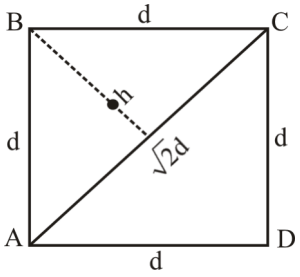
(a) $d^4/18$ (b) $d^4/24$

(c) $d^4/12$ (d) $d^4/8$

Vizag Steel (MT) 2017

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c)



Diagonal = $\sqrt{2}$d

Height (AC) of triangle = h= $\frac{AC}{\sqrt{2}} = \frac{\sqrt{2}d}{2}$

AC $\rightarrow$ just like a base of triangles of ABC & ADC

So moment of inertia of a square of side d about the diagonal AC

$$= 2 \times \left[\frac{(AC)h^3}{12}\right]$$

$$= 2 \times \left[\frac{\left(\sqrt{2}d\right).\left[\frac{\sqrt{2}d}{2}\right]^3}{12}\right]$$

$$= \frac{d^4}{12}$$

337. M.I. of a triangular section of base a and height h about an axis passing through its c.g. and parallel to base is-

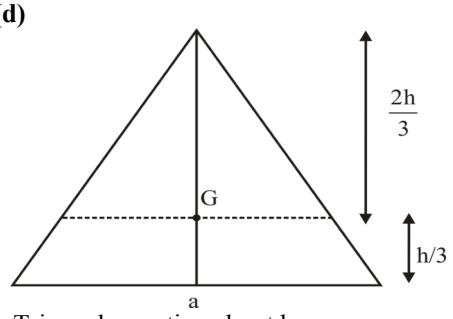
(a) $\frac{ah^3}{8}$ (b) $\frac{ah^3}{12}$

(c) $\frac{ah^3}{24}$ (d) $\frac{ah^3}{36}$

Karnataka PSC AE (WRD) 31.07.2021

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (d)



MI of a Triangular section about base

$$I_{base} = \frac{ah^3}{12}$$

MI of a Triangular section about a parallel line, passing through center of Gravity to base

$$I_{C.G.} = \frac{ah^3}{36}$$

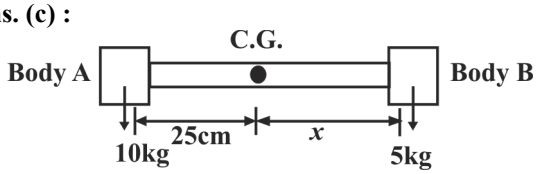
338. A body A of weight 10 kg with its C.G. 25 cm from the axis of rotation is to be balanced by another body B of weight 5 kg. The radius at which the C.G. of weight B should be placed is

(a) 2 cm (b) 12.5 cm

(c) 50 cm (d) None of these

ISRO Scientist/Engineer 24.05.2014

Ans. (c) :



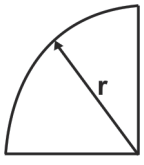
So, moment about C.G.

$$m_1 r_1 = m_2 r_2$$

$$r_2 = \frac{m_1 r_1}{m_2} = \frac{10 \times 25}{5}$$

$$r_2 = 50 \text{ cm}$$

339. Area moment of inertia for the quadrant shown below is



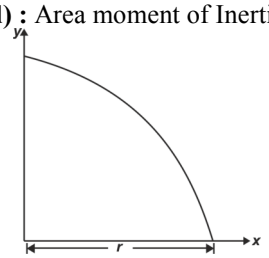
(a) $\pi r^4/2$ (b) $\pi r^4/4$

(c) $\pi r^4/8$ (d) $\pi r^4/16$

ISRO Scientist/Engineer 2012

Search on Telegram @apna_pdf

Ans. (d) : Area moment of Inertia



$$I_y = I_x = \frac{1}{4}(I_{circle})$$

$$= \frac{1}{4} \times \frac{\pi d^4}{64}$$

$$\frac{1}{4} \times \frac{\pi \times (2r)^4}{64}$$

$$= \frac{1}{4} \times \frac{\pi \times 16r^4}{64}$$

$$= \frac{\pi r^4}{16}$$

340. The mass moment of inertia of a cube with edges of length b, about an axis passing through an edge

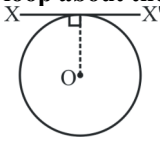
(a) $\frac{mb^2}{2}$ (b) $\frac{mb^2}{6}$

(c) $\frac{3mb^2}{2}$ (d) $\frac{2mb^2}{3}$

ISRO Scientist/Engineer 2011

Ans. (d)

341. A thin wire of length L and uniform linear mass density ρ is bent into a circular loop with centre O as shown in figure. The moment of inertia of the loop about the axis XX' is



(a) $\rho L^3/16\pi^2$ (b) $\rho L^3/8\pi^2$

(c) $5\rho L^3/16\pi^2$ (d) $3\rho L^3/8\pi^2$

ISRO Scientist/Engineer 03.07.2016

Ans. (d) : $L = 2\pi R$

$$R = \frac{L}{2\pi}$$

Linear mass moment–

$$M = \rho L$$

Parallel Axis Theorem–

$$I_{XX} = I_C + MX^2$$

$$= \frac{MR^2}{2} + MR^2$$

$$I_{XX} = \frac{3}{2}MR^2$$

$$= \frac{3}{2} \times \rho L \times \left(\frac{L}{2\pi}\right)^2 = \frac{3}{2} \times \rho L \times \frac{L^2}{4\pi^2}$$

$$I_{XX} = \frac{3\rho L^3}{8\pi^2}$$

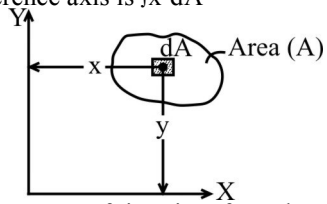
342. Moment of Inertia of an area dA at a distance x from a reference axis is:

(a) $\int x dA$ (b) $\int x^2 dA$

(c) $\int x^3 dA$ (d) $\int x^4 dA$

(HPPSC POLY. LECT. 2016)

Ans : (b) Moment of Inertia of an area dA at a distance x from a reference axis is $\int x^2 dA$



The axial moment of inertia of a plane area is the geometrical characteristic of the area defined by the integrals

$I_{xx} = \int y^2.dA$ and $I_{yy} = \int x^2.dA$

343. Moment of inertia of a body does not depend on

(a) Axis of rotation of the body

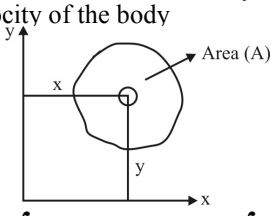
(b) Mass of the body

(c) Angular velocity of the body

(d) distribution of mass in the body

(KPSC AE 2015)

Ans : (c) Moment of Inertia of a body does not depend on angular velocity of the body



$$I_{xx} = \int y^2.dA \quad \text{and} \quad I_{yy} = \int x^2 dA$$

Where x and y the Co - ordinate of the differintial elements of area dA. Since this area dA is multiplied by the square of the distance, the moment of inertia is also called the second moment at area.

344. For principal axes, the moment of inertia will be :

(a) $I_{xy} = 0$ (b) $I_{xy} = 1$

(c) $I_{xy} = \infty$ (d) none of these

(HPPSC POLY. LECT. 2016)

Ans : (a) For principal axes, the moment of Inertia $I_{xy} = 0$

345. The radius of gyration 'k' for a solid cylinder of radius 'R' is equal to

(a) $\sqrt{2}R$ (b) $R/\sqrt{2}$

(c) 0.6324 R (d) 0.5 R

TNPSC AE 2017

Ans. (b) : The radius of gyration 'k' for a solid cylinder of radius 'R' is equal to $R/\sqrt{2}$.

346. The radius of gyration of a disc type fly wheel of diameter D is

(a) D (b) D/2

(c) D/4 (d) $\frac{3}{\sqrt{2}}D$

TNPSC AE 2018

Search on Telegram @apna_pdf

Ans. (c) : $I = AK^2$

$$K = \sqrt{\frac{I}{A}} = \sqrt{\frac{\frac{\pi}{64}D^4}{\frac{\pi}{4}D^2}}$$

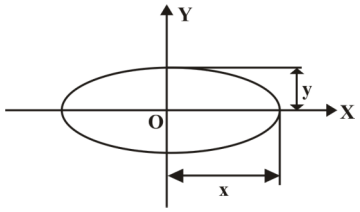
$$\boxed{K = \frac{D}{4}}$$

347. Moment of inertia of an elliptical area about the major axis is

(a) $\pi xy^3/4$ (b) $\pi xy^3/3$
(c) $\pi x^2y^3/4$ (d) πx^2y^3
(e) $\pi x^2y^3/3$

CGPSC AE 26.04.2014 Shift-I

Ans. (a) :



Moment of inertia of an elliptical area about the major axis

$$I_{xx} = \frac{\pi}{4}xy^3$$

Moment of inertia of an elliptical area about minor axis

$$I_{yy} = \frac{\pi}{4}yx^3$$

348. Statement (I) : Two circular discs of equal masses and thickness made of different materials will have same moment of inertia about their central axes of rotation.
Statement (II) : Moment of inertia depends upon the distribution of mass within the body.

ESE 2017

Ans. (d) : Mass moment of inertia for a uniform disc about its axis of rotation

$$I = \frac{MR^2}{2}$$

$$I = \frac{\rho AtR^2}{2}$$

$\because$ Mass & thickness is same,

$$\rho_1 A_1 t = \rho_2 A_2 t$$

$$I_1 = \frac{\rho_1 A_1 t R_1^2}{2} = \frac{\pi}{8}\rho_1 R_1^4 t$$

$$I_2 = \frac{\rho_2 A_2 t R_2^2}{2} = \frac{\pi}{8}\rho_2 R_2^4 t$$

If $\rho_1 > \rho_2$, $R_1 < R_2$, $I_1 > I_2$
Hence statement-I is wrong.

349. Moment of inertia of an area always least with respect to

(a) Bottom-most axis (b) Radius of gyration
(c) Central axis (d) Centroidal axis

Vizag Steel (MT) 2017
WBPSC AE, 2017

Ans. (d) : The moment of inertia about any axis passing through centroid is zero so Moment of inertia of an area always least with respect to centroidal axis.

350. Moment of Inertia about the centroidal axis of elliptical quadrant of base 'a' and height 'b' is

(a) $\frac{\pi ab}{24}(a^2+b^2)$ (b) $\frac{\pi ab}{24}(a^3+b^3)$
(c) $\frac{\pi ab}{16}(a^2+b^2)$ (d) $\frac{\pi ab}{24}(a^3+b^3)$

TNPSC AE 2013

Ans. (c) : $I = \frac{\pi ab}{16}\left(a^2+b^2\right)$

351. Length to radius ratio $\frac{l}{r}$ of a solid cylinder is such that the moments of inertia about the longitudinal and transverse axes are equal is

(a) 1 (b) $\sqrt{3}$
(c) $\sqrt{5}$ (d) 2

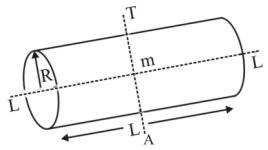
TNPSC AE 2014

Ans. (b) : MOI of a uniform solid cylinder about longitudinal axis

$$I_{L-L} = \frac{mR^2}{2}$$

MOI of a uniform solid cylinder about transfer axis

$$I_{T-A} = \frac{1}{4}mR^2 + \frac{1}{12}mL^2$$



Given-

$$I_{L-L} = I_{T-A}$$

$$\frac{mR^2}{2} = \frac{mR^2}{4} + \frac{1}{12}mL^2$$

$$\left[\frac{L}{R}\right]^2 = 3$$

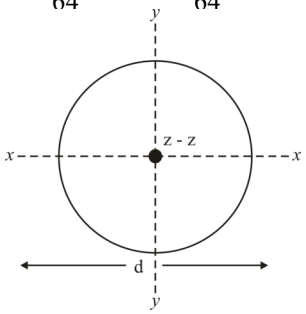
$$\left[L/R\right] = \sqrt{3}$$

352. Ratio of moment of Inertia of a circular body about its *x* axis to that about *y* axis is

(a) 0.5 (b) 1.0
(c) 1.5 (d) 2.0

NPCIL ET, 2015
TNPSC AE 2014

Ans. (b) : $I_{x-x} = \frac{\pi d^4}{64}$, $I_{y-y} = \frac{\pi d^4}{64}$

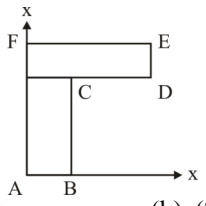


Search on Telegram @apna_pdf

$$I_{z-z} = I_{xx} + I_{yy} = \frac{\pi d^4}{32}$$

then $$\frac{I_{x-x}}{I_{y-y}} = \frac{\frac{\pi d^4}{64}}{\frac{\pi d^4}{64}} = 1$$

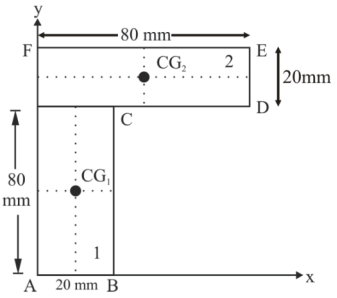
353. The coordinates of centroid of given geometry ABCDEFA [DE = 20 mm, EF = 80 mm, FA = 100 mm, AB = 20mm] will be given as : (A is origin)



(a) (60, 20) (b) (25, 60)
(c) (25, 65) (d) (65, 25)
(e) (25, 40)

CGPSC AE 25.02.2018

Ans. (c) : The coordinates of centroid is $(\bar{x}, \bar{y})$



$$\bar{x} = \frac{a_1x_1 + a_2x_2}{a_1 + a_2}$$

$$= \frac{80\times20\times10 + 80\times20\times40}{80\times20 + 80\times20}$$

$$\bar{x} = 25\text{mm}$$

$$\bar{y} = \frac{a_1y_1 + a_2y_2}{a_1 + a_2} = \frac{80\times20\times40 + 80\times20\times90}{80\times20 + 80\times20} = 65\text{mm}$$

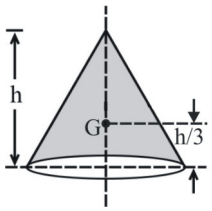
So coordinates of centroid (25, 65)

354. Centre of gravity of a thin hollow cone lies on the axis at a height of :

(a) one-fourth of the total height above base
(b) one-third of the total height above base
(c) one-half of the total height above base
(d) three-eighth of the total height above the base

HPPSC W.S. Poly. 2016

Ans : (b)



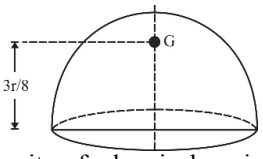
Centre of gravity of a thin hollow cone lies on the axis at a height of one-third of the total height above base.

355. The centre of gravity of a hemisphere of diameter 80 mm from its base diameter is

(a) 15 mm (b) 40 mm
(c) 20 mm (d) 10 mm

TSPSC AEE 2015

Ans : (a)



The centre of gravity of a hemisphere is at a distance of 3r/8 from base

C.G = 3r/8 (2r = d= 80mm)

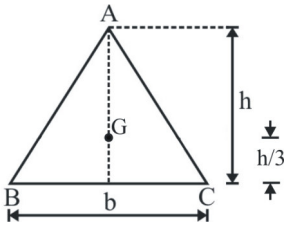
C.G = 15 mm.

356. The base of triangle is 60 mm and height is 50 mm. The moment of inertia about its base 'BC' is

(a) 2,08, 333.33mm^4 (b) 6,25,000 mm^4
(c) 9,00,000 mm^4 (d) 3,00, 000mm^4

TSPSC AEE 2015

Ans : (b)



$$I_{GG} = \frac{bh^3}{36}$$

$$I_{BC} = \frac{bh^3}{12}$$

$$I_{BC} = \frac{60\times(50)^3}{12}$$

$I_{BC} = 625000$ mm^4.

357. The centre of gravity of a plane lamina is not at its geometrical centre, if it is a

(a) circle
(b) square
(c) rectangle
(d) right angled triangle

UKPSC AE 2007 Paper -I

Ans. (d) : Right angled triangle

358. Which of the following represents the state of neutral equilibrium?

(a) Cube resting on one edge
(b) A smooth cylinder lying on a curved surface
(c) A smooth cylinder lying on a convex surface
(d) None of the above

UKPSC AE 2007 Paper -I

Ans. (d) : None of the above

359. The coordinate of centroid (x, y) of quarter circular lamina of radius (R), whose straight edges coincide with the coordinate axis in the first quadrant, are given as:

Search on Telegram @apna_pdf

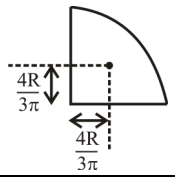
(a) $(0, 4R/3\pi)$ (b) $(4R/3\pi, 0)$

(c) $(4R/3\pi, 8R/3\pi)$ (d) $(4R/3\pi, 4R/3\pi)$

(e) $(8R/3\pi, 8R/3\pi)$

CGPSC AE 25.02.2018

Ans. (d) :



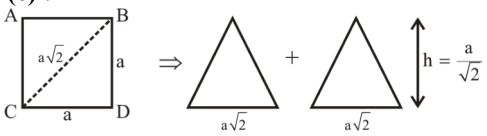
360. The area moment of inertia of a square of size 1 unit about its diagonal is

(a) $\frac{1}{3}$ (b) $\frac{1}{4}$

(c) $\frac{1}{12}$ (d) $\frac{1}{6}$

VIZAG STEEL MT 10.06.2012
VIZAG STEEL MT 18.08.2013

Ans. (c) :



Given a square with side a = 1

Diagonal of square = Base of the triangle (b) = $a\sqrt{2}$

MOI of the square about the diagonal

$$(I_{square})_{diagonal} = 2 \times (I_{triangle})_{base}$$

$$= 2 \times \frac{bh^3}{12}$$

$$= 2 \times \frac{(a\sqrt{2}) \times \left(\frac{a}{\sqrt{2}}\right)^3}{12}$$

$$(I_{square})_{diagonal} = \frac{a^4}{12} \Rightarrow \frac{1}{12} \quad [\because a = 1]$$

361. The ratio of the moment of inertia of a rectangle about its centroidal axis to that about its base, is:

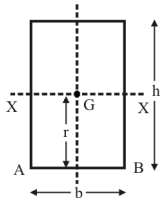
(a) 1/3 (b) 1/4

(c) 3/4 (d) 4

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (b) : Case (I)–MOI of a rectangle about its centroidal axis (X-X)

$$I_{XX} = \frac{bh^3}{12}$$



Case (II)–MOI of a reactangle about its base (AB)

$$I_{AB} = I_{XX} + Ar^2$$

$$= \frac{bh^3}{12} + bh \times \frac{h^2}{4}$$

$$= \frac{bh^3}{12} + \frac{bh^3}{4}$$

$$= \frac{4bh^3}{12}$$

$$= \frac{bh^3}{3}$$

$$\frac{I_{XX}}{I_{AB}} = \frac{bh^3}{12 \times bh^3} \times 3$$

$$= \frac{1}{4}$$

362. What is the point through which the whole weight of body acts, irrespective of its position, known as

(a) Moment of inertia (b) Centre of gravity

(c) Centre of percussion (d) Centre of mass

VIZAG STEEL MT 2011

Ans. (b) : The point through which the whole weight of body acts, irrespective of its position, known as centre of gravity.

363. The product of moment of inertia and angular velocity is known as :

(a) angular torque (b) kinetic energy

(c) angular momentum (d) none of the above

Kerala PSC IOF 19.04.2016

Ans. (c) The product of moment of inertia and angular velocity is known as angular momentum.

Angular momentum,

= moment of inertia × angular velocity

$= I \times \omega$

$= mk^2 \times \frac{v}{k}$

$\boxed{L = mkv}$

k = Radius of gyration.

364. The formula to calculate mass moment of inertia (I) of the circular rim is:

(a) $I = m^2 \times r$ (b) $I = (m^2 \times r)/2$

(c) $I = m \times r/2$ (d) $I = m \times r^2$

UPRVUNL AE 05.07.2021

Ans. (d) : $I = m \times r^2$

365. Section modulus of a circular section about an axis through its centre of gravity is

(a) $\frac{\pi}{32}d^3$ (b) $\frac{\pi}{16}d^3$

(c) $\frac{\pi}{8}d^3$ (d) $\frac{\pi}{64}d^3$

APPSC AEE 2012

Search on Telegram @apna_pdf

Ans : (a) Section modulus (z) = I/y

I = Moment of Inertia $= \frac{\pi d^4}{64}$

$y = \frac{d}{2}$

$\boxed{z = \frac{\pi d^3}{32}}$

366. A man weighs 980 N on earth. What will be his weight in moon and sun where gravitation force of moon $g_m = 1.7$ m/s^2 and that of the sun $g_s = 270$ m/s^2 :

(a) $W_m = 170$ N and $W_s = 27000$ N

(b) $W_m = 1666$ N and $W_s = 264600$ N

(c) $W_m = 17$ N and $W_s = 2700$ N

(d) $W_m = 16.66$ N and $W_s = 2646$ N

TNPSC AE (Industries) 09.06.2013

Ans. (a) :

367. Polar moment of inertia of a circular area is

(a) $\frac{\pi}{32}d^4$ (b) $\frac{\pi}{64}d^4$

(c) $\frac{\pi}{4}d^4$ (d) $\frac{\pi}{4}d^3$

APPSC AEE 2012

Ans. (a) : Polar moment of inertia of circle-

J = Area moment of inertia about x-axis + Area moment of inertia about y-axis

$J = I_x + I_y = \frac{\pi}{64}d^4 + \frac{\pi}{64}d^4$

$J = \frac{\pi}{32}d^4$

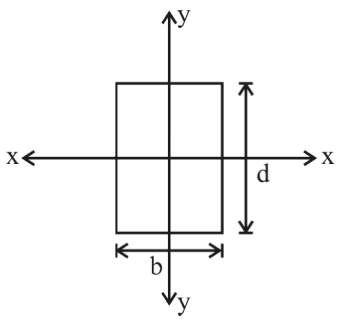
368. Radius of gyration for the rectangular section, with respect to horizontal axis. Take rectangle of width 'b' and depth 'd'.

(a) $\frac{d}{2\sqrt{3}}$ (b) $\frac{4}{\sqrt{3}}$

(c) $\frac{d}{4\sqrt{3}}$ (d) $\frac{d}{3}$

TNCSC AE 2020

Ans. (a) :



For rectangular–

Moment of inertia about horizontal axis 'x-x'

$I_{xx} = \frac{bd^3}{12}$

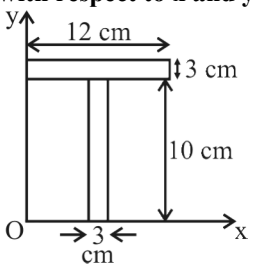
Area, A = bd

Radius of gyration (k) $= \sqrt{\frac{I}{A}}$

$\sqrt{\frac{\frac{bd^3}{12}}{bd}} = \sqrt{\frac{bd^3}{12} \times \frac{1}{bd}}$

$= \boxed{k = \frac{d}{2\sqrt{3}}}$

369. Find the centre of gravity of 'T' section given in figure with respect to x and y axis:

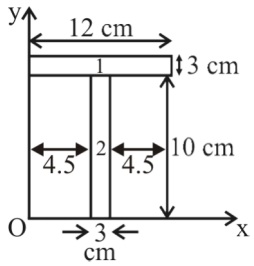


(a) 6.30 cm (b) 8.54 cm

(c) 11.25 cm (d) None of these

PTCUL AE 25.06.2017

Ans. (b) :



$A_1 = 12 \times 3 = 36$ cm^2

$A_2 = 10 \times 3 = 30$ cm^2

$x_1 = 6$ cm ; $y_1 = 11.5$ cm

$x_2 = 6$ cm ; $y_2 = 5$ cm

$x = \frac{A_1x_1 + A_2x_2}{A_1 + A_2}$

$= \frac{(36 \times 6) + (30 \times 6)}{36 + 30} = 6$

$y = \frac{A_1y_1 + A_2y_2}{y_1 + y_2} = \frac{(36 \times 11.5) + (30 \times 5)}{36 + 30}$

$= 8.545$ cm

5. Trusses and Beams

370. A framed structure of triangular shape is

(a) perfect (b) imperfect

(c) deficient (d) redundant

TSPSC Manager (Engg.) HMWSSB 12.11.2020

UPRVUNL AE 05.07.2021

Search on Telegram @apna_pdf

Ans. (a) : A framed structure of triangular shape is perfect.

371. If the number of members in a truss are more than that of a perfect truss. It is known as

(a) Redundant truss (b) Deficient truss
(c) Full truss (d) General type truss

APPSC AE Subordinate Service Civil/Mech. 2016
UKPSC AE, Paper-I 2013

Ans. (a) : If the number of members in a truss (m) is equal to 2j-3 then it is called perfect truss.

Stability and determinacy of truss

For 2-D truss

$m = 2j - 3 \rightarrow$ statically determinate (perfect truss)

$m < 2j-3 \rightarrow$ statically determinate but unstable (deficient truss)

$m > 2j - 3 \rightarrow$ statically indeterminate (redundant truss)

372. A perfect frame is that which satisfies the equation (Assume n = No. of members and j = No. of joints)

(a) $n = 3j - 2$ (b) $n > 3(j - 1)$
(c) $n < 3(j - 1)$ (d) $n = (2j - 3)$

TSPSC AEE 2015
ISRO Scientist/Engineer (RAC) 29.11.2015
ISRO Scientist/Engineer 24.05.2014
APPSC AE 2012
UKPSC AE Paper-I 2012
ISRO Scientist/Engineer 2009

Ans. (d) : In general let a frame have j joints and n members.

(i) if $n = 2j - 3$, then the frame is perfect frame.
(ii) if $n < 2j - 3$, then the frame is deficient (Imperfect) frame.
(iii) if $n > 2j - 3$, then the frame is redundant frame.

373. In a simple truss, if n is the total number of joints, the total number of members is equal to

(a) $2n + 3$ (b) $2n - 3$
(c) $n + 3$ (d) $n - 3$

Gujarat PSC AE 2019
OPSC Civil Services Pre. 2011
GATE 2014

Ans : (b) :

$$\boxed{m = 2n - 3}$$

Where, m = member of joints
n = Total number of joints

374. Ties are load carrying members which have many

(a) torsional loads
(b) axial compressive loads
(c) axial tension loads
(d) transverse loads

TNPSC AE, 2008

Ans. (c) : Ties are load carrying members which have many axial tension loads.

375. Method of sections in truss analysis is generally found useful to determine.

(a) Forces in all members
(b) Forces in selective members
(c) Weights of the members
(d) Bending of members

TSPSC Managers, 2015

Ans. (b) : The method of sections is a process used to solve for the unknown forces acting on members of a truss.

376. In a statically determinate problem, the number of non-trivial equilibrium equations :

(a) equals the numbers of unknowns
(b) is less than number of unknowns
(c) is more than number of unknowns
(d) cannot be determined

J&K PSC Civil Services Pre, 2013

Ans. (c) : For determinate beam number of non-trivial equilibrium equation should be more than number of unknowns.

377. If a truss consists of 8 joints, 10 members and 4 reaction components, then it is a

(a) cantilever truss (b) deficient truss
(c) redundant truss (d) None of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (b) : Condition for redundant $\Rightarrow h > 2J - R$
Condition for deficient $\Rightarrow h < 2J - R$
Where, h – Member of truss
J – Joint
R – Reaction

$h = 10$ $h < 2J - R$
$J = 8, R = 4$ $10 < 2 \times 8 - 4$
$\boxed{10 < 12}$

So, it is deficient truss.

378. Which of the following statement(s) is/are true for truss design?

(i) All loads are applied at the joints.
(ii) The members are joined together by smooth pin.
(iii) Each truss member acts as single force member.

(a) Only (i) (b) Only (i) and (ii)
(c) Only (i) and (iii) (d) Only (iii)
(e) All (i), (ii) and (iii)

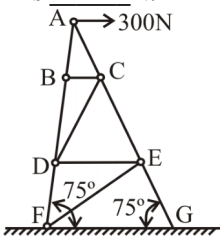
CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) : A truss is a structure that consists of members organised into connected triangles so that the overall assembly behaves as a single object. A truss is made up of a web of triangles joined together of enables the even distribution of weight and the handling of changing tension and compression without bending or shearing. All loads are applied at the points of member are joined together by smooth pin.

Each truss member acts as double force member as equal and opposite force (i.e., either tension or compression) at both ends of the member.

Search on Telegram @apna_pdf

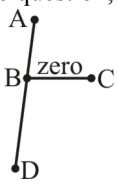
379. The figure shows an idealized plane truss. If a horizontal force of 300N is applied at point A, then the magnitude of the force produced in member CD is _____N.



(a) 300 (b) 0
(c) 116 (d) 276.5

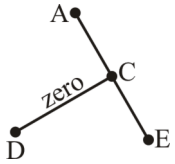
Assam Engg. College AP/Lect. 18.01.2021

Ans. (b) : According to question,



Since, members are collinear, therefore there will be no force in member BC,

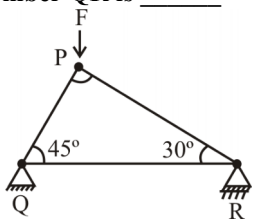
$F_{BC} = 0$



Again, $F_{CD} = 0$

Hence, the magnitude of the force produced in member CD is 0.

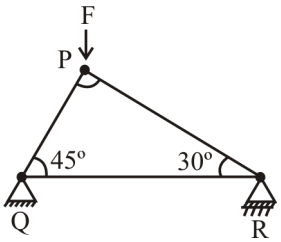
380. Consider a truss PQR loaded at P with a force F as shown in the following figure. The tension in the member QR is _____



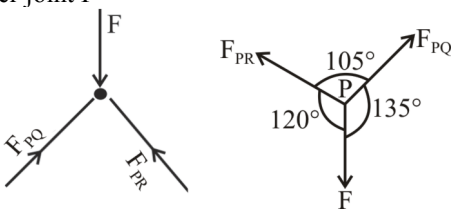
(a) 0.5 F (b) 0.63 F
(c) 0.73 F (d) 0.87 F

Assam Engg. College AP/Lect. 18.01.2021
GATE 2008
TSPSC AEE 2017

Ans. (b) : $\angle QPR = 180° - (45 + 30)$
$= 105°$



Consider joint P



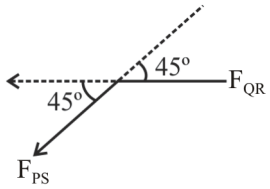
From Lami's Theorem

$$\frac{F_{PR}}{\sin 135°} = \frac{F_{PQ}}{\sin 120°} = \frac{F}{\sin 105}$$

$$F_{PQ} = \frac{F \times \sin 120°}{\sin 105°}$$

$F_{PQ} = 0.896\ F$

Consider point Q



$F_{QR} = F_{PQ} \cos 45°$
$= 0.896\ F \cos 45°$
$R_{QR} = 0.63397\ F$

381. Truss is said to be deficient, when number of members in truss are ____ than that required for perfect truss.

(a) more (b) equal to
(c) less (d) No relation

Oil India Senior Officer 23.12.2020

Ans. (c) : If number of members in truss are less than the required then it is called deficient or unperfect truss.
$[m < 2j - 3]$
where,
m = no. of members
n = number of joints
Deficient truss collapse when load is applied.

382. A mechanism converts into structure when the number of degrees of freedom is equal

(a) 0 (b) 1
(c) –1 (d) 2

UPRVUNL AE 05.07.2021

Ans. (a) : 0

383. Consider the following statements regarding types of supports and beams:

1. **When both supports of beams are roller supports, the beam is known as simply supported beam.**
2. **A beam with one end fixed and the other end free is known as fixed beam.**
3. **A beam with both ends fixed is known as cantilever beam.**
4. **A beam with one end fixed and the other simply supported is known as propped cantilever.**

Search on Telegram @apna_pdf

Which of the above statements is/are correct?

(a) 1 only (b) 1 and 4 only
(c) 1, 3 and 4 only (d) 2, 3 and 4 only

ESE 18.07.2021

Ans. (b) : The correct statements are-

- When both supports of beams are roller supports, the beam is known as simply supported beam.
- A beam with one end fixed and the other simply supported is known as propped cantilever.

Statements 2 and 3 are wrong because-

- A beam with one end fixed and other is free known as cantilever beam not fixed beam.
- Beam with both end fixed is known as fixed beam, not cantilever beam.

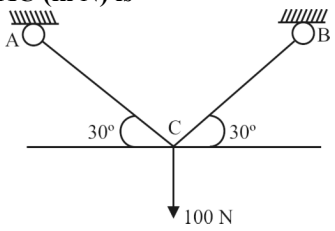
384. Mobility of a statically indeterminate structure is

(a) ≤ -1 (b) 0
(c) 1 (d) ≥ -2

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (a) : Mobility of a statically indeterminate structure is ≤ 1

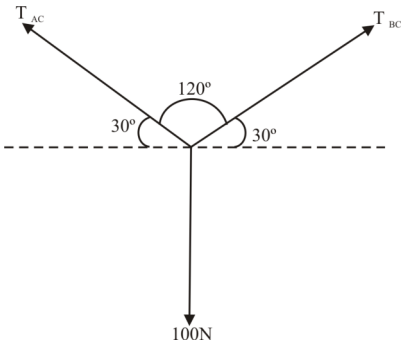
385. Two identical trusses supported a load of 100 N as shown in the figure. The length of each truss is 0.1 m; cross- sectional area is 200 mm^2, Young's modulus E=200 GPa. The force in the truss AC (in N) is



(a) 100N (b) 200N
(c) 50 N (d) 150N

PPSC Asstt. Municipal Engineer 15.06.2021
RPSC IOF & Boiler 2016
GATE 2015
RPSC IOF & Boiler 20.09.2017

Ans. (a) : By Lami's Theorem



$$\frac{T_{AC}}{\sin 120^\circ} = \frac{T_{BC}}{\sin 120^\circ} = \frac{100}{\sin 120^\circ}$$

$$T_{AC} = T_{BC} = 100N$$

386. In a truss it was found that $2j < m + 3$, where j is number of joints and m is number of member, then the truss is said to be

(a) statistically indeterminate
(b) unstable
(c) stable
(d) no such conclusion can be drawn for a truss

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) :

387. Pick the correct statement regarding analysis of forces in a truss

(a) Method of joints is used (when) as the forces at a joint are collinear
(b) Method of sections is preferred when the forces at imaginary cutting plane are non collinear
(c) Both are correct
(d) Both are wrong

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : Force analysis in a truss-

- Method of joints is used (when) as the forces at a joint are collinear.
- Method of sections is preferred when the forces at imaginary cutting plane are non collinear.

388. Which of the following is an analytical method for finding out forces in a frame?

(a) Method of pins (b) Method of frames
(c) Method of joints (d) Method of hinges

UPRVUNL AE 05.07.2021

Ans. (c) : Two analytical method for finding out forces in a frame-
(i) Method of joints
(ii) Method of section

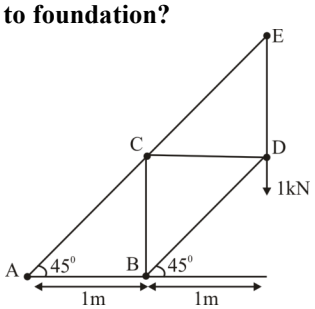
389. If $n < (2j - 3)$, where n is number of members and used in a frame structure and j is the number of joints used in the structure, then the frame is called

(a) Perfect frame (b) Deficient frame
(c) Redundant frame (d) None of the above

Gujarat PSC AE 2019
APPSC AEE Screening Test 2016

Ans : (b) : $n < (2j - 3)$ (Deficient frame)
Where, n = number of members
j = number of joints

390. What will be the axial force in the member EC, ED and DC of the plane truss (ABCDE) as shown in figure with end 'A' and 'B' is hinged to foundation?

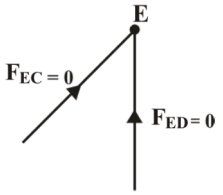


Search on Telegram @apna_pdf

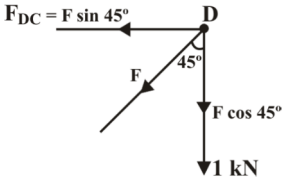
(a) $F_{EC} = F_{ED} = F_{DC} = 0$
(b) $F_{EC} = F_{ED} = 0$; $F_{DC} = 1$ kN (C)
(c) $F_{EC} = F_{ED} = 0$; $F_{DC} = 1$ kN (T)
(d) $F_{EC} = F_{ED} = F_{DC} = 1$ kN(T)
(e) $F_{EC} = F_{ED} = F_{DC} = 1$ kN (C)

CGPSC AE 25.02.2018

Ans. (c) : Point E-

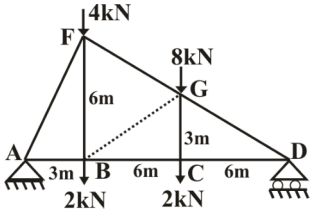


Point D-



F cos 45° = 1
F_{DC} = F sin 45°
= F cos 45°
= 1 kN (T)

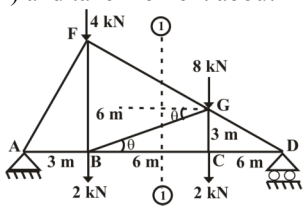
391. Determine the force in the member BG in the given truss

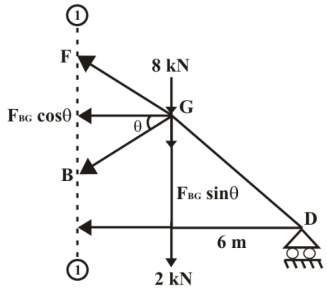


(a) 11.18 kN Tension
(b) 14.4 kN tension
(c) 11.18 kN Compression
(d) 14.40 kN compression

APPSC AEE SCREENING 17.02.2019

Ans. (c) : Take section 1 - 1 as shown in figure.
To find the force in BG, consider the right part of section (1) - (1) and take moment about 'D'.





$$\cos\theta = \frac{6}{3\sqrt{5}} = \frac{2}{\sqrt{5}}$$

$$\sin\theta = \frac{3}{3\sqrt{5}} = \frac{1}{\sqrt{5}}$$

$$\sum M_D = 0$$

$-F_{BG}\cos\theta \times 3 - F_{BG}\sin\theta \times 6 - 2 \times 6 - 8 \times 6 = 0$

$$-F_{BG} \times \frac{6}{\sqrt{5}} \times F_{BG} \times \frac{6}{\sqrt{5}} - 60 = 0$$

$$-2\left[F_{BG} \times \frac{6}{\sqrt{5}}\right] = 60$$

$$F_{BG} = -5\sqrt{5} \text{ kN (compressive)}$$

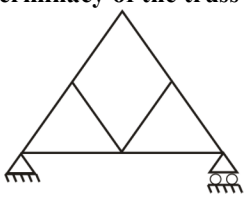
$$F_{BG} = 11.18 \text{ kN (compressive)}$$

392. A member in a truss can take
(a) axial force and bending moment
(b) only axial force
(c) only bending moment
(d) bending moment and shear force

APPSC AEE SCREENING 17.02.2019

Ans. (b) : Truss members take only axial forces (tension or compression). They cannot take shear force, bending moment and torsion.

393. Choose the correct combination of the stability and indeterminacy of the truss given.



(a) Statically indeterminate and stable
(b) Statically determinate and stable
(c) Unstable
(d) Statically determinate

APPSC AEE SCREENING 17.02.2019

Ans. (c&d) : No. of member m = 8
No. of joints, j = 6
m < 2j - 3
∴ The truss is internally unstable but determinate
∴ Both the options (c) and (d) are correct
Note- APPSC is given by answer (c) is correct.

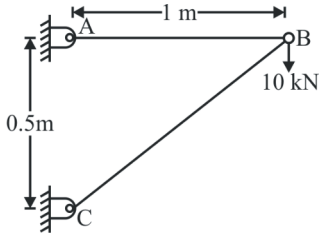
394. Regarding the ability of a truss, the condition m + r > 2j is
(a) Necessary
(b) Sufficient
(c) Necessary and Sufficient
(d) Sufficient but not necessary

APPSC AEE SCREENING 17.02.2019

Ans. (d) : Given condition
m + r > 2j
m > 2j - r
∴ The member is structurally stable but not necessarily have m > 2j - r. It is just sufficient to have
m = 2j – r
Note- APPSC is given by answer (a) is correct.

Search on Telegram @apna_pdf

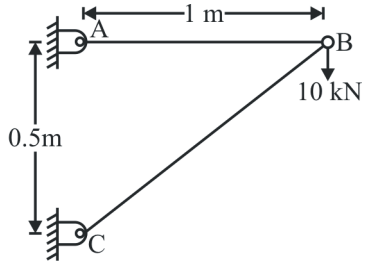
395. A two member truss ABC is configured as shown in figure. The force in the member AB is



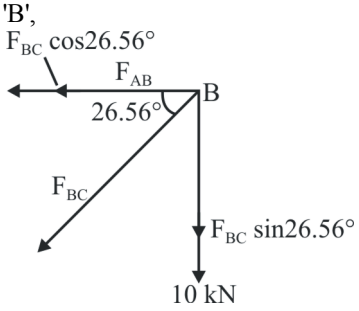
(a) 15 kN (b) 30 kN
(c) 20 kN (d) 5 kN

ISRO Scientist/Engineer 03.07.2016
UPPSC AE, Paper-I 13.12.2020

Ans. (c) :



At joint 'B',



From figure,

$$\tan\theta = \frac{0.5}{1}$$

$$\tan\theta = \frac{5}{10}$$

$$\theta = \tan^{-1}\left(\frac{1}{2}\right)$$

$$= \tan^{-1}(0.5)$$

$$\theta = 26.56°$$

$\Sigma V = 0$,

$$F_{BC} \sin 26.56 + 10 \text{ kW} = 0$$

$$F_{BC} \times 0.447 = -10$$

$$F_{BC} = -\frac{10}{0.447}$$

$F_{BC} = 22.37$ kW (Compression)

$\Sigma H = 0$,

$$F_{AB} + F_{BC} \cos(26.56) = 0$$

$$F_{AB} - 22.37 \times 0.894 = 0$$

$$F_{AB} = +22.37 \times 0.894$$

$$= +19.90 \text{ kN}$$

$F_{AB} = \approx 20$ kN (Tension)

396. For a statistically determinate plane truss, the number of unknown support reactions is

(a) two (b) three
(c) four (d) one

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (b) : For a statistically determinate plane truss, the number of unknown support reactions is three.

397. A Plane Truss has five joints and eight members. The truss is

(a) perfect (b) Redundant
(c) Deficient (d) None of the above

Karnataka PSC Lect., 27.05.2017

Ans (b) : Number of member (m) = 8
Number of joint (j) = 5
We know that,
For Redundant truss,

$$m > 2j - 3$$

$$8 > 2 \times 5 - 3$$

$$8 > 7$$

Note : $m = 2j - 3$, Perfect truss
$m > 2j - 3$, Redundant truss
$m < 2j - 3$, Deficient truss

398. If for a plane pin-jointed truss m = 2j-3 with the usual notion:

(a) It must be a just-rigid truss
(b) It may or may not be a just-rigid truss
(c) It cannot be over-rigid over any part of the truss
(d) It cannot be non-rigid over any part of the truss

UPRVUNL AE 21.08.2016

Ans. : (b) If for a plane pin-jointed truss m = 2j–3 with the usual notion it may or may not be a just rigid truss

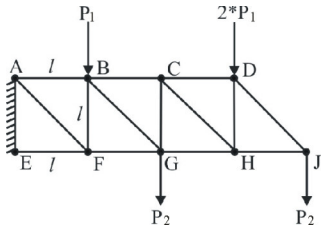
399. The maximum number of reaction components possible for a hinged support for all kinds of loading is

(a) 2 (b) 0
(c) 3 (d) 1

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Reaction components possible for hinged support = 2
Reaction components possible for fixed support = 3
Reaction components possible for roller support = 1

400. The force in member BC of steel truss structure shown in figure below is (Cross section of each member is A, Length of each member is 'ℓ')

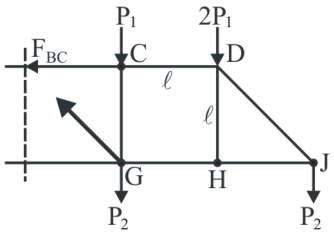


(a) $P_1 + 2P_2$ (b) $2P_1 + P_2$
(c) $2\times(P_1 + P_2)$ (d) $(P_1 + P_2)/2$

ISRO Scientist/Engineer 17.12.2017

Search on Telegram @apna_pdf

Ans. (c) :



Consider the right hand side part of the section.

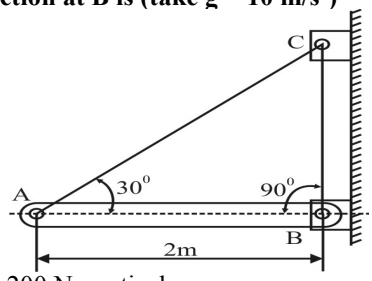
Taking moment about point G

$$F_{BC} \times \ell = 2P_1 \times \ell + P_2 \times 2\ell$$

$$F_{BC} = 2P_1 + 2P_2$$

$$F_{BC} = 2(P_1 + P_2)$$

401. The bar AB weighs 10 kg per meter and is supported by cable AC and a pin at B. Reaction at B is (take g = 10 m/s^2)



(a) 200 N, vertical
(b) 200 N, at 30^0 to horizontal
(c) 100 N vertical
(d) 100 N at 60^0 to horizontal

ISRO Scientist/Engineer 17.12.2017

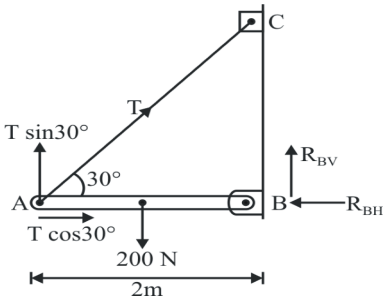
Ans. (b) : Weight of the rod

= 10 kg/m

= 10 × 10 N/m

= 100 × 2 N

= 200 N



Taking moment about point B

$$T\sin30 \times 2 - 200 \times 1 = 0$$

$$T = 200 \text{ N}$$

$\sum V = 0$

$$T\sin30° + R_{BV} - 200 = 0$$

$$200 \times \frac{1}{2} + R_{BV} - 200 = 0$$

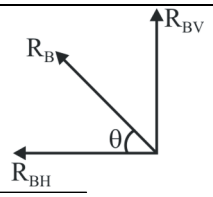
$$R_{BV} = 100 \text{ N}$$

$\sum H = 0$

$$T\cos30 - R_{BH} = 0$$

$$R_{BH} = 200 \times \frac{\sqrt{3}}{2} = 173.2 \text{ N}$$

Resultant reaction at B



$$R_B = \sqrt{R_{BV}^2 + R_{BH}^2}$$

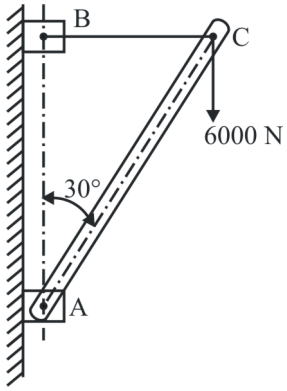
$$R_B = \sqrt{(100)^2 + (173.2)^2} = 200 \text{ N}$$

$$\theta = \tan^{-1}\left(\frac{R_{BV}}{R_{BH}}\right)$$

$$= \tan^{-1}\left(\frac{100}{173.2}\right)$$

$$= 30°$$

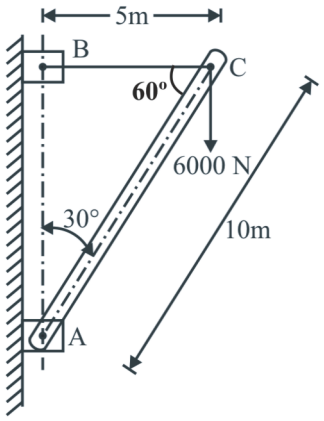
402. The bar AC, 10m long supports a load of 6000 N as shown in figure. The cable BC is horizontal and 5m long. Forces in the cable and the bar are



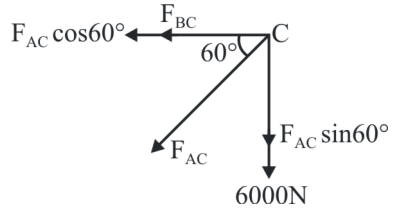
(a) 6928 N and 3464 N (b) 3464 N and 6928 N
(c) 3464 N and 3464 N (d) 6928 N and 6928 N

ISRO Scientist/Engineer 07.05.2017

Ans. (b) :



At joint 'C'–



Search on Telegram @apna_pdf

$\Sigma H = 0,$

$F_{AC}\cos 60° + F_{BC} = 0$

$F_{AC} \times \frac{1}{2} = -F_{BC}$

$F_{BC} = -\frac{F_{AC}}{2}$

$F_{AC}\sin 60° + 6000 = 0$

$F_{AC} \times \frac{\sqrt{3}}{2} + 6000 = 0$

$F_{AC} \times \frac{\sqrt{3}}{2} = -6000$

$F_{AC} = \frac{-6000 \times 2}{\sqrt{3}}$

$= -4000 \times \sqrt{3}$

$F_{AC} = -6928$ N

Bar, → $\boxed{F_{AC} = 6928 \text{ N (compression)}}$

Force is cable

$F_{BC} = -\frac{F_{AC}}{2}$

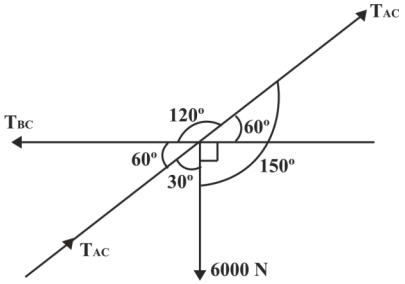
$= -\frac{(-6928)}{2}$

$= \frac{6928}{2}$

$F_{BC} = 3464$ (Tensile)

Using FBD,

Using Lami's theorem



$\frac{T_{BC}}{\sin 150} = \frac{6000}{\sin 120}$

$= \frac{T_{AC}}{\sin 90}$

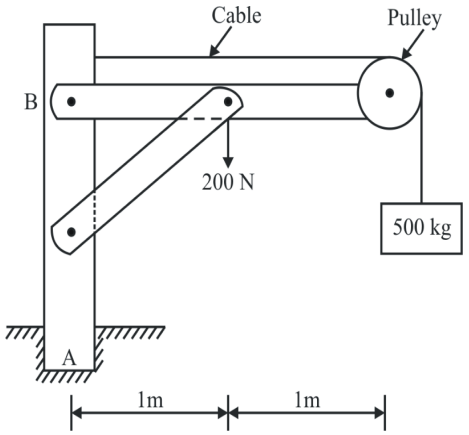
So,

$T_{AC} = \frac{6000 \times 2}{\sqrt{3}} = 6928.2N$ (compression)

$\boxed{T_{AC} = 6928.2 \text{ N (Compression)}}$

$\boxed{T_{BC} = 3464 \text{ N (Tension)}}$

403. What is the approximate reaction moment at the fixed support A for the loaded frame shown below? (Take the diameter of the pulley as 250 mm)



(a) 10010 Nm (b) 10624 Nm

(c) 9810 Nm (d) 1263 Nm

ISRO Scientist/Engineer 07.05.2017

Ans. (b) : Moment due to 500 kg weight is given as

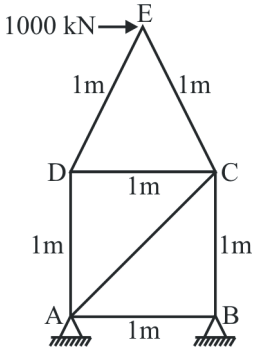
$M_1 = Mg\ (2 + 0.125)$

$M_1 = 500 \times 9.81 \times 2.125 = 10423.125$ Nm

Moment at fixed support A is given as

$M_A = M_1 + M_2 = 10423.125 + 200 = 10623.125$ Nm

404. A simple structure ABCDE is supported on a hinge at A and on rollers at B while it carries a horizontal force of 1000 kN at E as shown in the figure. Determine the force in member AC using the method of joints.

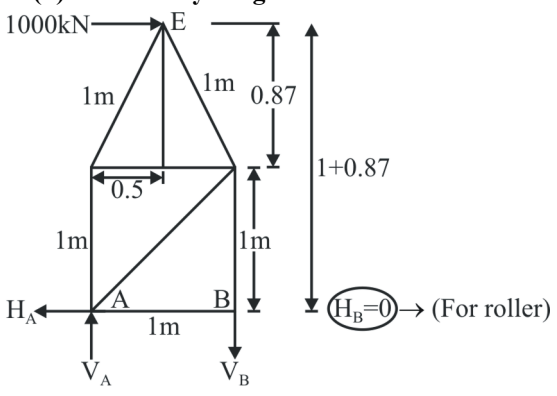


(a) 1500 kN (b) 1400 kN

(c) 1314 kN (d) 1414 kN

ISRO Scientist/Engineer 11.10.2015

Ans. (d) : Free Body Diagram–



Search on Telegram @apna_pdf

Finding reactions at A and B

$H_A = 1000$ kN

[Resolving forces horizontally]

Taking moment of all forces about "A".

$(\circlearrowleft)V_B \times 1 = 1000 \times 1.87\ (\circlearrowright)$

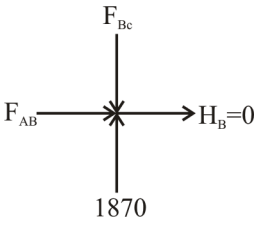
(A.C.W.) (C.W.)

$V_B = 1870$ kN

Since $V_A = V_B$

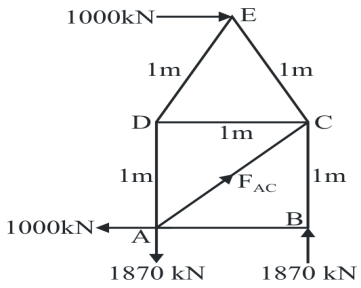
$V_A = -1870$ kN

At joint 'B'

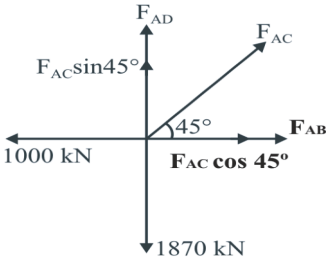


For roller support at B, $H_B = 0$

So, $F_{AB} = H_B = 0$



Considering Joint 'A'–



Resolving Forces Vertically–

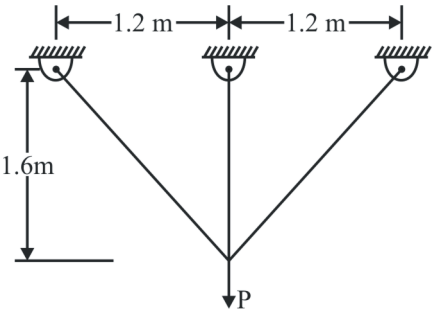
$F_{AC} \sin 45° + F_{AD} = 1870$ .....(i)

Resolving forces horizontally

$F_{AB} + F_{AC} \cos 45° = 1000$ .....(ii)

$$F_{AC} = \frac{1000}{\cos 45°} = 1414 \text{ kN}$$

405. A three bar truss to resist a service load P = 100 kN is shown in the figure. Use a load factor of 2 and consider all three members to have equal cross-sectional areas. The yield stress of the material of which the members are fabricated is 400 MPa. The area of cross section of each truss member is

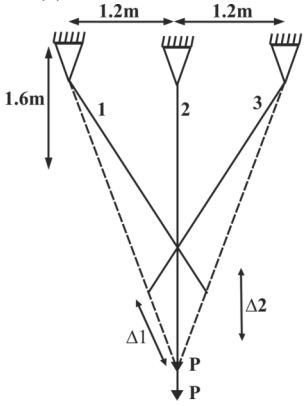


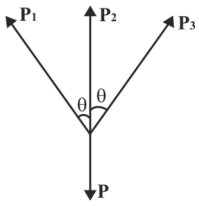
(a) $\frac{25}{26} cm^2$ (b) $\frac{26}{25} cm^2$

(c) $\frac{25}{13} cm^2$ (d) $\frac{13}{25} cm^2$

ISRO Scientist/Engineer 24.05.2014

Ans. (c) :





Equilibrium Equation

$2P_1 \cos\theta + P_2 = P$ ...(1)

Length of truss members 1 & 3

$= \sqrt{(1.2)^2 + (1.6)^2}$

$= 2$ m

$$\cos\theta = \frac{1.6}{2} = \frac{4}{5} = 0.8$$

Compatibility equation-

$\Delta_2 = \Delta_1 \cos\theta$

or $$\frac{P_2 L_2}{A_2 E_2} = \frac{P_1 L_1}{A_1 E_1} \cos\theta$$

or $$\frac{P_2}{P_1} = \frac{A_2 E_2}{A_1 E_1} \times \frac{L_1}{L_2} \cos\theta$$

$$\frac{P_2}{P_1} = \frac{1.6}{2} \times \frac{4}{5} = 0.64 \qquad [\because A_1 = A_2, E_1 = E_2]$$

From equation (1)

$2 \times P_1 \times 0.8 + P_2 = 100$

or $1.6P_1 + 0.64 \times P_1 = 100$

or $P_1 = 44.64$ kN

or $P_2 = 0.64 \times P_1 = 28.57$ kN

$$\text{Allowable stress} = \frac{\text{Permissible Stress}}{\text{FOS}}$$

Search on Telegram @apna_pdf

$= \frac{400}{2} = 200\,\text{MPa}$

Cross section area $A_1 = \frac{28.57 \times 10^3}{200}$

$= 142.85\ \text{mm}^2$

$= 1.42\ \text{cm}^2$

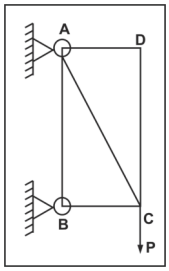
Cross-section area $A_2 = \frac{44.64 \times 10^3}{200}$

$= 223.2\ \text{mm}^2$

$= 2.23\ \text{cm}^2$

Nearest answer is $\frac{25}{13}\text{cm}^2$.

406. The stress in the rod AB in the pin jointed truss ABCD is

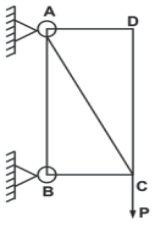


(a) $2P/\pi d^2$ (b) $4P/\pi d^2$

(c) 0 (d) $P/2\pi d^2$

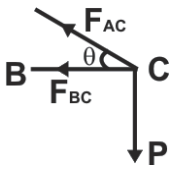
ISRO Scientist/Engineer 2012

Ans. (b) :



"Force in section AD and DC = 0. According to the given conditions. Since no external force acts on joint at 'D'."

Joint 'C'



$\therefore$ $F_{AC} \sin\theta = P$

At a point A

$F_{AB} = -F_{AC} \sin\theta$

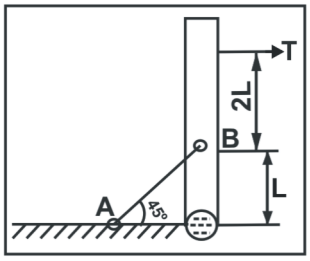
$F_{AB} = -P$

$\therefore$ $Stress = \frac{-P}{\frac{\pi d^2}{4}} = \frac{-4P}{\pi d^2}$

$= \frac{-4P}{\pi d^2}$

[$\because$ Negative sign shows compressible stress]

407. A plate is held by a chain AB through hinge joints. The plate is pulled with a force T as shown in figure. The tension in the chain is given by

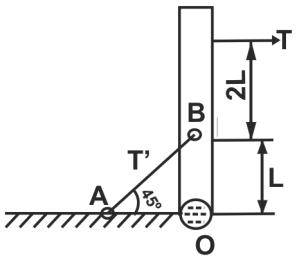


(a) $(\sqrt{3}/2)T$ (b) $(\sqrt{2}/3)T$

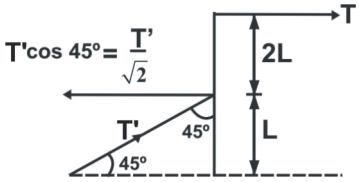
(c) T/2 (d) $3\sqrt{2}\,T$

ISRO Scientist/Engineer 2012

Ans. (d) :



Taking moment about O



$\frac{T'}{\sqrt{2}} \times L = T \times 3L$

$\therefore$ $T' = 3\sqrt{2}T$

408. Which one of the following is the wrong assumption:

(a) Members of the truss are pin-connected to each other

(b) Members of the truss are rigid

(c) Members of the truss are subjected to bending moments

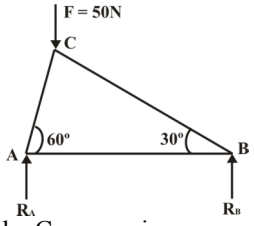
(d) Members are of uniform cross-section

TNPSC AE 2013

Ans. (c) : Members of the truss are not subjected to bending moments.

409. Determine the nature of force in member AB and AC respectively of the truss shown in figure. A is hinge support and B is roller support. The direction of reaction at supports (R_A and R_B) is also shown. Load 50N is acting at joint C.

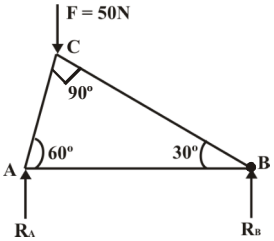
Search on Telegram @apna_pdf



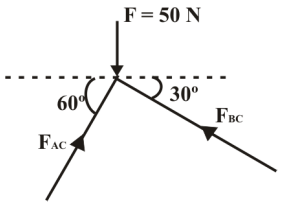
(a) Tensile, Compression
(b) Compression, Compression
(c) Tensile, Tensile
(d) Compression, Tensile

UPRVUNL AE 07.10.2016

Ans. (a) :



Joint-C



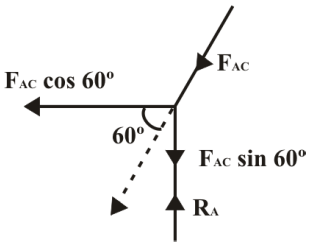
From Lami's theorem

$$\frac{F}{\sin 90} = \frac{F_{AC}}{\sin 120} = \frac{F_{BC}}{\sin 150}$$

$$F_{AC} = 50 \times \sin 120$$

$$\Rightarrow \boxed{F_{AC} = 43.3\ N}\ (Compressive)$$

Joint-A



Then,

$F_{AB} = F_{AC} \cos 60$

$= 43.3 \times \cos 60$

$F_{AB} = 21.65$ N (Tensile)

$R_A = 37.498$ N

410. In the joint method of plane truss analysis, value of forces in the member of truss can be found only when joint has:

(a) Only four unknown force members
(b) Only three unknown force members
(c) Not more than two unknown force members
(d) Any number of unknown force members

UPRVUNL AE 07.10.2016

Ans. (c) : In the joint method of plane truss analysis, value of forces in the member of truss can be found out when joint has not more than two unknown force members.

411. Which method is not there to analysing the trusses?

(a) Graphical Method (b) Analytical Method
(c) Method of Joints (d) Method of Sections

TNPSC AE 2013

Ans. (b) : Analytical method is not to analysing the trusses where as graphical method, joints method and method of sections are used to analysing the trusses.

412. For a perfect frame having 13 members, the number of joints must be :

(a) 6 (b) 8
(c) 10 (d) 13

OPSC Civil Services Pre. 2011

Ans. (b) : Given, $m = 13$

$m = 2J - 3$

$13 = 2J - 3 \Rightarrow \boxed{J = 8}$

413. In method of section, the section must pass through not more than members.

(a) 3 (b) 4
(c) 5 (d) 2

OPSC Civil Services Pre. 2011

Ans. (a) : In method of section, the section must pass through not more than 3 members.

414. Which of the following equilibrium equation should be satisfied by the joints in truss:-

(a) $\sum H = 0, \sum M = 0$
(b) $\sum H = 0, \sum V = 0$
(c) $\sum V = 0, \sum M = 0$
(d) $\sum H = 0, \sum V = 0$ and $\sum M = 0$

UKPSC AE-2013, Paper-I

Ans. (b) : No bending moment acting on the joints in truss so equilibrium equation should be satisfied by the joints in truss will be,

$\Sigma H = 0, \Sigma V = 0$

415. Choose the correct relationship between the given statements of Assertion (A) and Reason (R).

Assertion (A) : Only axial forces act in members of roof trusses.

Reason (R) : Truss members are welded together.

Code :

(a) Both (A) & (R) are correct. (R) is the correct explanation of (A).
(b) Both (A) & (R) are correct. (R) is not the correct explanation of (A).
(c) (A) is true, but (R) is false.
(d) (A) is false, but (R) is true.

UKPSC AE 2012 Paper-I

Ans. (c) : (A) is true, but (R) is false.

416. In the analysis of truss, the force system acting at each pin

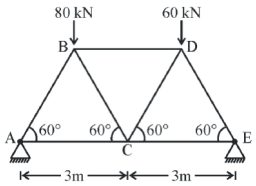
(a) is concurrent but not coplanar.
(b) is coplanar and concurrent.
(c) is coplanar and non-concurrent.
(d) does not satisfy rotational equilibrium.

UKPSC AE 2012 Paper-I

Ans. (b) : is coplanar and concurrent.

Search on Telegram @apna_pdf

417. For truss as shown below, the forces in the member AB and AC are



(a) Tensile in each
(b) Compressive in each
(c) Compressive and Tensile respectively
(d) Tensile and Compressive respectively

UKPSC AE 2012 Paper-I

Ans. (c) : Compressive and Tensile respectively

418. The possible loading in various members framed structure are

(a) Buckling or shear
(b) Compression or tension
(c) Shear or tension
(d) Bending

UPPSC AE 12.04.2016 Paper-I

Ans : (b) The possible loading in various members framed structure are compression or tension.

419. A truss hinged at one end, supported on rollers at the other, is subjected to horizontal load only. Its reaction at the hinged end will be:

(a) Horizontal
(b) Vertical
(c) Resultant of horizontal and vertical
(d) Difference between horizontal and vertical

TRB Polytechnic Lecturer 2017

Ans. (c) : Its reaction at the hinged end will be resultant of horizontal and vertical.

$$R = \sqrt{(\Delta H)^2 + (\Delta V)^2}$$

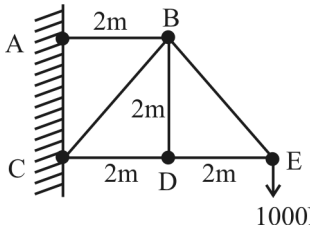
420. The force which is not considered in the analysis of the truss is

(a) External applied loads
(b) Horizontal forces on joints
(c) Vertical forces joints
(d) Support reactions
(e) Weight of the members

CGPSC AE 26.04.2014 Shift-I

Ans. (e) : Assumption for a perfect truss
(i) All the members of truss are straight and connected to each other at their ends by frictionless pins.
(ii) All external forces are acting only at pins.
(iii) All the members are assumed to be weightless.
(iv) All the members of truss and external forces acting at pins lies in same plane.
(v) Static equilibrium condition is applicable for analysis of perfect truss.

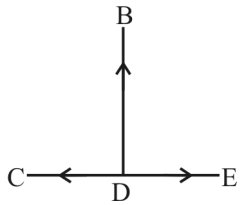
421. The force in the bar BD of the truss shown in figure is



(a) 1000 N
(b) – 1000 N
(c) 500 N
(d) 0 N

OPSC Civil Services Pre 2006

Ans. (d) :



Apply method of joint At D
$F_{DE} = F_{DC}$ Horizontal force (collinear force)
$F_{BD} = 0$ vertical force
Note- When three forces passing through a point and two of them collinear then in third member force is zero.

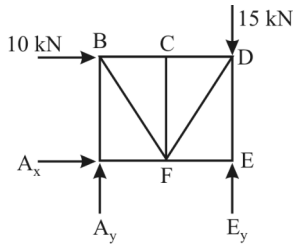
422. A truss (with j = number of - joints, m-number of members) is said to be deficient if.

(a) m – 2 j – 3
(b) m > 2j – 3
(c) m < 2j – 3
(d) j – 2m – 3

GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : for truss
m = 2j – 3 – for stable
m < 2j – 3 – for unstable or deficient
m > 2j – 3 – for redundant

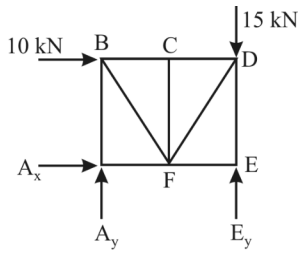
423. In the truss shown in figure, the zero force member (s) is/are



(a) CF only
(b) CF and EF
(c) AB only
(d) BF and EF

DRDO Scientists 2009

Ans. (b) :



Search on Telegram @apna_pdf

$A_y+E_y = 15$

$A_x+10 = 0$

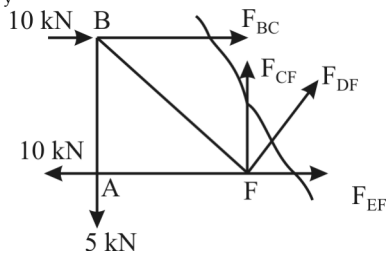
$A_x = -10kN$

$\Sigma M_A = 0$

$-10\times1-15\times2+E_y\times2 = 0$

$E_y = 20kN$

$A_y = -5kN$



$\Sigma F_x = 0,\ F_{BC}+F_{EF}+\frac{F_{DF}}{\sqrt{2}} = 0$

$\Sigma M_B = 0,$

$-10\times1+F_{DF}\times\sqrt{2}+F_{CF}\times1+F_{EF}\times1 = 0$

$\Sigma F_y = 0,\ F_{CF}+\frac{F_{DF}}{\sqrt{2}} = 5$

$\Sigma M_A = 0,$

$-10\times1-F_{BC}\times1+5\times1 = 0$

$F_{BC} = -5kN$

Now, we have

$$F_{CF}+\frac{F_{DF}}{\sqrt{2}} = 5$$

$$F_{CF}+\frac{F_{DF}}{\sqrt{2}} = 5$$

From these two equation,

$F_{CF} = F_{EF}$

CF is zero force member, so CF and EF is zero force member.

424. A plane truss has five joints and six members. The truss is

(a) Perfect (b) Redundant

(c) Deficient (d) None of these

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : Given,

$m = 6,\quad j = 5$

$m = 2j - 3$

$6 < 10 - 3$

$6 < 7$

$m < 2j - 3 \rightarrow$ Deficient truss

425. A member under tension is called

(a) strut (b) tie

(c) strut-tie (d) column

APPSC AEE 2012

Ans. (b) : Tension members are also known as tie members or simply a tie. Tension members are designed as structural members that are subjected to tensile force in direction which is parallel to its longitudinal axis.

426. Hinge support is not capable of resisting

(a) horizontal force

(b) moment

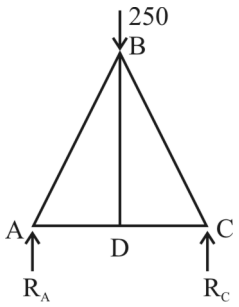
(c) vertical force

(d) both horizontal and vertical forces

DRDO Scientists 2008

Ans. (b) : Hinge support is not capable of resisting moment.

427. The axial force in the member BD of a steel truss shown in figure is



(a) 250 kN

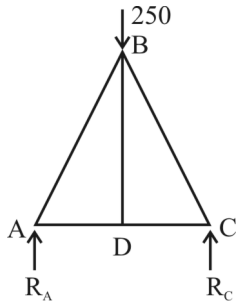
(b) –250 kN

(c) 0

(d) 125 kN

DRDO Scientists 2008

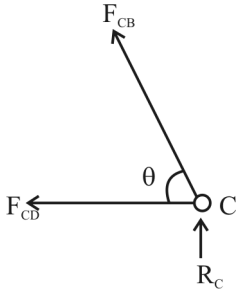
Ans. (c) :



$R_A + R_C = 250$

$R_A = R_C\ (\Sigma M_D = 0)$

$R_A = R_C = 125$ kN



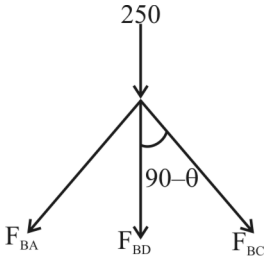
$F_{CB}\sin\theta = -R_C$

$$F_{CB} = -\frac{125}{2}\times\sqrt{20}$$

Search on Telegram @apna_pdf

$$\sin\theta = \frac{2}{\sqrt{4^2+2^2}} = \frac{2}{\sqrt{20}}$$

$$F_{AB} = -\frac{125\sqrt{20}}{2}$$



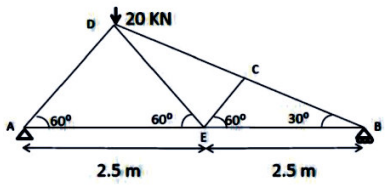
$2\,F_{BC}\sin\theta + F_{BD} = 250$

$$2\times\frac{125\sqrt{20}}{2}\times\frac{2}{\sqrt{20}} + F_{BC} = 250$$

$F_{BD} = 0$

BD is zero force member.

428. The axial forces in the members CE and DE of the plane truss shown in the figure below are equal to

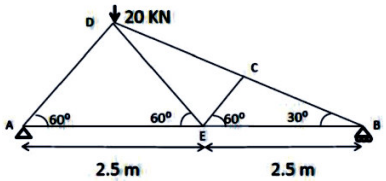


(a) 10, 10 in KN (b) 20, 20 in KN

(c) 8.7, 8.7 KN (d) 0, 0

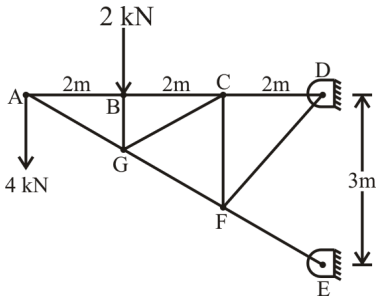
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : As we know, forced is transferred to A & B



So, there is no, Axial force on CE & DE.

429. Calculate the forces in the members CG and CF for the truss shown.



(a) $F_{CG} = \sqrt{5}\,kN, F_{CF} = 1\,kN$

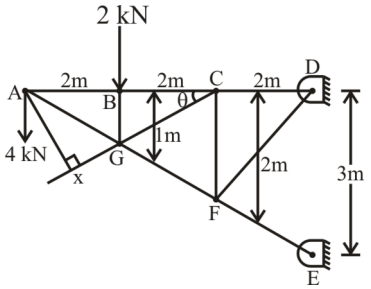
(b) $F_{CG} = \sqrt{3}\,kN, F_{CF} = 2\,kN$

(c) $F_{CG} = 2\,kN, F_{CF} = \sqrt{3}\,kN$

(d) $F_{CG} = \sqrt{5}\,kN, F_{CF} = 2\,kN$

ISRO Scientist/Engineer (RAC) 12.01.2020

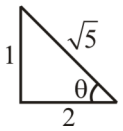
Ans. (a) :

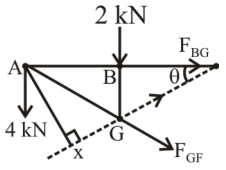


$\sum M_A = 0$

$2 \times 2 = F_{CG} \times AX$

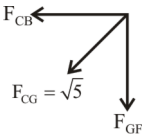
In ΔBGC $\tan\theta = \frac{1}{2}$





So $\sin\theta = \frac{1}{\sqrt{5}}$

In ΔAXC, $AX = AC\sin\theta = 4\times\frac{4}{\sqrt{5}}$



$$F_{CG} = \frac{2\times 2}{AX}$$

$F_{GF} = F_{CG}\sin\theta$

$= \sqrt{5}\times\frac{1}{\sqrt{5}} = 1\,kN = 1kN$

430. A truss having 5 joints and 7 members is termed as ..... truss.

(a) perfect (b) imperfect or deficient

(c) redundant (d) none of these

(HPPSC POLY. LECT. 2016)

Ans : (a) Perfect frame or truss:-

M = 2J - 3

M = No of member

J = No of Joints.

Given data

M = 7

J = 5

M = 2J - 3

7 = 2 × 5 - 3

LHS = RHS

A truss having 5 Joints and 7 member is termed as perfect frame.

Search on Telegram @apna_pdf

6. Kinematics and Kinetics of Particles & Rigid Body

431. A car moving with uniform acceleration covers 450 meter in first 5 second interval and covers 700 meters in next 5 second interval. The acceleration of the car is–

(a) 7 m/sec^2 (b) 50 m/sec^2
(c) 25 m/sec^2 (d) 10 m/sec^2

OPSC Civil Services Pre. 2011
TSPSC Managers, 2015
ISRO Scientist/Engineer 2007
HPPSC LECT. 2016
TSPSC AEE 2017
GATE 1998
ISRO Scientist/Engineer 2010

Ans. (d) : Let, the car travels with the initial velocity u and acceleration a.
Considering case-1
When displacement (s) = 450 m and time taken
t = 5 seconds
The displacement

$$s = ut + \frac{1}{2}at^2$$

$$450 = u \times 5 + \frac{1}{2}at^2 .....(i)$$

Considering case-2
When displacement (S) = 450+700 = 1150m
t = 10 seconds

$$1150 = u \times 10 + \frac{1}{2}a \times 10^2 ....(ii)$$

By solving equation (i) and (ii) we get,

$$\boxed{a = 10\,m/sec^2}$$

432. Center of percussion is a point at which

(a) total weight of the body acts
(b) center of mass acts
(c) resultant force of buoyancy acts
(d) if a blow is given, no reaction is felt at the point of suspension of the body

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : if a blow is given, no reaction is felt at the point of suspension of the body

433. The statement "The Impressed forces acting on anybody are in dynamic equilibrium with the inertia forces of the particles of the body" is related to

(a) Impulse momentum principle
(b) theorem of transmissibility of forces
(c) Lami's theorem
(d) D'Alembert's principle

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : The Impressed forces acting on any body are in dynamic equilibrium with the inertia forces of the particles of the body is related to D'Alembert's principle.

434. The acceleration of a body can be found from

(a) Area under velocity time graph
(b) slope of velocity time graph
(c) area under distance time graph
(d) slope of distance time graph

GPSC DEE, Class-2 (GWSSB) 04.07.2021

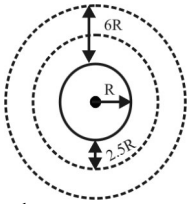
Ans. (b) : $a = \frac{dv}{dt}$
a= slope of velocity time graph

435. A geostationary satellite is orbiting the earth at a height of 6R above the surface of the earth; R being the radius of the earth. What will be the time period of another satellite at a height of 2.5R from the surface of the earth?

(a) $\frac{6}{\sqrt{2}}$ hr (b) $6\sqrt{3}$ hr
(c) $6\sqrt{3}$ hr (d) $6\sqrt{2}$ hr

WBPSC AE 2003

Ans. (d) :



From the Kepler's 3rd law.

$$T^2 \propto r^3$$

$$T_1^2 \propto r_1^3; \quad T_2^2 \propto r_2^3$$

$r_1 = 6R + R = 7R$ $\quad r_2 = 2.5R + R = 3.5R$

$$\left(\frac{T_1}{T_2}\right)^2 = \left(\frac{r_1}{r_2}\right)^3$$

$$\frac{T_1}{T_2} = \left(\frac{r_1}{r_2}\right)^{3/2}$$

$$\frac{T_1}{T_2} = \left(\frac{7R}{3.5R}\right)^{3/2} = (2)^{3/2} = 2\sqrt{2}\text{ hours}$$

T_1 = 24 hours (Geostationary satellite time period)
= earth time period

$$T_2 = \frac{T_1}{2\sqrt{2}} = \frac{24 \times \sqrt{2}}{2\sqrt{2} \times \sqrt{2}} = \frac{24 \times \sqrt{2}}{4}$$

$$\boxed{T_2 = 6\sqrt{2}hr}$$

436. If a body is moving with a uniform acceleration (a), then the final velocity (v) of the body after time (t) is equal to

(a) $ut + \frac{1}{2}at^2$ (b) $u + at$
(c) $u^2 + 2as$ (d) none of these

Where u = initial velocity
s = distance travelled in t seconds

TNPSC AE, 2008

Ans. (b) : Final velocity (v) = u + at
Where, a = uniform acceleration
t = time

Search on Telegram @apna_pdf

437. The displacement of a particle undergoing rectilinear motion along the x-axis is given by $t^3 - 21t^2 + 60t$ meters. The acceleration of the particle, when its velocity is zero will be :

(a) $-18\ m/s^2$ (b) $36\ m/s^2$
(c) $9\ m/s^2$ (d) $-9\ m/s^2$

J&K PSC Civil Services Pre, 2013

Ans. (*) : $x = t^3 - 21t^2 + 60t$

velocity $\frac{dx}{dt} = 3t^2 - 42t + 60 = 0$

$t_1 = 12.38$ and $t_2 = 1.614$ for zero velocity

Acceleration $\left(\frac{d^2x}{dt^2}\right) = 6t - 42$

Acceleration at t = 12.38, $a = 32.28\ m/s^2$

t = 1.614, $a = -32.28\ m/s^2$

$a = \pm 32.28\ m/s^2$

438. When a particle moves with a uniform velocity along a circular path, then the particle has

(a) tangential acceleration only
(b) centripetal acceleration only
(c) both (a) and (b)
(d) None of the above

APPSC Poly. Lect. 2013
TNPSC AE 2013

Ans. (b) : When a particle moves, with a uniform velocity along a circular path, then there will be no tangential acceleration, but it will have only centripetal acceleration (a_c).

$$a_c = \frac{V^2}{r} = \omega^2 . r$$

439. Which of the following disciplines provide study of inertia forces arising from the combined effect of the mass and the motion of the parts?

(a) Applied mechanics (b) Kinematics
(c) Kinetics (d) Theory of machines

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (c) Kinetics- It is the discipline of Engineering Mechanics which provide study of inertia forces arising from the combined effect of the mass and the motion of the parts.

440. A particle moving with an acceleration of $6m/s^2$ covers 40 m during 5th second of its journey. What was the initial velocity of particle?

(a) 10 m/s (b) 11 m/s
(c) 12 m/s (d) 13 m/s

APPSC Poly Lect. 13.03.2020

Ans. (d) : Given data : Acceleration (a) = $6\ m/s^2$
distance (s) = 40 m
n = 5
We know that, distance covered in n^{th} second

$\because\ s = u + \frac{1}{2}a(2n-1)$ Let, u = initial velocity

$\Rightarrow 40 = u + \frac{1}{2} \times 6 \times (2 \times 5 - 1)$

$\Rightarrow 40 = u + 3 \times 9$

$u = 40 - 27$

$\boxed{u = 13\ m/sec}$

441. A motorist is driving at 25 m/s on the curved road of radius 500 m. He suddenly applies the brakes and that causes the speed to decrease to 15 m/s at the constant rate in 10 seconds. What will be the tangential component (a_t) and the normal component (a_n) of acceleration immediately after the application of brakes?

(a) $a_t = -1 m/s^2,\ a_n = 1 m/s^2$
(b) $a_t = -1 m/s^2,\ a_n = 1.25 m/s^2$
(c) $a_t = -1.25\ m/s^2,\ a_n = 1 m/s^2$
(d) $a_t = -1.25\ m/s^2,\ a_n = 2\ m/s^2$

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given data :
Velocity (v) = 25 m/s
Radius of curved road (r) = 500 m

Normal component of acceleration $(a_n) = \frac{v^2}{r}$

$\Rightarrow a_n = \frac{(25)^2}{500} = \frac{625}{500} = \frac{25}{20}$

$\Rightarrow a_n = \frac{25}{20} = \frac{5}{4} = 1.25 m/s^2$

$\boxed{a_n = 1.25\ m/s^2}$

And, Tangential component of acceleration $(a^t) = \frac{\Delta v}{\Delta t}$

Given, $v_2 = 15$ m/s
$v_1 = 25$ m/s
t = 10 sec.

$a_t = \frac{v_2 - v_1}{\Delta t}$

$= \frac{15 - 25}{10} = \frac{-10}{10} = -1\ m/s^2$

$\Rightarrow \boxed{a_t = -1\ m/s^2}$

442. The time variation of the position of a particle in rectilinear motion is given by $x = 2t^3 + t^2 + 2t$. If 'V' is the velocity and 'a' acceleration of the particle in consistent units the motion started with

(a) V = 0, a = 0 (b) V = 0, a = 2
(c) V = 2, a = 0 (d) V = 2, a = 2

TSPSC AEE 2017
GATE 2005

Ans. (d) : $x = 2t^3 + t^2 + 2t$

$v = \frac{dx}{dt} = 6t^2 + 2t + 2$

$v_{t=0} = 2 m/s, \qquad a = \frac{dv}{dt} = 12t + 2$

$a_{t=0} = 2 m/s^2$

443. Area under the acceleration - time graph provides _____.

(a) the net change in displacement
(b) the net change in acceleration
(c) the net change in velocity
(d) the net work done

VIZAG Steel MT 24.01.2021, Shift-I

Search on Telegram @apna_pdf

Ans. (c) : The area under acceleration time graph gives the change in velocity.

Deceleration, $a = \frac{\Delta V}{\Delta t}$

Area between acceleration-time graph gives,

$$a \times \Delta t = \frac{\Delta V}{\Delta t} \times \Delta t = \Delta V$$

444. A body is moving with a velocity of 2 m/s. After 4 seconds, the velocity of the body becomes 5 m/s. The acceleration of the body is

(a) 0.55 m/s^2 (b) 0.65 m/s^2
(c) 0.75 m/s^2 (d) 0.45 m/s^2

ESE 18.07.2021

Ans. (c) :

$V_i = 2$ m/s
$V_f = 5$ m/s
$\Delta t = 4$ sec

$$\text{Acceleration} = \frac{\Delta V}{\Delta t} = \frac{5-2}{4} = \frac{3}{4} = 0.75\,\text{m/s}^2$$

445. A particle starts with an initial velocity of 200 cm/s and moves with a uniform retardation of 10 cm/s2. If it describes 1500 cm in time t, what is/are the possible value(s) of t?

(a) 10 sec only
(b) 10 sec and 30 sec
(c) 30 sec only
(d) 5 sec and 10 sec

ESE 18.07.2021

Ans. (b) : Given, $u = 200$ cm/s
$g = -10$ cm/s^2
$S = 1500$ cm

from second equation of motion-

$$S = ut + \frac{1}{2}gt^2$$

$\Rightarrow$ $t^2 - 40t + 300 = 0$
$t^2 - 30t - 10t + 300 = 0$
$t(t-30) - 10(t-30) = 0$
$(t-10)(t-30) = 0$
$t = 10$ sec. & $t = 30$ sec.

446. _____ is a scalar quantity

(a) velocity (b) force
(c) speed (d) Acceleration

UPRVUNL AE 05.07.2021

Ans. (c) : Speed is a scalar quantity.

447. A disc of radius 30 cm is rolling without slip with angular velocity of 10 rad/s on a horizontal surface. Which of the following statements is NOT true?

(a) Linear velocity of all the points is different
(b) Speed of all the points is different
(c) Acceleration of all the points is different
(d) Linear velocity of the point touching the horizontal surface is zero

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : Speed of all the points is different.

448. A 60 kg man is weighed by a balance as 54 kg in a lift which is accelerated downwards. The acceleration of the lift is

(a) 1.26 m/s^2 (b) 1.98 m/s^2
(c) 0.98 m/s^2 (d) 1.76 m/s^2

UPPSC AE 13.12.2020, Paper-I

Ans. (c) : $M_{eff}\, g = M(g - a)$

$$\frac{M_{eff}}{M} = \frac{g-a}{g}$$

$$\frac{54}{60} = 1 - \frac{a}{g}$$

$g = 10\,a$

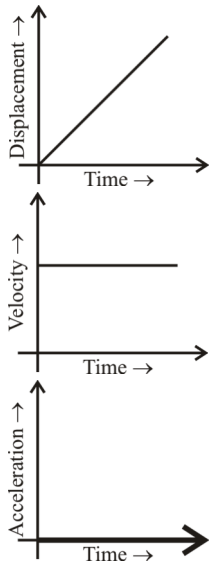
$$a = \frac{g}{10} = 0.98\,\text{m/s}^2$$

449. Which of the following statements is true, if a body moves with uniform velocity?

(a) Body covers equal distance in equal interval of velocity
(b) Body covers equal distance in equal interval of time
(c) Body covers equal distance in equal interval of speed
(d) Body covers equal distance in equal interval of acceleration

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : When the motion of a body is in such a way that it has equal displacement in equal intervals of time. The body is said to be in uniform velocity and the velocity of the particle is simply the ratio of the displacement in the given time interval to time interval.



450. If a slab A having linear velocity v rotates with an angular velocity ω about an instantaneous centre C, then what will be the distance (r) of the slab A from the centre C?

(a) $\omega = v_A + r$ (b) $v_A = r/\omega$
(c) $r = \omega/v_A$ (d) $r = v_A/\omega$

APPSC Poly Lect. Automobile Engg., 2020

Search on Telegram @apna_pdf

Ans. (d) : Linear velocity (v) with an angular velocity (ω) then we know that

$v = r\omega$

$v_A = r\omega$

$\boxed{r = v_A / \omega}$

451. An object of 30 kg is moved with a velocity of 2 m/s on horizontal smooth surface. What is the velocity of block for 4 sec, if force of 40 N is applied on it in the direction of force ?

(a) 2 m/s (b) 4.6 m/s
(c) 7.33 m/s (d) 9.33 m/s

APGCL AM, 2021

Ans. (c) :

Given:-

$m = 30$ kg
$V_1 = 2$m/sec
$t = 4$sec
$F = 40$N
$V_2 = ?$

Force (F) = ma

$$F = \frac{mdv}{dt}$$

$$40 = 30 \times \frac{(V_2 - V_1)}{t - 0}$$

$$40 = 30 \times \frac{(V_2 - 2)}{4}$$

$$V_2 - 2 = \frac{160}{30}$$

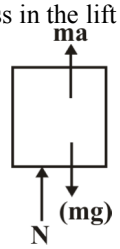
$V_2 = 5.33 + 2 = 7.33$ m/sec

452. A body exerts a force of 1 kN on the floor of the lift which moves upward with a retardation of 1.5 m/s^2. What is the mass of the body, in kg, carried in the lift?

(a) 120.33 (b) 101.94
(c) 88.42 (d) 77.32

APPSC AEE SCREENING 17.02.2019

Ans. (a) : FBD of mass in the lift



N = normal reaction between lift and mass

$\sum F_{net} = 0$

(N - mg) = m(-a) (-a = retardation)

$1\times10^3 = m(g - a)$

$1\times10^3 = m(9.81 - 1.5)$

$$m = \frac{1\times10^3}{(9.81 - 1.5)} = 120.33\ kg$$

453. A particle move along a straight line such that distance (x) traversal in t seconds is given by x = t^2 (t - 4), the acceleration of the particle will be given by the equation

(a) $3t^3 - 2t$ (b) $3t^2 + 2t$
(c) 6t - 8 (d) 6t - 4

TNPSC AE 2018

Ans. (c) $x = t^2 (t - 4)$

$$\frac{dx}{dt} = \vec{V} = 3t^2 - 8t$$

$$\frac{d^2x}{dt^2} = \frac{dV}{dt} = \vec{a} = 6t - 8$$

454. A motor car moving at a certain speed takes a left turn in a curved path. If the engine rotates in the same direction as that of wheels, then due to the centrifugal forces

(a) the reaction on the inner wheels increases and on the outer wheels decreases
(b) the reaction on the outer wheels increases and on the inner wheels decreases
(c) the reaction on the front wheels increases and on the rear wheels decreases
(d) the reaction on the rear wheels increases and on the front wheels decreases

RPSC Vice Principal ITI 2018

Ans. (b) : The reaction on the outer wheels increases and on the inner wheels decreases.

455. The motion of the particle is defined as x = t^3 + t –5, where 'x' is the displacement in meter and 't' is time in sec. Find the velocity and acceleration at 5 sec.

(a) 47 m/s, 30 m/s^2 (b) 25 m/s, 50 m/s^2
(c) 70 m/s, 60 m/s^2 (d) 76 m/s, 30 m/s^2

Oil India Limited Sr. Engineer (Production) 30.11.2019

Ans. (d) : Given,

Motion of particle (x) = $t^3 + t - 5$

Where x → displacement

T → time

$$\therefore \frac{dx}{dt} = 3t^2 + 1$$

Velocity (V) $\frac{dx}{dt} = 3t^2 + 1 \Rightarrow$ V/t =5sec.=$3\times5^2+1$=76 m/s

Or $\frac{d^2x}{dt^2} = 6t$

Acceleration $(a) = \frac{d^2x}{dt^2} = 6t$

Acceleration at t = 5 sec

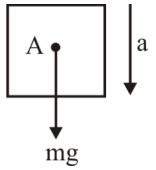
$= 6 \times 5 = 30 m/s^2$

456. The free fall of a body is referred as:

(a) Uniform motion
(b) Uniformly accelerated motion
(c) Curvilinear motion
(d) Non- uniformly accelerated motion

Oil India Limited Sr. Engineer (Production) 30.11.2019

Ans. (b) :



Search on Telegram @apna_pdf

Free fall of a body under gravity is referred as uniformly accelerated motion.
Assume body A of weight w = mg
Free failing under gravity
$\therefore \Sigma F = mg = ma$
$a = g = 9.81\ m/s^2$
So the uniforms acceleration is $9.81\ m/s^2$

457. A particle of mass m is moving in a horizontal circle of radius r under the action of centripetal force expressed as $-C/r^2$, where C is constant. Total energy of the particle is:
(a) $-C/2r$ (b) $C/2r$
(c) $2C/r$ (d) $C/2$
AAI Jr. Executive 29.11.2018

Ans. (a) : Centripetal force $F_c = -\frac{C}{r^2} = \frac{mv^2}{r}$

$KE = \frac{1}{2}mv^2 = \frac{F_c r}{2}$

Kinetic energy K is related to centripetal force as

$K = \frac{|F_c|}{2} r = \frac{C}{2r} \quad [\text{as } K > 0]$

$K = \frac{C}{2r}$ .....(i)

If potential energy of the system is U then force can be written as

$F_c = \frac{dU}{dr}$

$-\frac{dU}{dr} = -\frac{C}{r^2}$

$\int dU = \int \frac{C}{r^2} dr$

$U = -\frac{C}{r}$ ..... (ii)

Total energy = PE + KE

$= -\frac{C}{r} + \frac{C}{2r} = \frac{-C}{2r}$

458. The relation between time and distance is $t = \alpha x^2 + \beta x$, where α and β are constants. The retardation is given by:
(a) $2\beta v^3$ (b) $2\alpha v^2$ (c) $\alpha\beta v^3$ (d) $2\alpha\beta v^3$
AAI Jr. Executive 29.11.2018

Ans. (d) : $t = \alpha x^2 + \beta x \quad \{\because d = \alpha\}$

Differentiate w.r.t. x

$\frac{dt}{dx} = 2\alpha x + \beta$

$\frac{dx}{dt} = v$

$= \frac{1}{(2\alpha x + \beta)}$ ..... (i)

Again differentiate equation (i) with respect to x

$\frac{d^2x}{dt^2} = a = \frac{-2\alpha\beta v}{(2\alpha x + \beta)^2}$

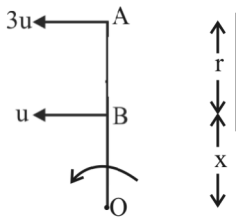
$\frac{d^2x}{dt^2} = a = \text{Acceleration}$

$a = -2\alpha\beta v^3$

$a = 2\alpha\beta v^3$ (Retardation)

459. Two points of a metal rod are moving with velocities 3u and u perpendicular to the rod and in same direction separated by a distance 'r'. Angular velocity of the rod will be:
(a) 2u/5r (b) 2u/r
(c) u/r (d) 2u/3r
AAI Jr. Executive 29.11.2018

Ans. (b) :



Velocity at a point A, $3u = (r + x)\omega$ .....(i)
Velocity at a Point B, $u = x\omega$ .....(ii)
From equation (i) & (ii)

$3u - u = (r + x)\omega - x\omega$

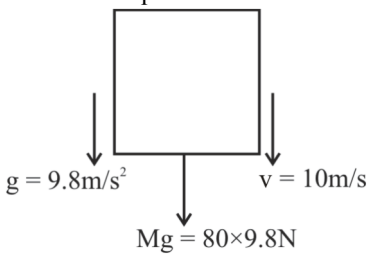
$2u = r\omega + x\omega - x\omega$

$2u = r\omega$

$\boxed{\omega = \frac{2u}{r}}$

460. A lift originally moving downwards at 10 m/s is brought to rest with a constant acceleration in a distance of 25 m. The force with which the feet of a passenger of mass 80 kg ($g = 9.8\ m/s^2$) press downwards on the floor of the lift is
(a) 160 N (b) 784 N
(c) 944 N (d) 1000 N
TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : From third equation of motion



$v^2 = u^2 + 2as$

$0 = 10^2 + 2a \times 25$

$a = \frac{-10 \times 10}{2 \times 25} = -2\ m/sec^2$

$F_{net} = M(g - a)$

$= 80 \times [9.8 - (-2)]$

$= 80 \times 11.8$

$= 944N$

461. The position of a particle which is confined to move along a straight line is $S = 4t^3 - 32t + 100$, where S is measured in meters and t in seconds. The time required for the particle to reach a velocity of 76 m/s from its initial condition at t = 0 is:
(a) 9 sec (b) 12 sec
(c) 4 sec (d) 3 sec
CIL MT 27.02.2020

Search on Telegram @apna_pdf

Ans. (d) : The position of the particle

$S = 4t^3 - 32t + 100$ (m)

$V = 76$ m/sec

Velocity equation $\frac{ds}{dt} = \frac{d}{dt}\left(4t^3 - 32t + 100\right)$

$V = 12t^2 - 32$

$76 = 12t^2 - 32$

$\boxed{t = 3\text{sec}}$

462. A body moves from rest with a constant acceleration of $5m/s^2$. The distance covered in 5s is most nearly to :

(a) 38 m (b) 62.5 m

(c) 96 m (d) 124 m

ESE 2018

J & K PSC Screening, 2006

Ans. (b) : Given,

Initial velocity = $u = 0$

Acceleration (a) = $5m/s^2$

Distance (s) = ?

Time $t = 5$ sec.

$s = ut + \frac{1}{2}at^2$

$= 0 \times 5 + \frac{1}{2} \times 5 \times 5^2$

$\boxed{S = 62.5}$ m

463. If a body is having motion of translation as well as motion of rotation, then the total kinetic energy is given by :

(a) $\frac{1}{2}(m + I)v^2$ (b) $\frac{1}{2}(m + I)\omega^2$

(c) $\frac{1}{2}mv^2 + \frac{1}{2}I\omega^2$ (d) $\frac{1}{2}m(v^2 + \omega^2)$

J & K PSC Screening, 2006

Ans. (c) : $(KE)_{Total} = (KE)_{Translation} + (KE)_{rotational}$

$(KE)_{Total} = \frac{1}{2}mv^2 + \frac{1}{2}I\omega^2$

464. A bullet leaves the muzzle of a gun with a velocity of 400 m/sec. Assuming constant acceleration from starting point to muzzle, what is the time taken by the bullet to travel a distance of 1m through the gun barrel.

(a) 0.2 second (b) 0.5 second

(c) 0.005 second (d) None of these

J & K PSC Screening, 2006

Ans. (c) : Initial velocity,

$u = 0$

$v^2 = u^2 + 2as$

$(400)^2 = 0 + 2a \times 1$

$a = \frac{(400)^2}{2}$

$a = 80 \times 10^3$ m/s^2

$v = u + at$

$400 = 0 + (80 \times 10^3)t$

$t = \frac{400}{80 \times 10^3}$

$t = 0.005$ sec

465. A man falling from a height 'h' starts rotating midway of his fall. The vertical velocity with which the man will touch the ground will be:

(a) $\sqrt{2gh}$

(b) less than $\sqrt{2gh}$

(c) greater than $\sqrt{2gh}$

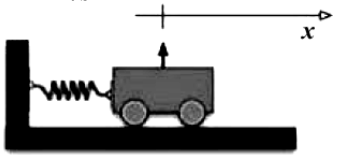
(d) less or more but never equal to $\sqrt{2gh}$

J & K PSC Screening, 2006

Ans. (a) : $V = \sqrt{2gh}$

466. A cart attached to a spring moves with an acceleration proportional to its position but of opposite sign.

$a(x) = -2x$ m/s^2



If the cart has a velocity $v = 5$ m/s when $x = 0$, determine the velocity of the cart when $x = 3$.

(a) 2.45 m/s (b) 2.5 m/s

(c) 2.65 m/s (d) 2.78 m/s

(e) 2.85 m/s

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) : Given,

At $x = 0$, $v = 5$ m/s

At $x = 3$, $v = ?$

$a(x) = -2x$

$\frac{vdv}{dx} = -2x$

$vdv = -2x\,dx$

Integrating both sides,

$\int_5^v vdv = -\int_0^3 2x\,dx$

$\left[\frac{v^2}{2}\right]_5^v = -2\left[\frac{x^2}{2}\right]_0^3$

$\frac{1}{2}(v^2 - 25) = -1(9)$

$v^2 = 25 - 18$

$v = 2.65$ m/s

467. The rotation of a flywheel is given mathematically as $a = 10t - t^2$, where a, the angular acceleration, is given in radians per square second and t is in seconds. The flywheel starts from rest, makes a certain number of revolutions, then stops for a while and then reverses its direction. How many revolutions does the flywheel make during this time, prior to reversing direction?

(a) 200 (b) 225

(c) 250 (d) 275

(e) 300

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) : Ans. (b) : Given,

$a = 10t - t^2$

$a = \frac{d\omega}{dt}$

$\omega = \int a\,dt$

Search on Telegram @apna_pdf

$= \int (10t - t^2)dt$

$\omega = \frac{10t^2}{2} = \frac{t^3}{3}$

When flywheel reverse direction, $\omega = 0$

$0 = \frac{10t^2}{2} - \frac{t^3}{3}$

$\boxed{t = 15 \text{ second}}$

At t = 15 sec, speed will reverse its direction,

$a = \frac{d^2\theta}{dt^2}$

$\frac{d\theta}{dt} = \int a\,dt = \int (10t^2 - t^2)dt$

$\frac{d\theta}{dt} = 5t^2 - \frac{t^3}{3}$

$\theta = \left[\frac{5}{3}t^3 - \frac{t^4}{12}\right]_0^{15}$

$\theta = \frac{5}{3}(15)^3 - \frac{1}{12}(15^4 - 0)$

$\theta = 1406.25$ radian,

No. of revolution = $\frac{\theta}{2\pi} = \frac{1406.25}{2\pi}$

No. of revolution = 223.8 rpm ≃ 225 rpm

468. The angular velocity of hour hand of a watch is

(a) 0.0001455 sec^{-1} (b) 0.001755 sec^{-1}

(c) 0.1047 sec^{-1} (d) 1.047 sec^{-1}

WBPSC AE, 2017

Ans. (a) : 1 hour = 2π

$\frac{2\pi}{12 \times 60 \times 60} = 0.0001453$

469. The rotation of a rigid body is defined by $\phi = 2 \sin \pi t/4$. The angular velocity and acceleration after 2 seconds will be

(a) 0,0 (b) $0, \pi^2/8$

(c) $1, \pi^2/8$ (d) $0, -\pi^2/8$

WBPSC AE, 2017

Ans. (d) : Rotation of rigid body $\phi = 2 \sin \frac{\pi t}{4}$

angular velocity $\omega = \frac{d\phi}{dt}$

$= \frac{d}{dt}\left(2 \sin \frac{\pi t}{4}\right)$

$= 2 \times \frac{\pi}{4} \cos \frac{\pi t}{4}$

$t = 2$

$\frac{\pi}{2} \times \cos \frac{\pi \times 2}{4}$

$\frac{\pi}{2} \cos \frac{\pi}{2} = 0$

angular acceleration = $\frac{\pi}{2} \times \frac{\pi}{4}\left(-\sin \frac{\pi t}{4}\right)$

$-\frac{\pi}{2}\frac{\pi}{4} \sin \frac{\pi t}{4}$

$\frac{\pi^2}{8} \sin \frac{\pi \times 2}{4}$

$\frac{-\pi^2}{8} \sin \frac{\pi}{2}$

$-\frac{\pi^2}{8} \times 1$

$= -\frac{\pi^2}{8}$

470. A particle starts from rest and moves in a straight line whose equation of motion is given by $S = 2t^3 - t^2 - 1$. The acceleration of the particle after one second will be

(a) 4 m/sec^2 (b) 6 m/sec^2

(c) 8 m/sec^2 (d) 10 m/sec^2

WBPSC AE, 2017

Ans. (d) : $S = 2t^3 - t^2 - 1$

$v = \frac{ds}{dt} = 6t^2 - 2t$

$a = \frac{dv}{dt} = 12t - 2$

t = 1 sec

$a = 12 \times 1 - 2$

$a = 10$ m/sec^2

471. When a train is rounding a curve, to prevent side thrust on the wheel flange of cars

(a) rail section is made thick on curvature.

(b) thrust eliminators are provided in the train.

(c) outside rails are raised.

(d) guide rail section are provided to take care of thrust.

WBPSC AE, 2017

Ans. (c) : When a train is rounding a curve, to prevent side thrust on the wheel flange of cars outside rails are raised.

472. The time required to stop a car moving with a velocity 20m/sec within a distance of 40m is equal to

(a) 2 sec (b) 4 sec

(c) 8 sec (d) 10 sec

WBPSC AE, 2017

Ans. (b) : u = 20 m/s

v = 0 m/s

$v^2 - u^2 = 2as$

$0^2 - 20^2 = 2 \times a \times 40$

$-400 = 80a$

$a = -5$ m/s^2

$v = u + at$

$v = 0$ $u = 20$ m/s $a = -5$ m/s^2

$0 = 20 - 5 \times t$

$5t = 20$

$t = 4$ sec

473. Time acceleration graph of a body moving with uniform acceleration is a straight line :

(a) Passing through the origin

(b) Inclined to time axis

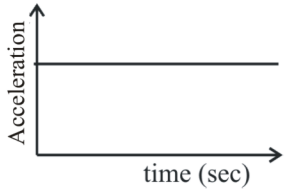
(c) Parallel to time axis

(d) Parallel to acceleration axis

J&K PSC Civil Services Pre, 2010

Search on Telegram @apna_pdf

Ans. (c) : For uniformly accelerated motion, acceleration is constant with time, hence, acceleration time graph will be a straight line parallel to the time axis. For a straight line parallel to the time axis, slope equals zero.



474. An iron ball and a cotton ball of same mass are thrown from a height h in air. Then
(a) the iron ball will reach the ground first
(b) the cotton ball will reach the ground first
(c) both balls reach the ground at the same time
(d) None of the above

Haryana PSC Civil Services Pre, 2014

Ans. (c) : Mass of both ball is m
So, weight in both cases will be mg. Hence acceleration would be 'g' by Newton's second law of motion.
Now

$$h = ut + \frac{1}{2}gt^2$$

Both balls are dropped from same height (h) & initial velocity of both balls (u = 0)

$$h = \frac{1}{2}gt^2$$

$$t = \sqrt{\frac{2h}{g}}$$

∵ height & acceleration due to gravity of balls are equals that's why both balls reach at the same time on the ground.

475. Acceleration due to gravity is
(a) same at all places
(b) more at the equator of the earth than at the poles
(c) decreasing with altitude
(d) All are correct

Haryana PSC Civil Services Pre, 2014

Ans. (c) : Acceleration due to gravity is location dependent. It is not same at all places. As we move upward or downward from earth surface then it's value decreases. Value of 'g' will be maximum at poles and minimum at equator.

476. A man moving in an accelerated train on horizontal tracks feels that his weight has
(a) decrease (b) increase
(c) zero (d) same

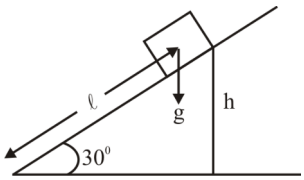
Haryana PSC Civil Services Pre, 2014

Ans. (d) : Man moving in an accelerated train on horizontal tracks feels that his weight will be same.
Man weight (apparent) changes when motion is in vertical direction means towards earth or away from earth or motion against or in direction of gravity.

477. A block slides down a smooth inclined plane at 30° in time from the top. If an identical block is released from the same point, falling freely to the ground, then it will reach in time
(a) t/2 (b) t/3
(c) t/4 (d) t

Haryana PSC Civil Services Pre, 2014

Ans. (a) :



$l \sin 30^0 = h$

$$l = \frac{h}{\sin 30^0}$$

$$l = \frac{h}{1/2}$$

$$l = 2h$$

Equation of motion along inclined plane

$$l = ut + \frac{1}{2}g\sin 30^0 t^2 \quad (u = 0)$$

$$\ell = \frac{1}{2}g \times \frac{1}{2}t^2$$

$$2h = \frac{1}{4}gt^2$$

$$t = \sqrt{\frac{8h}{g}} \quad \text{_____(i)}$$

time taken by block to reach at ground along inclined plane = t
Let, time taken by freely falling block = t_1

$$h = ut + \frac{1}{2}gt_1^2 \qquad (u = 0)$$

$$t_1 = \sqrt{\frac{2h}{g}} \quad \text{_____(ii)}$$

equation (i) divide by (ii)

$$\frac{t}{t_1} = \sqrt{\frac{8h}{g}} \times \sqrt{\frac{g}{2h}} = \sqrt{4} = 2$$

$$\boxed{t_1 = t/2}$$

478. A railway train of 200 m long passes over a bridge of 600 m long. If the train is moving at 10 m/s, the time taken to cross the bridge
(a) 60s (b) 90s
(c) 80s (d) 100s

Haryana PSC Civil Services Pre, 2014

Ans. (c)

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

$$\text{Time} = \frac{\text{Distance}}{\text{Speed}}$$

$$= \frac{200 + 600}{10} = \frac{800}{10}$$

$$\text{Time} = 80\,\text{sec}$$

479. If a body is moving in a straight line, the motion of the body is called
(a) rectilinear (b) rotational
(c) curvilinear (d) helical

Haryana PSC Civil Services Pre, 2014

Search on Telegram @apna_pdf

Ans. (a) :
Rectilinear Motion– Motion along straight line path.
Curvilinear Motion– Motion along curved path.
Rotational Motion– Every particle in body moves in a circle about axis of rotation.
Helical Motion– It is the superposition of straight line and circular motion.

480. The apparent weight of a man in moving lift is less than his real weight when it is going down with
(a) uniform speed
(b) an acceleration
(c) some linear acceleration
(d) retardation

Haryana PSC Civil Services Pre, 2014

Ans. (b) :

When lift is moving downward then apparent weight

$\boxed{W = m(g - a)}$

When lift moves upward then

$\boxed{W = m(g + a)}$

- Apparent weight of man in moving lift is less than his real weight (mg) when it is going down with an acceleration.

481. A body of mass 10 kg moving with a velocity of 1 m/s is acted upon by a force of 50 N for two seconds. The final velocity of the body will be –
(a) 22 m/s (b) 10 m/s
(c) $\sqrt{21}$ m/s (d) 11 m/s

TRB Asstt. Prof., 2012

Ans. (d) : Given, Force (F) = 50N
Mass (m) = 10 kg
Initial velocity (u) = 1 m/sec
Final velocity (v) = ?
Time (t) = 2 sec.
We know F = ma

$50 = 10 \times a$

$a = \frac{50}{10} = 5 m/sec^2$

From the first equation of motion.

$v = u + at$

$v = 1 + 5 \times 2$

$v = 11$ m/sec.

482. Mathematical formulation of Newton's law in Engineering Mechanics :
(a) $F = \frac{d}{dt}(mV)$ (b) $F = \frac{d}{dt}(P)$
(c) $F = \dot{P}$ (d) All of the above

KPSC ADF 2015

Ans. (d)

- Force (F) = $\frac{d}{dt}(mv)$

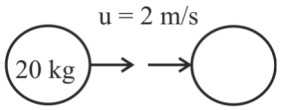
[linear momentum (P) = mv]
Now, Force = Rate of change of momentum

- $F = \frac{d}{dt}(P)$ (Rate of change of momentum)
- $F = \dot{P}$ (Rate of change of momentum)

483. A body of 20 kg mass moving with a velocity of 2 m/s is acted upon by a force of 100 N for four seconds. The final velocity will be :
(a) 22 m/sec (b) 10 m/sec
(c) $\sqrt{21}$m/sec (d) 11 m/sec

KPSC ADF 2015

Ans. (a) : m = 20 kg (moving body mass)
u = 2 m/s
$\because$ F = 100 N
t = 4 second



We know that, F = ma

$a = \frac{F}{m} = \frac{100}{20} = 5 m/s^2$

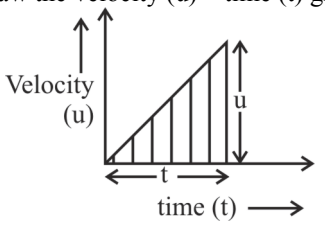
$\because$ V = u + at
= 2 + 5 × 4 = 2 + 20

$\boxed{V = 22 m/s}$

484. The velocity-time graph of a body is a straight line passing through the origin. If the slope of the graph is 'm', the distance travelled by the body in time 't' would be :
(a) $2mu^3$ (b) $\frac{mu^2}{2t^2}$
(c) $\frac{u^2}{2m}$ (d) $2mu^2$

KPSC ADF 2015

Ans. (c) : Draw the velocity (u) – time (t) graph–



Distance(s) = Area under the velocity time curve

$= \frac{1}{2} \times base \times height = \frac{1}{2} \times t \times u$

$s = \frac{ut}{2}$

Given, slope (m) = $\frac{u}{t} \Rightarrow u = mt$

or $t = \frac{u}{m}$

$s = \frac{u^2}{2m}$

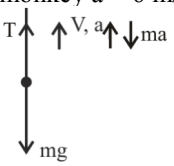
Search on Telegram @apna_pdf

485. A monkey of mass 40 kg climbs on a rope which can withstand maximum tension of 600 N. In which of the following cases when the rope break? (Take g = 10 m/s^2 & ignore the mass of the rope)

(a) Climbs up with an acceleration of 6 m/s^2
(b) Climbs down with an acceleration of 4 m/s^2
(c) Climbs up with uniform speed of 5 m/s^2
(d) None of the mentioned

GPSC EE Pre, 28.01.2017

Ans. (a) : Given-
Monkey's mass (m) = 40 kg
g = 10 m/s
Maximum tension in rope, T_{max} = 600 N
Acceleration due to monkey a = 6 m/s^2



According to second law of motion-
T = mg + ma
T = m[g + a]
T = 40[10 + 6]
T = 640 N
Since, T > T_{max} or (640 > 600) the rope will break in this case.

486. A cylinder of mass m rolls down an inclined plane from a height h above a horizontal level. If the velocity of the axis of the cylinder is v when it reaches the lower level, then :

(a) $v = gh$ (b) $v = mgh$
(c) $v = \sqrt{(2gh)}$ (d) $v < \sqrt{(2gh)}$

BPSC Asstt. Prof. 29.11.2015

Ans. (d)

487. When a Bofors 40 mm gun is fired, the recoil can be explained by which of the following laws?

(a) Newton's first law
(b) Newton's second law
(c) Newton's third law
(d) Newton's fourth law

KPCL AE 2016

Ans. (c) : Bofors 40 mm gun after referred to simply as the before gun, is an anti-aircraft automation. When a bofors 40 mm gun is fired the, recoil by Newton's third law of motion.
∴ Action = Reaction

488. The motion of an artificial satellite orbiting the Earth at constant height is an example of

(a) Linear motion (b) Space motion
(c) Circular motion (d) Superficial motion

KPCL AE 2016

Ans. (c) : A satellite of mass m of orbiting at radius r from the center of earth. The gravitational force supplies the centripetal acceleration.

$$V_{orbit} = \sqrt{\frac{GM_{earth}}{r}}$$

The earth's gravity is the only force acting from Newton's law of gravitation.

$$F = \frac{G\,mM_e}{r^2}$$

489. What is the weight of woman standing inside a lift which is moving down with an acceleration of 9.8 m/s^2?

(a) Half of her original weight
(b) Zero
(c) One-tenth of her original weight
(d) None of these

KPCL AE 2016

Ans. (b) : Given- Mass of the woman = (m)
as it is moving down acceleration (a) = $9.8\frac{m}{s^2}$
apparent weight = m(g – a)
= m (9.8 – 9.8)
= 0 $\left[\because g = 9.8 m/sec^2\right]$

490. The force which acts along the radius of a circle and directed towards its centre is known as _____

(a) Centrifugal force (b) Radial force
(c) Centripetal force (d) None of these

KPCL AE 2016

Ans. (c) : Force which acts on a body performing circular motion along its radius and directed towards the center is known as centripetal force

$$F_c = \frac{mv^2}{r}$$

r = radius
m = mass of body
v = speed of body

491. In case of relative equilibrium of a particle with respect to a moving body, the algebraic sum of the projections, on any axis, of all real forces acting on the particle together with the ..... due to base acceleration must be zero.

(a) Frictional force (b) Inertia force
(c) Tangential force (d) Shear force

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) : D'Alembert's principle of Inertial forces-
In case of relative equilibrium of a particle with respect to a moving body, the algebraic sum of the projections, on any axis, of all real forces acting on the particle together with the 'Inertia' due to base acceleration must be zero.

$$F_I - \sum_{i=1}^{n} F_i = 0$$

F_I = Inertial force.
F_i = A real force.

492. The absolute acceleration while dealing with relative motion may be considered as the geometric of ..... .

(a) base acceleration and relative acceleration
(b) relative acceleration and supplementary acceleration
(c) supplementary acceleration and based acceleration
(d) base acceleration, supplementary acceleration and relative acceleration

HPPSC Asstt. Prof. 29.10.2016

Search on Telegram @apna_pdf

Ans. (d) : The absolute acceleration while dealing with relative motion may be considered as the geometry sum of base acceleration, supplementary acceleration and relative acceleration.

493. A motorist is travelling at 90 kmph, when he observes a traffic light 250 m ahead of him turns red. The traffic light is timed to stay for 12 secs. If the motorist wishes to pass the light without stopping, just as it turns green, then the speed of the motor as it passes the traffic light will be .....

(a) 30 kmph (b) 45 kmph
(c) 60 kmph (d) zero

HPPSC AE (PWD) 10.09.2016

Ans. (c) : Given that u = 90 kmph

$$= 90 \times \frac{5}{18} = 25 \text{m/sec}$$

t = 12 sec s = 250

Applying Newton's law of motion

$s = ut + 1/2\ at^2$

$$250 = 25 \times 12 + \frac{1}{2}(a) \times (12)^2$$

$a = -0.694\ \text{m/sec}^2$

Now Appling Newton's law of motion equation

$v = u + at$

$v = 25 + (-0.694)\ (12)$

$v = 16.67$ m/sec

$$v = 16.67 \times \frac{18}{5} \text{kmph}$$

= 60 kmph

494. A car travels on a horizontal circular track of radius 9 m, starting from rest at a constant tangential acceleration of 3 m/s^2. What is the resultant acceleration of the car, 2 sec after starting ?

(a) 3 m /sec^2 (b) 4 m/sec^2
(c) 5 m/sec^2 (d) 7 m/sec^2

UPSC JWM Advt. No.-50/2010

Ans. (c) : Given, $a_t = 3\ \text{m/s}^2$, R = 9 m, t = 2 sec, $\vec{a} = ?$

According to Newton's first law, v = u + at

$v = 0 + 3 \times 2 = 6$ m/s

$$\vec{a} = \sqrt{a_r^2 + a_t^2}$$

Radial acceleration, $a_r = \frac{v^2}{R} = \frac{6^2}{9} = 4 \text{m/s}^2$

Resultant acceleration, $\vec{a} = \sqrt{4^2 + 3^2} = 5 \text{m/s}^2$

495. Water drops from a tap at the rate of four droplets per second. Determine the vertical separation between two consecutive drops after the lower drop attained a velocity of 4 m/s. (Take g = 10 m/s^2)

(a) 0.49 m (b) 0.31 m
(c) 0.50 m (d) 0.30 m

UPSC JWM Advt. No.-50/2010

Ans. (*) : Time taken by lower drop to 4 m/sec

$$\frac{4}{10} = 0.4 \text{sec}$$

So distance of lower drop from origin,

$$= \frac{1}{2} gt^2$$

$$\frac{10}{2} \times (0.4)^2 = 0.8 \text{m} \quad \text{.....(i)}$$

Time after lower drop 2nd drop released,

$$= \frac{1}{4} \text{sec} = 0.25 \text{sec}$$

So, 2nd drop falling time = 0.4 – 0.25 = 0.15 sec

So, distance travelled by second drop,

$$\frac{1}{2} gt^2 = 5(0.15)^2$$

= 0.1125 m .....(ii)

So, separation = 0.8 – 0.1125 = 0.6575 m

496. A car traveling at a speed of 20 m/s is subjected to acceleration $a = 10 - \frac{t}{2}$. Determine the maximum speed of the car.

(a) 200 m/s (b) 120 m/s
(c) 100 m/s (d) 80 m/s

UPSC JWM Advt. No.-50/2010

Ans. (b) : Given, U = 20 m/s, $a = 10 - \frac{t}{2}$

The maximum velocity, when a = 0

t = 20 sec.

Acceleration, $a = \frac{dv}{dt}$

$$\Rightarrow \quad \int a dt = \int dv$$

$$\int \left(10 - \frac{t}{2}\right) dt = \int dv$$

$$10t - \frac{t^2}{4} = v - 20$$

$200 - 100 = v - 20$

$v = 120$ m/s

497. A cylinder of mass "M" and radius "R" rolls down an inclined plane of inclination "θ". What is the linear acceleration of axis of cylinder?

(Where 'g' is acceleration due to gravity)

(a) g sin θ (b) 1/3 g sin θ
(c) 2/3 g sin θ (d) 3 g sin θ

UPRVUNL AE 2014

Ans : (c) If rolling object is a solid cylinder then

$$\text{Acceleration (a)} = \frac{g \sin\theta}{1 + \left(\frac{K^2}{R^2}\right)}$$

$$I = MK^2 = \frac{1}{2} MR^2$$

$$\frac{K^2}{R^2} = \frac{1}{2} \qquad a = \frac{g \sin\theta}{1 + \left(\frac{K^2}{R^2}\right)} = \frac{g \sin\theta}{1 + \frac{1}{2}} = \frac{2}{3} g \sin\theta$$

$$\boxed{a = \frac{2}{3} g \sin\theta}$$

Search on Telegram @apna_pdf

498. A particle is moving under the influence of a force $F(x) = -k/(2x^2)$ along the positive x-axis. At time t = 0, it is at x = 1 m and its velocity is v = 0. What would be its velocity, what it reaches x = 0.5 m?
(Where $k = 10^{-2}$ N-m^2 and mass of particle is 10^{-2} kg)
(a) 1 m/s (b) 0
(c) 2 m/s (d) 0.5 m/s
UPRVUNL AE 2014

Ans : (d) : From Newton's Second law of motion the inertia force acting on a body is given by, F = m × 1

$$\text{Given } F(x) = -\frac{k}{2x^2} = m \times a_x$$

$$a_x = -\frac{k}{m \times 2x^2} = -\frac{1}{2x^2}$$

$$\Rightarrow a_x = \frac{d^2x}{dt^2} = -\frac{1}{2x^2}$$

$$\Rightarrow v(x) = \frac{dx}{dt} = \frac{1}{2x} + c$$

Using the initial conditions
x = 1 m, v = 0

$$\Rightarrow 0 = \frac{1}{2} + c$$

$$\Rightarrow c = -\frac{1}{2}$$

$$\therefore \frac{dx}{dt} = \frac{1}{2x} - \frac{1}{2}$$

When x = 0.5m

$$v = \frac{1}{2 \times 0.5} - \frac{1}{2} = 0.5 \text{m/s}$$

Note : – The Commission has given answer option (a).

499. A tourist covers half of his journey by train at 60 km/h, half of the remainder by bus at 30 km/h and the rest by cycle at 10 km/h. The average speed of the tourist in km/h during his entire journey is
(a) 36 (b) 30
(c) 24 (d) 18
GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : Let total distance be 'D'
Average speed = Total distance/Total time
Hence, avg speed,

$$= \frac{D}{\frac{D}{2\times60} + \frac{D}{4\times30} + \frac{D}{4\times10}} = \frac{D}{\frac{D}{120} + \frac{D}{120} + \frac{D}{40}}$$

$$= \frac{D}{D\left(\frac{1}{120} + \frac{1}{120} + \frac{1}{40}\right)} = \frac{1}{\left(\frac{1+1+3}{120}\right)} = \frac{1}{\left(\frac{5}{120}\right)}$$

$$= \frac{120}{5} = 24 \text{km/h}$$

500. A body moves, from rest with a constant acceleration of 5 m per sec^2. The distance covered in 10 sec is most nearly.
(a) 200 m (b) 300 m
(c) 250 m (d) 500 m
ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c) Using equation of motion, we have

$$S = ut + \frac{1}{2}at^2$$

u = 0, a = 5m/sec^2, t = 10sec

$$S = \frac{1}{2} \times 5 \times 10 \times 10$$

$$\boxed{S = 250 \text{ m}}$$

501. Two cars are 10 km apart and moving in the same direction at speed of 40 km/hr. A car moving in opposite direction meets these cars at interval of 10 minutes. At what speed the other car is moving?
(a) 40 km/hr (b) 25 km/hr
(c) 30km/hr (d) 20km/hr
ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (d) Let us assume the two cars to be stationary, then the opposite car move with velocity (V + 40)km/hr where V is its original speed and we have added 40 since we considered two cars 10 km apart to be stationary. Speed of car relative to stationary car will be (40+V) km/hr.

$$(V + 40) = \frac{10}{\left(\frac{10}{60}\right)}$$

$$\boxed{V = 20 \text{ km/hr}}$$

502. Suppose that a particle moves on a coordinate line so that its velocity at time *t* is $v(t)=t^2-2t$ m/s. The displacement of the particle during time interval $0 \le t \le 3$ is-
(a) 4 m (b) 0m
(c) 8/3m (d) 3/8 m
ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (b) We know that

$$V = \frac{dx}{dt}$$

$$dx = Vdt$$

$$\int_0^L dx = \int_0^3 \left(t^2 - 2t\right)dt$$

$$L = \left[\frac{t^3}{3} - 2 \times \frac{t^2}{2}\right]_0^3$$

L = 9-9=0
L = zero

503. A point P moves along the path $y = x^2 - 4$. What is the displacement when the point moves from x = 1 to x = 3
(a) 8.24, @ $\tan^{-1}(4)^0$ (b) 2, @ $\tan^{-1}(1)^0$
(c) 11.3, @ $\tan^{-1}(4)^0$ (d) 11.3, @ $\tan^{-1}(1)^0$
ISRO Scientist/Engineer 17.12.2017

Ans. (a) : Given,

$$y = x^2 - 4$$

At $x_1 = 1$, $x_2 = 3$
$y_1 = -3$, $y_2 = 5$

$$\text{Displacement} = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$= \sqrt{(3-1)^2 + (5+3)^2}$$

$$= \sqrt{4 + 64}$$

$$= 8.24$$

Search on Telegram @apna_pdf

and $\theta = \tan^{-1}\left(\frac{y_2 - y_1}{x_2 - x_1}\right)$

$= \tan^{-1}\left(\frac{5+3}{3-1}\right)$

$= \tan^{-1}(4)$

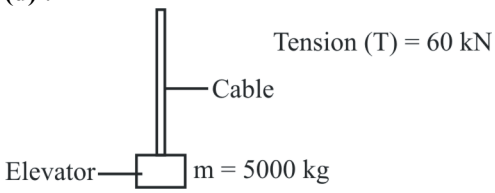
504. An elevator has a mass of 5000 kg. When the tension in the supporting cable is 60 kN, the acceleration of the elevator is nearly

(a) 8 m/s^2 (b) 12 m/s^2

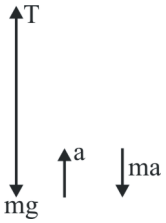
(c) –2 m/s^2 (d) 2 m/s^2

ISRO Scientist/Engineer 03.07.2016

Ans. (d) :



FBD–



$T - mg = ma$

$60000 - 5000 \times 9.81 = 5000\ a$

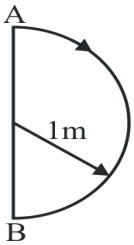
$60000 - 49050 = 5000\ a$

$10950 = 5000\ a$

$a = \frac{10950}{5000} = 2.19\ m/s^2$

$a = 2\ m/s^2$

505. In 1 second, a particle goes from point A to point B, moving in a semicircle (as shown in figure). The magnitude of the average velocity is



(a) 3.14 m/s (b) 1 m/s

(c) 2 m/s (d) Zero

ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Concept of Average Velocity–

Avg. velocity $= \frac{\text{Total distance}}{\text{Time}}$

$V_{avg.} = \frac{\text{Minimum total distance}}{\text{Time}}$

$V_{avg} = \frac{2}{1} = 2\ m/s$

506. A block is made to slide down an inclined plane (30° with horizontal) which is smooth. It starts sliding from rest and takes a time 't' to reach the bottom of the plane. An identical body is freely dropped from the same point. The time the body takes to reach the bottom is

(a) t (b) $\frac{t}{2}$

(c) $\frac{t}{3}$ (d) $\frac{t}{4}$

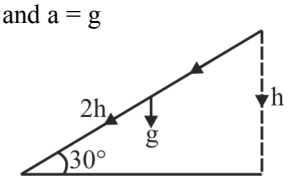
ISRO Scientist/Engineer 03.07.2016

Ans. (b) : Consider body freely drop from height 'h'.

$S = ut + \frac{1}{2}at^2$

At initial condition–

$u = 0$ and $a = g$



$2h = \frac{1}{2}\frac{g}{2}t^2$

$t = \sqrt{\frac{8h}{g}} = 2\sqrt{\frac{2h}{g}}$

If freely fall,

$h = \frac{1}{2}gt_2^2$

$t_2 = \sqrt{\frac{2h}{g}}$

$\therefore \quad \boxed{t_2 = \frac{t}{2}}$

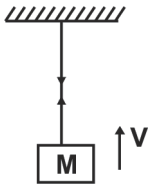
507. An elevator weighing 1000 Kg attains an upward velocity of 4m/sec in two seconds with uniform acceleration. The tension (in N) in supporting cable will be (g = 9.8 m/sec^2)

(a) 1204 N (b) 9800

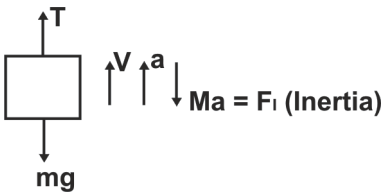
(c) 2000 N (d) 11800 N

ISRO Scientist/Engineer 2012

Ans. (d)



FBD,



M = 1000 kg

V = 4m/s

g = 9.8 m/s^2

Acceleration of lift = a

Search on Telegram @apna_pdf

V = u + at
4 = 0 + a × 2 [t = 2 sec]
4 = a × 2[Initial velocity u = 0]
∴ a = 2 m/s^2
∴ Tension in cable 'T'
T = mg + ma
= m (g + a)
= 1000 (9.8 + 2)
T = 11800 N

508. Two car are moving in the same direction with a speed of 45 km/hr and a distance of 10 km separates them. If a car coming from the opposite direction meets these two cars at an interval of 6 minutes, its speed would be

(a) 45 km/hr (b) 55 km/hr
(c) 65 km/hr (d) 75 km/hr

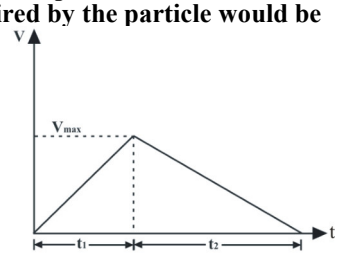
ISRO Scientist/Engineer 2011

Ans. (b) : Let speed of car moving in opposite direction is = V m/s
From relative velocity approach.
Due to same direction,
Relative velocity = V + 45

So, $V + 45 = \dfrac{10}{\left(\frac{6}{60}\right)}$

100 = V + 45
V = 100-45
V = 55 km/hr

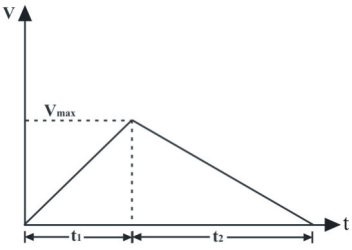
509. A particle starts from rest with a constant acceleration α m/sec^2 and after some time it decelerates at a uniform rate of β m/sec^2 till it comes to rest. If the total time taken between two rests positions is t, the maximum velocity acquired by the particle would be



(a) $\dfrac{\alpha+\beta}{2}t$ (b) $\dfrac{\alpha-\beta}{2}t$
(c) $\left(\dfrac{\alpha\beta}{\alpha+\beta}\right)t$ (d) $\left(\dfrac{\alpha-\beta}{\alpha+\beta}\right)t$

ISRO Scientist/Engineer 2010
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (c) : Let A particle starts from rest i.e. $u_1 = 0$
Acceleration $a_1 = \alpha$ m/s^2 and time = t_1
After t_2 time decelerates $a_2 = -\beta$ m/s^2
V = u + at



$V_{max} = 0 + \alpha t_1$ ...(1)
$0 = V_{max} - \beta t_2$ ...(2)
So,
$\alpha t_1 = \beta t_2$
$t_2 = \dfrac{\alpha}{\beta}t_1$
$t = t_1 + t_2$ ...(3)
$t_1 = \dfrac{\beta}{(\alpha+\beta)}.t$
So, from equation (1)
$V_{max} = \dfrac{\alpha.\beta}{(\alpha+\beta)}t$

510. A heavy block of mass m is slowly placed on a conveyer belt moving with speed v. If coefficient of friction between block and the belt is μ, the block will slide on the belt through distance

(a) $\dfrac{v}{\mu g}$ (b) $\dfrac{v^2}{\sqrt{\mu g}}$
(c) $\left(\dfrac{v}{\mu g}\right)^2$ (d) $\dfrac{v^2}{2\mu g}$

ISRO Scientist/Engineer 2008
ISRO Scientist/Engineer 2007

Ans. (d) : Mass of block = m
Speed = m
Coefficient of friction = μ
Reterdation due to friction = –μg
$u^2 - v^2 = 2$ as
$0 - v^2 = -2$ μgs
$s = \dfrac{v^2}{2\mu g}$

511. A car moving with speed u can be stopped in minimum distance x when brakes are applied. If the speed becomes n times, the minimum distance over which the car can be stopped would take the value

(a) $\dfrac{x}{n}$ (b) nx
(c) $\dfrac{x}{n^2}$ (d) n^2x

ISRO Scientist/Engineer 2008

Ans. (d) : A car moving speed = u
distance = x
speed becomes n times

So, $x = \dfrac{u^2}{2a}$ $[\because v^2 - u^2 = 2as]$

$s = \dfrac{(nu)^2}{2a}$

$s = \dfrac{n^2u^2}{2a}$ $\left(\because x = \dfrac{u^2}{2a}\right)$

$s = n^2x$

512. A particle starts with a velocity 2m/sec and moves on a straight-line track with retardation 0.1 m/sec^2. The time at which the particle is 15 from the starting point would be

Search on Telegram @apna_pdf

(a) 10 sec (b) 20 sec
(c) 50 sec (d) 40 sec

ISRO Scientist/Engineer 2007

Ans. (a) : u = 2m/s, a = 0.1 m/s^2

$$s = ut + \frac{1}{2}at^2$$

$$15 = 2t + \frac{1}{2}(-0.1)t^2 \quad [\text{Reterdation a} = -0.1 \text{ m/sec}^2]$$

$$2t - \frac{0.1}{2}t^2 = 15$$

$$2t - \frac{1}{20}t^2 = 15$$

$$40t - t^2 = 300$$

$$t^2 - 40t + 300 = 0$$

$$(t-10)(t-30) = 0$$

$$t = 10,\ t = 30$$

t = 10 sec

513. A stone is released from a certain height and it takes 5 seconds to reach the ground. If the stone is stopped after 3 seconds and released, the total time the stone will be in the air is :

(a) 14s (b) 4s
(c) 7s (d) 5s

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (c) : Given, u = 0, t = 5, t′ = 3

$$S = ut + \frac{1}{2}gt^2$$

$$S_1 = \frac{1}{2}g \times 5^2$$

$$S_1 = \frac{25}{2}g$$

After 3 sec. stopped

$$S_2 = ut + \frac{1}{2}gt^2$$

$$S_2 = \frac{1}{2}g \times 3^2$$

$$S_2 = \frac{9}{2}g$$

$$S_1 - S_2 = \frac{25}{2}g - \frac{9}{2}g$$

$$\Delta S = \frac{16g}{2}$$

$$\frac{16g}{2} = \frac{1}{2}gt^2$$

$$\boxed{t = 4}\ \text{sec}.$$

$\boxed{\text{Total time} = 4 + 3 = 7 \text{ sec.}}$

514. A ball is dropped vertically from a height d above the ground. It hits the ground and bounces up to a height d/2. Neglecting the subsequent motion and air resistance, its velocity (v) varies with height (h) above the ground as

(a) 
(b) 
(c) 
(d) 
ISRO Scientist/Engineer 03.07.2016

Ans. (a) : At height h = d, u = 0

At ground, velocity is maximum and downward consider velocity as negative (–ve) and upward positive (+ve).

When it return to height h velocity becomes zero.

$v^2 = u^2 + 2as$

u = 0

$\boxed{v^2 = 2as}$ → Variation parabolic

515. The motion of a body moving on a curved path is given by a equation $x = 4 \sin 3t$ and $y = 4 \cos 3t$. The resultant velocity of the car is

(a) 30 m/sec (b) 24 m/sec
(c) 12 m/sec (d) 40 m/sec

TNPSC AE 2014

Ans. (c) : $x = 4 \sin 3t$

$y = 4 \cos 3t$

velocity component in x & y direction respectively then

$$u_x = \frac{dx}{dt} = 4\cos 3t \times 3$$

$$= 12 \cos 3t$$

$$v_y = \frac{dy}{dt} = -4 \sin 3t \times 3$$

$$v_y = -12 \sin 3t$$

Resultant velocity -

$$v = \sqrt{u_x^2 + v_y^2}$$

$$= \sqrt{(12\cos 3t)^2 + (-12\sin 3t)^2}$$

$$= \sqrt{(144)\left[\sin^2 3t + \cos^2 3t\right]}$$

$$= \sqrt{144 \times 1}$$

$$\boxed{v = 12 \text{ m/s}}$$

516. The linear velocity of a body rotating at ω rad/s along a circular path of radius r is

(a) ω .r (b) ω/r
(c) $\omega^2 . r$ (d) ω^2 / r

APPSC AEE MAINS 2016, PAPER-III

Ans. (a) : We know that, linear velocity,

V = ω .r

517. The functional reaction between time t and distance x, in m, is $t = 2x^2 + 5x$.. The acceleration in m/s^2 at t = 12 s is :

(a) $\frac{-1}{121}$ units (b) $\frac{-4}{1331}$ units
(c) $\frac{-4}{121}$ units (d) $\frac{4}{1331}$ units

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (b) : Given-

$t = 2x^2 + 5x$

Acceleration a (m/s^2) at t = 12 sec.

$$t = 2x^2 + 5x$$

$$\frac{dt}{dx} = 4x + 5$$

or $$\frac{dx}{dt} = \frac{1}{4x+5}$$

$$v = \frac{dx}{dt} = \frac{1}{(4x+5)}$$

$$a = v\frac{dv}{dx} = \frac{1}{4x+5}\left[\frac{(4x+5)\times 0 - 1\times 4}{(4x+5)^2}\right]$$

$$a = \frac{-4}{(4x+5)^3} \quad ....(1)$$

$\therefore$ $t = 12$

$t = 2x^2 + 5x$

$2x^2 + 5x = 12$

$2x^2 + 5x - 12 = 0$

$(x + 4)(2x - 3) = 0$

$$x = \frac{3}{2}, -4$$

$x = \frac{3}{2}$ value is substitute in equation (1)

$$\left[a = \frac{-4}{\left[4\times\left(\frac{3}{2}\right)+5\right]^3} = \frac{-4}{(11)^3}\right]$$

$$= \frac{-4}{1331}\text{unit}$$

518. Time variation of the position of the particle in rectilinear motion is given by $x = 3t^3 + 2t^2 + 4t$. If v is the velocity and a is the acceleration of the particle in consistent units, the motion started with

(a) v = 0, a = 0 (b) v = 0, a = 4

(c) v = 4, a = 4 (d) v = 2, a = 4

(e) v = 4, a = 2

CGPSC AE 26.04.2014 Shift-I

Ans. (c) : Given,

$x = 3t^3 + 2t^2 + 4t$

$$\text{velocity } (v) = \frac{dx}{dt} = 9t^2 + 4t + 4 \quad ...(1)$$

$$\text{Acceleration } (a) = \frac{dv}{dt} = 18t + 4 \quad ...(2)$$

$\because$ Initially t = 0 so from equation (1) and (2)

$v = 9t^2 + 4t + 4$

at t = 0, v = 4

$a = 18t + 4$

at t =0, a = 4

519. A motorist travelling at a speed of 18 km/hr, suddenly applies the brakes and comes to rest after skidding 75 m. The time required for the car to stop is

(a) t = 30.25 sec (b) t = 29.94 sec

(c) t = 28.84 sec (d) t = 26.22 sec

TNPSC AE 2014

Ans. (b) : u = 18 km/hr

= 5 m/s

d = 75 m

v = 0

We know that after applies the brake-

$v^2 = u^2 - 2ad$

$(5)^2 = 2 \times a \times 75$

$$\boxed{a = \frac{1}{6}\,m/s^2}$$

then $v = u - a\,t$

$u = a \times t$

$$5 = \frac{1}{6} \times t$$

$$\boxed{t = 30\ sec}$$

520. The angular motion of a disc is defined by the relation ($\theta = 3t + t^3$), where θ is in radians and t is in seconds. What will be the angular position after 2 seconds?

(a) 14 rad (b) 12 rad

(c) 18 rad (d) 16 rad

CIL MT 26.03.2017

Ans. (a) : Given angular motion equation $\theta = 3t + t^3$

Motion covered in 2 seconds = $3 \times 2 + 2^3 = 14$ rad. So the angular position after 2 seconds will be 14 rad.

521. The position of a particle in rectilinear motion is given by the equation ($x = t^3 - 2t^2 + 10t - 4$), where x is in meters and t is in seconds. What will the velocity of the particle at 3s?

(a) 20 m/s (b) 25 m/s

(c) 15 m/s (d) 30 m/s

CIL MT 26.03.2017

Ans. (b) : Position $(x) = t^3 - 2t^2 + 10t - 4$

$$\text{Velocity } (v) = \frac{dx}{dt} = 3t^2 - 4t + 10$$

At t = 3s

$v = 3 \times 3^2 - 4 \times 3 + 10 = 25$ m/s

522. An object falls from the top of a tower. If comes down half the height in 2 seconds. Time taken by the object to reach the ground is:-

(a) 2.8 s (b) 3.2 s

(c) 4.0 s (d) 4.5 s

UKPSC AE-2013, Paper-I

Ans. (a) : We assume that the height of tower is h,

$$\frac{h}{2} = ut + \frac{1}{2}gt^2$$

$u = 0$, $t = 2s$

$$\boxed{h = 4g} \quad ...(i)$$

then,

$v^2 = u^2 + 2gh$

$$v = \sqrt{2gh} = \sqrt{2g \times 4g}$$

$$v = g\sqrt{8} \quad ...(ii)$$

then,

$v = u + gt$

$v = g \times t$

$$t = \frac{v}{g} = \frac{g\sqrt{8}}{g}$$

$$\boxed{t = 2.83\ s}$$

Search on Telegram @apna_pdf

523. Two cars 'A' and 'B' move at 15m/s in the same direction. Car 'B' is 300m ahead of car 'A'. If car 'A' accelerate at 6m/s^2 while car 'B' continues to move with the same velocity, car 'A' will overtake car 'B' after:-

(a) 7.5 s (b) 10 s
(c) 12 s (d) 15 s

UKPSC AE-2013, Paper-I

Ans. (b) : Two can A & B move initial at 15 m/s

So initial velocity of car A with respect to car B is zero.

So, car A will over take distance 300 m when accelerate at 6 m/s^2

$$s = ut + \frac{1}{2}at^2$$

$$300 = 0 \times t + \frac{1}{2} \times 6 \times t^2$$

$$\boxed{t = 10\ s}$$

524. Two balls are dropped from a common point after an interval of 1 second. If acceleration due to gravity is 10m/s^2, separation distance 3 second after the release of the first ball will be:-

(a) 5 m (b) 15 m
(c) 25 m (d) 30 m

UKPSC AE-2013, Paper-I

Ans. (c) : The first ball has traveled for 3 seconds under gravity wit acceleration g and initial velocity u = 0

$$S_1 = 0 \times 3 + \frac{1}{2} \times 10 \times (3)^2$$

S_1=45 m

Then second ball has traveled for 2 seconds

Then,

$$S_2 = 0 \times 2 + \frac{1}{2} \times 10 \times (2)^2$$

$S_2 = 20$ m

Then, distance between them will be

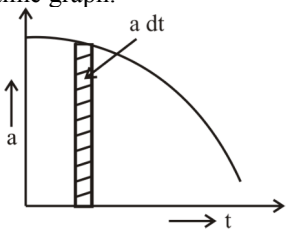
$S_1 - S_2 = 45 - 20 = 25$ m

525. ..... represents the area under acceleration - time graph.

(a) Acceleration (b) Displacement
(c) Motion (d) Change in velocity

(HPPSC POLY. LECT. 2016)

Ans : (d) Change in velocity represent the area under acceleration - time graph.



$$a = \frac{dv}{dt}$$

$$dv = a\ dt$$

$$\int dv = \int a\ dt$$

$$v_2 - v_1 = \int a\ dt$$

526. The speed of a particle moving in circular path is 600 rpm. Then, the angular velocity of the particle is

(a) 20π rad/ sec (b) 10 π rad/sec
(c) 20 /π rad/sec (d) 10/πrad / sec

TSPSC AEE 2015

Ans : (a) Speed. fo a particle = 600 rpm.

$$\text{Angular velocity} = \frac{2\pi N}{60}\ \text{rad/sec.}$$

$$= \frac{2\pi \times 600}{60}\ \text{rad/sec.}$$

Angular velocity = 20π rad/sec.

527. The tension in the cable supporting a lift is more when the lift is

(a) Moving downwards with uniform velocity.
(b) Moving upwards with uniform velocity.
(c) Moving upwards with acceleration.
(d) moving downwards with acceleration.

UPPSC AE 12.04.2016 Paper-I

Ans : (c) The tension in the cable supporting a lift is more when the lift is moving upwards with acceleration.

528. An object having 10 Kg mass and weights as 9.81 N on a spring balance. The value of "g" at that place is

(a) 9.81 m/s^2 (b) 10.m/s^2
(c) 0.981m/s^2 (d) 98.1 m/s^2

UJVNL AE 2016

Ans : (c) Given, Object mass = 10 kg
Spring weight = 9.81 N
W = mg
9.81 = 10 × g
g = 0.981 m/sec^2

529. A rigid body can be replaced by two masses placed at fixed distance apart. The two masses form an equivalent dynamic system, if (select the most appropriate answer).

(a) The sum of the two masses is equal to the total mass of the body.
(b) The centre of gravity of two masses coincide with that of the body
(c) The sum of the mass moment of inertia of the masses about their centre of gravity is equal to the mass moment inertia of the body.
(d) All of the above.

UPPSC AE 12.04.2016 Paper-I

Ans : (d) (i) The centre of gravity of two masses coincide with that of the body
(ii) The sum of the two masses is equal to the total mass of the body
(iii) The sum of the mass moment of inertia of the masses about their centre of gravity is equal to the mass moment inertia of the body

530. If the body falls freely under gravity, then the gravitational acceleration is taken as

(a) + 8.91 m/s^2 (b) – 8.91m/s^2
(c) + 9.81 m/s^2 (d) – 9.81 m/s^2

TSPSC AEE 2015

Ans : (c) If the body falls freely under gravity, then the gravitational acceleration is taken as + 9.81 m/sec^2

Search on Telegram @apna_pdf

531. How much force will be exerted by the floor of the lift on a passenger of 80 kg mass when lift is accelerating downward at 0.81 m/s^2?

(a) 740 N (b) 700 N
(c) 720 N (d) 680 N

CIL MT 26.03.2017

Ans. (c) : F_{net} = mg-ma = m(g-a)
= 80 (9.81-0.81) = 80×9 = 720 N

532. If velocity of a body change from 50 m/s to 200 m/s in 20 seconds, then the acceleration of the body is:

(a) 5.0 m/s^2 (b) 6.5 m/s^2
(c) 6.0 m/s^2 (d) 7.0 m/s^2
(e) 7.5 m/s^2

(CGPSC Polytechnic Lecturer 2017)

Ans. (e) : v_1 = 50 m/s, v_2 = 200 m/s, t = 20 s
Then acceleration (a) is given as
a = rate change in velocity

$$a = \frac{dv}{dt} = \frac{200-50}{20} = \frac{150}{20}$$

$$\boxed{a = 7.5\ m/sec^2}$$

533. A particle of mass 1 kg moves in a straight line under the influence of a force which increases linearly with time at the rate of 60N/ s, it being 40 N initially. The position of the particle after a lapse of 5s, if it started from rest at the origin, will be

(a) 1250 m (b) 1500 m
(c) 1750 m (d) 2000 m

ESE 2019

Ans. (c) : Given,

$$m = 1\ kg,\ \frac{dF}{dt} = 60\ N/s$$

$$dF = 60\ dt$$

$$\int dF = \int 60\ dt$$

$$F = 60\ t + c \quad .....(1)$$

at t = 0 F = 40

$$c = 40 \quad [from\ (1)]$$

$$\therefore \quad F = 60t + 40 \quad .....(2)$$

Using Newton's second law –

$$F = ma = 1 \times a = a$$

From equation (2)

$$a = 60t + 40$$

$$\frac{dv}{dt} = 60t + 40$$

$$dv = 60t \times dt + 40dt$$

Integrating it

$$\int dv = \int 60t \times dt + \int 40\ dt$$

$$v = 60\frac{t^2}{2} + 40t + c_1 \quad .....(3)$$

at t = 0, v = 0, $\therefore\ c_1 = 0$

Then $V = \frac{60t^2}{2} + 40t$

$$\frac{ds}{dt} = \frac{60t^2}{2} + 40t$$

Again integrating

$$\int ds = \int \frac{60t^2}{2} dt + \int 40t\ dt$$

$$s = \frac{60t^3}{6} + \frac{40t^2}{2} + c_2 \quad .....(4)$$

at t = 0, s = 0, $\therefore\ c_2 = 0$

then $s = \frac{60t^3}{6} + \frac{40t^2}{2}$

at t = 5 s

$$s = \frac{60\times5^3}{6} + \frac{40\times5^2}{2}, \quad s = 1750\ m$$

534. An elevator has a downward acceleration of 0.1 g m/s^2. What force will be transmitted to the floor of elevator by a man of weight 'W' travelling in the elevator?

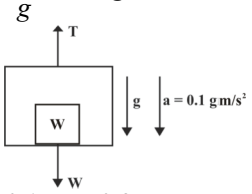
(a) W (b) W/10
(c) 11W/10 (d) 9W/10

UPRVUNL AE 07.10.2016

Ans. (d) : Newton's Second Law of motion

$$F_{net} = W - T = ma$$

$$W - T = \frac{W}{g} \times 0.1 \times g = 0.1 \times W$$



T = W - 0.1 W = 0.9 W

$$\boxed{T = \frac{9}{10}W}$$

535. Which of the following statements of D'Alembert's principle are correct?

1. **The net external force F actually acting on the body and the inertia force F_t together keep the body in a state of fictitious equilibrium**
2. **The equation of motion may be written as F + (– ma) = 0 and the fictitious force (– ma) is called an inertia force**
3. **It tends to give solution of a static problem an appearance akin to that of a dynamic problem.**

(a) 1 and 3 only (b) 1 and 2 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2020

Ans. (d) : 1, 2 and 3

536. A 2000 kg of automobile is driven down a 5 degree inclined plane at a 100 km/h, when the brakes are applied causing a constant total braking force (applied by the road on the tires) of 7 kN. Determine the distance traveled by the automobile as it comes to a stop.

(a) 146 m (b) 152 m
(c) 135.86 m (d) 122.44 m
(e) 149.5 m

CGPSC AE 26.04.2014 Shift-I

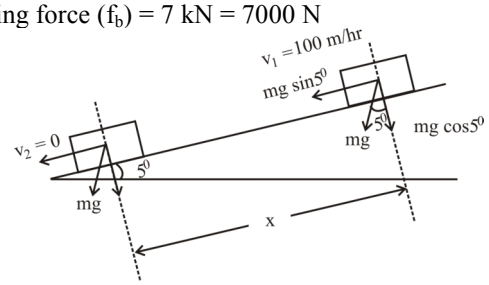
Ans. (a) : Given,
mass (m) = 2000 kg

Search on Telegram @apna_pdf

inclination (θ) = 5°

velocity (v_1) = 100 km/hr $= 100 \times \frac{5}{18} = 27.78$ m/s

braking force (f_b) = 7 kN = 7000 N



Apply work-energy principle

$$W_{1\text{-}2} = (K.E)_2 - (K.E)_1$$

$$(2000\ g \sin 5°)x - 7000\ x = 0 - \frac{1}{2}mv_1^2$$

$$-5290\ x = -771728.4$$

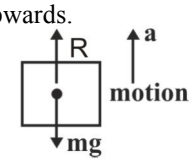
$$x = 145.88 \simeq 146 \text{ m}$$

537. Determine the apparent weight of a 70 kg man in a elevator when the acceleration of elevator is 2 m/s^2 upwards.

(a) 700 N (b) 686.7 N
(c) 826.7 N (d) 560 N
(e) 4.67 N

CGPSC AE 26.04.2014 Shift-I

Ans. (c) : As the elevator is moving upwards i.e. in the direction of reaction force, therefore, the net force would be R-mg upwards.



Following equation obtained from Newton's second law

$F_{net} = R - mg$

$R - mg = ma$

$R = mg + ma = m(g + a)$

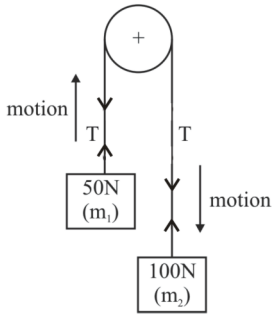
$R = 70\ (9.81 + 2) = 826.7$ N

538. Two blocks of 50 N and 100 N are connected by a light cord passing over a smooth frictionless pulley. The acceleration in blocks and tension in rope are respectively given by: [g = acceleration due to gravity]

(a) g/2, 40 N (b) g/3, 66.67 N
(c) g, 200 N (d) g/5, 40 N
(e) g/4, 50 N

CGPSC AE 25.02.2018

Ans. (b) : Using Newton's second law of motion



In equilibrium

$F_{net} = T - 50 = m_1 a$ .....(i)

$100 - T = m_2 a$ .....(ii)

from equation (i)

$$T - 50 = \frac{50}{g} \times a$$

$$T = \frac{50}{g} \times a + 50 \quad \text{.....(iii)}$$

from equation (ii)

$$100 - T = \frac{100}{g} a$$

$$T = 100 - \frac{100}{g} a \quad \text{.....(iv)}$$

equating equation (iii) & (iv)

$$\frac{100}{g} a + 50 = 100 - \frac{100}{g} a$$

$$\frac{150}{g} a = 50$$

$$\boxed{a = \frac{g}{3}}$$

summation of equation (iii) & (iv)

$$2T = 150 - \frac{50a}{g} = 150 - \frac{50}{3}$$

$$T = 66.67$$

539. A car of mass 150 kg is traveling on a horizontal track at 36 Km/hr. The time needed to stop the car is _____ (take $\mu = 0.45$).

(a) t = 2.26 sec (b) t = 3.20 sec
(c) t = 3.8 sec (d) t = 4.2 sec

TNPSC AE 2014

Ans. (a) : Given,

m = 150 kg, V = 36 km/hr = 10 m/s, $\mu = 0.45$

We know that,

Friction force = $\mu \times mg$

$F = 0.45 \times 150 \times 9.81$

$F = 662.175$ N

Let's suppose that the car stops after traveling a distance d. During this time the entire kinetic energy will be exhausted into the work done by the friction force $F \times d = \frac{1}{2} mv^2$

$$662.175 \times d = \frac{1}{2} \times 150 \times (10)^2$$

$$\boxed{d = 11.326 \text{ m}}$$

Then $v^2 = u^2 - 2ad$

$v = 0$

$u^2 = 2ad$

$(10)^2 = 2a \times 11.362$

$$\boxed{a = 4.414 \text{ m/s}^2}$$

Then $v = u - at$

$10 = 4.414 \times t$

$$\boxed{t = 2.2652 \text{ sec.}}$$

540. A car starting from rest attains a maximum speed of 100 kmph in 20 seconds. What will be its acceleration assuming it is uniform?

Search on Telegram @apna_pdf

(a) 1.0 m/s^2 (b) 1.4 m/s^2
(c) 1.8 m/s^2 (d) 2.0 m/s^2

CIL MT 26.03.2017

Ans. (b) : Initial velocity (u) = 0
Final velocity (v) = 100 kmph

$$= 100 \times \frac{5}{18} = \frac{500}{18} m/s$$

Time (t) = 20 sec.
v = u + at

$$\Rightarrow a = \frac{v-u}{t} = \frac{\frac{500}{18}}{20} = \frac{500}{18 \times 20} = 1.38\ m/s$$

541. ……deals with relationship between forces and the resulting motion of bodies on which they act.
(a) Dynamics of elastic bodies
(b) Statics
(c) Kinetics
(d) Theory of plasticity

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : Kinetics- kinetics deals with motion of body under the action of force under consideration
According to Newton's 2nd law.

$$\boxed{\vec{F} = m\vec{a}}$$

Kinematics – kinematics deals with motion of body without consideration of force of action.
In kinematics we deals with displacement, velocity and acceleration of body.

542. Which of the following equations is an equation of motion?
(a) $v = u + at^2$ (b) $v^2 - u^2 = 2at$
(c) $s = ut + \frac{1}{2}at^2$ (d) $u = s + at$

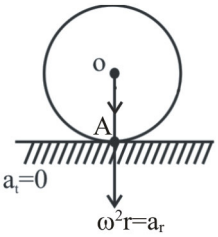
HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : According to Newton's law of motion equation,
(i) $v = u + at$
(ii) $s = ut + \frac{1}{2}at^2$
(iii) $v^2 = u^2 + 2as$
Where, u = initial velocity
v = final velocity
a = acceleration
t = time duration
s = distance

543. A solid disc of radius r rolls without slipping on the horizontal floor with angular velocity ω and angular acceleration α, the magnitude of acceleration of the point of contact on the disc is:
(a) Zero (b) rα
(c) $\sqrt{(r\alpha)^2 + (r\omega^2)^2}$ (d) rω^2

NPCIL ET, 2015, BEL PE 2015, GATE 2012

Ans. (d) :



Acceleration at point 'A'

$$a_A = \sqrt{a_T + a_r}$$

$$\overrightarrow{a_c} = 0 + \omega^2 r = \omega^2 r$$

544. Consider an attractive force which is central but inversely proportional to the distance from the centre. If a particle is in a circular orbit under such a force, its period is
(a) independent of the radius of the orbit
(b) proportional to the radius of the orbit
(c) proportional to the square of the radius of the orbit
(d) independent to the square of the radius of the orbit

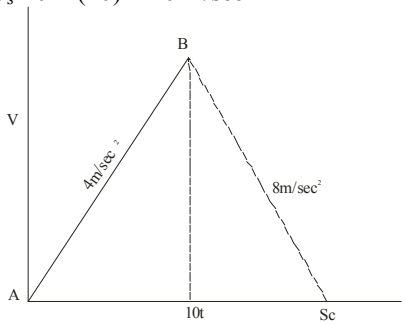
WBPSC AE, 2007

Ans. (c) : Consider an attractive force which is central but inversely proportional to the distance from the centre. If a particle is in a circular orbit under such a force, its period is proportional to the square of the radius of the orbit.

545. A motorbike starts from rest and accelerates at a rate of 4 m/sec^2 for 10 seconds and then decelerates at 8 m/sec^2 until it stops. The total distance travelled is
(a) 100 m (b) 200 m
(c) 300 m (d) 500 m

TRB Poly. Lect., 2012

Ans. (c) : For A-B
u= 0, a=4 m/sec^2, t = 10sec.
v= u+at
v_s= 0+4(10) = 40 m/sec



For B-C
v = u+ at
v_b=o+4(10)= 40 m/Sec.
= v = u + at,
u_c= 40m/sec., v_D =o
v_b= u_c+ at a= –8 m/sec^2
0 = 40+(-8)t
8t=40

Search on Telegram @apna_pdf

$$t = \frac{40}{8} = 5\,\text{sec}$$

Area under velocity time graph gives displacement =

$$\text{Area} = \text{Distance} = \frac{1}{2}\times 10 \times \frac{20}{40} + \frac{1}{2}\times 5 \times 20 \times 2$$

$$= 200+100$$

$$=300\ \text{m}$$

546. The linear acceleration (a) of a body of radius (r) with an angular acceleration of α rad/s², is:

(a) $a = \alpha / r$ (b) $a = \alpha . r$

(c) $a = r / \alpha$ (d) $a = \alpha^2 r$

TSPSC Managers, 2015

Ans. (b) : linear acceleration (a) = rα

Radial acceleration (a_r) = $\omega^2 r$

ω = angular velocity

r = radius

547. A particle is of weight 8 kg. When it is allowed to fall under the force of gravity its momentum at the time t = 2 sec would be ____ kg sec.

(a) 2 (b) 8

(c) 16 (d) 32

MPSC Poly. Lect. 2014

Ans. (c) : m = 8 kg

t = 2 sec

v = u + at

v = at = 9.81 × 2 = 19.62 m/s

$$\text{Momentum } P = mv = 8 \times 19.62 \left(\frac{\text{kgm}}{\text{s}}\right)$$

Momentum in kg-sec

$$P = 8 \times 19.62 \left(\frac{\text{kgm}}{\text{s}}\right) \times \frac{1}{9.81}\left(\frac{\text{s}^2}{\text{m}}\right)$$

$$\boxed{P = 16\ \text{kg-sec}}$$

548. A stone of mass 1 kg is tied to a string of length 1m and whirled in a horizontal circle at a constant angular speed 5 rad/sec. The tension in the string is :

(a) 30 N (b) 25 N

(c) 15 N (d) 10 N

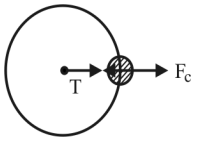
Kerala PSC Asstt. Prof. 27.09.2016

Ans. (b) : $T = F_C$

$F_C = mr\omega^2$

Where, T = Tension

F_C = Centrifugal force



$$= 1\text{kg} \times 1\text{m} \times \left(\frac{5\text{rad}}{\text{sec}}\right)^2$$

$F_C = T = 25$ N

549. What is the motion of a particle rounded a fixed axis called?

(a) Translatory

(b) Rotary

(c) Circular

(d) Translatory as well as rotory

VIZAG STEEL MT 2011

TNPSC ACF 2012

Ans. (c) : The motion of particle round a fined axis is circular.

550. A body of mass 1 kg when subjected to a force results in a displacement y (measured in meters) given by $y = 5t^2 + 2t$, where t is in secs. The force acting on the body is equal to

(a) 2 N (b) 5 N

(c) 7 N (d) 10 N

DRDO Scientists 2009

Ans. (d) : Displacement velocity acceleration force

$y = 5t^2+2t$

$\dot{y} = 10t+2$

$\ddot{y} = 10$

$F = m\ddot{y} = 10\text{N}$

551. The velocity of a particle moving in a straight line is given by, $V=2t^3-t^2 + 10$. Its acceleration at t =6 sec will be

(a) 406 ms^{-2} (b) 204ms^{-2}

(c) 308ms^{-2} (d) 23 ms^{-2}

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : $V=2t^3-t^2 + 10$.

$$a = \frac{dv}{dt} = 6t^2 - 2t$$

at time (t) =6 sec

$a=6\,(6)^2-2\,(6) = 204\ \text{m/s}^2$

552. The component of acceleration directed towards center of curvature when a body moves around a curve is

(a) linear acceleration

(b) normal acceleration

(c) tangential acceleration

(d) total acceleration

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : normal acceleration

553. A particle moves along a straight line so that its displacement in metres from a fixed point to $s = 2t^3+4t^2-6t+8$. The acceleration after 4 seconds is :

(a) 8 m/s^2 (b) 176 m/s^2

(c) 122 m/s^2 (d) 56 m/s^2

TNPSC AE (Industries) 09.06.2013

Ans. (d) : $s = 2t^3+4t^2-6t+8$

$$\frac{ds}{dt} = 6t^2 + 8t - 6$$

$$\frac{d^2s}{dt^2} = 12t + 8$$

$$\text{acceleration, } a = \frac{d^2s}{dt^2}$$

acceleration, (at t=4 sec) =12(4)+8 =56 m/s^2

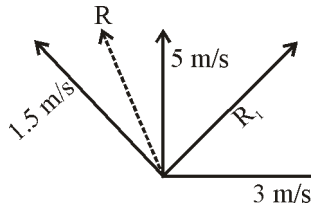
Search on Telegram @apna_pdf

554. A ship is sailing north at a velocity of 5 m/s. The current is taking its east at the rate of 3 m/s, and a sailor is climbing a vertical mass at the rate of 1.5 m/s. What is the absolute velocity the sailor ?

(a) 5.02 m/s (b) 6.02 m/s
(c) 9.5 m/s (d) 6.5 m/s

TNPSC AE (Industries) 09.06.2013

Ans. (b) :



$R = \sqrt{R_1^2 + 1.5^2}$ ——(i)

$R_1 = \sqrt{5^2 + 3^2}$

$= \sqrt{34}$

From equation (i)

$= \sqrt{34 + 2.25}$

$= \sqrt{36.25}$

R = 6.02 m/s

555. The motion of a particle is defined by the relation $x = \frac{5}{2}t^2 - 20t + 10$, where x and t are expressed in meters and seconds respectively. The position x of the particle at zero velocity is

(a) 30 m (b) –30 m
(c) –20 m (d) 50 m

DRDO Scientists 2008

Ans. (b) : Displacement velocity

$x = \frac{5t^2}{2} - 20t + 10$

$\dot{x} = 5t - 20$

$0 = 5t - 20$

t = 4 sec.

x = ? at t = 4

So displacement

$x = \frac{5}{2} \times 16 - 20(4) + 10 = -30m$

556. A body is moving with uniform acceleration. In 4th second of its travel it covers 20 m and 30 m in 8th second. The distance traveled at the 10th seconds is (in m):

(a) 24 (b) 35
(c) 43 (d) 52

HPPSC ADF 05.03.2019

Ans. (b) : $S_n = u + \frac{a}{2}(2n-1)$

$20 = u + \frac{a}{2}(7)$

$30 = u + \frac{a}{2}(15)$

4a = 10

a = 2.5

$u = \frac{45}{4}$

$\therefore S_w = u + \frac{a}{2}(2n-1)$

$= \frac{45}{4} + \frac{5}{4} \times \frac{1}{2}(19)$

$= \frac{140}{4} = 35m$

557. A 75 Kg (736 N) man stands on a spring scale in an elevator. During the first 3 seconds of motion from rest, the tension T in the hoisting cable is 8110 N. The total mass elevator, man and scale is 750 kg (7360 N). The reading R of the scale in newton's is _____.

(a) 750 N (b) 1250 N
(c) 811 N (d) 830 N

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) : Given–

t = 3 sec, u = 0

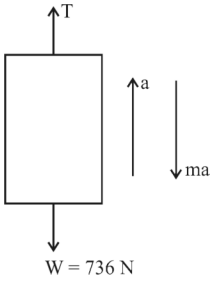
T = 8110 N

$\Sigma F = ma$

$T - W = 750 \times a$

$8110 - 7360 = 750 \times a$

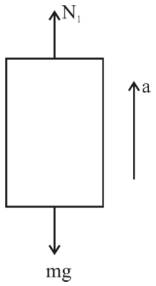
$a = 1\ m/s^2$



Now, $v = u + at$

$v = 0 + (1 \times 3)$

$v = 3\ m/s^2$



For upward (elevator) motion–

$N_1 - mg = ma$

$N_1 = ma + mg$

$= m(a + g)$

$N_1 = 75(1 + 9.81)$

$= 75 \times 10.81$

$N_1 = 810.75$ N

$N_1 \approx 811$ N

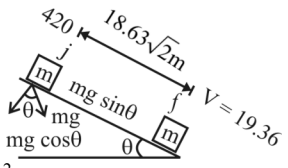
558. A particle while sliding down a smooth plane of $18.36\sqrt{2}$ m length acquires a velocity of 19.86 m/sec. The inclination of plane is

Search on Telegram @apna_pdf

(a) 30º (b) 60º
(c) 45º (d) 75º

GPSC Lect. (Poly.) 07.12.2014

Ans. (c) :



$v^2 = u^2 + 2as$

$(19.36)^2 = 0 + 2a \times 18.36\sqrt{2}$

$a = \dfrac{(19.86)^2}{2\times 18.36\sqrt{2}}$

$a = 7.59\ m/s^2$

$F = ma$

$mg \sin\theta = m.a$

$\sin\theta = \dfrac{7.59}{9.81}$

$\boxed{\theta = 50.73}$

Nearest option is option (c) i.e. 45°

7. Work, Power and Energy

559. If a rigid body is in equilibrium, the total virtual work of the external forces acting on the rigid body due to virtual displacement of the body is _____

(a) $-\infty$ (b) 1
(c) 0 (d) $+\infty$

Oil India Limited Sr. Engineer (Production) 30.11.2019
Karnataka PSC Lect., 27.05.2017
HPPSC AE (PWD) 10.09.2016

Ans. (c) : We know that if a system of forces acting on a body or a system of bodies be in equilibrium and the system be imagined to undergo a small displacement with the geometric conditions, then algebraic sum of the virtual work done by all the forces of the system is zero.
For rigid body is in equilibrium the total work of the external forces acting on the rigid body due to virtual displacement of the body is 0.

560. Which of the following types of energy is possessed by a tightly wound watch spring?

(a) Radial energy (b) Kinetic energy
(c) Strain energy (d) Circular energy

KPCL AE 2016
MECON MT 2019

Ans. (c) : A wound spring has potential energy. The spring does not possesses kinetic energy until it is released and starts to move. Hence energy in the form of potential energy is stored in the spring and when it is unwound it transfers its to energy to the moving parts in the form of kinetic energy.
Strain energy is a form of potential energy stored in the material.

561. When a body of mass moment of inertia about its axis (I) is rotated about the axis with an angular velocity (ω), then the kinetic energy of rotation is:

(a) $0.5\ (I^2\omega)$ (b) $2\ (I\omega^2)$
(c) $I\omega^2$ (d) $0.5\ (I\omega^2)$

CIL MT 27.02.2020
TNPSC AE 2013
TNPSC AE 2018

Ans. (d) : Kinetic energy $K = \dfrac{1}{2}mV^2$

Rotational kinetic energy due to the rotation of an object and is part of its total kinetic energy. Looking at rotational energy separately around an object's axis of rotation, the following dependence on the object moment of inertia is observed.

$(KE)_{rotational} = \dfrac{1}{2}I\omega^2$

$(KE)_{rotational} = 0.5\ (I\omega^2)$

562. Two particles with masses in the ratio 1:4 are moving with equal kinetic energies. The magnitude of their linear momentums will conform to the ratio

(a) 1:8 (b) 1:2
(c) $\sqrt{2}:1$ (d) $\sqrt{2}$

ISRO Scientist/Engineer 2007
GPSC DEE Class-2 (GWSSB) 04.07.2021

Ans. (b) :

$$\frac{1}{2}m_1v_1^2 = \frac{1}{2}m_2v_2^2$$

$$\frac{m_1}{m_2} = \left(\frac{v_2}{v_1}\right)^2$$

$$\frac{v_2}{v_1} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

$$\frac{(momentum)_1}{(momentum)_2} = \frac{P_1}{P_2} = \frac{m_1v_1}{m_2v_2}$$

$$= \frac{1}{4}\times\frac{2}{1}$$

$$\frac{P_1}{P_2} = \frac{1}{2}$$

563. If two bodies one light and other heavy have equal kinetic energies, which one has a greater momentum

(a) Heavy body
(b) Light body
(c) Both have equal momentum
(d) It depends on the actual velocities

TRB Asstt. Prof., 2012
ISRO Scientist/Engineer 2007

Ans. (a) : Kinetic energy are same $\dfrac{1}{2}m_lv_l^2 = \dfrac{1}{2}m_hv_h^2$

$$\frac{m_l}{m_h} = \left(\frac{V_h}{V_l}\right)^2$$

the ratio of momentum

$$\frac{m_hV_h}{m_lV_l} = \left(\frac{m_h}{m_l}\right)\left(\frac{V_h}{V_l}\right)$$

Search on Telegram @apna_pdf

$$= \left(\frac{V_l}{V_h}\right)^2 \times \frac{V_h}{V_l} = \frac{V_l}{V_h} = \sqrt{\frac{m_h}{m_{ll}}} > 1$$

so heavy body have greater momentum

564. The wheels of a moving car posses

(a) potential energy only
(b) kinetic energy of translation only
(c) kinetic energy of rotation only
(d) kinetic energy of translation and rotation both

TNPSC AE 2019
UKPSC AE 2007 Paper -I

Ans. (d) : The wheels of a moving car posses kinetic energy of translation and rotation both.

565. A boy walks up a stalled escalator in 90 seconds. When the same escalator moves, he is carried up in 60 seconds. How much time would it take him to walk up the moving escalator?

(a) 48 seconds (b) 36 seconds
(c) 30 seconds (d) 24 seconds

ESE 2017
ISRO Scientist/Engineer 2006

Ans. (b) : Let 'ℓ' be length of escalator,

Velocity of boy $v_b = \frac{\ell}{90}$

Velocity of escalator $v_e = \frac{\ell}{60}$

If both start moving,

$$\text{Time} = \frac{\ell}{\left(\frac{\ell}{90}\right)+\left(\frac{\ell}{60}\right)} = 36 \text{ sec.}$$

566. The escape velocity on the surface of the earth is

(a) 11.2 km/s (b) 8.2 km/s
(c) 3.2 km/s (d) 1.2 km/s

UKPSC AE 2012 Paper-I
UKPSC AE 2007 Paper -I
TNPSC AE (Industries) 09.06.2013

Ans. (a) : 11.2 km/s

567. Condition for stable equilibrium of a conservative force system in terms of potential energy U is

(a) $\delta U = 0$ and $\delta^2 U = 0$
(b) $\delta U = 0$ and $\delta^2 U > 0$
(c) $\delta U = 0$ and $\delta^2 U < 0$
(d) $\delta U > 0$ and $\delta^2 U = 0$

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : Considering a potential energy U and a displacement of x, the force is given by

$$F = -\frac{\partial U}{\partial x}$$

For stable equilibrium

$$F = -\frac{\partial U}{\partial x} = 0$$

i.e. $\partial U = 0$ and $\frac{\partial^2 U}{\partial^2 x} > 0$

568. A truck hauls a trailer at 40 km/hour when exerting a steady pull of 600N. If the work is done for 40 minutes, the power required is

(a) 6 kW (b) 4 kW
(c) 2.4 kW (d) 10 kW

ISRO Scientist/Engineer 22.04.2018

Ans. (d) : Velocity is given as

$$V = 60 \times \frac{5}{18} = \frac{50}{3} \text{ m/sec}$$

We know that Power

$$P = F \times V = 600 \times \frac{50}{3}$$

P = 10,000 W
P = 10 kW

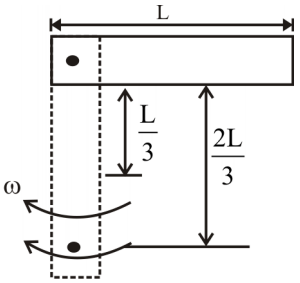
Note:- Power is work done per unit time so it does not matter for how long your hauls it.

569. A thin uniform rod of mass M and length L is hinged at its upper end, and released from rest from a horizontal position. The tension at a point located at a distance L/3 from the hinge point, when the rod becomes vertical, will be

(a) 22 Mg/27 (b) 11 Mg/13
(c) 6 Mg/11 (d) 2 Mg

GPSC EE Pre, 28.01.2017

Ans. (d) :



Taking energy equation, we get

$$\frac{1}{2} I\omega^2 = Mg \times \frac{L}{2}$$

$$\omega^2 \times \frac{1}{2} \times \frac{ML^2}{3} = Mg \times \frac{L}{2}$$

$$\omega = \sqrt{\frac{3g}{L}}$$

Let T be tension at hinge point and T be tension at $\frac{L}{3}$ position.

From FBD-

$$T = Mg + \frac{Mv^2}{r}$$

$$= M[g + r\omega^2]$$

$$= M\left[g + \frac{2L}{3} \times \frac{3g}{L}\right]$$

$$= \frac{2M}{3}[g + 2g] = \frac{2M}{3} \times 3g$$

$$T = 2Mg$$

Search on Telegram @apna_pdf

570. If D is the distance moved by effort and d is the distance moved by load then the velocity ratio is given by:

(a) d/D (b) D/d
(c) d×D (d) 1/(d×D)

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (b) : $\text{Velocity Ratio} = \frac{\text{Distance moved by effort}}{\text{Distance moved by load}}$

$\text{VR} = \frac{D}{d}$

571. Capacity to exert force through a distance, is called

(a) Entropy (b) Energy
(c) Power (d) Work

Oil India Senior Officer 23.12.2020

Ans. (d) : Capacity to exert force through a distance, is called work.

572. An electric motor drives a punching press. A flywheel fitted to the press has a radius of gyration of 0.5 m and runs at 250 rpm. The press is capable of punching 800 holes per hour with each punching operation taking 1.5 seconds and requiring 12,000 N-m of work. The energy delivered by the motor during punching operation is

(a) 2000 N-m (b) 3000 N-m
(c) 4000 N-m (d) 5000 N-m

ESE 18.07.2021

Ans. (c) : Given, Actual punching time, $t_a = 1.5$ sec
Cycle time or time required to complete one ratio, $T_c = 4.5$ sec.

$\left[\because 800\,\text{hole/hr} \quad 1\,\text{hole}/4.5\,\text{sec.}\right]$

Energy required-

$E_{req} = 12000$ N-m or Joule

$\therefore\ P_{motor} = \frac{E_{req}}{T_c} = \frac{12000}{4.5}$ Joule/sec

$\therefore$ Energy delivered by motor,

$E = P_{motor} \times t_a$

$= \frac{12000}{4.5} \times 1.5$

$= 4000$ Joule

$\boxed{E = 4000\ \text{N} - \text{m}}$

573. For a conservative force, the work done is independent of

(a) path (b) time
(c) distance (d) All of the above

APPSC AEE SCREENING 17.02.2019

Ans. (d) : Conservative force are electrical force, gravitational force and elastic force etc.

574. The energy possessed by a body, for doing work by virtue of its position, is called-

(a) Potential energy (b) kinetic energy
(c) electrical energy (d) chemical energy

TNPSC AE 2018
TNPSC ACF 2012

Ans. (a) : The energy possessed by a body, for doing work by virtue of its position, is called Potential energy.

P. E. = mgh

K. E. = $\frac{1}{2}mv^2$

E. E. = i^2Rt

575. A block A is dropped down along a smooth inclined plane, while another block B is released for free fall from the same height

(a) Both will hit the ground simultaneously
(b) Block A will have higher velocity than block B while hitting the ground
(c) Block A will hit the ground earlier
(d) Block B will hit the ground earlier

Gujarat PSC AE 2019

Ans : (a) : Initially both block have same potential energy and at the lowest point both block have same kinetic energy in absence of friction.
So both block have same velocity and both will hit the ground simultaneously.

576. Wheel has mass 100 kg and radius of gyration of 0.2 m. The additional amount of energy stored in flywheel, if its speed increases from 30 rad/s to 35 rad/s, will be:

(a) 65 J (b) 650 kJ
(c) 650 J (d) 65 kJ
(e) 65 MJ

CGPSC AE 25.02.2018

Ans. (c) : Data given :

m = 100kg k = 0.2
$\omega_1 = 30$ rad/s $\omega_2 = 35$ rad/s

Then additional amount of energy & forced in flywheel,

$\Delta E = E_2 - E_1$

$\Delta E = \frac{1}{2}I\omega_2^2 - \frac{1}{2}I\omega_1^2$

$= \frac{1}{2}\left[mk^2\right]\left[\omega_2^2 - \omega_1^2\right]$

$= \frac{1}{2} \times 100 \times (0.2)^2 [35-30][35+30]$

$\boxed{\Delta E = 650\ \text{J}}$

577. If the direction of force component and displacement is opposite, then the work done is-

(a) Positive (b) Negative
(c) Zero (d) Both (b) and (c)

MECON MT 2019

Ans. (b) : If the direction of force component and displacement is opposite, then the work done is negative.

578. If a satellite is orbiting around earth and its K.E. is doubled, then its:

(a) Orbits at higher
(b) Orbits in elliptical
(c) Falls back on earth
(d) Escape from earth's pull path

HPPSC ADF 05.03.2019

Ans. (d) : Kinetic energy of satellite = k

$\therefore\ k = kE = \frac{1}{2}mv_0^2;\quad m \rightarrow \text{mass of satelite}$

Search on Telegram @apna_pdf

$$v_0 = \sqrt{\frac{2k}{m}}$$

We know, for a satellite-

$$\frac{GMm}{r^2} = \frac{mv_0^2}{r} \Rightarrow v_0 = \sqrt{\frac{GM}{r}}$$

Also, escape velocity $= \sqrt{\frac{2GM}{r}} = \sqrt{2}v_0$

So, when kinetic energy is doubled k = 2k

$$v' = \sqrt{\frac{2k'}{m}} = \sqrt{\frac{2(2k)}{m}} = \sqrt{2}\sqrt{\frac{2k}{m}}$$

$$= \sqrt{2}\, v_0$$

Here, we can see on doubling the k.E., the velocity of satellite becomes equal to escape velocity.

579. The dimensional formula $[ML^2T^{-3}]$ represents

(a) work (b) power
(c) force (d) momentum

HPPSC Poly. Lect. 05.07.2021
Assam PSC CCE Pre 2015
UKPSC AE-2013, Paper-I

Ans. (b) : Dimension–

Power $= F.v$

$$= M \cdot \frac{L}{T^2} \cdot \frac{L}{T}$$

$$= ML^2T^{-3}$$

- Work is dimensionally represented as $[M^1L^2T^{-2}]$
- Force is dimensionally represented as $[MLT^{-2}]$
- Momentum is dimensionally is represented $[MLT^{-1}]$

580. What power is required to move a car along a level road at 100 km/hr against a horizontal resisting force of 2 kN along the line of motion if the overall efficiency is 85%?

(a) 100 W (b) 90 W
(c) 942 J (d) 65.3 W

CGPSC AE 15.01.2021

Ans. (*) : Given, Resisting force = 2kN

Velocity (V) = 100 km/hr

$$= 100 \times \frac{5}{18} = 27.77 \text{m/sec}$$

Overall efficiency, $\eta_o = 0.85$

$$\eta_o = \frac{F \times v}{\text{Power required}}$$

$$\text{Power required, (P)} = \frac{2 \times 27.77}{0.85}$$

$$= 65.35 \text{ kW}$$

Note- There is no option given in kW.

581. A train of weight 1200 kN is driven by an engine on a level track at a constant speed of 72 kmph. The resistance due to friction is 2% of the weight of the train. The power of the engine is_____ .

(a) 24 kW (b) 480 kW
(c) 72 kW (d) 96 kW

VIZAG MT, 14.12.2020

Ans. (b) : Given,

W = 1200 kN

v = 72 km/h = 20 m/s

Resistance due to friction = 2%

Power of engine = ?

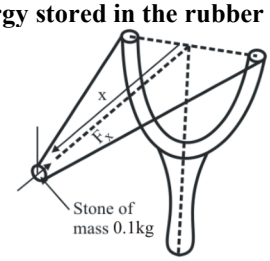
$$P = F_t \times v$$

$$= \mu \times N \times v$$

$$= 0.02 \times 1200 \times 20$$

$$\boxed{P = 480 \text{ kW}}$$

582. A stone with mass of 0.1 kg is catapulted as shown in the figure. The total force F_x (in N) exerted by the rubber band as a function of distance x (in m) is given by $F_x = 300x^2$ is the stone is displaced by 0.1 m from the un-stretched position (x = 0) of the rubber band, the energy stored in the rubber band is :



(a) 0.01 J (b) 0.1 J
(c) 1 J (d) 10 J

Vadodara Muncipal Corp. DEE, 2018
GATE 2011

Ans. (b) : Energy stored in rubber band = Workdone to place the stone

$$U = \int F_x d_x$$

$$= \int_0^{0.1} 300x^2 dx$$

$$= 300\left[\frac{x^3}{3}\right]_0^{0.1}$$

$$= 300 \times \left[\frac{0.1^3}{3} - 0\right]$$

$$\boxed{U = 0.1 \text{ J}}$$

583. If a solid cylinder and a hollow cylinder of the same mass are allowed to roll down an inclined plane simultaneously then.

(a) Hollow cylinder reach the ground first
(b) Solid cylinder reach the ground first
(c) Both reaches the ground at the same time
(d) Unpredictable

TSPSC Managers, 2015

Ans. (b) : Time taken to reach the bottom of the inclination plane.

$$t = \sqrt{\frac{2l\left(1 + \frac{k}{R^2}\right)}{g \sin\theta}}$$

Here, l is the length of inclination plane for solid cylinder $= k^2 = \frac{R^2}{2}$

For hollow cylinder $= k^2 = R^2$

Hence, solid cylinder will reach the bottom first.

584. The law of conservation of mechanical energy is valid :

(a) irrespective of the nature of force field
(b) only in gravitational field

Search on Telegram @apna_pdf

(c) only if the total work done by the particle in moving around in a closed trajectory
(d) only if the forces is tangential to the trajectory

J&K PSC Civil Services Pre, 2013

Ans. (a) : Law of conservation of mechanical energy is valid irrespective of the nature of force field.

585. Ten watt is equal to
(a) 10 Nm/hr (b) 1 N/mt
(c) 15 KNm/hr (d) 10 Nm/s

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (d) : We know that,
1 watt = 1 J/sec = 1 Nm/s [$\because$ 1J = 1 N-m]
$\therefore$ 10 watt = 10 Nm/s

586. If a system is in equilibrium and the position of the system depends upon many independent variables, the principle of virtual work states that the partial derivatives of its total potential energy with respect to each of the independent variable must be
(a) –1.0 (b) 0
(c) 1.0 (d) ∞

TSPSC AEE 2017
GATE 2006

Ans. (b) : Total potential energy = (Independent variable)
Hence for a system in equilibrium
Total P.E. = Constant
Thus P.D. of its total P.E. w.r.t. each independent variable must be zero.

587. Which of the following physical quantities is not a vector?
(a) Mass (b) Momentum
(c) Impulse (d) Acceleration

Assam PSC CCE Pre 2015

Ans. (a) : Vector Quantities– Displacement, Weight, Force, Momentum, Acceleration, Velocity
Scalar Quantities– Time, Distance mass, Area, Density, work, Temperature, Speed, Energy, Power

588. The rate of doing work is known as -
(a) Potential energy (b) Power
(c) Kinetic energy (d) Heat energy

GMB AAE 25.06.2017

Ans. (b) : Power : Rate of doing work known as power
It is amount of energy consumed per unit time.

$$P = \frac{dw}{dt} \text{ (w-work)}$$

$$P = \frac{d}{dt}(F.dx)$$

$$P = \left(\frac{dx}{dt}\right).F \qquad \left(\therefore v = \frac{dx}{dt}\right)$$

$$\boxed{P = F.v}$$

The unit of power is J/sec or watt.

589. The expression ($mv^2/2$), where m is the mass and v is the velocity; denotes
(a) centrifugal force (b) kinetic energy
(c) potential energy (d) centripetal force

Haryana PSC Civil Services Pre, 2014

Ans. (b) :

Centrifugal force = $\frac{mv^2}{r} = mr\omega^2$

Kinetic energy = $\frac{1}{2}mv^2$

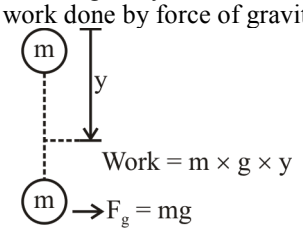
Potential energy = mgh

Centripetal force = equal and opposite of centrifugal force = $\frac{mv^2}{r}$ or $mr\omega^2$

590. When a body is freely falling, the work done by force of gravity is :
(a) Positive (b) Negative
(c) Zero (d) Infinite

MPPSC State Forest Service Exam, 2014

Ans. (a) : As the gravity force acts in downward direction, the work done by force of gravity is positive.

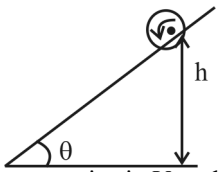


So, the work is +ve.

591. If a sphere, a solid cylinder and a hollow cylinder (all of identical masses) roll down the same inclined plane without sliding, which one will reach the bottom first?
(a) solid cylinder
(b) sphere
(c) hollow cylinder
(d) all of them simultaneously

OPSC Civil Services Pre 2006

Ans. (b) :



Let velocity at bottom point is V and Angular velocity ω
From energy conservation,

$$mgh = \frac{1}{2}I\omega^2 + \frac{1}{2}mv^2$$

$$mgh = \frac{1}{2}\frac{Iv^2}{r^2} + \frac{1}{2}mv^2$$

$$v = \sqrt{\frac{mgh}{\frac{I}{2r^2} + \frac{1}{2}m}}$$

For same, radius and mass, the body which have max mass moment of Inertia 'I', will have least velocity and reach the bottom last.

Mass MOI of solid cylinder or disc = $\frac{1}{2}mr^2$

Mass MOI of hollow cylinder or ring = mr^2

Mass MOI of solid sphere = $\frac{2}{5}mr^2$

Search on Telegram @apna_pdf

Mass MOI of hollow sphere $= \frac{2}{3}mr^2$

Sphere have least Mass MOI so it will reach bottom first.

592. A particle moves along a straight line with a starting velocity of V_0. If the retarding force on the particle is K times the distance travelled, the distance travelled by the particle before coming to rest is

(a) $\frac{2V_0}{K}$ (b) $\frac{2V_0}{\sqrt{K}}$

(c) $\frac{V_0}{K}$ (d) $\frac{V_0}{\sqrt{K}}$

OPSC Civil Services Pre 2006

Ans. (d) : F = – kx (Restoring force)

Kinetic energy = work done by force

$$-\frac{1}{2}mv_0^2 = -\int_0^x kxdx$$

$$\frac{1}{2}mv_0^2 = \frac{kx^2}{2}$$

$$x = v_0\sqrt{\frac{m}{k}}$$

$$x = \frac{v_0}{\sqrt{k}} \quad (\text{for } m = 1kg)$$

593. When is work said to be done?

(a) When a force acts on a body and the body undergoes displacement

(b) When a force acts on a body and the body undergoes no displacement

(c) When there is no force but the body undergoes a displacement

(d) None of these

KPCL AE 2016

Ans. (a) : Work is said to be done when a force acts on a body and the body undergoes a displacement.

Work = Force × displacement

W = F × d

594. The total energy possessed by a system of moving bodies is_____

(a) Varies according to the direction of movement

(b) Constant at any point in time

(c) Hyperbolically decreasing over time

(d) None of these

KPCL AE 2016

Ans. (b) : The total energy possessed by a system of moving bodies is constant any point in time. Total mechanical energy is the energy possessed by object due to either its motion or its stored energy of position. The total amount of mechanical energy is merely the sum of these two form of energy.

Note-Commission is right answer option (b or d), but actual correct answer is option (b).

595. A planet is moving around the sun in a circular orbit of circumference 'c', The work done on the planet by the gravitational force (F) of the sun in:

(a) $\frac{F}{C}$ (b) zero

(c) $\frac{FC}{2}$ (d) FC

WBPSC AE 2008

Ans. (b) : Planet is moving in circular orbit hence. Its displacement is tangential. The force acting is in radial direction. So force (F) and displacement ds are perpendicular to each other work done W = F.ds cos θ but $\theta = 90^0$

$\boxed{W = 0}$

596. An annular disc has a mass m, inner radius R and outer radius 2R. The disc rolls on a flat surface without slipping. If the velocity of the centre of mass is v, the kinetic energy of the disc is

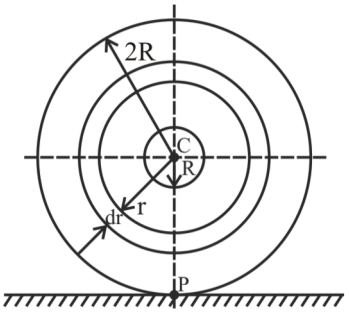
(a) $\frac{9}{6}mv^2$ (b) $\frac{11}{16}mv^2$

(c) $\frac{13}{16}mv^2$ (d) $\frac{15}{16}mv^2$

GPSC Asstt. Director of Transport 05.03.2017

GATE 2014

Ans. (c) :



$$I_C = \frac{1}{2}m(2R)^2 + \frac{1}{2}mR^2$$

$$= \frac{5}{2}mR^2$$

$$I_P = I_C + m(2R)^2$$

$$= \frac{5}{2}mR^2 + 4mR^2$$

$$= \frac{13}{2}mR^2$$

Point P can be considered as the instantaneous centre of rotation with angular velocity $\left(\frac{V}{2R}\right)$.

Kinetic energy $= \frac{1}{2}I_p\omega^2$

$$= \frac{1}{2} \times \frac{13}{2}mR^2 \times \left(\frac{V}{2R}\right)^2$$

$$= \frac{13}{16}mv^2$$

Search on Telegram @apna_pdf

597. Two metallic blocks having masses in the ratio 2:3 are made to slide down a friction less inclined plane starting initially from rest position. When these blocks reach the bottom of the inclined plane, they will have their kinetic energies in the ratio

(a) 2:3 (b) 3:5
(c) 3:2 (d) 7:4

ISRO Scientist/Engineer 2010
MPSC Poly. Lect. 2014
J&K PSC Civil Services Pre, 2013

Ans. (a) : Let two metallic block having mass $m_1 : m_2 = 2 : 3$

$$\frac{m_1}{m_2} = \frac{2}{3}$$

For mass m_1-
Kinetic energy

$$E_1 = \frac{1}{2} m_1 v^2$$

For mass m_2-
Kinetic energy

$$E_2 = \frac{1}{2} m_2 v^2$$

$$\frac{E_1}{E_2} = \frac{\frac{1}{2} m_1 v^2}{\frac{1}{2} m_2 v^2}$$

$$= \frac{m_1}{m_2} = \frac{2}{3}$$

598. A block whose mass is 650 gm is fastened to a spring of spring constant K equals 65 N/m whose other end is fixed. The block is pulled a distance x = 11cm from its equilibrium position at x = 0 on a smooth surface, and released from rest at t = 0. The maximum speed 'S' of the oscillating block is

(a) 11 cm/sec (b) 11 m/sec
(c) 11 mm/sec (d) 1.1 m/sec

ISRO Scientist/Engineer 2007

Ans. (d) : Maximum speed of spring will be at $x = 0$ when total spring energy will be converted into kinetic energy of mass

$$\frac{1}{2} kx^2 = \frac{1}{2} mv^2$$

$$\frac{1}{2} \times 65 \times (0.11)^2 = \frac{1}{2} \times (0.650) V^2$$

V = 1.1 m/sec.

599. The units of energy in SI units

(a) Joule (b) Watt
(c) Joule/sec. (d) Watt/sec.

UJVNL AE 2016
UKPSC AE 2012 Paper-I

Ans : (a) The units of energy in SI unit Joule
Energy:-
It may be defined as the capacity to do work. The energy exists in many forms e.g. mechanical, electrical, chemical, heat, light, etc. But we are mainly concerned with mechanical energy.

600. A circular disc rolls down without slipping on an inclined plane. The ratio of its rotational kinetic energy to the total kinetic energy is.

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$
(c) $\frac{1}{3}$ (d) $\frac{2}{3}$

UPPSC AE 12.04.2016 Paper-I

Ans : (c) Total kinetic Energy = $\frac{1}{2} I\omega^2 + \frac{1}{2} mv^2$

Rotational kinetic Energy = $\frac{1}{2} I\omega^2$

Moment of Inertia of Circular disc = $\frac{1}{2} mR^2$

Total kinetic Energy = $\frac{1}{2} \times \frac{1}{2} mR^2 \times \omega^2 + \frac{1}{2} m(R.\omega)^2$

Total kinetic Energy = $\frac{1}{4} mR^2\omega^2 + \frac{1}{2} mR^2\omega^2$

Total kinetic Energy = $\frac{3}{4} mR^2\omega^2$

Rotational kinetic Energy = $\frac{1}{2}\left(\frac{mR^2}{2}\right)\omega^2$

Rotational kinetic Energy = $\frac{1}{4} m^2R^2\omega^2$

Ratio of rotational kinetic Energy of the Total Kinetic Energy = $\frac{\frac{1}{4} m^2R^2\omega^2}{\frac{1}{4} mR^2\omega^2 + \frac{1}{2} mR^2\omega^2} = \frac{1}{3}$

601. If a particle is in static equilibrium, then the work done by the system of force acting on that particle is:

(a) Negative (b) Infinity
(c) Zero (d) Positive

CIL MT 26.03.2017

Ans. (c) : Static equilibrium is a state in which the net force and net torque acted upon the system is zero. In other words, both linear momentum and angular momentum of the system are conserved.

602. Which conversion is incorrect?

(a) 1 kWh = 3.6×10^6 Nm
(b) 1 Nm = 0.238×10^{-3} kcal
(c) 1 HP hr = 0.746 kWh
(d) 1kcal = 4.1868 Nm

UPPSC AE 12.04.2016 Paper-I

Ans : (d) (i) 1 kWh = 3.6×10^6 Nm
(ii) 1 Nm = 0.238×10^{-3} kcal
(iii) 1 HP hr = 0.746 kWh
(iv) 1cal = 4.1868 Nm

603. A body of mass 20 kg is lifted up through a height of 4 m. How much work is done? (take g = 9.81 m/s^2)

(a) 648 J (b) 684 J
(c) 748 J (d) 784 J
(e) 848 J

(CGPSC Polytechnic Lecturer 2017)

Search on Telegram @apna_pdf

Ans. (d) : Work done to left a mass of 20 kg upto 4 m

W = Force × distance

= m × g × 4

= 20 × 9.81 × 4

= 784.80 N-m

= 784 J

604. A man weighing 900 N climbs a staircase of 15 m height in 30 seconds. How much power is consumed?

(a) 150 watt (b) 250 watt

(c) 350 watt (d) 450 watt

(e) 2500 watt

(CGPSC Polytechnic Lecturer 2017)

Ans. (d) : W = 900 N, h = 15 m, t = 30 sec.

Power (P) = ?

We know that,

$$P = \frac{\text{Work done}}{\text{time}}$$

$$P = \frac{900 \times 15}{30}$$

P = 450 Watt

605. Torque acting on a body of moment of Inertia (I) and angular acceleration (α) is:

(a) $2\ I\alpha$ (b) $2^2\ I\alpha$

(c) $2^3\ I\alpha$ (d) $I\alpha$

TRB Polytechnic Lecturer 2017

Ans. (d) : $T = I\alpha$

606. A block of 500N is to be moved upward for a distance of 1.6 m on an inclined plane of 45º with horizontal. Work done will be (μ = 0.25):

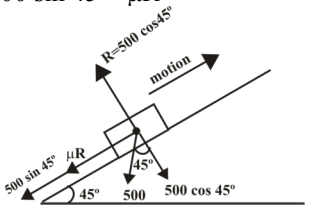
(a) 1000 Nm (b) 100 Nm

(c) $500\sqrt{2}$ Nm (d) 500 Nm

UPRVUNL AE 07.10.2016

Ans. (c) : Total force acting in upward direction

F = 500 sin 45 + μR



$$F = 500 \times \frac{1}{\sqrt{2}} + 0.25 \times 500 \times \frac{1}{\sqrt{2}}$$

$$F = 500 \times \frac{1}{\sqrt{2}} \times 1.25$$

Then to be moved upward for a distance 1.6 m on an inclined plane.

$$W = F \times d = 500 \times \frac{1}{\sqrt{2}} \times 1.25 \times 1.6$$

$$\boxed{W = 500\sqrt{2}\ N-m}$$

607. If m is the mass of the body and g is the acceleration due to gravity then the gravitational force is given by:

(a) $m \times g^3$ (b) $m \times g^2$

(c) m/g (d) m × g

CIL MT 26.03.2017

Ans. (d) : Gravitational force = mass × Acceleration due to gravity = m × g

608. A ball is thrown up. The sum of kinetic and potential energies will be maximum at

(a) the ground (b) the highest point

(c) the centre (d) all the points

TNPSC AE 2017

Ans. (d) : A ball is thrown up. The sum of kinetic and potential energies will be maximum at all the points.

$$\frac{1}{2}\ mv^2 + mgh = \text{constant.}$$

Then we can say that summation of energy will remain constant at each point.

609. The potential energy an elevator losses in coming down from the top of a building to stop at the ground floor is

(a) lost to the driving motors

(b) converted into heat

(c) lost in friction of the moving surfaces

(d) used up in lifting the counter poise weight

TNPSC AE 2017

Ans. (d) : The potential energy an elevator losses in coming down from the top of a building to stop at the ground floor is used up in lifting the counter poise weight.

610. A truck weighing 150 kN and travelling at 2 m/sec impacts with a buffer spring which compresses 1.25 cm per 10 kN. The maximum compression of the spring will be :

(a) 26.6 cm (b) 27.6 cm

(c) 28.6 cm (d) 30.6 cm

OPSC Civil Services Pre. 2011

Ans. (b) : By using conservation of mechanical energy,

$$\frac{1}{2}mv^2 = -\frac{1}{2}kx^2 \text{.....(i)}$$

(–Ve → compression of spring)

$$\frac{150 \times 1000 \times 4}{9.81} = \frac{10 \times 1000 \times x^2}{1.25 \times 10^{-2}}$$

x = 27.65 cm

611. A body is pulled through a distance of 15 m along a level track. The force applied is 400 N, acting at an angle of 60° to the direction of motion. Then the work done is

(a) 13.33 N-m (b) 3000 N-m

(c) 5196.15 N-m (d) 26.66 N-m

TSPSC AEE 2015

Ans : (b) Given,

Distance = 15 m

Applied force = 400 N.

Acting angle = 60°

work done = Fd cos 60

W = 400 × 15 cos 60

$\boxed{W = 3000N.m}$

612. A body is moving with a velocity 1 m/s and a force F is needed to stop it within a certain distance. If the speed of the body becomes three times, the force needed to stop it within the same distance would be

(a) 1.5 F (b) 3.0 F

(c) 6.0 F (d) 9.0 F

UKPSC AE 2012 Paper-I

Search on Telegram @apna_pdf

Ans. (d) : $\frac{1}{2}mv^2 = Fx_1 \Rightarrow \frac{m}{2} = F_1x$ .....(i)

$\frac{1}{2}m \cdot 3^2 = F_2x$ .....(ii)

From (i) & (ii)

$\boxed{F_2 = 9.0F_1}$

613. When a body is thrown up at an angle of 45° with a velocity of 100 m/sec, it describes a parabola. Its velocity on point of return down will be

(a) zero (b) 50 m/sec

(c) $\frac{100}{\sqrt{2}}$ m/s (d) $100\sqrt{2}$ m/sec

UKPSC AE 2012 Paper-I

Ans. (c) : The velocity on point of return will be the velocity at the maximum height but at the highest point only the constant horizontal velocity (4 cosθ)

$= 100 \cos 45^0$

$= \frac{100}{\sqrt{2}}$ m/s

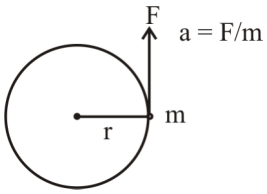
614. A thin circular ring of mass 100 kg and radius 2 m resting on a smooth surface is subjected to a sudden application of a tangential force of 300 N at a point on its periphery. The angular acceleration of the ring will be

(a) 1.0 rad/sec^2 (b) 1.5 rad/sec^2

(c) 2.0 rad/sec^2 (d) 2.5 rad/sec^2

UKPSC AE 2012 Paper-I

Ans. (b) :



Given F = 300 N, m = 100 kg, r = 2 m

Angular Acceleration (a) = rα

By the Newton's second law

F = ma

F = mrα

300 = 100 × 2 × α

$\boxed{\alpha = 1.5 \text{rad/sec}^2}$

615. A train crosses a tunnel in 30 seconds time. The speed of the train at entry and at exit from the tunnel are 36 and 54 km/hour respectively. If acceleration remains constant, the length of the tunnel is

(a) 350 m (b) 360 m

(c) 375 m (d) 400 m

UKPSC AE 2012 Paper-I

Ans. (c) : Given, time t = 30 sec

Distance at entry of tunnel

$s_1 = 36 \times \frac{5}{18} \times 30$

$s_1 = 300$ m

Distance at exit of tunnel –

$s_2 = 54 \times \frac{5}{18} \times 30$

$= 15 \times 30$

$s_2 = 450$ m

Total distance covered by train = (Entry + Exit) of tunnel

$= 450 + 300 = 750$ m

So, here length of train and length of tunnel will be equal,

∵ Train + tunnel = 750

$2s = 750$ $(s = s_1 = s_2)$

$s = 750/2 = 375$ m

616. If T_1 and T_2 are the initial and final tensions of an elastic string and x_1 and x_2 are the corresponding extensions, then the work done is

(a) $(T_2 + T_1)(x_2 - x_1)$ (b) $(T_2 - T_1)(x_2 + x_1)$

(c) $\frac{(T_2 - T_1)(x_2 + x_1)}{2}$ (d) $\frac{(T_2 + T_1)(x_2 - x_1)}{2}$

UKPSC AE 2012 Paper-I

Ans. (d) : $\frac{(T_2 + T_1)(x_2 - x_1)}{2}$

617. A motor boat whose speed in still water is 15 km/hr goes 30 km downstream and comes back in a total time of four and half hours. The stream has a speed of

(a) 3 km/hr (b) 4 km/hr

(c) 5 km/hr (d) 6 km/hr

UKPSC AE 2012 Paper-I

Ans. (c) : Data given

Speed of boat = 15 km/hr

Total time taken will 4.5 hr

Let x be the speed (T) of steam

$(T) = t_1 + t_2$

$T = \frac{30}{S_D} + \frac{30}{S_U}$ $\left\{\text{Where } \begin{matrix} SD = \text{speed of down stream} \\ SU = \text{Speed of upstream} \end{matrix}\right\}$

$T = \frac{30}{S_B + S_S} + \frac{30}{S_B - S_S}$

$4.5 = \frac{30}{15 + x} + \frac{30}{15 - x}$

$450 - 30x + 450 - 30x = 4.5\ (15+x)\ (15-x)$

$900 = 4.5\ (15^2 - x^2)$

$200 = 225 - x^2$

$x^2 = 25$

$x = 5$ km/hr

618. Identify the pair which has same dimensions :

(a) Force and power

(b) Energy and work

(c) Momentum and energy

(d) Impulse and momentum

UKPSC AE 2012 Paper-I

Ans. (b) : Energy and work

619. 0.01 kilowatt is equal to

(a) 10.01 J/s (b) 1.0 J/s

(c) 0.10 J/s (d) 0.01 J/s

UKPSC AE 2007 Paper -I

Ans. (a) : 10.01 J/s

620. The total energy possessed by moving bodies

(a) remain constant at every instant

(b) varies from time to time

(c) is maximum at the start

(d) is minimum before stopping

UKPSC AE 2007 Paper -I

Ans. (a) : Remain constant at every instant

Search on Telegram @apna_pdf

621. Inertia force of a body is expressed as

(a) product of mass of the body and the acceleration of its centre of gravity in the direction of acceleration

(b) product of mass of the body and the acceleration of its centre of gravity acting in an opposite direction of acceleration

(c) product of linear acceleration of the body and its mass moment of inertia in the direction of acceleration of its centre of gravity

(d) none of the above

UKPSC AE 2007 Paper -I

Ans. (b) : Product of mass of the body and the acceleration of its centre of gravity acting in an opposite direction of acceleration

622. Which one of the following is a scalar quantity?

(a) Force (b) Displacement

(c) Speed (d) Velocity

UKPSC AE 2012 Paper-I

Ans. (c) : Speed

623. A bullet of mass 0.03kg moving with a speed of 400 m/s penetrates 12 cm into a fixed block of wood. The average force exerted by the wood on the bullet will be

(a) 30 kN (b) 20 kN

(c) 15 kN (d) 10 kN

ESE 2017

UKPSC AE-2013, Paper-I

Ans. (b) : m = 0.03 kg

v = 400 m/s

K.E. of bullet = Work done

$$\frac{1}{2}mv^2 = \text{Force} \times \text{distance}$$

$$\frac{1}{2} \times 0.03 \times (400)^2 = \text{Force} \times 0.12$$

F = 20 kN

624. A cricket ball of mass 175 gm is moving with a velocity of 36 km/hr. What average force will be required to stop the ball in 0.2 second?

(a) –5.75 N (b) –6.75 N

(c) –7.75 N (d) –8.75 N

UKPSC AE 2007 Paper -I

Ans. (d) : Given, $m = 175 \times 10^{-3}$ kg

$$n = 36 \times \frac{5}{18} = 10\,m/sec$$

t = 0.2

We know that,

v = u + at

0 = u + at

–at = u

$$a = -\frac{u}{t} = \frac{10}{0.2}$$

$a = -50\ m/s^2$

Now, average force (F) = ma

$= 175 \times 10^{-3} \times -50$

$= -8.75$ N

625. A body moving with a velocity of 1 m/s has kinetic energy of 1.5 Joules. Mass of the body is:-

(a) 0.75 kg (b) 1.5 kg

(c) 3.0 kg (d) 30 kg

UKPSC AE-2013, Paper-I

Ans. (c) : We know that

$$K.E. = \frac{1}{2}mV^2$$

$$1.5 = \frac{1}{2} \times m \times (1)^2$$

$\boxed{m = 3.0\ kg}$

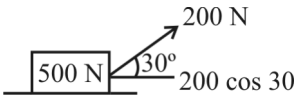
626. A block weighing 500 N resting on a horizontal floor. A force of 200 N applied at 30° with horizontal moves the block to a distance of 60 m. Work done is

(a) 10392.3 Nm (b) 12000 Nm

(c) 6000 Nm (d) 5196 Nm

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) :



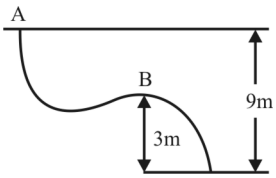
S = 60

Work done = Force × displacement

W = 200 cos 30 ×60

$\boxed{W = 10392.30\ Nm}$

627.



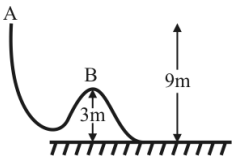
A ball starts rolling from a state of rest at point A, as shown in the figure above, Determine its velocity at point B. Assume the track is smooth.

(a) $3\sqrt{3g}$ (b) $\frac{3\sqrt{3}}{2}g$

(c) $2\sqrt{3g}$ (d) $\sqrt{3g}$

UPSC JWM Adv. No-16/2009

Ans. (c) :



Given the track is smooth

No energy loss is there,

Energy at A = Energy at B

$$mgh_1 = mgh_2 + \frac{1}{2}mv^2$$

$$mgh_1 - mgh_2 = \frac{1}{2}mv^2$$

$$g \times (9-3) = \frac{v^2}{2}$$

$$v = \sqrt{2g \times 6} = \sqrt{12g}$$

$\boxed{V = 2\sqrt{3g}}\ m/s$

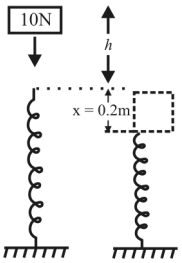
Search on Telegram @apna_pdf

628. A block of weight 10 N falls from a height h meter on a spring of stiffness 1000 N/m, the spring is compressed by 0.2 m. What is the height?

(a) 2.2 m (b) 2.0 m
(c) 1.8 m (d) 1.6 m

UPSC JWM Adv. No-16/2009

Ans. (c) :



Applying Conservation of energy –

$$mg(h + x) = \frac{1}{2}kx^2$$

Given, mg = 10N, x = 0.2 m, k = 1000 N/m

$$\therefore \quad 10 \times (h + 0.2) = \frac{1}{2} \times 1000 \times (0.2)^2$$

$$\Rightarrow \quad h + 0.2 = \frac{500 \times 0.04}{10}$$

$$\Rightarrow \quad h + 0.2 = 2$$

$$\Rightarrow \quad \boxed{h = 1.8m}$$

629. Work done by non-conservation forces on a particle is equal to

(a) Change in kinetic energy
(b) Change in mechanical energy
(c) Change in potential energy
(d) Change in internal energy

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : Work done by non-conservative forces changes the mechanical energy of system.

630. A body having weight of 1000 N is dropped from a height of 10 cm over a close coiled helical spring of stiffness 200 N/cm. The resulting deflection of spring is nearly.

(a) 5 cm (b) 16 cm
(c) 35 cm (d) 100 cm

APPSC AEE 2012

Ans. (b) : W = 1000 N, h = 10 cm, k = 200 N/cm
Resulting = ?
When the weight drops at a height of 10 cm. It has potential energy, is absorbed by the spring and undergoes a displacement 'X'

$$P.E = mg(h + x) = \frac{1}{2} \times \text{force} \times \text{displacement}$$

$$\Rightarrow W(h + x) = \frac{1}{2} \times Kx^2$$

$$1000(10 + x) = \frac{1}{2} \times 200 \times x^2$$

$$100 + 10x = x^2$$

$$x = 16 \text{ cm}$$

8. Principle of Virtual Work & simple machines

631. Virtual work refers to :

(a) Virtual work done by Virtual forces
(b) Virtual work done by Actual forces
(c) Actual work done by Actual forces
(d) Actual work done by Virtual forces

TRB Polytechnic Lecturer 2017

Ans. (b) : Virtual work is the work done by a real force acting through a virtual work done by actual forces.

632. Principle of virtual work was developed by

(a) Mohr (b) Poiseuille
(c) Euler (d) Johann Bernoulli

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : Principle of virtual work was developed by Johann Bernoulli.

633. By principle of virtual work, the work done by the force is given by {dot.(.) represents dot product, cross (×) represents cross product}

(a) dU = F. dr (b) dU = F× dr
(c) dU=F(dr)tan θ (d) dU=F(dr)cot θ

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : The work done is given by the dot product of force and displacement.
dU=F.dr
dU=F dr cosθ

634. Efficiency of a machine in terms of M.A. (Mechanical advantage) and velocity Ratio (V.R) is given as _____.

(a) V.R./M.A. 100 (b) M.A. × V.R.
(c) V.R/M.A (d) M.A/V.R

HPPSC Workshop Suptd. 08.07.02021

Ans. (d) : Efficiency of a machine,

$$\eta = \frac{MA}{VR}$$

MA= Mechanical advantage
VR= Velocity Ratio

635. If l_1 is the effort arm and l_2 is the load arm of the lever, the '*leverage*' is defined as

(a) $\frac{l_2}{l_1}$ (b) $\frac{l_1}{l_2}$
(c) $\frac{l_1^2}{l_2^2}$ (d) $\sqrt{\frac{l_1}{l_2}}$

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : In levers , leverage is the ratio of

$$= \frac{\text{Effort Arm}}{\text{Load Arm}} = \frac{\ell_1}{\ell_2}$$

636. In virtual work principle, the work done by the frictional force acting on wheel it rolls without slip is

(a) Zero (b) Positive
(c) Negative (d) All of these

APGCL AM, 2021
HPPSC W.S. Poly. 2016

Search on Telegram @apna_pdf

Ans. (a) : In virtual work principle, the work done by the frictional force acting on wheel it rolls without slip is zero.

637. The mechanical advantage of a lifting machine is the ratio of

(a) distance moved by effort to the distance moved by load
(b) load lifted to the effort applied
(c) output to input
(d) All of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (b) : Mechanical advantage of a lifting machine is the ratio of load lifted to the effort applied.

638. A man is pulling a bucket of water up to the roof of a building of 6 m height. The total weight of the rope is 20 N and the weight of the bucket with water is 100 N. The work done by the man is

(a) 300 N-m (b) 660 N-m
(c) 600 N-m (d) 360 N-m

VIZAG Steel MT 24.01.2021

Ans. (b) : Given,
Depth (h) = 6 m
Rope weight (mg) = 20 N
Weight of bucket of water (Mg) = 100 N
Work done = Change in P.E. of bucket and rope

$$\left[\because \text{Centre of mass of rope} = \frac{h}{2} = \frac{6}{2} = 3\right]$$

$$W = Mgh + mg\frac{h}{2}$$

$$= \left(M + \frac{m}{2}\right)gh$$

$$= \left(Mg + \frac{mg}{2}\right)h$$

$$= \left(100 + \frac{20}{2}\right) \times 6$$

W = 660 N-m

639. According to the Principle of 'Virtual Work', which quantity remains zero during the analysis?

(a) Virtual displacement due to external force
(b) External force due to virtual work
(c) External work due real displacement
(d) Work due to virtual displacement

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Principle of virtual work : It states if a system of force acting on a body or a system of bodies be in equilibrium and if the system be imagined to undergo a small displacement consistent with the geometrical conditions, then the algebraic sum of the virtual work done by all the forces of the system is zero.

640. Virtual work means

1. work done by real forces due to virtual displacement
2. work done by virtual forces during real displacement

(a) Both 1 and 2 are correct
(b) Both 1 and 2 are wrong
(c) 1 is correct and 2 is wrong
(d) 2 is correct and 1 is wrong

APPSC AEE SCREENING 17.02.2019

Ans. (a) :
Virtual work = Virtual force × Real displacement (or)
Virtual work = Virtual displacement × Real force

641. A lifting machine will be reversible, if the efficiency

(a) > 50% (b) equal to 100%
(c) >75% (d) <50%

GPSC Engineer, Class-II Pre- 19.01.2020
APPSC AE Subordinate Service Civil/Mech. 2016

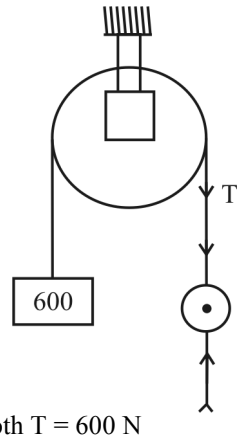
Ans. (a) : Reversible machine – If a machine is capable of doing some work in the reverse direction, after the effort is removed, then the machine is known as reversible machine. The condition for a machine to be reversible, its efficiency should be more than 50%.

642. A pulley is mounted on a vertical pillar above the head of a man of weight 800 N. The man holds one end of a rope that passes over this pulley and to the other end of which is attached a block of weight 600 N. The force with which the man's feet press against the floor is

(a) 200 N (b) 400 N
(c) 600 N (d) 800 N

OPSC Civil Services Pre 2006

Ans. (a)



If pulley is smooth T = 600 N
Force on the earth by feet = Man weight - T
= 800 – 600
= 200 N

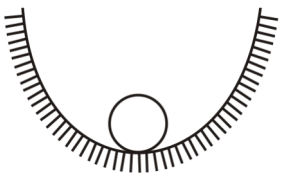
643. In the case of an unstable position of equilibrium of the body, its potential energy .....on any virtual displacement.

(a) decreases (b) increases
(c) is always zero (d) remains constant

HPPSC Asstt. Prof. 29.10.2016

Ans. (a) : There three case for position of equilibrium of body.

1. Stable condition– +



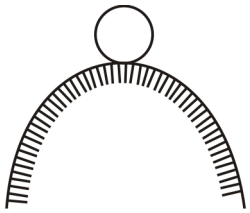
Body has minimum potential energy (U)

Search on Telegram @apna_pdf

$$\boxed{\frac{d^2U}{dx^2} > 0}$$

For any virtual displacement, U increases.

2. Unstable condition–

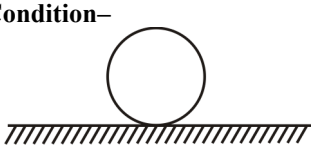


Body has maximum potential energy (U)

$$\boxed{\frac{d^2U}{dx^2} < 0}$$

• For any virtual displacement (U) decreases.

3. Neutral Condition–



Body has constant potential energy (U).

$$\boxed{\frac{d^2U}{dx^2} = 0}$$

for any virtual displacement, (U) unchanged.

644. In track type machines, the purpose of front idler and yoke is -

(a) To align track chain
(b) To replace track chain
(c) To loose track chain
(d) To tight track chain

MPSC Dy. Engineer 2014

Ans. (a) : In track type machines the purpose of front idler and yoke is to align track chain.

645. In dozer, track chains serve mounting pad for-

(a) Track frame (b) Sprocket
(c) Track shoes (d) Front idler

MPSC Dy. Engineer 2014

Ans. (c) : In dozer, track chains serve mounting pad for track shoes.
Dozer track chains are oil filled and designed with more wear material to withstand the constant movement. The NTP excavator track chain is designed with long bushings, reaching into the link to obtain a stable and wear resistant solution.

646. In a lock-gate, the reaction between two gates is
(Where P = Resultant pressure on the lock gate, and α = Inclination of the gate with normal to the side of the lock)

(a) $\frac{p}{2\sin\alpha}$ (b) $\frac{p}{\sin\alpha}$
(c) $\frac{2p}{\sin\alpha}$ (d) $\frac{2p}{\sin(\alpha/2)}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : $\frac{p}{2\sin\alpha}$

647. The law of machine can be expressed mathematically in the form of

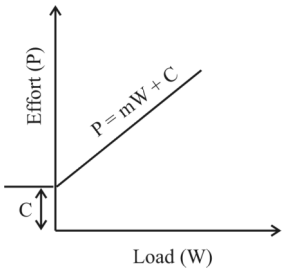
(a) linear (b) exponential
(c) parabolic (d) hyperbolic

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Law of machines – Machines which are used to lift a load are governed by the **'Law of Machine'** which states that the effort to be applied on the machine (P) is related to the weight (w) which it can lift as –

$\boxed{P = mW + C}$ → [Equation of straight line]

Where,
m and C are positive constants which are characteristics of the machine



m = slope of line
C = Effort required to start the machine

648. In lifting machines, as load increases the mechanical advantage

(a) increases
(b) decreases
(c) remains same
(d) initially increases and then decreases

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Lifting machines are those machines that are used for lifting loads. The force (or effect) is applied at one point of one machine and weight (or load) is lifted at the other point of the machine as the load increase the mechanical advantage increases.

649. What is the velocity ratio of a lifting machine that is working at an efficiency of 60% in raising a load of 7700 N by an effort of 150N?

(a) 85.55 (b) 51.33
(c) 61.72 (d) 55

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : $\text{Efficiency} = \frac{\text{Force ratio}}{\text{Velocity ratio}}$

$\text{Velocity Ratio} = \frac{\text{Force ratio}}{\text{Efficiency}}$

$VR = \frac{7700 \times 100}{150 \times 60}$

$VR = 85.55$

650. The velocity ratio as per law of machine is equal to
(Where m = slope of line and is equal to coefficient of friction, W = load lifted and c= amount of effort required by the m/c to overcome the friction)

(a) $m + \frac{c}{W}$ (b) $mW + c$
(c) $\frac{m}{W} + c$ (d) $mc + W$

APPSC AE Subordinate Service Civil/Mech. 2016

Search on Telegram @apna_pdf

Ans. (a) : Velocity Ratio as per law of machine –

$$VR = m + \frac{c}{W}$$

651. In general, in first order pulley system velocity ratio is given by (Where n is the number of movable pulleys.)

(a) 2^n (b) 2n

(c) n^2 (d) 2n–1

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Velocity ratio of first order pulley system = 2^n.

Where, n = number of movable pulley.

Velocity ratio of second order pulley system = n

Velocity ratio of third order pulley system = n – 1

652. Velocity ratio in wheel and differential axle is given by

(Where D= diameter of effort A, d_2 = diameter of the axle B and d_1 = diameter of the axle C.)

(a) $\frac{2D}{d_2 - d_1}$ (b) $\frac{2D}{d_2 + d_1}$

(c) $\frac{d_2 - d_1}{2D}$ (d) $\frac{d_2 + d_1}{2D}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Differential wheel and Axle

$$\text{Velocity ratio} = \frac{2D}{d_1 - d_2}$$

$$\text{Mechanical advantage} = \frac{W}{P}$$

$$\text{Efficiency} = \frac{M.A.}{V.R.}$$

653. In a first order system of pulleys, there are 3 movable pulleys. What is the mechanical advantage of the system if the efficiency of the system is 80%.

(a) 6.4 (b) 4.6

(c) 6.0 (d) 8.0

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : $V.R = 2^n = 2^3$

$$\text{Efficiency, } \eta = \frac{MA}{VR}$$

$$0.80 = \frac{MA}{2^3}$$

$MA = 0.80 \times 8 = 6.4$

654. If the screw in a screw jack is double threaded then lead of the screw is

(a) 2 × pitch (b) equal to pitch

(c) pitch / 2 (d) $(\text{pitch})^2$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : If the screw in a screw jack is double threaded then load of the screw is equal to 2 times of pitch.

655. In actual machines mechanical advantage is

(a) unity

(b) less than unity

(c) less than velocity ratio

(d) greater than velocity ratio

UKPSC AE 2007 Paper -I

Ans. (c) : An actual machine is that in which there is a loss of energy in some manner. In an actual machine, the work output is less than the work input, i.e. efficiency of an actual machine is always less than 100%.

656. Which one of the following is not an example of plane motion ?

(a) Motion of a duster on a black board.

(b) Motion of ball point of pen on the paper.

(c) Motion of a cursor on the computer screen.

(d) Motion of a nut on a threaded bolt.

UKPSC AE 2012 Paper-I

Ans. (d) : Motion of a nut on a threaded bolt.

657. The velocity ratio of a lifting machine is '8', which lifts a load 900 N by an effort of 150 N. Then, the efficiency of the machine is

(a) 75% (b) 70%

(c) 65% (d) 60%

TSPSC AEE 2015

Ans : (a) Velocity ratio (V.R) = 8

lifted load (w) = 900N

Effort (p) = 150 N.

$$\text{Efficiency } (\eta) = \frac{\text{mechanical advantage}}{\text{velocity ratio.}}$$

$$M.A = \frac{w}{P} = \frac{900}{15} = 6$$

$$\eta = \frac{6}{8}$$

$\eta = 0.75$ or 75%

658. The velocity ratio of a lifting machine is 20 and an effort of 200 N is necessary to lift a load of 3000 N. The frictional load is

(a) 7000N (b) 1000N

(c) 50 N (d) 350N

TSPSC AEE 2015

Ans : (b) Velocity ratio (V.R) = 20

Effort (P) = 200 N.

Lift a load (w) = 3000 N.

Frictional load = (P × VR - lifted load)

frictional load = (20× 200 - 3000)

Frictional load = 1000 N.

659. In an ideal machine, the output as compared to input is

(a) Less

(b) More

(c) Equal

(d) May be less more depending of efficiency

Vizag Steel (MT) 2017

Ans. (c) : In an ideal machine, the output as compared to input is equal.

Ideal machine efficiency is 100%.

660. If the algebraic sum of the virtual work for every displacement is ..... the system is in equilibrium.

(a) zero (b) one

(c) infinity (d) none of these

(HPPSC POLY. LECT. 2016)

Ans : (a) Principle of virtual work:- If a particle is in equilibrium, the total virtual work of forces acting on the particle is zero for any virtual displacement since work done by internal forces [equal, opposite and collinear) cancels each other.

Search on Telegram @apna_pdf

661. In the third order pulley system of the pulleys, the velocity ratio is given by

(a) $(n^2 - 1)$ (b) $(2^n - 1)$
(c) n^n (d) 2^n
(e) 2n

CGPSC AE 26.04.2014 Shift-I

Ans. (b) Velocity ratio of first order pulley system = 2^n
Velocity ratio of second order pulley system = n
Velocity ratio of third order pulley system = $2^n - 1$

662. In a lifting machine, an effort of 500 N is to be moved by a distance of 20 m to raise a load of 10,000 N by a distance of 0.8m. Determine the efficiency of the machine.

(a) 70% (b) 75%
(c) 80% (d) 85%
(e) 90%

CGPSC AE 26.04.2014 Shift-I

Ans. (c) : Given,
load (W) = 10,000 N
effort (P) = 500 N
Distance moved by the effort (D) = 20 m
Distance moved by the load (d) = 0.8 m

Mechanical Advantage (MA) = $\frac{W}{P} = \frac{10000}{500} = 20$

Velocity Ratio (VR) = $\frac{D}{d} = \frac{20}{0.8} = 25$

Efficiency = $\frac{MA}{VR} = \frac{20}{25} = 0.8 = 80\%$

663. In a lifting machine, an effort of 200 N is applied to raise a load of 800 N. what will be the velocity ratio, if efficiency is 50%.

(a) 8 (b) 6
(c) 7 (d) 9

RPSC IOF & BOILER 20.09.2017

Ans : (a) Given Effort,
P = 200 N
W = 800 N
Mechanical Advantage = $\eta \times VR$

$$\frac{W}{P} = \frac{800}{200} = 0.5 \times VR$$

V.R. = 8

664. In virtual work equation some forces are neglected. Select the most appropriate answer from the following:

(a) Reaction of a rough surface on a body which rolls on it without slipping.
(b) Reaction of any smooth surface with which the body is in contact.
(c) Reaction at a point or on an axis, fixed in space, around which a body is constrained to turn
(d) All of the above.

UPPSC AE 12.04.2016 Paper-I

Ans : (d) All of the above

665. In virtual work principle the work done by self weight of body is taken into consideration when

(a) centre of gravity moves vertically
(b) centre of gravity moves horizontally
(c) shear centre moves horizontally
(d) shear centre moves vertically

TSPSC AEE 2015

Ans. (a) : In virtual work principle the work done by self weight of body is taken into consideration when centre of gravity moves vertically.

666. The maximum mechanical advantage of a lifting machine is

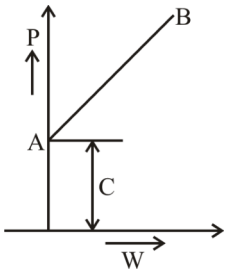
(a) 1/m
(b) m
(c) 1-m
(d) 1+m (Law of machine: $\rightarrow P - mw \div c$)

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) : Law of Machine–It is the relationship between the load lifted (W) and the effort applied (P). It is given by the equation,

$$P = m.W + C$$

Where, m = A constant (called coefficient of friction) which is equal to the slope of the line AB as shown in fig. 1.23, and
C = Another constant, which represent the machine friction.



Maximum Mechanical Advantage–

Mechanical advantage (MA) $= \frac{W}{P}$

$$MA = \frac{W}{mW + C} = \frac{1}{m + \frac{C}{W}}$$

For MA $\rightarrow$ max, $\frac{C}{W} \rightarrow 0$

$$\boxed{(MA)_{max} = \frac{1}{m}}$$

9. Impulse, Momentum and Collision

667. The coefficient of restitution for inelastic bodies is

(a) zero
(b) between zero and one
(c) one
(d) more than one

APPSC Poly. Lect. 2013
APPSC AEE MAINS 2016, PAPER-III
OPSC Civil Services Pre. 2011
GPSC Executive Engineer 23.12.2018
UPRVUNL AE 05.07.2021
GPSC DEE, Class-II (GWSSB) 04.07.2021

Search on Telegram @apna_pdf

Ans. (a) : The coefficient of restitution for inelastic bodies is e = 0.
for elastic bodies, it is e = 1

668. During inelastic collision of particles, which of the following is conserved?
(a) Total linear momentum only
(b) Total kinetic energy only
(c) Both linear momentum and kinetic energy
(d) Neither linear momentum nor kinetic energy

TSPSC AEE 2017
RPSC IOF & Boiler 20.09.2017
GATE 2007

Ans. (a) : In both elastic and inelastic collision total linear momentum remains conserved. In the inelastic collision loss in K.E. occurs because the coefficient of restitution is less than one.

669. The co-efficient of restitution of a perfectly plastic impact is
(a) 0 (b) 1
(c) 2 (d) ∞

TSPSC AEE 2017
GPSC Asstt. Director of Transport 05.03.2017
CGPSC AE 15.01.2021
TSPSC AEE 2015
GATE 2011

Ans. (a) : The coefficient of restitution is measure of the bounciness of a collision b/w two objects.

$$e = \frac{\text{speed of separation}}{\text{Speed of approach}}$$

$e = 1 \rightarrow$ for perfectly elastic collision.
$e = 0 \rightarrow$ For perfectly plastic collision.

670. Two particles with masses in the ratio 1 : 4 are moving with kinetic energies. The magnitude of their linear momentum will conform to the ratio :
(a) 1 : 8 (b) 1 : 2
(c) 2 :1 (d) 4 : 1

J&K PSC Civil Services Pre, 2010
ISRO Scientist/Engineer 2009
GPSC EE Pre, 28.01.2017
TRB Poly. Lect., 2012

Ans. (b) : Two particles with masses,

$\frac{m_1}{m_2} = \frac{1}{4}$ and $(KE)_1 = (KE)_2$

$$\therefore \frac{(\text{kinetic energy})_1}{(\text{kinetic energy})_2} = \frac{\frac{1}{2}m_1v_1^2}{\frac{1}{2}m_2v_2^2}$$

$$\frac{m_1v_1^2}{m_2v_2^2} = \frac{\frac{(m_1v_1)^2}{m_1}}{\frac{(m_2v_2)^2}{m_2}}$$

[$\therefore$ Let, linear momentum $(P_1) = m_1v_1$
linear momentum $(P_2) = m_2v_2$]

$$\frac{(KE)_1}{(KE)_2} = \frac{P_1^2}{m_1} \times \frac{m_2}{P_2^2} \Rightarrow \left(\frac{P_1}{P_2}\right)^2 \times \frac{m_2}{m_1}$$

$$\frac{(KE)_1}{(KE)_2} = \left(\frac{P_1}{P_2}\right)^2 \times \frac{m_2}{m_1}$$

$$\frac{m_1}{m_2} = \left(\frac{P_1}{P_2}\right)^2 \qquad \left[\because (KE)_1 = (KE)_2\right]$$

$$\left(\frac{P_1}{P_2}\right) = \sqrt{\frac{m_1}{m_2}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

671. In a closed system, the total momentum is constant. This statement is known as____
(a) Law of conservation of momentum
(b) Law of closed momentum
(c) Law of Constance
(d) None of these

KPCL AE 2016
VIZAG STEEL MT 2011
UPRVUNL AE 05.07.2021

Ans. (a) : Law of conservation of momentum in a closed system, the total momentum is constant.
$\because \quad m_1v_1 = m_2v_2$

672. If e = 1.0, the bodies are
(a) inelastic (b) slightly elastic
(c) perfectly elastic (d) any of the above

WBPSC AE 2008
KPCL AE 2016
Assam PSC CCE Pre 2015
J&K PSC Civil Services Pre, 2010
Gujarat PSC AE 2019

Ans. (c)
If $e = 1 \Rightarrow$ perfectly elastic body
If $e = 0 \Rightarrow$ perfectly inelastic body
If $e < 1 \Rightarrow$ perfectly elastic body

673. A mass m_1 of 100 kg travelling with a uniform velocity of 5 m/s along a line collides with a stationary mass m_2 of 1000 kg. After the collision, both the masses travel together with the same velocity. The coefficient of restitution is
(a) 0.6 (b) 0.1
(c) 0.01 (d) 0

GPSC Asstt. Director of Transport 05.03.2017
NPCIL ET, 2015
GATE 2014

Ans. (d) :

$$\text{Co-efficient of restitution} = \frac{(\text{Velocity of separation})}{(\text{Velocity of approach})}$$

$$= \frac{v_2 - v_1}{u_1 - u_2}$$

Given,
$u_1 = 0$, $v_1 = v_2 = v$, $u_1 = 5$ m/s

$$e = \frac{(v - v)}{(5 - 0)} = 0$$

Search on Telegram @apna_pdf

674. Which of the following statement is correct:

(a) The kinetic energy of a body during impact remains constant

(b) The kinetic energy of a body before impact is equal to the kinetic energy of a body after impact

(c) The kinetic energy of a body before impact is less than the kinetic energy of a body after impact

(d) The kinetic energy of a body before impact is more than the kinetic energy of a body after impact

CGPSC AE 16.10.2016
TNPSC AE 2013

Ans. (d) : The kinetic energy of a body before impact is more than the kinetic energy of a body after impact is correct statement.

675. If v_1 and v_2 are the initial velocities of two bodies making direct collision and if u_1 and u_2 are their respective velocities after collision then the coefficient of restitution is given by:

(a) $\frac{(u_1 - u_2)}{(v_2 - v_1)}$ (b) $\frac{(u_1 - u_2)}{(v_1 - v_2)}$

(c) $\frac{(u_1 + u_2)}{(v_1 - v_2)}$ (d) $\frac{(u_1 - v_2)}{(u_1 - u_2)}$

CIL MT 26.03.2017
TNPSC AE 2014

Ans. (a) : The energy dissipation during impact is called by the term, coefficient of restitution, a scalar quantity

$$e = \frac{\text{velocity of separation}}{\text{velocity of approach}}$$

$$e = \frac{u_1 - u_2}{v_2 - v_1}$$

676. A ball 'A' of mass 'm' falls under gravity from a height 'h' and strikes another ball 'B' of mass 'm' which is supported at rest on a spring of stiffness 'k'. The impact between the balls is perfectly elastic. Immediately after the impact:

(a) The velocity of ball A is $\frac{1}{2}\sqrt{2gh}$

(b) The velocity of ball A is zero

(c) The velocity of both the balls is $\frac{1}{2}\sqrt{2gh}$

(d) None of the above

OPSC Civil Services Pre. 2011
TSPSC AEE 2017
GATE 1996

Ans. (b) : The velocity of ball A is zero

Velocity of ball A before collision

$u_A = \sqrt{2gh}$

Velocity of ball B before collision

$u_B = 0$

For perfectly elastic impact

Velocity of Approach = velocity of separation

$u_A - u_B = v_B - v_A$

$v_B - v_A = \sqrt{2gh}$.....(i)

Using momentum conservation

$mu_A + mu_B = mv_A + mv_B$

$m\sqrt{2gh} + 0 = m(v_A + v_B)$

$v_A + v_B = \sqrt{2gh}$.....(ii)

From (i) and (ii)

$\boxed{v_A = 0}$ $\boxed{v_B = \sqrt{2gh}}$

677. In collisions, coefficient of restitution is defined as ratio of

(a) relative velocity of bodies before impact to relative velocity of bodies after impact.

(b) relative velocity of bodies after impact to relative velocity of bodies before impact

(c) difference in velocity of heavier body before and after impact to difference in velocities of lighter body before and after impact

(d) difference in velocity of lighter body before and after impact to difference in velocities of heavier body before and after impact

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : Coefficient of Restitution (e)

$$e = \frac{\text{Velocity of Separation}}{\text{Velocity of approach}}$$

678. For a perfectly elastic body, the value of co-efficient of restitution is

(a) zero (b) 0.372

(c) 0.5 (d) 1.0

VIZAG STEEL MT 18.08.2013
GATE 2011

Ans. (d) : Coefficient of restitution of perfectly elastic body is "1.0".

679. If U_1 and U_2 are the velocities of approach of two moving bodies in the same direction and their corresponding velocities of separation are V_1 and V_2 then as per Newton's law of collision of elastic bodies, the coefficient of restitution e is given by

(a) $e = \frac{V_1 - V_2}{U_1 - U_2}$ (b) $e = \frac{U_2 - U_1}{V_1 - V_2}$

(c) $e = \frac{V_1 - V_2}{U_2 - U_1}$ (d) $e = \frac{V_2 - V_1}{U_1 - U_2}$

TNPSC AE, 2008
TSPSC AEE 2015
TNPSC AE 2014

Ans. (d) :

Coefficient of Restitution (e)

$$= \frac{\text{Relative velocity after collision}}{\text{Relative velocity before collision}}$$

$$\boxed{e = \frac{V_2 - V_1}{U_1 - U_2}}$$

680. The ratio of minimum exergy which must be consumed to performance the task to the actual amount of energy consumed in performing the same task is called as

Search on Telegram @apna_pdf

(a) first law efficiency
(b) second law efficiency
(c) exergy efficiency
(d) None of the above

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (b) :

681. Propulsive coefficient ____ if the difference between jet and airplane velocity increases.

(a) becomes zero (b) decreases
(c) does not change (d) increases

UPRVUNL AE 05.07.2021

Ans. (c) : Propulsive coefficient does not change if the difference between jet and airplane velocity increases.

682. Loss of kinetic energy due to the direct impact of two bodies depends on mass of those two bodies and

(a) difference between initial and final velocities
(b) initial velocity of the two bodies
(c) final velocity of the two bodies
(d) product of initial velocities

UPRVUNL AE 05.07.2021

Ans. (c) :

683. The ratio of magnitude of linear momentum for two objects having mass 30 kg and 10 kg respectively with equal kinetic energy is

(a) $\sqrt{\frac{1}{3}}$ (b) $(3)^2$
(c) $\sqrt{3}$ (d) $\left(\frac{1}{\sqrt{3}}\right)^2$

UPPSC AE 13.12.2020, Paper-I

Ans. (c) : Given, $m_1 = 30$ kg, $m_2 = 10$ kg

$$K = \frac{1}{2}mv^2$$

$$K = \frac{1}{2}\frac{mv^2 \times m}{m}$$

Kinetic energy $(K) = \frac{1}{2}\frac{P^2}{m}$

$$K_1 = K_2$$

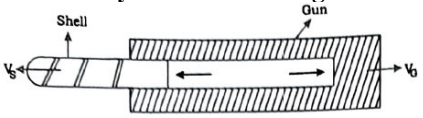
$$\frac{P_1^2}{m_1} = \frac{P_2^2}{m_2}$$

$$\frac{P_1}{P_2} = \sqrt{\frac{m_1}{m_2}}$$

$$= \sqrt{\frac{30}{10}}$$

$$= \sqrt{3}$$

684. A gun of mass 3000 kg fires horizontally a shell of mass 50 kg with a velocity of 300 m/s. What is the velocity with which the gun will recoil?



(a) – 5 m/s (b) 10 m/s
(c) 50 m/s (d) 30 m/s

UPPSC AE 13.12.2020, Paper-I

Ans. (a) : Given, $m_g = 3000$ kg, $m_b = 50$ kg
$v_g = ?$, $v_b = 300$ m/s

Before firing, both the gun and bullet are at rest, hence total momentum of bullet and gun = 0.

Applying law of conservation of momentum

Initial momentum = Final momentum

$$0 = m_g v_g + m_b v_b$$

$$v_g = -\frac{m_b v_b}{m_g}$$

$$= -\frac{50 \times 300}{3000} = -5\,m/s$$

685. Newton's second law of motion connects

(a) change of momentum and velocity
(b) momentum and acceleration
(c) momentum and rate of change of force
(d) rate of change of momentum and external force

HPPSC Poly. Lect. 05.07.2021

Ans. (d) : Newton's second law of motion,

$$\vec{F} = m\vec{a}$$

$$F = m\frac{dv}{dt}$$

$$F = \frac{m(v_2 - v_1)}{dt}$$

$$\boxed{F = \frac{dp}{dt}}$$

External force = Rate of change of momentum.

686. A cube strikes a stationary ball exerting an average force of 50 N over at time of 10ms. The ball has mass of 0.20 kg. Its speed after the impact will be

(a) 3.5 m/s (b) 2.5 m/s
(c) 1.5 m/s (d) 0.5 m/s

ESE 2018

Ans. (b) : Given data

F = 50 N
u = 0
m = 0.2 kg
t = 10 ms = 10×10^{-3} sec

$$F_{avg} = \frac{\Delta p}{\Delta t} = \frac{mv - mu}{\Delta t}$$

$$50 = \frac{mv}{\Delta t} = \frac{0.2 \times v}{10 \times 10^{-3}}$$

v = 2.5 m/s

687. If (F) refers to force, (m) refers to mass, (v) refers to velocity and (t) refers to time, then which of the following equation is known as momentum principle?

(a) $F = \frac{d(m^2 v)}{dt}$ (b) $F = \frac{dv}{dt}$
(c) $F = \frac{d(mv)}{dt}$ (d) $F = \frac{d(mv)}{dt^2}$

TNPSC AE 2019
UKPSC AE 2007 Paper-II

Search on Telegram @apna_pdf

Ans. (c) : Momentum principle- Momentum is the quantity of motion of a moving body.

From Newton's second law

$$\vec{F} = m\vec{a}$$

$$= m \times \frac{dv}{dt} \qquad m = \text{constant}$$

$$\vec{F} = \frac{d(mv)}{dt}$$

This above equation is known as momentum principle equation.

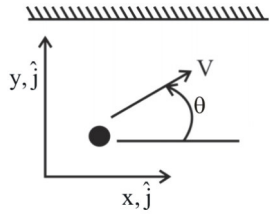
688. In elastic collisions of bodies:

(a) Only the total kinetic energy is conserved.
(b) Neither momentum of the colliding bodies nor the total kinetic energy are recoverable.
(c) Only the total momentum of the colliding objects is conserved.
(d) Both of the momentum and total kinetic energy are conserved.

CIL MT 27.02.2020

Ans. (d) : An elastic collision is an encounter between two bodies in which the total kinetic energy of the two bodies remains the same. In an ideal, perfectly elastic collision, there is no net conversion of kinetic energy into other forms such as heat, noise, or potential energy.

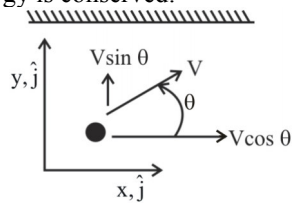
689. A point mass having mass M is moving with a velocity V at an angle θ to the wall as shown in the following figure. The mass undergoes a perfectly elastic collision with the smooth wall and rebounds. The total change in the momentum of the mass is



(a) $-2MV\cos\theta\, j$ (b) $2MV\sin\theta\, j$
(c) $-2MV\sin\theta\, j$ (d) $2MV\cos\theta\, j$

Assam Engg. College AP/Lect. 18.01.2021
GATE 2016

Ans. (c) : Due to perfectly elastic collision momentum as well as energy is conserved.



In x- direction there is no obstruction so momentum (P_x) = constant = MV cosθ

In y direction momentum before collision $P_{y1} = MV\sin\theta\hat{j}$

In y direction momentum after collision $P_{y2} = MV\sin\theta\hat{j}$

Charge in moment $= P_{y2} - P_{y1}$

$= -MV\sin\theta\hat{j} - MV\sin\theta\hat{j}$

$= -2MV\sin\theta\hat{j}$

690. A small ball of mass 1 kg moving with a velocity of 12 m/s undergoes a direct central impact with a stationary ball of mass 2 kg. The impact is perfectly elastic. The speed (in m/s) of 2 kg mass ball after the impact will be _____.

(a) 6 (b) 8
(c) 12 (d) 16

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (b) : Given, $m_1 = 1kg$, $m_2 = 2kg$, $u_1 = 12$, $u_2 = 0$

Momentum before collision = momentum after collision

$1 \times 12 + 2 \times 0 = 1 \times V_1 + 2 \times V_2$

$V_1 + 2V_2 = 12$.....(1)

Coefficient of restitution

$$e = \frac{v_2 - v_1}{u_1 - u_2} = 1 \qquad \text{(For perfectly elastic collision)}$$

$$e = 1$$

$$\frac{v_2 - v_1}{12 - 0} = 1$$

$v_2 - v_1 = 12$ .....(2)

Eq^n (1) + (2)

$v_2 - v_1 = 12$

$2v_2 + v_1 = 12$

$3v_2 = 24$

$v_2 = 8$ m/sec.

691. When a bullet is fired from a gun, it is coiled in the backward direction, it is due to :

(a) Impulse
(b) Inertia
(c) Conservation of momentum
(d) None of these

J&K PSC Civil Services Pre, 2010

Ans. (c) : When a bullet is fired from a gun, it is coiled in the backward direction, it is due to conservation of linear momentum.

692. Two objects moving with uniform speeds are 5m apart, after 1 second when they move towards each other and are 1m apart, when they move in same direction. The speed of the objects are:

(a) 2m/sec and 2m/sec
(b) 3m/sec and 2m/sec
(c) 3m/sec and 3m/sec
(d) 4m/sec and 6m/sec

TSPSC Managers, 2015

Ans. (b) : Given- Let two object having velocity v_1 and v_2

$$v_1 + v_2 = 5 \qquad .....(i)$$

$$v_1 - v_2 = 1 \qquad .....(ii)$$

from equation (i) and (ii)

$$2v_1 = 6$$

$$\boxed{v_1 = 3 \text{ m/sec}}$$

$v_1 = 3$ substituting in equation (i)

$$3 + v_2 = 5$$

$$v_2 = 5 - 3$$

$$\boxed{v_2 = 2\text{m/sec}}.$$

Search on Telegram @apna_pdf

693. A ball is dropped vertically downward from the top of a building and another one is thrown horizontally, which will strike ground first?

(a) One dropped vertically
(b) One thrown horizontally
(c) Both will strike simultaneously
(d) It will depend

TSPSC Managers, 2015

Ans. (c) : A ball is dropped vertically downward from the top of a building and another one is thrown horizontally then both will strike simultaneously. Neglect subsequent motion and air resistance.

694. A ball of mass 0.1 kg, initially at rest, is dropped from height of 1 m. Ball hits the ground and bounces off the ground. Upon impact with the ground, its velocity reduces by 20%. The height (in m) to which the ball will rise is:

(a) 0.61 (b) 0.62
(c) 0.63 (d) 0.64

NPCIL ET, 2015
GATE 2014

Ans. (d) : Given- h = 1 m

$$v = \sqrt{2gh} = \sqrt{2\times 9.81\times 1}$$

$v = 4.42944$ m/sec

$\because$ When velocity reduced 20%, so

$v_1 = 80\%$ of v

$$v_1 = \frac{80}{100}\times 4.42944$$

$$v_1 = 3.5435$$

$$h = \frac{v_1^2}{2g} = \frac{(3.5435)^2}{2\times 9.81}$$

$= 0.6399$

$h = 0.64$ m

695. Relation between coefficient of restitution (e) and velocities of bodies (v) is given by:

(a) $e = (-)\dfrac{(v_2)f-(v_1)f}{(v_2)i-(v_1)i}$

(b) $e = \dfrac{(v_2)f-(v_1)f}{(v_2)i-(v_2)i}$

(c) $e = (-)\dfrac{(v_2)i-(v_1)i}{(v_2)f-(v_1)i}$

(d) $e = \dfrac{(v_2)i-(v_1)i}{(v_2)f-(v_1)f}$

(e) $e = \dfrac{(v_2)f-(v_1)f}{(v_2)i-(v_1)f}$

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (a) : As we know that,

Before The Collision

After the Collision

$$\text{Coefficient of restitution (e)} = \frac{\text{Velocity of separation}}{\text{Velocity of Approach}}$$

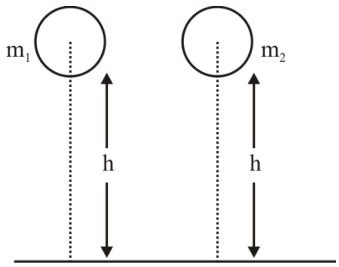
$$\boxed{e = \frac{(v_2)_f-(v_1)_f}{(v_1)_i-(v_2)_i}}$$

696. Two bodies of masses m_1 and m_2 are dropped from the height. The ratio of their momentum at the ground is

(a) m_1/m_2 (b) m_2/m_1
(c) $(m_1/m_2)^2$ (d) $(m^2/m^1)^{1/2}$

Haryana PSC Civil Services Pre, 2014

Ans. (a) :



Momentum of body (1)

$P_1 = m_1 v$

$= m_1 \times \left[\sqrt{u^2+2gh}\right]$ (u = 0)

$P_1 = m_1 \times \sqrt{2gh}$ …….. (1)

Momentum of body (2)

$P_2 = m_2 v$

$= m_2 \times \sqrt{u^2+2gh}$ (u = 0)

$P_2 = m_2 \times \sqrt{2gh}$ …….. (2)

$$\frac{P_1}{P_2} = \frac{m_1\sqrt{2gh}}{m_2\sqrt{2gh}}$$

$$\boxed{\frac{P_1}{P_2} = \frac{m_1}{m_2}}$$

697. A ball of mass 1 kg moving with a velocity of 2m/sec collides directly on a stationary ball of mass 2 kg and comes to rest after impact. The velocity of the second ball after impact will be

(a) zero (b) 0.5 m/s
(c) 1.0 m/s (d) 2.0 m/s

TRB Asstt. Prof., 2012
WBPSC AE, 2017

Ans. (c) : Before and after collision linear momentum conserved the

$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$

$m_1 = 1$kg; $m_2 = 2$kg

u_1 and u_2 = Velocity of the body before collision.

v_1 and v_2 = Velocity of the body after collision.

$u_1 = 2$m/sec $u_2 = 0$

$v_1 = 0$ $v_2 = ?$

$1\times 2 + 0 = 0 + v_2 \times 2$

$\boxed{v_2 = 1\text{m/sec}}$

698. A ball falls vertically for 2 seconds and hits a plane inclined at 30° to the horizontal. If the co-efficient of restitution = 0.75, the time that elapses before it again hits the inclined plane is

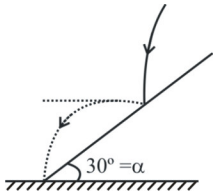
Search on Telegram @apna_pdf

(a) 3 seconds (b) 2 seconds

(c) $\frac{3}{2}$ seconds (d) 1 second

OPSC Civil Services Pre 2006

Ans. (a) :



Velocity with which ball hits will be

$V = u + gt = g \times 2$

Velocity of ball after hitting will = $e \times V = 0.75 \times 2g = 1.5\ g$

α = Indication of plane with horizontal

β = Angle of projection with horizontal

time of flight 't' $= \frac{2u\sin(\alpha+\beta)}{g\sin\beta}$

If, projection in downward direction

$$= \frac{1.5g \times 2 \times \sin(30+0)}{g\sin 30} = 3\,\text{sec}.$$

699. A sphere impinges directly on a second identical sphere at rest. If the coefficient of restitution is 'e', the ratio of the velocity of the first sphere to that of the second sphere after the impact is

(a) $\frac{1-e}{1+e}$ (b) $\frac{1+e}{1-e}$

(c) $\frac{e}{1+e}$ (d) $\frac{e}{1-e}$

OPSC Civil Services Pre 2006

Ans. (a) : Let initial velocities are u_1 & u_2 and v_1 & v_2 are final velocity

$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$ $\quad m_1 = m_2,\ u_2 = 0$

$u_1 = v_1 + v_2$.....(1)

Co-efficient of restitution

$$e = \frac{v_2 - v_1}{u_1 - u_2} = \frac{\text{relative velocity of seperation}}{\text{Relative velocity of approach}}$$

$$e = \frac{v_2 - v_1}{u_1} \Rightarrow eu_1 = v_2 - v_1$$

$$eu_1 = v_2\left(1 - \frac{v_1}{v_2}\right)$$

$$\frac{eu_1}{v_2} = 1 - \frac{v_1}{v_2} \text{.....(2)}$$

from eq. (1) $\frac{u_1}{v_2} = \frac{v_1}{v_2} + 1$ < putting eq. (2)

$$e\left(\frac{v_1}{v_2} + 1\right) = 1 - \frac{v_1}{v_2}$$

$$e\frac{v_1}{v_2} + e = 1 - \frac{v_1}{v_2}$$

$$\frac{v_1}{v_2} = \frac{1-e}{1+e}$$

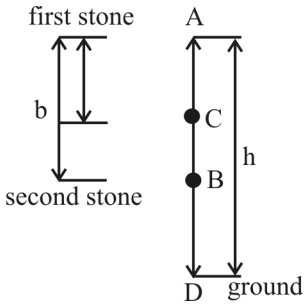
700. A stone is dropped from the top of a tower of height h. At the instant it has fallen a distance c meter, a second stone is released from rest from a point b meter below the top of the tower (b > c). The two stones strike the ground at the same time. The height of the tower is

(a) $\frac{(b+c)^2}{4c}$ (b) $\frac{(b-c)^2}{4c}$

(c) $\frac{b^2}{4c}$ (d) $\frac{4c}{(b+c)^2}$

OPSC Civil Services Pre 2006

Ans. (a) :



Velocity of first stone at 'C' $= \sqrt{2gc}$

velocity of second stone at B = 0

as both stone reach ground simultaneously

For first stone

$$h - c = \sqrt{2gc} \times t + \frac{1}{2}gt^2 \text{.....(1)}$$

For second stone

$$h - b = 0 \times t + \frac{1}{2}gt^2 \text{.....(2)}$$

or $t = \sqrt{\frac{2(h-b)}{g}}$ - putting in eq. (1)

$$h - c = \sqrt{2gc} \times \sqrt{\frac{2(h-b)}{g}} + (h-b)$$

$$b - c = \sqrt{4c(h-b)} \text{ or } \frac{(b-c)^2}{4c} + b = h$$

$$h = \frac{b^2 + c^2 - 2bc + 4bc}{4c} \text{ or } h = \frac{(b+c)^2}{4c}$$

701. A force F acts on a particle for a short time *t*. The product *F*. *t* will be equal to the change of:

(a) kinetic energy (b) impact energy

(c) momentum (d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (b) : Impact energy

702. The linear momentum of a system of rigid bodies will be conserved, if:

(a) the system is in a gravitational field

(b) no external forces act on the system

(c) kinetic energy is conserved

(d) None of the above

BPSC Asstt. Prof. 29.11.2015

Search on Telegram @apna_pdf

Ans. (b) : The Linear momentum of a system of rigid bodies will be conserved if no external forces act on the system.

703. A ball A of mass 0.25 kg moving on a smooth horizontal table with a velocity of 10 m/sec strikes an identical stationary ball B on the table. If the impact is perfectly plastic, the velocity of the ball B just after the impact will be :

(a) 5 m/sec (b) 10 m/sec
(c) zero (d) 2.5 m/sec

MPSC Poly. Lect. 2014

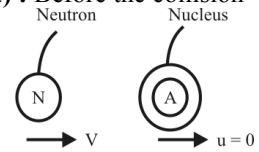
Ans. (a) : $M_A = M_B = 0.25$ kg
$u_1 = 10$ m/s.
$u_2 = 0$
$V_B = ?$
after plastic collision two bodies moves stick together coefficient of resistance is zero.
$e = 0$
conservation of momentum
$M_A \times u_1 + M_B \times u_2 = (M_A + M_B) \times V_B$
$0.25 \times 10 + 0.25 \times 0 = (0.25 + 0.25) \times V_B$
$\boxed{V_B = 5 \text{ m/s}}$

704. A neutron moving at a speed V undergoes a head on elastic collision with a nucleus of mass number A at rest. The ratio of the kinetic energies of the neutron after and before the collision is :

(a) $\left(\frac{A-1}{A+1}\right)^2$ (b) $\left(\frac{A+1}{A-1}\right)^2$
(c) $\left(\frac{A}{A+1}\right)^2$ (d) $\left(\frac{A}{A-1}\right)^2$

WBPSC AE 2003

Ans. (a) : Before the collision



after the collision

e = 1 for elastic collision

$$e = \frac{(V_2)_f - (V_1)_f}{(V_1)_i - (V_2)_i} \qquad \begin{bmatrix} f = \text{final} \\ i = \text{initial} \end{bmatrix}$$

$$1 = \frac{V_2 - V_1}{V - (0)}$$

$$[V_2 - V_1 = V] \qquad ...(i)$$

Conservation of linear momentum is applicable since, $\Sigma F_{ext} \rightarrow$ external force in the direction of collision.

$$\Sigma F_{ext} = 0$$

$$(P_{system})_i = (P_{system})_f$$

$$(m_N)V + 0 = A(m_N)V_2 + (m_N) \times V_1$$

$$V + 0 = AV_2 + V_1$$

$$[V = AV_2 + V_1] \qquad ...(ii)$$

$$\frac{(KE)_f}{(KE)_i} = \frac{(1/2\, m_N)(V_1)^2}{(1/2\, m_N)(V)^2} = \frac{(V_1)^2}{(V)} \qquad ...(iii)$$

using equation (i) & (ii)

$$AV_2 + V_1 = V$$

$$-AV_2 + AV_1 = VA$$

$$V_1 (1+A) = (1-A)V$$

$$\left[V_1 = \left(\frac{1-A}{1+A}\right)V\right] \rightarrow \text{keep is (iii)}$$

$$\frac{(KE)_f}{(KE)_i} = \left(\frac{V_1}{V}\right)^2 = \frac{\left(\frac{1-A}{1+A}\right)^2 V^2}{V^2} = \left(\frac{1-A}{1+A}\right)^2$$

$$\boxed{\frac{(KE)_f}{(KE)_i} = \left(\frac{A-1}{A+1}\right)^2}$$

705. If the momentum of a given body is doubled, its kinetic energy will

(a) get halved
(b) remain same
(c) increase by four times
(d) increase by six times

WBPSC AE 2008
UKPSC AE Paper-I, 2007

Ans. (c)

$$K.E = \frac{1}{2} mv^2 = \frac{m^2v^2}{2m}$$

$$K.E_1 = \frac{P^2}{2m} \qquad -----(1)$$

$$K.E_2 = \frac{(2P)^2}{2m} = 4\left(\frac{P^2}{2m}\right) \qquad -----(2)$$

Comparing (1) & (2)

$$\boxed{K.E_2 = 4(K.E)}$$

706. The value of coefficient of restitution lies between zero and one, when the impact is:

(a) Perfectly elastic (b) Perfectly plastic
(c) Semi-elastic (d) None of the above

HPPSC AE (PWD) 10.09.2016

Ans. (c) : The coefficient of restitution (e) is the ratio of the final to initial relative velocity between two object.

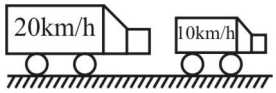
$$e = \frac{\text{Velocity of sepration}}{\text{Velocity of approach}}$$

$$e = \frac{v_2 - v_1}{u_1 - u_2}$$

If ranges from 0 to 1
e = 1 perfectly elastic
e = 0 perfectly plastic
0 < e < 1 Partially elastic collision (semi-elastic)

707. A big vehicle moving at 20km per hour hits a smaller vehicle half its mass while coasting in front of it, in neutral at 10km/hr along the same straight line on a level road. Assuming the coefficient of restitution as 0.3 estimate their speeds after collosion.

Search on Telegram @apna_pdf



(a) $V_1 = 5.18$ m/s and $V_2 = 4.35$ m/s
(b) $V_1 = 5.35$ m/s and $V_2 = 6.18$ m/s
(c) $V_1 = 4.35$ m/s and $V_2 = 5.18$ m/s
(d) $V_1 = 2.35$ m/s and $V_2 = 3.18$ m/s

UPRVUNL AE 21.08.2016

Ans. : (c) $e = \frac{v_2 - v_1}{u_1 - u_2} = \frac{v_2 - v_1}{20 - 10} = 0.3$

$v_2 - v_1 = 3$ km/h

Linear momentum conservation

$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$

$m \times 20 + \frac{m}{2} \times 10 = m \times v_1 + \frac{m}{2} \times v_2$

$25 = \frac{v_1 + v_2}{2}$ ... (ii)

for equation (i) and (ii)

$v_1 = 15.66$ Km/h = 4.3 m/sec

$v_2 = 18.6$ Km/h = 5 m/sec

708. Which of the following is NOT true?

(a) For direct impact of two bodies, coefficient of restitution is the ratio of relative velocity of approach of the two bodies to their relative velocity of separation
(b) Conservation of angular momentum implies that total angular momentum of system remains constant unless acted on by an external torque
(c) Conservation of linear momentum in a given direction implies that the surce external forces in that direction is zero
(d) The coefficient of friction is independent of area of contact

ISRO Scientist/Engineer 17.12.2017

Ans. (a) : Co-efficient of restitution

$= \frac{\text{Relative velocity of separation}}{\text{Relative velocity of approach}}$

709. For two bodies having direct impact, co-efficient of restitution is given by

(a) $\frac{\text{Velocity of approach}}{\text{Velocity of separation}}$

(b) $\frac{\text{Velocity of separation}}{\text{Velocity of approach}}$

(c) $\frac{\text{Initial velocity of the body}}{\text{Final velocity of the body}}$

(d) None of the above

ISRO Scientist/Engineer 24.05.2014

Ans. (b) : Coefficient of restitution

$e = \frac{\text{Velocity of separation}}{\text{Velocity of approach}}$

$= \frac{v_2 - v_1}{u_1 - u_2}$

where u_1 and u_2 are initial velocities of the two collide bodies and v_1, v_2 are their final velocities after collision.

710. Two objects P & Q are travelling horizontally with velocity of 8m/sec & 6m/sec from left to right. They are separated by a distance of 15m. The mass of the objects are 3 kg and 5 kg. If the coefficient of restitution is 0.7 what is the velocity (m/s) of P and Q after impact and when (seconds) and where (meters) will they impact with respect to initial positioning of Q. The corresponding answers are respectively.

(a) 7.6, 5.4, 2.1, 15 (b) 8, 6, 2.5, 7.5
(c) 7.6, 6.2, 7.5, 45 (d) None of these

ISRO Scientist/Engineer 12.05.2013

Ans. (d) : Conservation of Linear momentum

$M_P \times 8 + M_Q \times 6 = M_P V_P + M_Q V_R$

or, $3 \times 8 + 5 \times 6 = 3V_P + 5V_R$

or, $3V_P + 5V_R = 54$ ...(1)

Coefficient of Restitution

$e = \left(\frac{V_Q - V_P}{8 - 6} \right)$

$e = \frac{velocity\ of\ separation}{velocity\ of\ Approach}$

or, $V_Q - V_P = 1.4$ ...(2)

$5V_R + 3V_P = 54 \times 1$

$V_Q - V_P = 1.4 \times 3$

or, $5V_Q + 3V_Q = 54$

$3V_Q - 3V_P = 4.2$

or, $8V_Q = 58.2$

or, $8V_Q = 58.2$

$V_Q = 7.275$ m/s

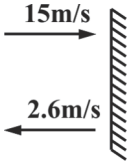
$V_P = 5.875$ m/s

711. A car crashes against a wall. The initial velocity at collision is 15m/ sec and the velocity after collision is 2.6 m/sec in the opposite direction. The mass of the car is 1500 kg, what is the average force exerted on the automobile bumper if collision lasts for 0.15 seconds.

(a) 1.76×10^5 N (b) 2.1×10^5 N
(c) 2.76×10^5 N (d) None of these

ISRO Scientist/Engineer 12.05.2013

Ans. (a) :



Change in Linear momentum $(\vec{P} = m\vec{V}cm)$

$\frac{dP}{dt} = \frac{d(mv)}{dt} = m\frac{dv}{dt} = ma = (\vec{F}R)External$

$\frac{d\vec{P}}{dt} = (\vec{F}R)Ext.$

$F = \frac{mv_1 + mv_2}{dt}$

$F = \frac{1500(15 + 2.6)}{0.15}$

$F = 1.76 \times 10^5$ N

Search on Telegram @apna_pdf

712. A uniform circular ring of mass M and radius r is rotating with an angular speed ω about an axis passing through its center and perpendicular to the plane of the ring. Two identical beads, each of mass m, some how get attached at two diametrically opposite points. The rotational speed of the ring will become

(a) $\frac{\omega M}{M+2m}$ (b) $\frac{\omega M}{M+m}$

(c) $\frac{2\omega M}{M+2m}$ (d) ω

ISRO Scientist/Engineer 2009

Ans. (a) : Initial angular momentum = final angular momentum

$$MR^2\omega = 2mR^2\omega' + MR^2\omega'$$

$$\omega' = \frac{\omega M}{M+2m}$$

713. Only rocket engines can be propelled to space because

(a) They can generate very high thrust
(b) They have high propulsion efficiency
(c) These engines can work on several fuels
(d) They are not air-breathing engines

ISRO Scientist/Engineer 2007

Ans. (d) : Only Rocket engines can propelled to space because in space air breathing engines will not work because no air present in space.

714. A ball is dropped from a height of 10m to a surface which rebounds to a height of 2m. The coefficient of restitution of the surface is :

(a) $\sqrt{0.2}$ (b) 0.6

(c) $\sqrt{0.5}$ (d) 08

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (a) : Coefficient of restitution (e) $= \sqrt{\frac{h_{after}}{h_{before}}}$

$$= \sqrt{\frac{2}{10}} = \sqrt{0.2}$$

715. The angular momentum of a body of mass m rotating about an axis with angular velocity

(a) mωr (b) $m\omega r^2$

(c) mω (d) $m\omega^2 r$

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (b) : Angular momentum (L) = Iω
where $I = mr^2$
then

$\boxed{L = mr^2w}$

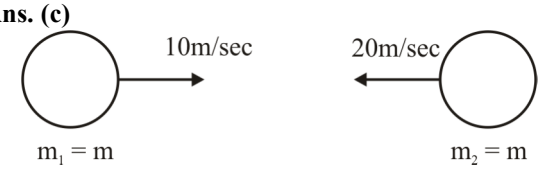
716. A perfectly elastic ball moving with a velocity 10 m/s impinges directly another perfectly elastic ball of same mass moving in opposite direction with a velocity 20m/s. The velocity of the first ball after impact will be

(a) 15 m/s (b) 20 m/s

(c) 10 m/s (d) 14.14 m/s

Kerala LBS Centre For Science & Tech. Asstt. Prof. 2014

Ans. (c)



Where u_1 & u_2 velocity first ball before and after collision and v_1 & v_2 are the velocity of second ball before and after collision respectively.

From conservation of momentum

$m_1u_1 + m_2v_1 = m_1u_2 + m_2v_2$

$u_1 + v_1 = u_2 + v_2$

$10 - 20 = u_2 + v_2$

$u_2 + v_2 = -10$ m/sec .....(i)

$$e = \frac{u_2 - v_2}{u_1 - v_1}$$

$u_1 - v_1 = u_2 - v_2$

$10 + 20 = u_2 - v_2$

$u_2 - v_2 = 30$ .....(ii)

From equation (i) & (ii)

$2u_2 = 20$

$u_2 = 10$ m/sec

And $v_2 = -20$ m/sec

717. A body of mass 20 kg falls freely under gravity. What will be its momentum after 3 seconds? (take g = 10 m/s^2)

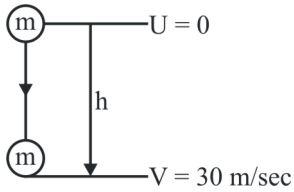
(a) 300 N sec (b) 400 N sec

(c) 500 N sec (d) 600 N sec

(e) 700 N sec

(CGPSC Polytechnic Lecturer 2017)

Ans. (d) : Given m = 20 kg, g = 10 m/sec^2
Then velocity after 3 seconds



$v = u + gt$

$v = 0 + 10 \times 3$

$\boxed{v = 30\ m/sec}$

Then momentum after 3 seconds

M = Final momentum – initial momentum

$= mv - mu$

$= 20 \times 30 - 20 \times 0$

$\boxed{M = 600\ N - sec.}$

718. A stone of mass is tied to an inextensible massless string of the length *l* and rotated in vertical circle. The minimum speed required at the top is

(a) $\sqrt{(0.5lg)}$ (b) $\sqrt{(lg)}$

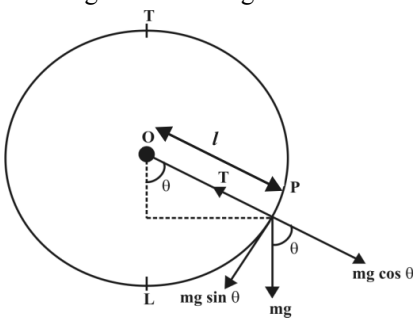
(c) $\sqrt{(2lg)}$ (d) $\sqrt{(3lg)}$

(e) $\sqrt{(4lg)}$

CGPSC AE 26.04.2014 Shift-I

Search on Telegram @apna_pdf

Ans. (b) : A particle of mass m is attached to a light and inextensible string. The other end of the string is fixed at O and the particle moves in a vertical circle of radius r equal to the length of the string as shown in the figure.



Consider the particle when it is at the point P and the string makes an angle θ with vertical forces acting on the particle are

T = tension in the string along its length

mg = weight of the particle vertically downwards

Hence, net radial force on the particle

$$F_R = T - mg\cos\theta$$

$$\frac{mv^2}{l} = T - mg\cos\theta$$

$$T = \frac{mv^2}{l} + mg\cos\theta$$

Since speed of the particle decrease with height, hence tension is maximum at bottom (i.e. θ = 0) and tension is minimum at top (i.e. θ = 180)

$$T_{max} = \frac{mv_L^2}{l} + mg$$

$(\cos 0^o = 1)$

$$T_{min} = \frac{mv_T^2}{l} - mg$$

$(\cos 180^o = 1)$

For v_T to be minimum, $T \simeq 0$

$$\frac{mv_T^2}{l} - mg = 0$$

$$v_T^2 = lg$$

$$v_T = \sqrt{lg}$$

719. A ball is dropped on a smooth horizontal surface from height 'h'. What will be the height of rebounce after second impact. If coefficient of restitution between ball and surface is 'e'?

(a) e^2h (b) eh

(c) e^3h (d) e^4h

UPRVUNL AE 07.10.2016

Ans. (d) : e = co-efficient of restitution

$$e = \frac{V_2}{V_1} = \frac{\sqrt{2gh_2}}{\sqrt{2gh_1}} = \sqrt{\frac{h_2}{h_1}} = \sqrt{\frac{h_3}{h_2}}$$

$h_2 = e^2h_1$

$h_3 = e^2h_2 = e^2 \times e^2\, h_1$

$\boxed{h_3 = e^4h_1}$

720. Principle of conservation of momentum is

(a) the initial momentum is greater than final momentum

(b) the initial momentum is equal to final momentum

(c) the initial momentum is smaller than final momentum

(d) the initial momentum is equal to zero

TNPSC AE 2013

Ans. (b) : The principle of conservation of momentum states that when you have an isolated system with no external forces, the initial total momentum of object before collision equals the final total momentum of the object after the collision.

721. A steel ball of weight 0.1 N falls a height 6 m and rebounds to a height of 4 m. The impulse is

(a) 0.0201 N - s (b) 0.201 N - s

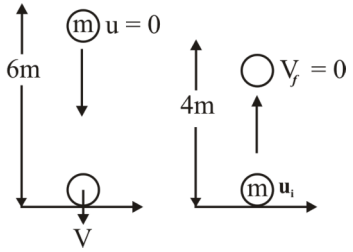
(c) 1.205 N - s (d) 12.05 N - s

TNPSC AE 2013

Ans. (b) : $v^2 = u^2 + 2 \times g \times h$

$v^2 = 2 \times 9.81 \times 6$

$\boxed{v \downarrow = 10.8498\ m/s}$



$(v_f)^2 = u_i^2 - 2gh$

$u_i^2 = 2 \times 9.81 \times 4$

$\boxed{u_i \uparrow = 8.8588\ m/s}$

then, $v_{final} = u_i \uparrow$ and $v_{initial} = V \downarrow$

Then impulse

$I = \Delta P$

$I = m\,[V_{final} - V_{initial}]$

$$= \frac{0.1}{9.81}\left[8.858 - (-10.8498)\right]$$

$I = 0.2009 = 0.201\ N - s$

722. Momentum equations are derived from

(a) First Law of Thermodynamics

(b) Newton's First Law

(c) Newton's Second Law of Motion

(d) Second Law of Thermodynamics

TNPSC AE 2013

Ans. (c) : Momentum equations are derived from Newton's Second Law of Motion.

$$F_{net} = m\vec{a} = \frac{d(mv)}{dt} = m\frac{dv}{dt}$$

$$= \frac{mv_1 - mv_2}{v_2} \quad = \frac{P_1 - P_2}{dt} = \frac{dP}{dt}$$

Equation (1) is known as momentum equation.

Search on Telegram @apna_pdf

723. If a constant force 'F' acts on a body of mass 'm' for time 't' and changes its velocity from u to v under an acceleration of 'a' all in the same direction, then for equilibrium of the body

(a) $F = \frac{mu}{t}$ (b) $F = \frac{mv}{t}$

(c) $F = m\left(\frac{v-u}{t}\right)$ (d) $F = m\left(\frac{v+u}{t}\right)$

TNPSC AE 2017

Ans. (c) : We know that

Newton's second law of motion-

$F_{net} = ma = m\frac{dv}{dt}$

$F \times t = m \times$ [change in velocity]

$F \times t = m\,[v_f - v_i]$ ...(1)

Then, we can say that product of force and time equal to change in linear momentum in the direction of force. acting

$$\boxed{F = m\frac{(v-u)}{t}}$$

724. A particle is dropped from a height of 3m on a horizontal floor, which has a coefficient of restitution with the ball of 1/2. The height to which the ball will rebound after striking the floor is

(a) 0.5 m (b) 0.75 m

(c) 1.0 m (d) 1.5 m

TSPSC AEE 2015

Ans. (b) : $e = \sqrt{\frac{h_2}{h_1}} = \frac{1}{2}$

$\frac{h_2}{3} = \frac{1}{4}$

$$\boxed{h_2 = 0.75\ m}$$

725. A bullet of mass 1 kg if fired with a velocity of u m/s from a gun of mass 10 kg. The ratio of kinetic energies of bullet and gun is

(a) 10 (b) 11

(c) 1.1 (d) 1.0

TSPSC AEE 2015

Ans. (a) : Total initial momentum of gun and bullet

$= m_1u_1 + m_2u_2 = 0$

Total momentum of gun and bullet after firing-

$= m_1 v_1 + m_2 v_2 = 1 \times u + 10 \times v_2$

Law of conservation of linear momentum

Total momentum after firing = Total momentum before firing

Then, $v_2 = -\frac{u}{10}$

It is recoil velocity of gun $= -\frac{u}{10}$ m/s.

Then, $(K.E.)_B = \frac{1}{2}m_1v_1^2 = \frac{1}{2}\times 1 \times u^2$

$$(K.E.)_G = \frac{1}{2}m_2v_2^2 = \frac{1}{2}\times 10 \times \left(\frac{u}{10}\right)^2 = \frac{(K.E.)_B}{10}$$

$$\boxed{\frac{(K.E.)_B}{(K.E.)_G} = 10}$$

726. Two balls of equal mass and of perfectly elastic material are lying on the floor. One of the ball with velocity 'v' is made to struck the second ball. Both the balls after impact will move with a velocity.

(a) v (b) v/2

(c) v/4 (d) v/8

TSPSC AEE 2015

Ans. (b) : Given as,

$m_1 = m_2 = m$

$u_1 = v$, $u_2 = 0$

$e = 1$

According to momentum conservation principle-

$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$

$mv + m\times 0 = mv' + mv'$

$v' \times 2m = mv$

$$\boxed{v' = \frac{v}{2}}$$

727. A lead ball with a certain velocity is made to strike a wall, it falls down, but rubber ball of same mass and with same velocity strikes the same wall. It rebounds. Select the correct reason from the following-

(a) both the balls undergo an equal change in momentum

(b) the change in momentum suffered by rubber ball is more than the lead ball

(c) the change in momentum suffered by rubber is less than the lead ball

(d) none of the above

TSPSC AEE 2015

Ans. (b) : A rubber ball which have same mass with same velocity strikes the same wall as lead ball, rubber ball rebounds because of the change in momentum suffered by rubber ball is more than the lead ball.

728. Rate of change of momentum takes place in the direction

(a) of applied force

(b) of motion

(c) opposite to the direction of applied force

(d) perpendicular to the direction of motion

(KPSC AE 2015)

Ans : (a) Rate of change of momentum takes place in the direction of applied force.

Rate of change of momentum $= \frac{d}{dt}(mv) = m\frac{dv}{dt}$

Rate of change of momentum $= m\frac{dv}{dt}$

$$\boxed{\vec{F}_{net} = m\vec{a} = m\frac{d\vec{v}}{dt}}$$

Search on Telegram @apna_pdf

729. Two masses 2 kg, 8 kg are moving with equal kinetic energy. The ratio of magnitude of their momentum is.

(a) 0.25 (b) 0.50
(c) 0.625 (d) 1.00

UPPSC AE 12.04.2016 Paper-I

Ans : (b) Kinetic Energy $= \frac{1}{2}mv^2$

$$(KE)_1 = \frac{p_1^2}{2m_1} \text{.....(i)}$$

$$(KE)_2 = \frac{p_2^2}{2m_2} \text{.....(ii)}$$

Given, $m_1 = 2kg, \quad m_2 = 8kg$

kinetic energy equal $\frac{p_1^2}{2m_1} = \frac{p_2^2}{2m_2}$

$$\frac{p_1}{p_2} = \sqrt{\frac{m_1}{m_2}}$$

$$\frac{p_1}{p_2} = 0.50$$

730. When two bodies collide without the presence of any other force or force fields?

(a) Their total kinetic energy must be conserved.
(b) Their total momentum must be conserved.
(c) Their collision must be direct.
(d) Both (a) and (b)

UPPSC AE 12.04.2016 Paper-I

Ans : (d) When two bodies collide without the presence of any other force or force fields.
(i) Their total kinetic energy must be conserved.
(ii) Their total momentum must be conserved.

731. If the momentum of a body is doubled, its kinetic energy will be

(a) doubled (b) quadrupled
(c) same (d) halved

UKPSC AE 2007 Paper -I

Ans. (b) : Quadrupled

We know, $K_1 = \frac{p^2}{2m}$

$$\boxed{K \propto p^2}$$

If the momentum is doubled then,

$$K_2 = 4\left(\frac{p^2}{2m}\right)$$

$$K_2 = 4K_1$$

732. The bodies which rebound after impact are called

(a) elastic (b) inelastic
(c) plastic (d) none of the above

UKPSC AE 2007 Paper -I

Ans. (a) : Elastic

733. The total momentum of a system of moving bodies in any one direction remains constant, unless acted upon by an external force in that direction. This statement is called

(a) Principle of conservation of energy
(b) Newton's second law of motion
(c) Newton's first law of motion
(d) Principle of conservation of momentum

UKPSC AE 2007 Paper -I
GPSC Executive Engineer 23.12.2018

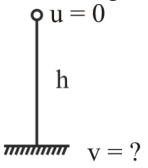
Ans. (d) : Principle of conservation of momentum

734. The velocity of a body on reaching the ground from a height 'h', is given by

(a) $v = 2gh$ (b) $v = 2gh^2$
(c) $v = \sqrt{2gh}$ (d) $v = \frac{h^2}{2g}$

APPSC Poly Lect. Automobile Engg., 2020
UKPSC AE 2007 Paper -I

Ans. (c) If a body fall from height h then



By the equation
$v^2 = u^2 + 2gh$
$v^2 = 0 + 2gh$
$v = \sqrt{2gh}$

735. Impulse is:-

(a) Minimum momentum
(b) Maximum momentum
(c) Average momentum
(d) Final momentum - Initial momentum

UKPSC AE-2013, Paper-I

Ans. (d) :
Impulse = Final momentum – Initial momentum

736. A ball of 2kg drops vertically onto the floor with a velocity of 20m/s. It rebounds with an initial velocity of 10m/s, impulse acting on the ball during contact will be:-

(a) 20 (b) 40
(c) 60 (d) 30

UKPSC AE-2013, Paper-I

Ans. (c) : We know that, impulse is equal to change in momentum
So, initial momentum
$= 2 \times 20$
$= 40$ kg - m/s
Final momentum
$= -2 \times 10$
$= -20$ kg-m/s
Then impulse
$= [-20 - 40]$
$= -60$ kg-m/s
$= 60$ kg-m/s
So, the impulse is 60 Ns acting upwards.

737. The loss of kinetic energy, during inelastic impact of two bodies having masses m_1 and m_2, which are moving with velocity v_1 and v_2 respectively, is given by

Search on Telegram @apna_pdf

(a) $\frac{m_1m_2}{2(m_1+m_2)}(v_1-v_2)^2$

(b) $\frac{2(m_1+m_2)}{m_1m_2}(v_1-v_2)^2$

(c) $\frac{m_1m_2}{2(m_1+m_2)}(v_1^2-v_2^2)$

(d) $\frac{2(m_1+m_2)}{m_1m_2}(v_1^2-v_2^2)$

UKPSC AE 2012 Paper-I

Ans. (a) : $\frac{m_1m_2}{2(m_1+m_2)}(v_1-v_2)^2$

738. The force applied on a body of mass 100 kg to produce an acceleration of 5 m/s^2 is

(a) 500 N (b)100 N

(c) 20 N (d)10 N

TSPSC AEE 2015

Ans : (a) Second law of Newton's :-

$F = m.\frac{dv}{dt}$

$F = ma$

$F = 500$ N.

739. A rubber ball is dropped from a height of 2 m. if there is no loss of velocity after rebounding the ball will rise to a height of

(a) 1 m (b) 2 m

(c) 3 m (d) 4 m

Vizag Steel (MT) 2017

Ans. (b) : For rebounding height attain = e^2x

then $h_1 = e^2x$

for $x = 2$ m

No loss in kinetic energy so for elastic body e = 1

$h_1 = 1 \times 2$

for second rebounding

$h_2 = e^4x$

$x = 4$ m

$h_2 = 1\times4$

$h_2 = 4$ m

then $\frac{h_1}{h_2} = \frac{2}{4}$

$\frac{h_1}{h_2} = \frac{1}{2}$

$\boxed{h_2 = 2h_1}$

740. During elastic impact, the relative velocity of the two bodies after impact is _____ the relative velocity of the two bodies before impact

(a) equal to (b) equal and opposite to

(c) less than (d) greater than

TSPSC AEE 2015

Ans. (b) : During elastic impact, the relative velocity of the two bodies after impact is equal and opposite to the relative velocity of the two bodies before impact.

741. The law of motion involved in the recoil of gun is

(a) Newton's first law of motion

(b) Newton's second law of motion

(c) Newton's third law of motion

(d) none of these

TNPSC ACF 2012

Ans. (c) : The law of motion involved in the recoil of gun is Newton's third law of motion. According to Newton's third law motion if an object A exerts a forces on object B then object B must exert a force of equal magnitude and opposite direction back on object A.

742. An impulse force $\vec{F} = 3t^2\hat{i} + 2t\hat{j} + \hat{k}$ acts at the centre of a stationary body of mass 1 kg from time t = 0 to t = 1 s. The magnitude of the velocity attained by the body is,

(a) 3 m/s (b) 2 m/s

(c) 1.8 m/s (d) 1.71 m/s

DRDO Scientists 2009

Ans. (d) : $F = 3t^2\hat{i} + 2t\hat{j} + \hat{k}$

$\frac{mdv}{dt} = F$

$dv = \int F dt$

$dv = \int (3t^2\hat{i} + 2t\hat{j} + \hat{k})dt$

$v = t^3\hat{i} + t^2\hat{j} + t\hat{k}$

$= 1\hat{i} + 1\hat{j} + 1\hat{k}$

$v = \sqrt{3} = 1.7$ m/s

743. Line of impact is :

(a) Common surface to the two colliding bodies

(b) Common tangent to the two colliding bodies

(c) Common normal to the two colliding bodies

(d) Common point to the two colliding bodies

TNPSC AE (Industries) 09.06.2013

Ans. (c) : Line of impact is common normal to the two colliding bodies.

744. A 20 kg car moving at a speed of 20 m/s to the right collides with a 35 kg car which is at rest. After the collision the 35 kg car is moving towards right at a speed of 10 m/s. The speed of the 20 kg car is

(a) 2.5 m/s (b) –2.5 m/s

(c) 50 m/s (d) 0

DRDO Scientists 2008

Ans. (a) : From momentum conservation

$m_1 v_1 = m_2 v_2 + m_1 v_f$

$20\ (20) = 35\ (10) + 20\ (v_f)$

$v_f = 2.5$ m/s

745. Two bodies collide each other and the collision is perfectly elastic. The co-efficient of restitution of these two bodies is

(a) 0 (b) 0.5

(c) 1 (d) 2

TANGEDCO AE 2015

Search on Telegram @apna_pdf

Ans. (c) : Coefficient of restitution,

$$e = \frac{\text{Impulse of recovery}}{\text{Impulse of deformation}} = \frac{\int F_r dt}{\int F_d dt}$$

F_r = Impulse force at recovery

F_d = Impulse force at deformation

$$e = (-)\frac{V_b' - V_a'}{V_b - V_a} = (-)\frac{\text{Velocity of separation}}{\text{Velocity of approach}}$$

1. (e = 0) = For plastic impact (no recovery)
- Only momentum is conserved.

2. (e = 1) = For elastic impact (complete recovery)
- Energy remains conserved (Initial kinetic energy = Final kinetic energy).
- Momentum is conserved.

746. A 1.0 kg ball drops vertically onto the floor with a speed of 25 m/s. It rebounds with an initial speed of 10 m/s. The impulse acting on the ball during contact will be

(a) 15 N-s (b) 25 N-s
(c) 35 N-s (d) 45 N-s

VIZAG STEEL MT 18.08.2013

Ans. (c) : Impulse (J) : It is defined as a change in the linear moment (P) with respect to time.

$J = F \times dt = \Delta P$

Given, $m = 1.0$ kg, $v_1 = 25$ m/sec., $v_2 = 10$ m/sec

$J = \Delta P = m(v_1 - v_2) = 1.0) = 1.0 \times [25 - (-10)]$

$\boxed{J = 35 \text{ N} - \text{second}}$

10. Simple Harmonic Motion and Projectile Motion

747. In simple harmonic motion the acceleration is proportional to :

(a) displacement
(b) linear velocity
(c) angular velocity
(d) rate of change of angular velocity

RPSC ACF-2011
ISRO Scientist/Engineer 2006
ISRO Scientist/Engineer 2010
WBPSC AE, 2017
CGPSC AE 26.04.2014 Shift-I
RPSC AE 2016
(HPPSC POLY. LECT. 2016)
Rajasthan Nagar Nigam AE 2016, Shift-II
ASSAM PSC CEE Pre 2015

Ans. (a) : Let the equation of SHM,

$x = A \sin(\omega t)$

$v = A\omega\cos(\omega t)$

$a = -A\omega^2 \sin(\omega t) \Rightarrow a = -\omega^2 x$

$\therefore$ $\boxed{a \propto x}$

$\because$ Acceleration is directly proportional to displacement of the particle from the mean position.

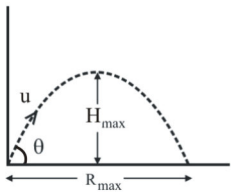
748. The range of a projectile is maximum, when the angle of projection is :

(a) 30° (b) 45°
(c) 60° (d) 90°

RPSC AE GWD, 2011
TRB Poly. Lect., 2012
UKPSC AE 2007 Paper -I
UKPSC AE 2012 Paper-I
TSPSC Managers, 2015
GPSC DEE, Class-II, (GWSSB) 04.07.2021

Ans. (b) : Range of projectile $R = \frac{u^2 \sin 2\theta}{g}$

For maximum Range $\frac{dR}{d\theta} = 0$



$$\frac{u^2}{g}\cos 2\theta \times 2 = 0$$

$$\cos 2\theta = 0$$

$$2\theta = 90°$$

$$\boxed{\theta = 45°}$$

- $H = \frac{u^2 \sin^2\theta}{2g}$
- $T = \frac{2u\sin\theta}{g}$
- R_{max} at $\theta = 45°$
- H_{max} at $\theta = 90°$

749. In order to double the period of a simple pendulum, the length of the string should be:

(a) Halved (b) Doubled
(c) Tripled (d) Quadrupled

ISRO Scientist/Engineer (RAC) 22.04.2018
UKPSC AE 2007 Paper -I
UKPSC AE 2012 Paper-I

Ans. (d) : We know that

$$T = 2\pi\sqrt{\frac{l}{g}}$$

$$T \propto \sqrt{l}$$

$$T = C\sqrt{l}$$

Then, $T_2 = 2T$, $l_2 = ?$

$$\frac{T_2}{T_1} = \sqrt{\frac{l_2}{l_1}} \Rightarrow \frac{2T}{T} = \sqrt{\frac{l_2}{l_1}}$$

$$\boxed{l_2 = 4l_1}$$

750. The length of a second's pendulum is-

(a) 99.0 cm (b) 100 cm
(c) 101 cm (d) 99.4 cm

ISRO Scientist/Engineer (RAC) 29.11.2015
WBPSC AE, 2017

Ans : (d) Second's Pendulum is the term used to define the pendulum with a time period of 2 seconds. Seconds pendulums were used in vintage clocks which would advance one second every time the pendulum reaches an extreme position. Since the pendulum reaches its extreme position twice in one oscillation, the time period of a second pendulum is 2 seconds.

Search on Telegram @apna_pdf

$$T=2\pi\sqrt{\frac{\ell}{g}}$$

$$2=2\pi\sqrt{\frac{\ell}{9.81}}$$

$\lambda = 0.9939$ m = 99.4 cm= 994 mm

751. To take longest possible jump, an athlete should make an angle of :

(a) 60° with the ground
(b) 45° with the ground
(c) 30° with the ground
(d) None of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014
J&K PSC Civil Services Pre, 2010
BPSC Asstt. Prof. 29.11.2015

Ans. (b) : To take longest possible jump means range of projectile should be maximum.

$$R=\frac{u^2\sin 2\theta}{g}$$

For R_{max}

$\sin 2\theta = 1$

$2\theta = 90°$

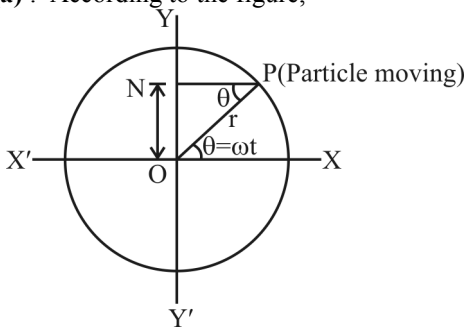
$\boxed{\theta = 45°}$

752. In S.H.M., the velocity vector w.r.t. displacement vector

(a) leads by 90° (b) lags by 100°
(c) leads by 120° (d) leads by 180°

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (a) : According to the figure,



Displacement, $\vec{y} = ON = r\sin\theta = r\sin\omega t$

$$\therefore \quad \vec{v}=\frac{d\vec{y}}{dt}=r\omega\cos\omega t$$

$= r\omega \cos \omega t$

$\vec{v} = r\omega \sin (90° + \omega t)$

$r\omega$ is constant so in SHM velocity vector w.r.t. displacement vector leads by 90°.

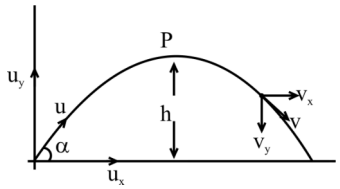
753. If the velocity of projection is u m/sec and the angle of projection is α^a, the maximum height of the projectile on a horizontal plane is :

(a) $\frac{u^2\cos^2\alpha}{2g}$ (b) $\frac{u^2\sin^2\alpha}{2g}$

(c) $\frac{u^2\tan^2\alpha}{2g}$ (d) $\frac{u^2\sin^2\alpha}{g}$

HPPSC W.S. Poly. 2016
ISRO Scientist/Engineer (RAC) 29.11.2015
MECON MT 2019

Ans : (b)



U = velocity of projection
α = angle of projection
(i) Flight - time of Projectile:-

$$T=\frac{2u\sin\alpha}{g}$$

(ii) Height of projectile:-

$$h=\frac{u^2\sin^2\alpha}{2g}$$

(iii) Range of projectile:-

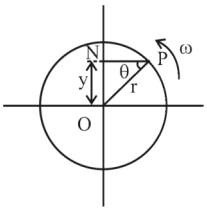
$$R=\frac{u^2\sin 2\alpha}{g}$$

754. The acceleration of a particle, moving with simple harmonic motion, at any instant is given by

(a) $\omega \cdot y$ (b) $\omega^2 \cdot y$
(c) ω^2 / y (d) ω^3 / y

GMB AAE 25.06.2017
TSPSC AEE 2015
Assam PSC CCE Pre 2015
TNPSC ACF 2012

Ans. (b) Let particle P moving with constant angular Velocity w in SHM.



In Δ OPN

$\vec{y} = r \sin \theta$

$\vec{y} = r \sin \omega t \qquad (\omega = \theta/t)$

$$\frac{d\vec{y}}{dt} = r\ \cos\omega t\ \times \omega = r\omega\cos\omega t$$

$\vec{v} = r\omega \cos \omega t$

$$\frac{d\vec{V}}{dt} = -r\omega\sin\omega t\times\omega$$

$= -r\omega^2 \sin \omega t = -\omega^2 (r \sin \omega t)$

$$\frac{d\vec{V}}{dt} = \vec{a} = -\omega^2\vec{y}$$

$\vec{a} = -\omega^2 \vec{y}$ and $\vec{a} \propto \vec{y}$ $[\omega^2 = \text{constant}]$

755. The projectile will reach the maximum height, when the vertical component of velocity of projection becomes _____.

(a) maximum
(b) independent of velocity
(c) unity
(d) zero

HPPSC Workshop Suptd. 08.07.02021

Search on Telegram @apna_pdf

Ans. (d) : The projectile will reach the maximum height, when the vertical component of velocity of projection becomes zero.

756. A pendulum is made of a hollow sphere of negligible mass and having a small hole in the bottom. The pendulum is made to vibrate after filling it with water.

As the water gradually flows out of the hole, the time period of the pendulum will

(a) increase
(b) decrease
(c) may increase or decrease
(d) remain unchanged

HPPSC Poly. Lect. 05.07.2021

Ans. (a) : A pendulum is made of a hollow sphere of negligible mass and having a small hole in the bottom. The pendulum is made to vibrate after filling it with water.
As the water gradually flows out of the hole, the time period of the pendulum will increase.

757. The maximum speed of the bob of a seconds pendulum is stated to be 1 m/s. Its maximum acceleration would be

(a) $5.62\ m/s^2$ (b) $6.48\ m/s^2$
(c) $1.57\ m/s^2$ (d) $3.14\ m/s^2$

HPPSC Poly. Lect. 05.07.2021

Ans. (d) : Time period of second pendulum

$$T = 2$$

$$T = \frac{2\pi}{\omega}$$

$$2 = \frac{2\pi}{\omega} \Rightarrow \omega = \pi$$

$$V = r\omega \Rightarrow 1 = r\omega$$

$$\boxed{r = \frac{1}{\omega} = \frac{1}{\pi}}$$

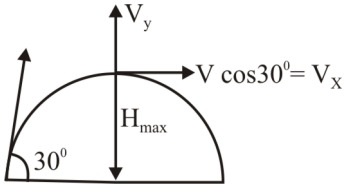
$$a = r\omega^2 = \frac{1}{\pi} \times \pi^2 = \pi = 3.14\,m/s^2$$

758. A body is projected with a velocity of 30 ms^{-1} at an angle of 30^0 to the ground. The vertical component of velocity at its maximum height will be

(a) $25.98 ms^{-1}$ (b) $0\ ms^{-1}$
(c) $15\ ms^{-1}$ (d) $30\ ms^{-1}$

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) :



The vertical component of velocity at maximum height is zero, and the horizontal component is constant i.e., $v\cos\theta$

759. A body is just released from the window of a moving bus moving along a horizontal road. When observed by a person on the ground, the stone will hit the ground following a

(a) Parabolic path (b) Straight line path
(c) hyperbolic path (d) circular path

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Parabolic path.

760. The shape of the projectile is

(a) a straight line
(b) curvilinear motion
(c) a parabola
(d) a hyperbola

TANGEDCO AE 2015

Ans. (c) : The shape of the projectile is a parabola.

761. A ball is projected vertically upward with a certain velocity. It takes 40 s for its upward journey. The time (in seconds) taken for its downward journey is

(a) 10 (b) 20
(c) 30 (d) 40

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (d) : The time taken for its downward journey is same as its upward journey. The time taken for downward journey is 40 sec.

762. When a body moves with simple harmonic motion, the product of its periodic time and frequency is equal to

(a) zero (b) 1
(c) $\pi/2$ (d) π

Assam PSC CCE Pre 2015
UKPSC AE-2013, Paper-I

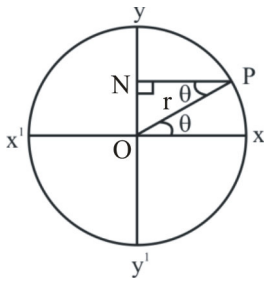
Ans. (b) : When a body moves with simple harmonic motion, the product of its periodic time and frequency is equal to 1.
Periodic time (T) × Frequency (f) = 1

763. The velocity of a particle moving with simple harmonic motion, at any instant is given by (where ω = Displacement of the particle from mean position)

(a) $\omega\sqrt{x^2 - r^2}$ (b) $\omega\sqrt{r^2 - x^2}$
(c) $\omega^2\sqrt{x^2 - r^2}$ (d) $\omega^2\sqrt{r^2 - x^2}$

Sikkim PSC (Under Secretary), 2017
APPSC Poly. Lect. 2013

Ans. (b) :



A particle moving along circumference of circle Radius r with a uniform angular velocity of ω rad/sec.

Search on Telegram @apna_pdf

Let
P is position of particle at some instant after t second from x.
angle turned by the particle,

$$\theta = \omega t \text{ rad}$$

Displacement at point N

$$y = ON = r\sin\theta$$

$$= r\sin\omega t \quad \text{.....(i)}$$

Differentiate with respect to time 't'

$$\frac{dy}{dt} = r\omega\cos\omega t$$

$$V = r\omega\sqrt{1-\sin^2\omega t}$$

from equation (i) we find out

$$\sin\omega t = \frac{y}{r}$$

$$V = r\omega\sqrt{\left(1-\frac{y^2}{r^2}\right)}$$

$$V = \omega\sqrt{r^2-y^2}$$

similarly

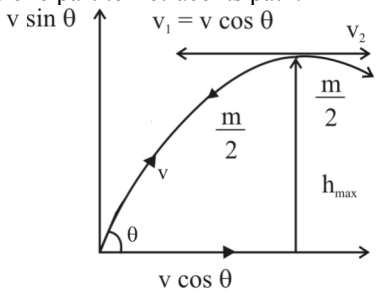
$$V = \omega\sqrt{r^2-x^2}$$

764. A shell fired from cannon with a speed 'v' at an angle 'θ' with the horizontal direction. At the highest point in its path it explodes into pieces of equal mass. One of the pieces retraces its path to the cannon. The speed of other piece immediately after explosion is:

(a) 3 v cos θ (b) 2 v cos θ
(c) 3/2 v cos θ (d) $\sqrt{3/2}$ v cos θ

ISRO Scientist/Engineer 11.10.2015
OPSC Civil Services Pre. 2011
GATE 1994

Ans. (a) : At the highest point of the trajectory the shell will have the only horizontal velocity that is –v cos θ. For its one part to retrace its path.



After explosion the piece that retraces its path is having velocity,

$$v_1 = -v\cos\theta$$

Since, there is no force acting on the shell in horizontal direction, so its linear momentum remains constant,

$$mv\cos\theta = \frac{m}{2}v_1 + \frac{m}{2}v_2$$

$$v_2 = 2v\cos\theta - v_1$$

$$v_2 = 2v\cos\theta - (-v\cos\theta)$$

$$\boxed{v_2 = 3v\cos\theta}$$

765. A harmonic motion is given by the equations x = 6 sin $\left(10t-\frac{\pi}{4}\right)$ cm where phase angle is in radian. The maximum acceleration is given by:

(a) 1200 cm/sec^2 (b) 900 cm/sec^2
(c) 60 cm/sec^2 (d) 600 cm/sec^2

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (d) : Given, For a harmonic motion

$$x = 6\sin\left(10t-\frac{\pi}{4}\right)$$

We know that for sigma
Maximum acceleration (a_{max}) = $A\omega^2$
∴ Compare given equation with

$$x = A\sin(\omega t - \phi)$$

A = 6 cm, ω = 10 rad/sec.
Maximum acceleration (a_{max}) = $A\omega^2$

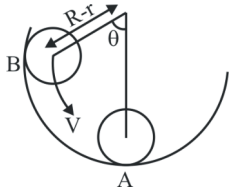
$$a_{max} = 6 \times 10^2 = 600 \text{ cm/sec}^2$$

766. The radius of arc is measured by allowing a 20 mm diameter roller to oscillate to and fro on it and the time for 25 oscillations is noted at 56.25 s. The radius of arc will be

(a) 865 mm (b) 850 mm
(c) 835 mm (d) 820 mm

ESE 2019

Ans. (b) : Given,
Radius of roller



$$r = \frac{20}{2} = 10 \text{ mm}$$

Time period of

Oscillation $T = \frac{56.25}{25} = 2.25$ sec

$$\omega_n = \sqrt{\frac{2g}{3(R-r)}}$$

$$T = 2\pi\sqrt{\frac{3(R-r)}{2g}}$$

$$2.25 = 2\pi\sqrt{\frac{3(R-0.01)}{2\times 9.81}}$$

0.8395 = R – 0.01
R = 0.849 m
R = 850 mm

767. Speed of particle executing simple harmonic motion with amplitude 'a' is half of the maximum speed. At that instant, displacement of the particle is

(a) $\frac{a}{2}$ (b) $\frac{\sqrt{3}}{2}a$
(c) $\frac{2a}{\sqrt{3}}$ (d) $3\sqrt{2}a$

ISRO Scientist/Engineer 2008
ISRO Scientist/Engineer 2006
HPPSC Poly. Lect. 05.07.2021

Search on Telegram @apna_pdf

Ans. (b) : x = a sin ωt

$v = a\omega \cos \omega t$

$\frac{a\omega}{2} = a\omega \cos \omega t$

$\therefore \omega t = \frac{\pi}{3}$

at $\omega t = \frac{\pi}{3}$ displacement is

$x = a \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2} a$

where a is maximum displacement.

768. If the natural frequency of a spring mass system on earth is *f*, its natural frequency on moon where acceleration due to gravity is one-sixth of that on earth will be

(a) $f/6$ (b) $6f$

(c) $f/\sqrt{6}$ (d) f

ISRO Scientist/Engineer 22.04.2018

Ans. (d): We know that natural frequency is given by

$$f = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$$

Natural frequency is not depend on gravity so it will be remain same on earth and moon.

769. On which of the following factors does the periodic time of a simple pendulum depend?

(a) Length of the pendulum

(b) Mass of the bob

(c) Size of the bob

(d) Material of the bob

WBPSC AE 2008
ISRO Scientist/Engineer (RAC) 29.11.2015
ISRO Scientist/Engineer 2007
CIL MT 26.03.2017

Ans. (a)

$$T = 2\pi\sqrt{\frac{L}{g}}$$

Hence time period of simple pendulum depends only on length.

770. Lengths of two simple pendulums are in the ratio 16:1. They start vibrating together and are in same phase once again after the smaller pendulum has made n oscillations. The value of n is:

(a) 2/3 (b) 3/2

(c) 4/3 (d) 1/4

HPPSC ADF 05.03.2019

Ans. (d) : Let us say, in phase when shorter pendulum has mode n_1 oscillations and bigger pendulum n_2 oscillations. So total time elapsed = $T_1 \times n_1 = T_2 \times n_2$

$$\Rightarrow \frac{n_1}{n_2} = \frac{T_2}{T_1} = \sqrt{\frac{l_2}{l_1}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$$

They will again be in phase for the first time when the shorter pendulum has mode 1 oscillation and the bigger pendulum has 4 oscillation.

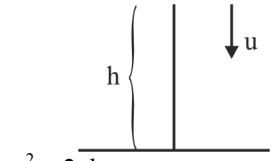
771. A monkey standing on the rooftop of a house of height h throws a ball vertically downwards and another ball horizontally with the same velocity u. The ratio of their velocities when they reach the earth's surface will be:

(a) 1 : 3 (b) 2 : 1

(c) 1 : 2 (d) 1 : 1

AAI Jr. Executive 29.11.2018

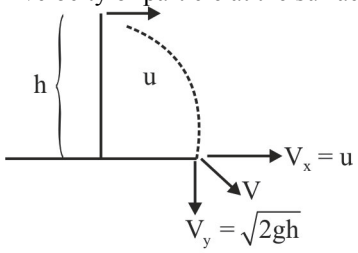
Ans. (d) : When particles thrown in vertically downward direction with velocity u then final velocity at the ground level.



$v^2 = u^2 + 2gh$

$v = \sqrt{u^2 + 2gh}$

Another particle is thrown horizontally with same velocity then velocity of particle at the surface of earth.



Horizontal component of velocity $V_x = u$

$\therefore$ Resultant velocity

$v = \sqrt{u^2 + 2gh}$

For both particles, final velocities when they reach the earth's surface are equal 1:1.

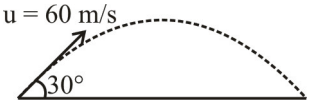
772. A projectile is fired upward at an angle 30° with a velocity of 60 m/s, The time taken by the projectile to reach the ground after the instant of firing is _____. (assume g as 10 m/s)

(a) 3 s (b) 12 s

(c) 6 s (d) 9 s

VIZAG MT, 14.12.2020

Ans. (c) :



Flight time

$$T = \frac{2u\sin\theta}{g}$$

$$= \frac{2 \times 60 \times \sin 30}{10}$$

$$\boxed{T = 6\,\text{sec}}$$

773. The radius of curvature of trajectory for a projectile is minimum, if

(a) velocity is minimum

(b) acceleration is maximum

(c) Both (a) and (b)

(d) None of the above

Assam PSC AE (IWT) 14.03.2021

Search on Telegram @apna_pdf

Ans. (c) : The radius of curvature is given as–

$$\rho = \frac{v^2}{a_N}$$

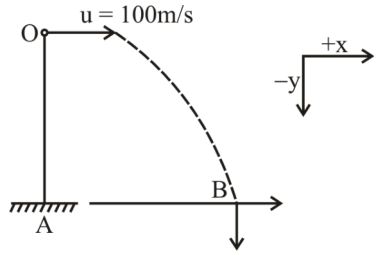
Here, v is the velocity of particle and a_N is the acceleration in normal direction. When velocity is minimum radius of curvature is minimum.
When acceleration increases radius of curvature decreases.
Hence the radius of curvature of trajectory for a projectile is minimum, if velocity is minimum and acceleration is maximum.

774. A cannonball is fired from a tower 80 m above the ground with a horizontal velocity of 100 m/s. Determine the horizontal distance at which the ball will hit the ground. (Take g = 10 m/s^2)

(a) 400 m (b) 280 m
(c) 200 m (d) 100 m

UPSC JWM Advt. No.-50/2010

Ans. (a) :



Time taken for each ground,

$$-80 = v_y \times t + \frac{1}{2} \times a_y \times t^2$$

$$-80 = 0 \times t + \frac{1}{2}(-10) \times t^2$$

$$t = 4 \text{ sec}$$

$$\text{Distance (AB)} = U_x t + \frac{1}{2} \times a_x \times t^2$$

$$= 100 \times 4 + \frac{1}{2}(0) \times 4^2$$

$$= 400 \text{ m}$$

775. Pick out the correct statement:

(a) The path traced by a projectile is trajectory
(b) The area under v-t diagram is acceleration
(c) Efficiency of simple machine is velocity ratio/mechanical advantage
(d) If efficiency is < 50% that simple machine is reversible

TNPSC AE, 2008

Ans. (a) : The path traced by a projectile that accelerates only in the vertical direction while moving at constant horizontal velocity is called a parabola. When air resistance can be neglected, the curved paths are parabolic and the paths are called trajectories.

776. A stone is dropped from the top of a tall building. If it takes 4 seconds to fall on the ground, find the height of the building. lets take g=10m/s^2.

(a) 85 m (b) 80 m
(c) 70 m (d) 75 m

VIZAG Steel MT 24.01.2021

Ans. (b) : The time of flight is,

$$T = \sqrt{\frac{2h}{g}} \qquad \left[\because h = ut + \frac{1}{2}gt^2\right]$$

When, h is the height from which ball is dropped, since, t = 4 sec.

So, $$4 = \sqrt{\frac{2 \times h}{10}} \Rightarrow 16 = \frac{2h}{10}$$

$$\Rightarrow \quad h = \frac{160}{2} = 80\,\text{m}$$

777. The maximum velocity and maximum acceleration of a particle executing simple. Harmonic motion are 2m/sec and 20 m/sec^2. The time period of motion equals :

(a) π (b) $\frac{\pi}{5}$
(c) $\frac{\pi}{10}$ (d) $\frac{\pi}{3}$

J & K PSC Screening, 2006

Ans. (b) : In SHM maximum velocity

$$y\omega = 2 \text{ m/sec} \qquad \ldots(i)$$

and maximum acceleration = $-\omega^2 y$

$$(a_{max})_{magnitude} = \omega^2 y = 20 \text{m/sec}^2 \qquad \ldots(ii)$$

divide equation (i) & (ii)

$$\frac{y\omega}{\omega^2 y} = \frac{2}{20}$$

$$\frac{1}{\omega} = \frac{1}{10}$$

$$\omega = 10$$

$$\frac{2\pi}{T} = 10$$

$$\boxed{T = \frac{2\pi}{10} = \frac{\pi}{5}}$$

778. A projectile is fired at an angle α such that its horizontal range is 500m. What is the angle α if the maximum horizontal range of the projectile is 1000m.

(a) 60° (b) 45°
(c) 22.5° (d) 15°

J & K PSC Screening, 2006

Ans. (d) : $R = \frac{u^2 \sin 2\theta}{g}$

$$500 = \frac{u^2 \sin 2\theta}{g} \qquad \ldots(i)$$

$$\text{Maximum Range} = \frac{u^2}{g}$$

$$1000 = \frac{u^2}{g}$$

In equation (i) put $\frac{u^2}{g} = 1000$

Search on Telegram @apna_pdf

$$500 = 1000 \sin 2\theta$$

$$\sin 2\theta = \frac{500}{1000}$$

$$2\theta = 30°$$

$$\boxed{\theta = 15°}$$

779. A fighter plane flying in the sky dives with a speed of 120 m/sec in a vertical circle of radius of 100 m. Mass of the pilot is 80 kg. Force with which the pilot presses the seat at the highest position is :

(a) 10720 N (b) 15000 N
(c) 8000 N (d) 12720 N

NPCIL ET, 2015

Ans. (a) : At the highest point of the vertical circle
Centripetal force $F_c = N + mg$……..(1)
Where N is the normal force between pilot and the seat and this is the force we have to find from equation (1) we get

$$\frac{mv^2}{r} = N + mg$$

$$N = \frac{mv^2}{r} - mg \text{ ……..(2)}$$

Given, m = 80 kg and r = 100m
v = 120 m/sec

So, $$N = \frac{80 \times (120)^2}{100} - mg$$

$$N = \frac{80 \times (120)^2}{100} - 80 \times 10$$

$$N = \frac{80 \times (120)^2}{100} - 800$$

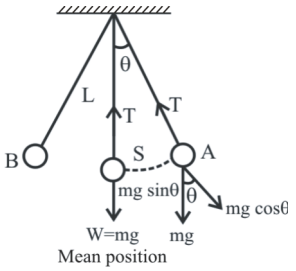
N = 10720 N

780. A simple pendulum of length of 5 m, with a bob of mass 1 kg, is in simple harmonic motion. As it passes through its mean position, the bob has a speed of 5 m/s. The net force on the bob at the mean position is:

(a) 0 (b) 2.5 N
(c) 5 N (d) 25 N

NPCIL ET, 2015
GATE 2005

Ans. (a) :



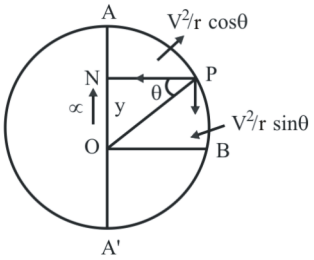
The restoring force is given by
$F = -mg\sin\theta$
$F = 0$ [At mean position, $\theta = 0$]
Here, option 'A' is correct.

781. The Maximum acceleration of particle moving with Simple Harmonic Motion is -

(a) ω (b) ω . r
(c) ω^2.r (d) ω^2/r

TNPSC ACF 2012

Ans. (c) : Let radius is *r*



From fig.

$$a = \frac{-V^2}{r}\sin\theta$$

$\because$ $v = r\omega$

and $\sin\theta = y/r$

so, $$a = \frac{-r_2\omega_2}{r} \times y/r$$

$$a = \omega^2 y$$

(i) when y = 0
a = 0
(ii) if y = r
$\boxed{a = \omega^2 r}$

782. Simple Harmonic Motion is a :

(a) Rectilinear motion with uniform acceleration
(b) Rectilinear motion with variable acceleration
(c) Curvilinear motion with variable acceleration
(d) Curvilinear motion with variable angular speed

MPPSC State Forest Service Exam, 2014

Ans. (b) : Simple harmonic motion is defined as a motion in which the restoring force is directly proportional to the displacement of the body from its mean position or we can say rectilinear motion with variable acceleration.

$$\vec{F} = -k\vec{x}$$

$$\vec{a} = -\frac{k}{m}\vec{x}$$

$\Rightarrow$ $\vec{a} = -\omega^2\vec{x}$ Where, $\omega = \sqrt{\frac{k}{m}}$

$$\boxed{\frac{d^2\vec{x}}{dt^2} = -\omega^2\vec{x}}$$

783. When a particle is executing Simple Harmonic Motion, the velocity is maximum at.

(a) The mean position
(b) Extreme position
(c) Midway between extreme and mean position
(d) One-third distance from mean position

MPPSC State Forest Service Exam, 2014

Ans. (a) : As we know,

$$v = \omega\sqrt{A^2 - y^2}$$

Search on Telegram @apna_pdf

At mean position.

$y = 0$

$\boxed{v_{max} = \omega A}$

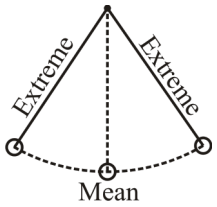
As particle executing simple harmonic motion, the velocity is maximum at mean position and zero at the extreme point.

784. A ball tied at the end of a flexible inelastic string of length 'ℓ' is executing SHM in a vertical plane. At the mean position the mass has

(a) Maximum KE and Minimum PE
(b) Maximum KE and Maximum PE
(c) Minimum KE and Maximum PE
(d) Minimum KE and Minimum PE

Karnataka PSC AE, 10.09.2017

Ans. (a) :



At mean position KE is maximum and PE is minimum.

785. In case of SHM, the period of oscillation is given by :

(a) $T = \frac{\omega}{2\pi}$ (b) $T = \frac{2\omega}{\pi}$

(c) $T = \frac{2\pi}{\omega}$ (d) $T = \frac{\pi}{2\omega}$

KPSC ADF 2015
TNPSC AE 2019

Ans. (c) : $\omega = 2\pi n$

$\omega = \frac{2\pi}{T}, \; n = \frac{1}{T}$

$\boxed{T = \frac{2\pi}{\omega}}$

786. A spring balance is attached to the ceiling of a lift. A man hangs his bas on the spring and the spring reads 49 N, when the lift is stationary. If the lift moves downwards with an acceleration of 5 m/s^2, the reading of the spring balance will be

(a) 24 N (b) 74 N
(c) 15 N (d) 49 N

GPSC EE Pre, 28.01.2017

Ans. (a) : If lift is stationary, then spring force balances weight.

F_x = mg = 49 N (k = force constant of spring, x = deflection)

$\Rightarrow \quad k = \frac{49}{x}$

and $\quad m = \frac{49}{9.8} = 5\,kg$

When lift moves with acceleration 5 m/s^2 downward we have.

Spring force = kx_2 = mg – 5 × a (pseudo force in lift)

= 49 – 5 × 5

= 49 – 25 = 24 N

787. A body of mass m is dropped from a height of h. Simultaneously another body of mass 2m is thrown up vertically with such a velocity v that they collide at height h/2. If the collision is perfectly inelastic, the velocity of combined mass at time of collision with the ground will be

(a) $\sqrt{\frac{5gh}{4}}$ (b) $\sqrt{gh}$

(c) $\sqrt{\frac{gh}{4}}$ (d) None of these

GPSC EE Pre, 28.01.2017

Ans. (d) : m_1 = 'm' mass falls a distance $\frac{h}{2}$ in time 't'

$\therefore$ Initial velocity u = 0

$$h = ut + \frac{1}{2}gt^2$$

$$\frac{h}{2} = \frac{1}{2}gt^2 \;\; \therefore t = \sqrt{\frac{h}{g}}$$

For mass $m_2 = 2m$

$h_2 = \frac{h}{2}$, finial velocity =V = initial velocity

$$\frac{h}{2} = Vt - \frac{1}{2}gt^2$$

$$= V\sqrt{\frac{h}{g}} - \frac{h}{2g}$$

$\therefore \quad V = \sqrt{gh}$

Now, let u is the velocity with which combined mass collides with ground then,

$$u = \sqrt{\left(\frac{2}{3}V\right)^2 + 2g\left(\frac{h}{3}\right)}$$

$$= \sqrt{\frac{4}{9}gh + \frac{2}{3}gh}$$

$$= \frac{\sqrt{10}}{3}\sqrt{gh} = \frac{\sqrt{10gh}}{3}$$

788. The super elevation 'e' of the order rail on a rail road curve of radius 'r' so that a car travelling at a speed 'V' around the curve will exert equal pressures on the two rails (distance between the rails being 'b') is

(a) $\frac{bV^2}{g}$ (b) $\frac{bV^2}{gr}$

(c) $\frac{gr}{bV^2}$ (d) $\frac{V^2}{gr}$

OPSC Civil Services Pre 2006

Search on Telegram @apna_pdf

Ans. (d) : Elevation (angle) has no unit only option (d) is unit less.

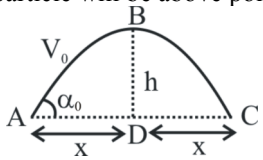
789. A projectile is fired from the level ground at an angle α_0 to the horizontal and with an initial velocity V_0. The time elapsed by the projectile to hit the ground is

(a) $\frac{2V_0\cos\alpha_0}{g}$ (b) $\frac{V_0^2\sin 2\alpha_0}{g}$

(c) $\frac{2V_0\sin\alpha_0}{g}$ (d) $\frac{V_0^2\sin^2\alpha_0}{2g}$

OPSC Civil Services Pre 2006

Ans. (c) : By vertical component of velocity V_0 find, particle will reach height point in time 't' second. and at the same time, particle will be above point D.



Vertical component of velocity at point B will be zero.

$0 = V_0\sin\alpha_0 - gt$ or $t = \frac{V_0\sin\alpha_0}{g}$

time of flight $= 2t = \frac{2V_0\sin\alpha_0}{g}$

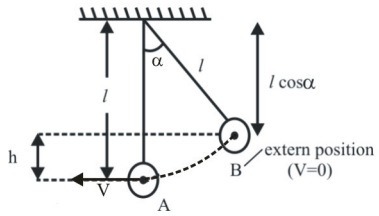
790. A pendulum has a length ℓ. Its bob is pulled aside from its equilibrium position through an angle α and then released. The speed of the bob when it passes through the equilibrium position is given by

(a) $\sqrt{2g\ell}$ (b) $\sqrt{2g\ell\cos\alpha}$

(c) $\sqrt{2g\ell(1-\cos\alpha)}$ (d) $\sqrt{2g\ell(1-\sin\alpha)}$

WBPSC AE 2003

Ans. (c) :



$h = l - l\cos\alpha$

$h = l(1-\cos\alpha)$

from energy conservation (B to A)

$KE_B + PE_B = KE_A + PE_A$

$KE_B + PE_B = KE_A + PE_A$

$0 + mgh = \frac{1}{2}mv^2 + 0$

$mgh = \frac{1}{2}mv^2$

$g[l(1-\cos\alpha)] = \frac{1}{2}v^2$

$2g\,l(1-\cos\alpha) = v^2$

$\boxed{v = \sqrt{2gl(1-\cos\alpha)}}$

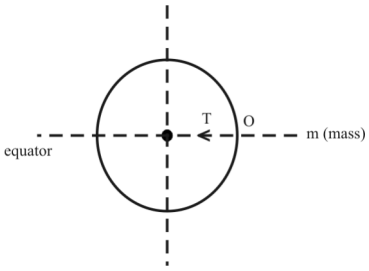
791. Consider a particle of mass m suspended vertically by a string at the equator. Let R and M denote the radius and the mass of the earth, respectively. If acceleration due to gravity at equator is $g - \omega^2R$ where ω is the angular velocity of earth's rotation about its own axis, the tension in the string is equal to

(a) $G\frac{mM}{2R^2}$ (b) $G\frac{mM}{R^2}$

(c) $G\frac{mM}{R^2} + m\omega^2R$ (d) $G\frac{mM}{R^2} - m\omega^2R$

WBPSC AE 2003

Ans. (d) :



T = tension is string.

∵ The acceleration due to gravity at a place on the surface of the earth is given by –

$g' = g - \omega^2 R\cos\phi$

where ϕ is the lattitude of the place but for equator $\phi = 0$

$\therefore\ g' = g - \omega^2R$ Which is given is question.

Therefore, the tension in the string will be –

$T = mg'$

$= m(g - \omega^2R)$

$= mg - m\omega^2R$ .....(i)

∵ mg ⇒ gravitational force

$mg \Rightarrow \frac{GmM}{R^2}$ .....(ii)

From equation (i) & (ii)

$\boxed{T = \frac{GmM}{R^2} - m\omega^2R}$

also, T = gravitational force Centrifugal force

792. The value of acceleration due to gravity at moon is g/6; where g is the value of acceleration due to gravity at earth. The value of frequency of oscillation of simple pendulum on moon as compared to earth will be-

(a) $1/\sqrt{6}$ times (b) 6 times

(c) 1/6 times (d) $\sqrt{6}$times

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) Frequency is given by on earth

$f_E = \frac{1}{2\pi}\sqrt{\frac{g}{\ell}}$ (on earth)

frequency is given by on moon

$f_m = \frac{1}{2\pi}\sqrt{\left(\frac{g/6}{\ell}\right)}$

$\frac{f_m}{f_E} = \sqrt{\frac{1}{6}}$, $\boxed{f_m = \frac{1}{\sqrt{6}}f_E}$

Search on Telegram @apna_pdf

793. A particle is projected at an angle θ to the horizontal and it attains a maximum height H. The time taken by the projectile to reach the highest point, of its path is

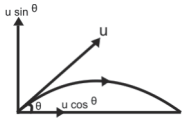
(a) $\frac{\sqrt{H}}{g}$ (b) $\sqrt{\frac{2H}{g}}$

(c) $\frac{\sqrt{2H\sin\theta}}{g}$ (d) $\frac{\sqrt{2H}}{\sin\theta}$

ISRO Scientist/Engineer 2010

Ans. (b) : $a_x = 0$, $a_y = -g$

At the highest point



$v_y = 0$

$v_y^2 - u_y^2 = -2gH$

$0 - u^2\sin^2\theta = -2gH$

$+u^2\sin^2\theta = +2gH$

$u\sin\theta = \sqrt{2gH}$

$v_y = u_y + a_y t$

$0 = \sqrt{2gH} - gt$

time taken by

$u = \frac{\sqrt{2gH}}{\sin\theta}$

$0 = \frac{\sqrt{2gH}}{\sin\theta} - gt$

$gt = \frac{\sqrt{2gH}}{\sin\theta}$

$t = \frac{\sqrt{2gH}}{\sin\theta.g} \times \frac{\sqrt{g}}{\sqrt{g}}$

$= \frac{\sqrt{2H}\times g}{\sin\theta \times g\sqrt{g}}$

$= \frac{\sqrt{2H}}{\sqrt{g}\sin\theta}$

$\theta = 90°$

$t = \sqrt{\frac{2H}{g}}$

794. For the apparent weight of a body at equator to become zero, the earth should rotate with an angular velocity of

(a) $\sqrt{\frac{2g}{r}}$ (b) $\sqrt{\frac{g}{r}}$

(c) $\sqrt{\frac{g}{2r}}$ (d) $\frac{g}{r}$

ISRO Scientist/Engineer 2010

Ans. (b) : The body will becomes weight less when acceleration toward earth of the body becomes zero.

$mg = m\omega^2 r$

$\omega = \sqrt{\frac{g}{r}}$

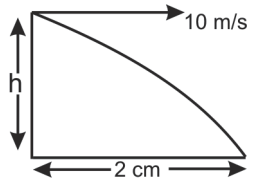
Where ω is rotation of earth, r radius of earth and m is mass of any body on earth.

795. A stone is projected horizontally from a cliff at 10 m/sec and lands on the ground below at 20 m from the base of the cliff. Find the height of the cliff. Use g=10 m/sec^2

(a) 18 m (b) 20 m

(c) 22 m (d) 24 m

ISRO Scientist/Engineer 2007



Ans. (b) :

distance = velocity × time

or 20 = 10 × t

t = 2 sec

u = 0, Initial velocity

$h = ut + \frac{1}{2}at^2$

$h = \frac{1}{2}at^2$

$\frac{1}{2}\times 10\times 4 = 20\,m$

796. Oscillation of a particle is prescribed by the equation x = 3 cos 0.25 πt. Where t is the time in seconds.

Then time taken by the particle to move from position to equilibrium to maximum displacement is

(a) 0.5 sec (b) 1.0 sec

(c) 2.0 sec (d) 3.0 sec

ISRO Scientist/Engineer 2007
ISRO Scientist/Engineer 2011

Ans. (c) :

$x = 3\cos 0.25\,\pi t$

For maximum displacement, $x_{max} = 3$

$3 = 3\cos 0.25\pi t$

$\cos 0.25\pi t = 1$

$\cos 0.25\pi t = \cos 0$

$0.25\pi t = 0$

$t = 0$

For equilibrium displacement, x = 0

$0 = 3\cos(0.25\pi t)$

$0.25\pi t = \frac{\pi}{2}$

$\frac{1}{4}\pi t = \frac{\pi}{2}$

$\boxed{t = 2\,sec}$

Search on Telegram @apna_pdf

797. A car is travelling on a curved road of radius 300 m at speed of 15 m/s. The normal and tangential components of acceleration respectively are given by:

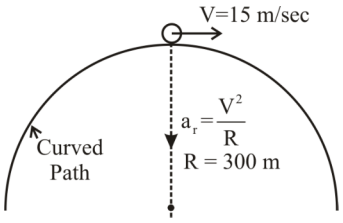
(a) 0.75 m/s^2, zero
(b) 0.75 m/s^2, 0.75 m/s^2
(c) zero, zero
(d) zero, 0.75 m/s^2

UPRVUNL AE 07.10.2016

Ans. (a) : Radial/normal components of acceleration due to change in direction continually (a_r)

$$= \frac{v^2}{r} = \frac{(15)^2}{300}$$

$a_r = 0.75$ m/s^2



In this case no tangential acceleration because of no change in angular velocity due to unifrom circular motion.

798. A particle is projected with an initial velocity of 60 m/sec at an angle of 75^o with horizontal. The maximum height attained by the particle is

(a) 171.19 m (b) 185.22 m
(c) 221.11 m (d) 198.20 m

TNPSC AE 2014

Ans. (a) : Given, u = 60 m/s, $\theta = 75^0$

The maximum height its,

$$h_{max} = \frac{u^2 \sin^2 \theta}{2g}$$

$$h_{max} = \frac{(60)^2 \times (\sin 75^o)^2}{2 \times 9.81}$$

$$\boxed{h_{max} = 171.194 \text{ m}}$$

799. The particle is projected a point 'Q' with initial velocity 'u' inclined at 'α' to x-axis, x-component of initial velocity at point 'O' is

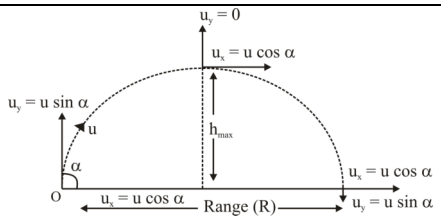
(a) $u_x = u \sin\alpha$
(b) $u_x = u \cos\alpha . \sin\alpha$
(c) $u_x = u \cos\alpha$
(d) $u_x = u \tan\alpha$

TNPSC AE 2013

Ans. (c) : $u_x = u\cos\alpha$

Time of flight (T)

$$T = 2 \times t_{peak} = \frac{2.u \sin\alpha}{g}$$



$$R = \frac{u^2 \sin 2\alpha}{g}, \quad H_{max} = \frac{u^2 \sin^2 \alpha}{2g}$$

800. A particle is projected at such an angle with the horizontal that the maximum height attained by the particle is one-fourth of the horizontal range. The angle of projection should be:-

(a) 30º (b) 45º
(c) 60º (d) 75º

UKPSC AE-2013, Paper-I

Ans. (b) : In projection motion

$$h = \frac{u^2 \sin^2 \theta}{2g}$$

and

$$\text{Range } (R) = \frac{u^2 \sin 2\theta}{g}$$

According to question

$$\frac{R}{4} = h \text{ at } \theta_{max}.$$

$$\frac{u^2 \sin 2\theta}{4 \times g} = \frac{u^2 \sin^2 \theta}{2g}$$

$$\sin\theta \cos\theta = \sin^2 \theta$$

$$\tan\theta = 1$$

$$\theta = \tan^{-1}(1)$$

$$\boxed{\theta = 45^o}$$

801. The maximum displacement of a body moving with simple harmonic motion from its mean position is called

(a) oscillation (b) amplitude
(c) beat (d) none of the above

UKPSC AE 2007 Paper -I

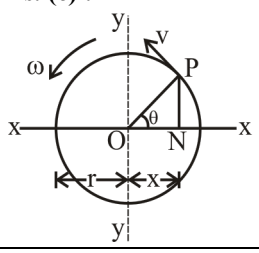
Ans. (b) : Amplitude

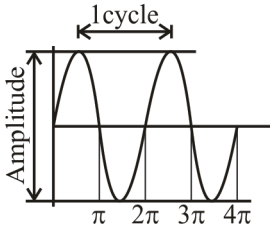
802. A body in S.H.M will have maximum velocity when its amplitude is

(a) Maximum (b) –ve maximum
(c) Zero (d) Average
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (c) :





Search on Telegram @apna_pdf

$\therefore \quad v_N = v\sin\theta = r\omega\sin\theta$

$v_N = \omega\sqrt{r^2 - x^2}$

The velocity is maximum when amplitude (x = 0) i.e. when N pass through O (i.e. mean position).

$\therefore \quad \boxed{v_{max} = \omega.r}$

803. The frequency of oscillation of a compound pendulum is

(a) $2\pi\sqrt{\{gh/(k_G^2 + h^2)\}}$

(b) $2\pi\sqrt{\{(k_G^2 + h^2)/gh\}}$

(c) $1/2\pi\sqrt{\{gh/(k_G^2 + h^2)\}}$

(d) $1/2\pi\sqrt{\{(k_G^2 + h^2)/gh\}}$

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (c) : Frequency of oscillation of a compound pendulum.

We know, for simple pendulum,

$$\omega = \sqrt{\frac{g}{h}}, \quad T = 2\pi\sqrt{\frac{h}{g}}$$

For compound,

$$\boxed{f = \frac{1}{2\pi}\sqrt{\frac{gh}{k_G^2 + h^2}}}$$

804. The minimum periodic time of a compound pendulum is

(a) $1/2\pi\sqrt{(k_G/g)}$ (b) $1/2\pi\sqrt{(2k_G/g)}$

(c) $2\pi\sqrt{(k_G/g)}$ (d) $2\pi\sqrt{(2k_G/g)}$

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (d) : The periodic time of compound pendulum is minimum when the distance between the point of suspension and the centre of gravity is equal to the radius of gyration of the body about its centre of gravity.

We know,

$$T = 2\pi\sqrt{\frac{k_G^2 + h^2}{gh}}$$

For $T_{min} \Rightarrow (h = k_G)$

$$\boxed{T_{min} = 2\pi\sqrt{\left(\frac{2k_G}{g}\right)}}$$

805. The direction of projection for the range of a projectile to be maximum on an inclined plane having angle of inclination 30° to the horizontal should be

(a) 30° with the horizontal

(b) 30° with vertical

(c) 45° with horizontal plane

(d) 45° with inclined plane

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (b) : For the maximum range in case of the inclined plane, the angle from the inclined should be,

$$\boxed{\theta = \frac{\pi}{4} - \frac{\alpha}{2}}$$

Where, $\theta \Rightarrow$ Angle of projection from the inclined plane

$\alpha \Rightarrow$ The angle of incline from horizontal

Given, $\alpha = 30° = \frac{\pi}{6}$

For maximum range,

$$\theta = \frac{\pi}{4} - \frac{\alpha}{2}$$

$$\theta = 45° - \frac{30°}{2}$$

$$\boxed{\theta = 30°}$$

Angle of projection from the vertical = 30°.

806. In simple harmonic motion, with respect to the displacement vector, the positions of velocity vector and acceleration vector will be respectively

(a) 180 deg and 90 deg

(b) 90 deg and 180 deg

(c) 0 deg and 90 deg

(d) 90 deg and 0 deg

APPSC AEE 2012

Ans. (b) : In SHM displacement vector, velocity & acceleration vector -

Displacement Velocity	x = r cos wt ... (i) v = rw (– sin wt) v= rw cos (90+wt) ....(2)	x = r sin wt ....(i) v = rw cos wt v = rw sin (90 + wt) ... (2)
Acceleration	$a = -rw^2$ cos wt $= rw^2$ (180 +wt) ..... (3)	$a = -rw^2$ sin wt $a = rw^2$ sin (180 + wt) ..... (3)

from both table its is proved that velocity & acceleration vector is load 90º & 180 respectively from displacement vector.

807. A rigid bar of length 1.96 m hanging from a frictionless pivot exerts no horizontal component of reaction force at the pivot when a sudden blow is applied horizontally at a distance of 1 m from the point of suspension. The time period of free vibration of the bar is

(a) 2 sec

(b) 1.41 sec

(c) 1 sec

(d) 0.4 sec

DRDO Scientists 2009

Ans. (a) : Time period T is given by

$$T = 2\pi\sqrt{\frac{L}{g}} = 2\pi\sqrt{\frac{1}{9.81}} = 2s$$

Search on Telegram @apna_pdf

02.

STRENGTH OF MATERIALS

1. Simple Stress and Strain

1. Poisson's ratio is expressed as

(a) Lateral stress/lateral strain
(b) Longitudinal stress/longitudinal strain
(c) Lateral strain/longitudinal strain
(d) Lateral stress by longitudinal stress

VIZAG MT, 14.12.2020

TNPSC AE 2013
APPSC AEE 2012
UKPSC AE 2012 Paper-I
APPSC IOF, 2009

Ans. (c) : Poisson ratio (μ)-The ratio of the transverse contraction of a material to the longitudinal extension strain in the direction of the stretching force is the Poisson's Ratio for a material.
This Poisson's Ratio for most of the materials is in the range of 0 to 0.5.
When the Poisson's Ratio is 0 there is no reduction in the diameter or one can even say there is no laterally contraction happening when you are elongating the material but the density would reduce. The value 0.5 indicates the volume of the material or object will remain the same or constant during the elongation process or when the diameter decrease of material when the material is elastomeric.
Rubber (μ) = 0.5, Cork (μ) = 0.

2. Hooke's law holds good upto

(a) Yield point
(b) Limit of proportionality
(c) Ductile limit
(d) Breaking point

Ans. (a) : The relation between modulus of elasticity (E) & bulk modulus (k)

$E = 3k(1 - 2\mu)$

$E = 2G(1 + \mu)$

$$E = \frac{9KG}{3K + G}$$

$$\mu = \frac{3K - 2G}{6K + 2G}$$

Where μ – Poisson's ratio

9. The value of Poisson's ratio for steel varies from:

(a) 0.20 to 0.25 (b) 0.25 to 0.35

(c) 0.35 to 0.40 (d) 0.40 to 0.55

GPSC DEE, Class-2 (GWSSB) 04.07.2021
HPPSC AE 2018
Nagaland PSC (CTSE) Paper-I 2018
Vizag Steel (MT) 2017
GMB AAE 25.06.2017
Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : Poisson's ratio (μ) – the ratio of the transverse contraction of a material to the longitudinal extension strain in the direction of stretching force. is the Poisson's ratio of material.

The value of Poisson's ratio for

Steel (μ) = 0.25 to 0.33

Rubber (μ) = 0.50

Cork (μ) = 0

Aluminium (μ) = 0.32

Concrete (μ) = 0.20

10. The deformation of a bar under its own weight as compared to that when subjected to a direct axial load equal to its own weight will be

(a) half (b) double
(c) one fourth (d) the same

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
Nagaland PSC (CTSE) Paper-I 2018
UKPSC AE-2013, Paper-I
APPSC AEE 2012, ESE 1998

Ans. (a) : Deflection due to load P

$$\delta_1 = \frac{PL}{AE}$$

Deflection due to self load

$$\delta_2 = \frac{PL}{2AE}$$

$$\frac{\delta_2}{\delta_1} = \frac{\left[\frac{PL}{2AE}\right]}{\left[\frac{PL}{AE}\right]} = \frac{1}{2}$$

11. Which of the following materials is most elastic.

(a) glass (b) brass
(c) plastic (d) steel

GWSSB AAE, 27.12.2015
APPSC AEE 2012
APPSC AE 04.12.2012
J&K PSC Civil Services Pre, 2010
CSE Pre-1995

Ans. (d) : Elasticity is the property of solid materials to return to their original shape and size after the forces deforming them have been removed.
Steel is more elastic than any other thing because steel comes back to its original shapes faster than rubber when the deforming forces are removed.

12. A steel bar of 40 mm x 40 mm square cross-section is subjected to an axial compressive load of 200 kN. If the length of the bar is 2m and E = 200 GPa, the elongation of the bar will be:

(a) 1.25 mm (b) 2.70 mm
(c) 4.05 mm (d) 5.40 mm

ISRO Scientist/Engineer (RAC) 22.04.2018
RPSC Vice Principal ITI 2018

UPRVUNL AE 2014
VIZAG Steel MT 18.06.2013
VIZAG Steel MT 10.06.2012
GATE-2006

Ans. (a) : Elongation or shortenig $\delta l = \frac{Pl}{AE}$

$$= \frac{200\times10^3\times2}{(0.040\times0.040)\times200\times10^9}$$

$=1.25\times10^{-3}$ m
=1.25 mm

13. Modulus of rigidity is defined as the ratio of

(a) longitudinal stress to longitudinal strain
(b) volumetric stress to volumetric strain
(c) lateral stress to lateral strain
(d) shear stress to shear strain

Assam PSC AE (IWT) 14.03.2021
VIZAG Steel MT 24.01.2021
APPSC AEE SCREENING 17.02.2019
SJVN ET 2019
Rajasthan Nagar Nigam AE Shift-II 2016
TNPSC AE (Industries) 09.06.2013

Ans. (d) : Shear modulus or modulus of rigidity is defined as the ratio of shear stress to the shear strain.

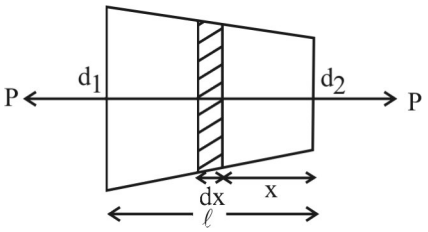
$$\text{Modulus of rigidity (G)} = \frac{\text{Shear stress}(\tau)}{\text{Shear strain}(\gamma)}$$

14. A bar uniformly tapering from a diameter d_1 at one end to a diameter d_2 at the other end, is subjected to an axial tensile load P. The length of the bar is ℓ and the young's modulus is E. The extension of the bar is

(a) $\frac{4P\ell}{\pi E d_1 d_2}$ (b) $\frac{P\ell E}{4\pi d_1 d_2}$
(c) $\frac{P\ell}{4\pi E d_1 d_2}$ (d) $\frac{4P\ell d_1 d_2}{\pi E}$

GPSC Engg. Class-2 Pre 19.01.2020
GPSC Executive Engineer 23.12.2018
APPSC AE Subordinate Service Civil/Mech. 2016
APPSC IOF, 2009
CSE Pre-1996
ESE 1995

Ans. (a) :



Consider a small strip of thickness 'dx' at a distance 'x' from smaller dia side.
Let the dia of the bar be d' at distance x

$$d' = d_1 - \left(\frac{d_1 - d_2}{\ell}\right)x$$

Let, $\left(\frac{d_1 - d_2}{\ell}\right) = K$

$\therefore d' = d_1 - Kx$

$\therefore$ cross sectional area at distance x from the smaller end $= A' = \frac{\pi}{4}d^{12} = \frac{\pi}{4}(d_1 - kx)^2$

Intensity of stress on the section = σ'

$$= \frac{P}{A'} = \frac{4P}{\pi(d_1 - kx)^2}$$

$\therefore$ Strain = $e' = \frac{\sigma'}{E} = \frac{4P}{\pi E(d_1 - kx)^2}$

$\therefore$ Extension of the length dx = e'dx

$$= \frac{4P}{\pi E(d_1 - kx)^2}.dx$$

Search on Telegram @apna_pdf

$\therefore$ Total extension of the bar $= \delta = \dfrac{4P}{\pi E}\int_0^{\ell}\dfrac{dx}{(d_1 - kx)^2}$

$$\delta = -\frac{4P}{\pi EK}\left[\frac{1}{d_1 - kx}\right]_0^{\ell}$$

$$\delta = \frac{4P}{\pi EK}\left[\frac{1}{d_1 - k\ell} - \frac{1}{d_1}\right]$$

put, $K = \dfrac{d_1 - d_2}{\ell}$

$$\delta = \frac{4P\ell}{\pi E(d_1 - d_2)}\left[\frac{1}{d_1 - d_1 + d_2} - \frac{1}{d_1}\right]$$

$$\delta = \frac{4P\ell}{\pi E(d_1 - d_2)}\left[\frac{1}{d_2} - \frac{1}{d_1}\right]$$

$$\delta = \frac{4P\ell}{\pi E(d_1 - d_2)} \cdot \frac{d_1 - d_2}{d_1 d_2}$$

$$\delta = \frac{4P\ell}{\pi E d_1 d_2}$$

For the particular case when the rod is of uniform dia.

$d_1 = d_2 = d$

and for this case, $\delta = \dfrac{4P\ell}{\pi E d^2}$

15. If Poisson's ratio is 0.25, then the modulus of rigidity (G) and the modulus of elasticity (E) are related as

(a) $G = 0.33\ E$ (b) $G = 0.5\ E$
(c) $G = 0.4\ E$ (d) $G = 0.25\ E$

CGPSC AE 15.01.2021
RPSC 2016
APPSC AEE Screening Test 2016
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
APPSC Poly. Lect. 2013
TNPSC AE, 2008

Ans. (c) Given, $\mu = 0.25$

We know that, $E = 2G(1+\mu)$

$E = 2G(1+.25)$

$E = 2G \times 1.25$

$E = 2.50G$

$E = 2G(1+\mu)$

$G = \dfrac{10}{25}E$

$G = \dfrac{2}{5}E$

$\boxed{G = 0.4E}$

16. If the value of Poisson's ratio is zero then it means that :

(a) The material is rigid
(b) The material is perfectly plastic
(c) There is no longitudinal strain in the material
(d) The longitudinal strain in the material is infinite.

OPSC AEE 2019 Paper-I
GPSC ARTO Pre 30.12.2018
Kerala PSC IOF 19.04.2016
KPSC ADF 2015
ESE 1994

Ans. (a) : If the value of Poisson's ratio is zero then it means that the material is rigid.

17. The unit of elastic modulus is the same as those of

(a) Stress, strain and pressure
(b) Strain, shear modulus and pressure
(c) Shear modulus, stress and force per unit area
(d) Strain, shear modulus and force

GPSC Executive Engg. 23.12.2018
HPPSC Asstt. Prof. 18.09.2017
APPSC AE 04.12.2012
UKPSC AE 2012 Paper-I
APPSC AEE 2012

Ans. (c) : Unit of elastic modulus (E) = MPa or Pa or N/m^2
(i) Shear modulus (G) = MPa or Pa or N/m^2
(ii) Stress (σ) = MPa or Pa or N/m^2
(iii) Force per unit area $\dfrac{F}{A} = N/m^2$

18. For a linearly elastic, isometric and homogeneous material , the number of elastic constants required to relate stress and strain are :

(a) Four (b) Two
(c) Three (d) Six

UPRVUNL AE 05.07.2021
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
OPSC AEE 2015 Paper-I
TSPSC AEE 2015
APPSC AEE 2012
ESE 1998
CSE Pre-1990

Ans : (b) For a linearly elastic, isometric and homogeneous material, the number of elastic constant required to relate stress and strain are two.

19. If the radius of wire stretched by a load is doubled, then its Young's Modulus will be

(a) Doubled
(b) Halved
(c) Become four times
(d) Become one fourth
(e) None of the above

TNPSC AE 2017
Rajasthan Nagar Nigam AE 2016, Shift-II
CGPSC Poly. Lect. 22.05.2016
ISRO Scientist/Engineer 2006

Ans. (e) : The Young's Modulus of any materials is equal to the ratio of stress and the strain.
Its formula is given by –

$$E = \frac{\sigma}{\varepsilon}$$

or

$$E = \frac{F/A}{\Delta L/L}$$

The Young's Modulus of any material is inherited property. Its only depends on the temperature and the pressure.
So, if the radius of a wire stretched by a load is doubled then its Young's Modulus will remain unaffected.

Search on Telegram @apna_pdf

20. The number of elastic constants for a completely anisotropic elastic material are :

(a) 3 (b) 4
(c) 21 (d) 25

Kerala PSC Poly. Lect., 2017
APPSC AEE 2012
APPSC AE 04.12.2012
ESE 1999

Ans. (c) :

Material	Number of independent elastic constant
Homogeneous & Isotropic	2
Orthotropic	9
Anisotropic	21

21. A steel bar of 5 mm is heated from 15 °C to 40°C and it is free to expand. The bar will induce

(a) No stress (b) Shear Stress
(c) Tensile Stress (d) Compressive stress

Nagaland PSC (CTSE) Paper-I 2018
RPSC ADE 2016
APPSC AEE Mains (Civil Mechanical) 2016
Haryana PSC Civil Services Pre, 2014

Ans. (a) : A bar subjected to heating and allow to free expansion will not experience any stress. The stress produced due to oppose of expansion or contraction.

22. A solid uniform metal bar of cross-section area A and length L is hanging vertically from its upper end. If w is the total weight of bar and E the Young's modulus of elasticity, the elongation of bar due to self-weight would be

(a) WL/2AE (b) WL/4AE
(c) WL/AE (d) 2WL/AE

APPSC AEE SCREENING 17.02.2019
WBPSC AE, 2017
APPSC AEE Mains (Civil Mechanical) 2016
DRDO Scientist 2009

Ans. (a) : Specific weight, γ = Weight/Volume

$$\sigma = \frac{Ax\gamma}{A} = x\gamma$$

$$\in = \frac{\sigma}{E} = \frac{x\gamma}{E}$$

Total elongation of bar due to self weight,

$$= \int_0^L \in dx = \int_0^L \frac{x\gamma}{E} dx$$

$$= \frac{\gamma L^2}{2E} = \frac{WL}{2AE}$$

23. The material which exhibit the same elastic properties in all direction are called

(a) homogeneous (b) inelastic
(c) isotropic (d) anisotropic

APPSC AEE SCREENING 17.02.2019
Mizoram PSC AE/SDO 2014, Paper-II
APPSC AEE 2012
APPSC AE 04.12.2012

Ans. (c) : Homogeneous Material–A material is said to be homogeneous when it exhibits same elastic properties at any point in a given direction i.e. properties are independent of point.

Example–Wood, Aluminium, Copper, Steel and Gold.

Isotropic Material–The material which exhibit the same elastic properties in all direction are called isotropic.
Example–Steel, Brass.

Homogeneous and Isotropic–A material is said to be homogeneous and isotropic when it exhibits same elastic property in any direction at any point.
Example–Steel, Copper, Gold, Aluminum.

Orthotropic Material–A material is said to be orthotropic when it exhibits different elastic property in orthogonal direction at a given point.
Example–Any layered material like plywood, graphite.

Anisotropic Material–A material which exhibits direction dependent elastic properties is known as anisotropic material.
Example–Composite material.

24. For a given material. Young's Modulus is 200 GN/m^2 and Modulus of Rigidity is 80 GN/m^2. Its Poisson Ratio will be:

(a) 0.15 (b) 0.20
(c) 0.25 (d) 0.35

SJVN ET 2013
UPSC JWM Adv. No-16/2009
UKPSC AE 2007 Paper -I
CSE Pre-2007

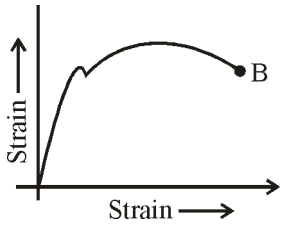
Ans. (c) : Given, E = 200 GN/m^2
G = 80 GN/m^2
$E = 2G(1 + \mu)$
$200 = 2 \times 80 (1 + \mu)$
$\boxed{\mu = 0.25}$

25. Which one of the following is rupture stress?

(a) Breaking stress
(b) Maximum load/original cross-sectional area (A)
(c) Load breaking point /Area (A)
(d) Load at breaking point/neck area

Assam PSC AE (PHED) 18.10.2020
TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-2006
TSPSC (Telangana)

Ans. (a&d) :



B = Rupture stress or Breaking stress.

26. If a material expands freely due to heating it will develop

(a) Thermal stresses (b) Tensile stress
(c) No stress (d) Bending

Assam PSC AE (PHED), 18.10.2020
(CGPSC Polytechnic Lecturer 2017)
UPRVUNL AE 2014
ISRO Scientist/Engineer 2007

Search on Telegram @apna_pdf

Ans. (c) : If a material expands freely due to heating it will develop no stress i.e. zero stress.

27. Young's modulus of elasticity and Poisson's ratio of a material are 1.25×10^5 MPa and 0.34 respectively. The modulus of rigidity of the material is

(a) 0.4025×10^5 MPa (b) 0.4664×10^5 MPa
(c) 0.8375×10^5 MPa (d) 0.9469×10^5 MPa

APGCL AM, 2021
APPSC AEE 2012
APPSC AE 04.12.2012
CSE Pre-1994

Ans. (b) :
Given:-

$E = 1.25 \times 10^5$ MPa
$\mu = 0.34$
$E = 2G(1 + \mu)$

$$\frac{1.25 \times 10^5}{2(1+0.34)} = G$$

$G = 46641.79$ MPa
$= 0.4664 \times 10^5$ MPa

28. The bulk modulus of a body is equal to

(a) $\frac{mE}{3(m-2)}$ (b) $\frac{mE}{3(m+2)}$
(c) $\frac{mE}{2(m-2)}$ (d) $\frac{mE}{2(m+2)}$

(where $\frac{1}{m}$ = Poisson's Ratio and E = Young's Modulus of Elasticity)

RPSC IOF, 2020
Nagaland PSC (CTSE) Paper-I 2018
TNPSC ACF 2012

Ans. (a) : The bulk modulus of a body

$$K = \frac{mE}{3(m-2)}$$

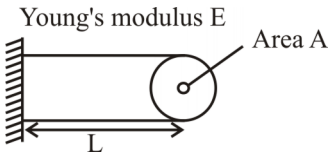
Where, K = bulk modulus
E = modulus of elasticity
$\frac{1}{m} = \mu$ = Poissons ratio

29. A circular rod of length L and area of cross-section A has a modulus of elasticity E and coefficient of thermal expansion α. One end of the rod is fixed and the other end is free. If the temperature of the rod is increased by ΔT, then

(a) Stress developed in the rod is zero and strain developed in the rod is αΔT
(b) Both stress and strain developed in the rod are zero
(c) Stress developed in the rod is EαΔT and strain developed in the rod is αΔT
(d) Stress developed in the rod is EαΔT and strain developed in the rod is zero

Assam Engg. College AP/Lect. 18.01.2021
ISRO Scientist/Engineer 07.05.2017
TSPSC AEE 2015, GATE 2014

Ans. (a) :



If temperature is increased by ΔT then
Stress developed in the rod is zero. ($\sigma_{th} = 0$) because there is no any restriction.

Strain developed in the rod $\varepsilon = \frac{\alpha \Delta T \times L}{L}$

$\varepsilon = \alpha \Delta T$

30. A steel rod 2m long is heated through a temperature of 100°C. The coefficient of linear expansion is 6.5×10^{-6}/°C and Young's Modulus is 2×10^6 N/m^2, the stress induced in the bar will be :

(a) 1000 N/m^2 (b) 1200 N/m^2
(c) 1300 N/m^2 (d) 1400 N/m^2

GPSC ARTO 01.05.2016
MPPSC AE 08.11.2015
MPPSC State Forest Service Exam, 2014

Ans. (c) : Given, $\alpha = 6.5 \times 10^{-6}$/°C, $L_0 = 2$m
$E = 2 \times 10^6$ N/m^2 $\Delta t = 100$°C
$\Delta L = L_0 \alpha \Delta T$
Thermal stress = $E \alpha \Delta T$
$= 2 \times 10^6 \times 6.5 \times 10^{-6} \times 100$
$= 1300$ N/m^2

31. Bars of copper and steel form a composite system. They are heated to a temperature of 40^{0}C. What type of stress is induced in the copper bar?

(a) Tensile
(b) Compressive
(c) Both tensile and compressive
(d) Shear.

GPSC Poly. Lect. 07.12.2014
ESE 2013
TRB Asstt. Prof., 2012

Ans. (b) : $\alpha_{copper} = 16 \times 10^{-6}$/°C
$\alpha_{steel} = 12 \times 10^{-6}$/°C
Thermal expansion of copper material is more as compare to steel hence as temperature increases the copper material elongate more than steel hence copper material experiences compression while steel material experiences tension.

32. The maximum stress produced in a bar of tapering section is at

(a) smaller end (b) larger end
(c) middle (d) anywhere

Haryana PSC Civil Services Pre, 2014
VIZAG STEEL MT 2011

Ans. (a) : The maximum stress produced in a bar of tapering section is at smaller end.

33. The Young's modulus of elasticity of a material is 2.5 times its modulus of rigidity. The poission's ratio for the material will be:

(a) 0.50 (b) 0.75
(c) 0.33 (d) 0.25

HPPSC Asstt. Prof. 18.09.2017
UPRVUNL AE 21.08.2016
CSE Pre-1997

Search on Telegram @apna_pdf

Ans. : (d) Relation between Young's Modulus and modulus of rigidity

$E = 2G(1 + \mu)$
$E = 2.5\ G$
$2.5\ G = 2G(1+\mu)$
$2.5 = 2 + 2\mu$
$2\mu = 0.5$
$\mu = 0.25$

34. The ratio of modulus of rigidity to modulus of elasticity for a Poisson's ratio of 0.25 would be

(a) 0.5 (b) 0.3
(c) 0.4 (d) 0.2
(e) None of the above

CGPSC AE 16.10.2016
GPSC Poly. Lect. 07.12.2014
ESE 2007

Ans. (c) : As we know,

$$G = \frac{E}{2(1+\mu)}$$

So, $\frac{E}{G} = 2(1+\mu)$ or $\frac{G}{E} = \frac{1}{2(1+\mu)}$

$$\frac{G}{E} = \frac{1}{2(1+0.25)} = 0.4$$

35. A rod of length L and diameter D is subjected to a tensile load P. Which of the following is sufficient to calculate the resulting change in diameter ?

(a) Young's modulus
(b) Shear modulus
(c) Poisson's ratio
(d) Both Young's modulus and Shear modulus

GPSC ARTO Pre 30.12.2018
BPSC Asstt. Prof. 29.11.2015
GATE-2008

Ans. (d) : We can find longitudinal elongation using Young's modulus–

$$\Delta L = \frac{PL}{AE}$$

Now to find decrease in diameter of rod, Poisson's ratio (μ) should be known –

$$\mu = -\frac{\text{Lateral strain or diametral strain}}{\text{Longitudinal strain}}$$

Hence we need both E and μ but by knowing E and G we can find μ, $E = 2G(1 + \mu)$
So, both Young's modulus and shear modulus.

36. If poisson's ratio for a material is 0.5, then the elastic modulus for the material is-

(a) 3 times its shear modulus
(b) 4 times its shear modulus
(c) Equal to its shear modulus
(d) Indeterminate

APPSC IOF, 2009
ISRO Scientist/Engineer 2006
ESE 1995

Ans. (a) : Given–
Poisson's ratio (μ) = 0.5

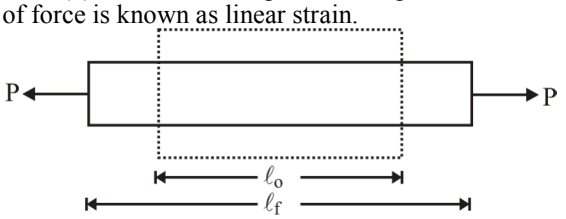
$E = 2G(1 + \mu)$
$\mu = 0.5,$
$E = 2G(1 + 0.5)$
$\frac{E}{2} = G(1.5)$
$E = 3G$

37. Deformation per unit length in the direction of force is known as

(a) Lateral strain (b) Linear strain
(c) Tensile stress (d) Linear stress

HPPSC Poly. Lect. 05.07.2021
Rajasthan Nagar Nigam AE 2016, Shift-I
UPRVUNL AE 2014

Ans. (b) : Deformation per unit length in the direction of force is known as linear strain.



Deformation ($\delta\ell$) per unit length in the direction of force/load is know as linear/longitudinal strain.

$\therefore$ linear or longitudinal strain $(\epsilon_{long}) = \frac{\delta\ell}{\ell_o} = \frac{\ell_f - \ell_o}{\ell_o}$.

38. A steel rod 10 mm in diameter and 1 m long is heated from 20 ºC to 120 ºC,E = 200 GPa and $\alpha = 12 \times 10^{-6}$ per ºC. If the rod is not free to expand, the thermal stress developed is

(a) 120 MPa (tensile) (b) 240 MPa (tensile)
(c) 120 MPa (comp. (d) 240 MPa (comp.)

RPSC Vice Principal ITI 2018
TSPSC AEE 28.08.2017 (Civil/Mechanical)
UPRVUNL AE 21.08.2016, CSE Pre 2003

Ans. (d) : Thermal strain = $e = \alpha\Delta T$
Thermal stress = $\sigma = E.e = E\ \alpha\ \Delta T$
$= (200 \times 10^9) \times (12 \times 10^{-6}) \times (120 - 20)$
$= 200 \times 10^9 \times 12 \times 10^{-6} \times 100$
= 240 MPa (compressive)
Since, body tries to expand, but it's expansion is restricted.
$\therefore$ Compressive stress will be induced.

39. In a simple tensile test, Hooke's law is valid upto the

(a) elastic limit
(b) limit of proportionality
(c) ultimate stress
(d) breaking point

TSPSC AEE 28.08.2017 (Civil/Mechanical)
TNPSC AE (Industries) 09.06.2013
APPSC AE 04.12.2012, CSE Pre 1998

Ans. (b) : In a simple tensile test, Hooke's law is valid upto the limit of proportionality.

40. The independent elastic constants for a homogeneous and isotropic material are

(a) E, G, K, ν (b) E, G, K
(c) E, G, ν (d) E, G

APPSC AEE 2012
CSE Pre-1995

Ans. (d) : Isotropic materials have the same properties in all directions. The number of independent elastic constants for such materials is 2. Out of E, G, K and μ if any two constants are known for any linear elastic and isotropic material then rest two can be derived.

Search on Telegram @apna_pdf

41. The true strain $\in_t$ and engineering strain $\in$ relationship is

(a) $\in_t = ln(1-\in)$ (b) $\in_t = ln(1+\in)$

(c) $\in_t = ln(1-2\in)$ (d) $\in_t = ln\dfrac{1}{(1+\in)}$

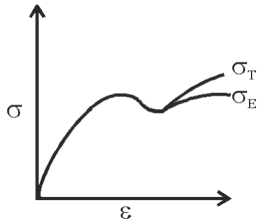
UPPSC AE 12.04.2016 Paper-I
GPSC ARTO 01.05.2016
GATE-2014

Ans : (b) True strain:-

$$\in_T = \int_{Lo}^{L_f} \frac{\delta\ell}{\ell} = \left[l\,n\right]_{Lo}^{L_f} = l\,n\left(\frac{L_f}{L_o}\right)$$

$$\in_T = l\,n\left(\frac{L_o + \Delta L}{L_o}\right)$$

$$\in_T = l\,n(1+\in)$$



$$\sigma_T = \sigma_0(1+\varepsilon)$$

42. Which of the relationship between bulk modulus (K), modulus of elasticity (E) and modulus of rigidity (G) is correct.

(a) $G = \dfrac{9KE}{K+3E}$ (b) $G = \dfrac{9KE}{E+3K}$

(c) $G = \dfrac{3KE}{E+9K}$ (d) $\dfrac{9}{E} = \dfrac{3}{G} + \dfrac{1}{K}$

ISRO Scientist/Engineer 22.04.2018
RPSC LECTURER 16.01.2016
ESE 2008

Ans. (d) :

$$E = \frac{9KG}{3K+G}$$

$$E = \frac{1}{\left[\frac{3K}{9KG}\right] + \left[\frac{G}{9KG}\right]}$$

$$E = \frac{1}{\left[\frac{1}{3G}\right] + \left[\frac{1}{9K}\right]}$$

$$\frac{1}{E} = \frac{1}{3G} + \frac{1}{9K}$$

$$\frac{9}{E} = \frac{3}{G} + \frac{1}{K}$$

43. A steel rod of diameter 1 cm and 1m long is heated from 20^0C its $\alpha = 12\times10^{-6}$/K and E = 200 GN/m^2. If the rod is free to expand, the thermal stress developed in it is–

(a) 12×10^4 N/m^2 (b) 240 KN/m^2

(c) Zero (d) Infinity

TSPSC AEE 28.08.2017 (Civil/Mechanical)
RPSC 2016
CSE Pre-2002

Ans : (c) If a material expands or contract freely due to heating or cooling. Then no stress will develop in material but if this expansion and contraction is prevented than internal resisting forces are developed in the material and because of these internal in the material.

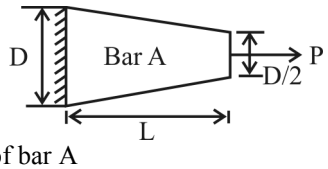
44. Two tapering bars of the material are subjected to a tensile load P. The length of both the bars are the same. The larger diameter of each of the bars is D. The diameter of the bar A at its smaller end is D/2 and that of the bar B is D/3. What is the ratio of elongation of the bar A to that of the bar B?

(a) 3 : 2 (b) 2 : 3

(c) 4 : 9 (d) 1 : 3

OPSC AEE 2019 Paper-I
TSPSC Managers, 2015
ESE 2006

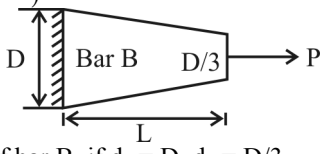
Ans : (b) :



Elongation of bar A

$$(\delta_A) = \frac{4PL}{\pi E d_1 d_2}$$

$$= \frac{4PL}{\pi E(D)(D/2)} = \frac{8PL}{\pi ED^2}$$



Elongation of bar B, if $d_1 = D$, $d_2 = D/3$

$$(\delta_B) = \frac{4PL}{\pi E d_1 d_2} = \frac{4PL}{\pi E(D)(D/3)} = \frac{12PL}{\pi ED^2}$$

$$\frac{\delta_A}{\delta_B} = \frac{8}{12} = \frac{2}{3}$$

45. For a ductile material, toughness is a measure of

(a) resistance to scratching
(b) ability to absorb energy up to fracture
(c) ability to absorb energy till elastic limit
(d) resistance to indentation

Gujarat PSC AE 2019
GPSC Executive Engineer 23.12.2018, GATE 2013

Ans. (b) : Toughness of a material is defined by energy absorbed up to fracture. It is equal to area load deformation diagram. Area under stress strain diagram up to fracture represents energy absorbed per unit volume which is known as modulus of toughness, it is measure of toughness of material.

46. If a block of material of length 25 cm, breadth 10 cm and height 5 cm undergoes a volumetric strain of 1/5000, then change in volume will be:

(a) 0.50 cm^3 (b) 0.25 cm^3

(c) 0.20 cm^3 (d) 0.75 cm^3

HPPSC Asstt. Prof. 18.09.2017
TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-1997

Search on Telegram @apna_pdf

Ans. (b) : Volumetric strain = $e_v = \frac{\Delta V}{V}$

Initial volume V = (25 × 10 × 5) cm^3

$e_v = \frac{1}{5000}(\text{given})$

$\Delta V = e_v \times V$

$= \frac{1}{5000} \times (25 \times 10 \times 5)$

$= 0.25\ cm^3$

47. A material has a young's modulus of 1.25×10^5 N/mm^2 and a poisson's ratio of 0.25. The bulk modulus of the material will be

(a) 83×10^5 N/mm^2 (b) 0.83×10^5 N/mm^2

(c) 8.3×10^3 N/mm^2 (d) 8.3×10^5 N/mm^2

ISRO Scientist/Engineer (RAC) 22.04.2018
Mizoram PSC AE/SDO Paper-II 2014

Ans. (b) : Given,

$E = 1.25 \times 10^5$ N/mm^2, $\mu = 0.25$

then $K = ?$

$E = 3K(1-2\mu)$

$1.25 \times 10^5 = 3 \times K \times (1 - 0.5)$

$K = \frac{2.50}{3} \times 10^5$

$K = 8.33 \times 10^4$

$K = 0.833 \times 10^5$ N/mm^2

48. A free bar of length 1 is uniformly heated from 0°C to a temperature t°C. α is the coefficient of linear expansion and E is the modulus of elasticity. The stress in the bar is

(a) α TE (b) E/αT

(c) Zero (d) None of the above

ISRO Scientist/Engineer (RAC) 07.05.2017
Karnataka PSC Lect., 27.05.2017, GATE 1995

Ans. (c) : The stress in the heated bar will be zero because the bar is free to expand so therefore no stress produced in heated bar.

49. Robert Hooke's discovered experimentally that within elastic limit

(a) Stress = strain

(b) Stress/strain = a constant

(c) Stress x strain = 1

(d) None of these

ISRO Scientist/Engineer 2011
ESE 2020

Ans. (b) : Hooke's law—According to Hook's law the stress is directly proportional to strain within elastic limit i.e. normal stress (σ) ∝ Normal strain (ε)

$\sigma = E\varepsilon$

And shear stress (τ) ∝ shearing strain (γ)

or $\tau = G\gamma$

50. The ratio of volumetric stress to the corresponding volumetric strain in a body is always constant is known as :

(a) Surface tension

(b) Bulk modulus of elasticity

(c) Compressibility

(d) Viscosity

Karnatka PSC AE (WRD) 31.07.2021
MECON MT 2019

Ans. (b) : The ratio of volumetric stress to the corresponding volumetric strain in a body is always constant is known as bulk modulus of elasticity.

51. The ratio between the change in volume and original volume of the body is called

(a) tensile strain (b) compressive strain

(c) volumetric strain (d) shear strain

UP Jal Nigam AE 2016
APPSC AEE 2012

Ans : (c)

Volumetric strain $= \frac{\text{change in volume}}{\text{original volume}}$

$$\varepsilon_v = \frac{\Delta V}{V}$$

52. A rod of copper originally 305 mm long is pulled in tension with a stress of 276 MPa. If the modulus of elasticity is 110 GPa and the deformation is entirely elastic, the resultant elongation will be nearly

(a) 1.0 mm (b) 0.8 mm

(c) 0.6 mm (d) 0.4 mm

ESE 2020
ESE 2019

Ans. (b)

Elongation,

$$\delta\ell = \frac{P\ell}{AE} = \frac{\sigma\ell}{E} = \frac{276 \times 305}{110 \times 10^3} = 0.765\,\text{mm} \simeq 0.8\,\text{mm}$$

53. Temperature stress are set up in a material when

(a) It is free to expand or contract

(b) It is first heated then cooled

(c) It is first cooled and then heated

(d) its expansion and contraction is restrained

Nagaland PSC CTSE 2017, 2016 Paper-I

Ans. (d) : Whenever there is some increase or decrease in the temperature of a body, it causes the body to expand or contract, there is no stresses are induced in the body. But, if the deformation of the body is prevented, some stresses are induced in the body, such stresses are known as thermal stresses or temperature stresses.

54. A 200 × 100 × 50 mm steel block is subjected to a hydrostatic pressure of 15 MPa. The Young's modulus and Poisson's ratio of the material are 200 GPa and 0.3 respectively. The change in the volume of the block is

(a) 100 mm^3 (b) 110 mm^3

(c) 85 mm^3 (d) 90 mm^3

(e) 80 mm^3

CGPSC AE 26.04.2015 Shift-I
GATE 2007

Ans. (d) : Given,

Volume (V) = 200 × 100 × 50 = 10^6 mm^3

Hydrostratic pressure (σ) = 15 MPa = 15 N/mm^2

Young's modulus (E) = 200 GPa = 200 × 10^3 N/mm^2

Poisson's ratio (μ) = 0.3

[∵ For Hydrostratic pressure, $\sigma_x = \sigma_y = \sigma_z = \sigma$]

Volumetric strain $(e_v) = \frac{3\sigma}{E}(1-2\mu)$

Search on Telegram @apna_pdf

$$\frac{\Delta V}{V} = \frac{3\sigma}{E}(1-2\mu)$$

$$\Delta V = \frac{3\sigma V}{E}(1-2\mu)$$

$$= \frac{3\times 15\times 10^6(1-2\times 0.3)}{200\times 10^3} = 90 \text{ mm}^3$$

55. _____ is the capacity of material to absorb energy when it is elastically deformed and then upon unloading, to have this energy recovered.

(a) Toughness (b) Tensile strength
(c) Plasticity (d) Resilience

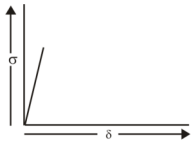
CIL MT 26.03.2017
ESE 2016

Ans. (d) : Resilience- It is energy absorbed by a member in elastic region. It denotes the capacity of material to absorb energy when it is elastically deformed and then upon unloading, to release this energy.

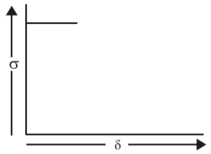
Toughness- It is energy absorbed by member just before its fracture.

56. The stress-strain curve of an ideal elastic material with strain hardening will be as-

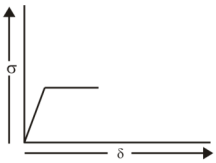
(a)



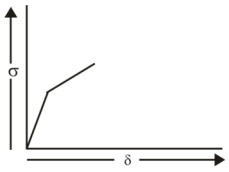
(b)



(c)

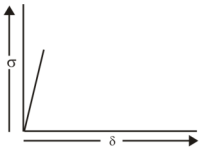


(d)

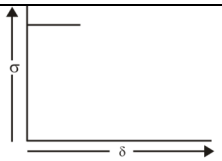


RPSC AE 2018
CSE Pre-1998

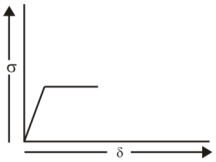
Ans. (d) : 1. The stress-strain curve for an ideal elastic material.



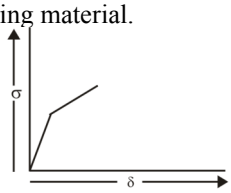
2. The stress-strain curve for rigid - Perfectly plastic material



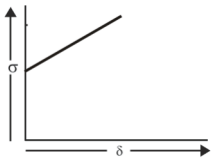
3. Stress-strain curve for elastic - Perfectly plastic material.



4. Stress-strain curve for an ideal elastic material with strain hardening material.



5. stress-strain curve for rigid - Linear hardening material

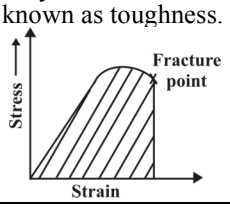


57. The ability of the material to absorb energy before fracture is known as:

(a) Toughness (b) Ductility
(c) Cold shortness (d) Hardness

UPRVUNL AE 07.10.2016
SJVN ET 2013

Ans. (a) : The ability of the material to absorb energy before fracture is known as toughness.



58. The equation for relationship between $\frac{1}{m}$, C & K is,

(a) $\frac{1}{m} = \frac{3K-2C}{6K+2C}$ (b) $\frac{1}{m} = \frac{2C-3K}{2C+6K}$

(c) $\frac{1}{m} = \frac{2K-3C}{2C+6K}$ (d) $\frac{1}{m} = \frac{3K+2C}{6K-2C}$

TNPSC AE 2013
BPSC AE 2012 Paper - VI

Ans. (a) : We know that relation between poisson ratio $\left[\mu \text{ or } \frac{1}{m}\right]$, modulus of rigidity (C) and Bulk Module (K) is given as

$$2C(1+\mu) = 3K(1-2\mu)$$

$$2C + 2C\mu = 3K - 6K\mu$$

$$\mu = \frac{1}{m} = \frac{3K-2C}{6K+2C}$$

Search on Telegram @apna_pdf

59. In a body, thermal stress is induced because of the existence of :
(a) Latent heat (b) Total heat
(c) Temperature gradient (d) Specific heat

OPSC AEE 2019 Paper-I
ESE 2013

Ans : (c) : Thermal stress- If the material is restrained from expanding or contracting while the temperature change, then stress builds within the part.

60. True strain for a steel bar which is doubled its length by tension is :
(a) 0.307 (b) 0.5
(c) 0.693 (d) 1.0

OPSC AEE 2019 Paper-I
ISRO Scientist/Engineer 2012

Ans : (c) :
Initial length of bar, $\ell_i = \ell$

Final length of bar, $\ell_f = 2\ell$

Engineering strain, $\in = \frac{\Delta L}{\ell} = \frac{2\ell_i - \ell_i}{\ell_i} = 1$

$True\,strain\left(\in_{true}\right) = \ln\left(1+\in\right) = \ln\left(1+1\right)$

$\in_{true} = \ln\left(2\right)$

$= 0.693$

61. Resilience of material should be considered when it is subjected to
(a) shock load (b) electroplating
(c) chemical coating (d) polishing

RPSC AE 2016
GWSSB DEE 07.07.2016
RPSC ACF-2011

Ans : (a) Resilience of material should be considered when it is subjected to shock loading.
Resilience:- It is the property of a materials to absorb energy and to resist shock and impact loads. It is measured by the amount of energy absorbed per unit volume within elastic limit this property is essential for spring materials.

62. Strain in direction at right angle to the direction of applied force is known as:-
(a) Lateral strain
(b) Shear strain
(c) Volumetric strain
(d) None of the above

UKPSC AE-2013, Paper-I
APPSC AEE 2012

Ans. (a) : Strain in direction at right angle to the direction of applied force is known as lateral strain.

63. Stress and Strain are tensor of
(a) zero-order (b) first order
(c) second order (d) None of the above

HPPSC Asstt. Prof. 2014
UKPSC AE 2012 Paper-I

Ans. (c) : Stress in second order tensor. Magnitude, direction and plane are required to describe stress that's why it is known as second order tension.

64. What does the elasticity of material enables it to do ?
(a) Regain the original shape after the removal of applied force.
(b) Draw into wires by the application of force.
(c) Resist fracture due to high impact.
(d) Retain deformation produced under load permanently.

UKPSC AE 2012 Paper-I
VIZAG STEEL MT 2011

Ans. (a) : Regain the original shape after the removal of applied force.

65. The relation between E (modulus of elasticity) and k (bulk modulus of elasticity) is
(a) $E = k\left[1-\frac{2}{m}\right]$ (b) $E = 2k\left[1-\frac{2}{m}\right]$
(c) $E = 3k\left[1-\frac{2}{m}\right]$ (d) $E = 4k\left[1-\frac{2}{m}\right]$

UPRVUNL AE 07.10.2016
UKPSC AE 2007 Paper -I

Ans. (c) : $E = 3k\left[1-\frac{2}{m}\right]$

66. Which one of the following is connect respect of poisson's ratio (μ) limits for an isotropic elastic solid:
(a) $0 < \mu < 1$ (b) $-1 < \mu < 1$
(c) $-1 < \mu < 0.5$ (d) $0 < \mu < 0.5$

PTCUL AE 25.06.2017
ESE 2004

Ans. (c) : The Poisson's ratio (μ) for any material lies in $\boxed{-1 < \mu < 0.5}$

67. Whenever some external system of forces act on a body, it undergoes deformation. As the body goes under deformation, it sets up some resistance to the deformation. What is this resistance per unit area of deformation called as?
(a) Strain
(b) Stress
(c) Pressure
(d) Modulus of elasticity

HPPSC Poly. Lect. 05.07.2021
VIZAG STEEL MT 2011

Ans. (b) : Resistance force per unit area of deformation is called stress.

68. Which one of the following information cannot be obtained from the static tensile test of a mild steel specimen?
(a) Modulus of elasticity
(b) Qualitative determination of toughness
(c) Ductility
(d) Weldability

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-2006

Ans. (d) : Weldability cannot be obtained from static tensile test.

69. A straight bimetallic strip of copper and steel is heated. It is free at ends. The strip will
(a) Expand and remain straight
(b) Not expand but bend
(c) Expand and bend also
(d) First only

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre 2002

Search on Telegram @apna_pdf

Ans. (c) : If heated and free to expand
since $\alpha_{copper} = 18 \times 10^{-6}$ /°c
$\alpha_{steel} = 11 \times 10^{-6}$ /°c
Copper expands more than steel and hence the bimetallic strip will bend with outer fiber as copper.

70. The work done per unit volume in elongating a body by a uniaxial force is :
(a) stress/strain (b) stress × strain
(c) $\frac{1}{2}$ stress × strain (d) None of the above

APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (c) :
Workdone/volume = $\frac{1}{2}$ stress × strain = $\frac{1}{2}\sigma.\varepsilon$

71. The Poisson's ratio a material which has Young's modulus of 120 GPa and shear modulus of 50 GPa, is
(a) 0.1 (b) 0.2
(c) 0.3 (d) 0.4

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
UKPSC AE-2013, Paper-I

Ans. (b) : As, we know, the relation between E, μ & G
$E = 2G[1+\mu]$
$120 = 50 \times 2[1+\mu]$
$\mu = 0.2$

72. Thermal Strain, developed in a rod of length '*l*' and temperature rise 'ΔT', is given by- (Where α = Coefficient of Thermal Expansion; E = Young's modulus)
(a) αΔT (b) EαΔT*l*
(c) EαΔT (d) Zero

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
APPSC AEE 2012

Ans. (a) : As we know,
$\Delta L = \alpha \Delta T L$ [∴ General equation]
Strain, $\frac{\Delta L}{L} = \alpha \Delta T$

73. Which one of the following properties is more sensitive to increase in strain rate?
(a) Yield strength (b) Proportional Limit
(c) Elastic Limit (d) Tensile Strength

APPSC AEE 2012
RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (a) : Yield strength is more sensitive to increase in strain rate.
Note : No answer is given by commission.

74. The ratio of Bulk Modulus to Young's Modulus of a Poisson's ratio of 0.25 will be :
(a) 1/3 (b) 2/3
(c) 1 (d) 3/2

APPSC AE Subordinate Service Civil/Mech. 2016
RPSC AE GWD, 2011

Ans. (b) : Given, Poisson's ratio (μ) = 0.25
$E = 3K(1-2\mu)$
$\frac{K}{E} = \frac{1}{3(1-2\mu)}$
$\frac{K}{E} = \frac{1}{3(1-2\times 0.25)}$
$\frac{K}{E} = \frac{1}{3\left(1-\frac{2}{4}\right)}$
$= \frac{4}{3\times 2}$
$\boxed{\frac{K}{E} = 2/3}$

75. If modulus of rigidity of a material is 80 GPa and modulus of elasticity is 200 GPa, what will be the bulk modulus of material?
(a) 133.3 GPa (b) 153.3 GPa
(c) 163.3 GPa (d) 173.3 GPa

APPSC Poly Lect. 13.03.2020
ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (a) : Given data : G = 80 GPa, E = 200 GPa
K = ?
∵ $E = 2G(1+\mu) \Rightarrow 200 = 2\times 80(1+\mu)$
$\Rightarrow 1+\mu = \frac{200}{2\times 80} \Rightarrow \mu = \frac{10}{8} - 1 = \frac{1}{4} = 0.25$
Now,
$E = 3K(1-2\mu)$
Bulk modulus (K) = $\frac{E}{3(1-2\mu)} = \frac{200}{3(1-0.50)} = \frac{200}{3\times 0.50}$
$\Rightarrow \boxed{K = 133.33 \text{ GPa}}$

76. A uniform slender cylindrical rod is made of a homogeneous and isotropic material. The rod rests on a frictionless surface. The rod is heated uniformly. If the radial and longitudinal thermal stresses are represented by σ_r and σ_z respectively, then
(a) $\sigma_r = 0, \sigma_z = 0$ (b) $\sigma_r \neq 0, \sigma_z = 0$
(c) $\sigma_r = 0, \sigma_z \neq 0$ (d) $\sigma_r \neq 0, \sigma_z \neq 0$

TSPSC AEE 2017
GATE-2005

Ans. (a) : When any material is heated or cooled and allowed to expand or contract without any restriction then they will not generate any stress, this is known as free expansion or contraction.
Hence, $\sigma_r = 0$ and $\sigma_z = 0$

77. The Young's modulus of a material is 125 GPa and Poisson's ratio is 0.25. The modulus of rigidity of the material is
(a) 30 GPa (b) 50 GPa
(c) 80 GPa (d) 100 GPa

Assam PSC CCE Pre 2015
JPSC AE 2013, Paper-V

Ans. (b) : Given as,
$E = 125$ GPa
$\mu = 0.25$
$E = 2G(1+\mu)$
$125 = 2G(1+0.25)$
$125 = 2G(1.25)$
$G = 50$ GPa

78. When a wire is stretched to double its length, the longitudinal strain produced in it is
(a) 0.5 (b) 1.0
(c) 1.5 (d) 2.0

Assam PSC CCE Pre 2015
UKPSC AE-2013, Paper-I

Search on Telegram @apna_pdf

Ans. (b) : Given, Initial length, $\ell_i = \ell$

Final length, $\ell_f = 2\ell$

$$\text{Longitudinal strain} = \frac{\text{Change in Length}(\delta l)}{\text{Original Length}(l_o)}$$

If l_o be the original length and if stretched to double of its length, change in length $(\delta l) = (\ell_f - \ell_i) = (2 \times l - l) = l$

So, strain $(\in) = \frac{\delta l}{l_o} = \frac{l}{l} = 1$

79. Two threaded bolts A and B of the same material and length are subjected to identical tensile load. If the elastic strain energy stored in bolt A is 4 times that of bolt B and the mean diameter of bolt A is 12 mm, the mean diameter of bolt B in mm is:

(a) 16 (b) 24
(c) 36 (d) 48

NPCIL ET, 2015
GATE-2013

Ans. (b) : Strain energy is given by

$$U = \frac{P^2L}{2AE}$$

Given that-

$$U_A = 4U_B$$

$$\frac{P^2L}{2A_AE} = 4\frac{P^2L}{2A_BE}$$

Since bolts are of some material, length and subjected to identical tensile load.

$$\frac{1}{A_A} = 4\frac{1}{A_B}$$

$$\frac{1}{D_A^2} = 4\frac{1}{D_B^2}$$

$$D_B = 2D_A$$

$$D_B = 2 \times 12$$

$$D_B = 24 \text{ mm}$$

80. A solid cube of side 1 m is kept at a room temperature of 32°C. The coefficient of linear thermal expansion of the cube material is 1×10^{-5}/°C and the bulk modulus is 200 GPa. If the cube is constrained all around and heated uniformly to 42°C, then the magnitude of volumetric (mean) stress (in MPa) induced due to heating is_____

(a) 180 (b) 240
(c) 30 (d) 60

Assam Engg. College AP/Lect. 18.01.2021
GATE-2019

Ans. (d) : Given,

$\alpha = 1\times10^{-5}$/°C, K = 200 GPa, $T_1 = 32$°C, $T_2 = 42$°C

Volumetric strain $\varepsilon_v = 3 \times \varepsilon$

$= 3 \times \alpha\Delta T$

$= 3 \times 1\times10^{-5} \times (42 - 32)$

$= 3 \times 10^{-4}$

$$\text{Bulk modulus } K = \frac{\sigma_v}{\varepsilon_v} = \frac{\text{Direct stress}}{\text{Volumetric strain}}$$

$\sigma_v = K \times \varepsilon_v$

$= 200 \times 10^3 \times 3 \times 10^{-4}$

Volumetric stress $\sigma_v = 60$ MPa

81. A rod of length 20 mm is stretched to a length of 40 mm. Subsequently, it is compressed to make a rod of final length 10 mm. Consider the longitudinal tensile strain as positive and compressive strain as negative. What is the total true longitudinal strain in the rod?

(a) –0.5 (b) –1.0
(c) –0.75 (d) –0.69

Assam Engg. College AP/Lect. 18.01.2021
GATE-2017

Ans. (d) : Total true longitudinal strain

$$(\varepsilon_T) = (\varepsilon_T)_1 + (\varepsilon_T)_2$$

$$= \left[l\,n\left(\frac{l_f}{l_i}\right)\right]_1 + \left[l\,n\left(\frac{l_f}{l_i}\right)\right]_2$$

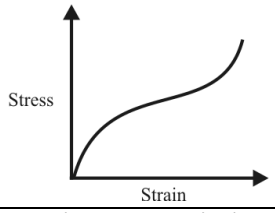
$$= l\,n\left(\frac{40}{20}\right) + l\,n\left(\frac{10}{40}\right) = -0.693$$

82. The elastic stress-strain behavior of rubber is -

(a) Linear
(b) Non-linear
(c) Plastic
(d) No fixed relationship

TNPSC AE 2018
GMB AAE 25.06.2017

Ans. (b) : The most common example of this kind of material is rubber whose stress-strain relationship can be defined as non-linearly Elastic, Isotropic, in compressible and generally Independent of strain role. Hyper elasticity provides a means of modeling the stress-strain behavior of such material.



83. For the material loaded within the elastic limit, the Young's modulus is defined as the ratio of

(a) longitudinal strain in lateral strain
(b) volumetric stress to volumetric strain
(c) longitudinal stress to longitudinal strain
(d) shear stress to shear strain

Haryana PSC AE (PHED) 05.09.2020, Paper-II
GPSC Lect. 23.10.2016
SJVN ET 2013
VIZAG Steel MT 2011

Ans. (c) :

$$\text{Young's modulus } (E) = \frac{\text{Longitudinal stress}(\sigma)}{\text{Longitudinal strain}(\varepsilon)}$$

84. When a body is subjected to three mutually perpendicular stresses of equal intensity, the ratio of direct stress to the expanding volumetric strain is known as :

(a) Young's modulus
(b) Modulus of rigidity
(c) Bulk modulus
(d) Poisson's ratio

ISRO Scientist/Engineer (RAC), 10.03.2019
Punjab PSC SDE 12.02.2017

Search on Telegram @apna_pdf

Ans. (c) :

$$\text{Bulk modulus (K)} = \frac{\sigma}{\left(\frac{\Delta V}{V}\right)} = \frac{\sigma}{\text{Volumetric strain}}$$

85. A copper rod 400 mm long is pulled in tension to a length of 401.2 mm by applying a tensile load of 330 MPa. If the deformation is entirely elastic, the Young's modulus of copper is

(a) 110 GPa (b) 110 MPa
(c) 11 GPa (d) 11 MPa

GPSC EE Pre, 28.01.2017
ESE 2012

Ans. (a) : Given-
$l_1 = 400$ mm
$l_2 = 401.2$ mm
Elastic of modulus = (E)

$$\text{Strain } (\varepsilon) = \frac{l_2 - l_1}{l_1}$$

$$= \frac{401.2 - 400}{400}$$

$$\text{Strain } (\varepsilon) = \frac{1.2}{400} = 0.003$$

$$\text{Modulus of elasticity (E)} = \frac{\text{stress}}{\text{strain}}$$

$$(E) = \frac{330 \times 10^6}{0.003}$$

$$= \frac{330 \times 10^6 \times 10^3}{3}$$

$$(E) = 110 \times 10^9 = 110 \text{ GPa}$$

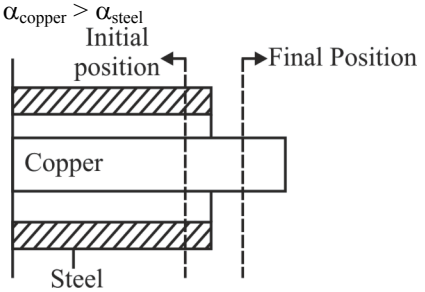
86. A composite bar made of copper and steel is heated to 120 °C from room temperature. If $\alpha_c > \alpha_s$, the stress induced in copper bar is:

(a) No stress (b) Compressive stress
(c) Shear stress (d) Tensile stress

CIL MT 27.02.2020
GPSC EE Pre, 28.01.2017

Ans. (b) : Given, T = 120 °C

$\alpha_{copper} > \alpha_{steel}$



As the coefficient of expansion of copper is more as compared to that of steel.
The final expansion is less than the free expansion of copper due to temperature rise and thus compressive stress will be developed in copper bar.

87. The stress-strain relationship for the perfectly rigid material is :

(a) (b) (c) (d) None of the above

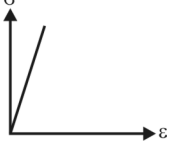
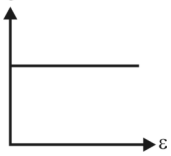
BPSC Asstt. Prof. 29.11.2015
CSE Pre-1996

Ans. (b) : (i) Linear Elastic Materials-

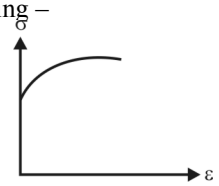


(ii) Rigid materials-

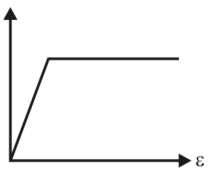
(iii) Perfectly Plastic (Non-Strain hardening)-



(iv) Rigid hardening –



(v) Elasto Plastic Material-



88. stress-strain relationship best describes the behavior of brittle materials such as ceramics and thermosetting plastics, (σ = stress and ε = strain)?

(a) (b) 
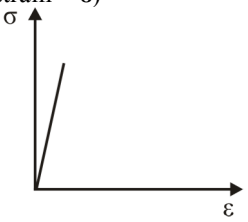
Search on Telegram @apna_pdf

(c) 
(d) 
(e) None of the above

CGPSC Poly. Lect. 22.05.2016
GATE-2015

Ans. (d) : In stress-strain relationship best describes describes the behavior of brittle materials such as ceramics and thermosetting plastics
(σ = stress and strain = ε)



89. Normal stresses are divided into
(a) tensile and torsion
(b) compressive and thermal
(c) shear and bending
(d) tensile and compressive

UPRVUNL AE 05.07.2021

Ans. (d) : Normal stresses are divided into tensile and compressive.

90. Eccentric loading applies to _____ stress
(a) Bending (b) torsional
(c) tensile (d) thermal

UPRVUNL AE 05.07.2021

Ans. (a) : Eccentric loading applies to bending stress.

91. True stress at fracture _____ during tensile testing.
(a) becomes zero
(b) is the same as ultimate stress
(c) is higher than ultimate stress
(d) is lower than ultimate stress

UPRVUNL AE 05.07.2021

Ans. (c) : True stress at fracture is higher than ultimate stress during tensile testing.

92. Factor of safety is equal to _____
(a) $\frac{\text{Allowable stress}}{\text{Failure stress}}$
(b) $\frac{\text{Allowable load}}{\text{Failure load}}$
(c) Allowable stress × failure stress
(d) $\frac{\text{Failure stress}}{\text{Allowable stress}}$

UPRVUNL AE 05.07.2021

Ans. (d) : Factor of safety = $\frac{\text{Failure stress}}{\text{Allowable stress}}$

93. Measurements have been made for the Young's modulus of elasticity for mild steel specimen both in tension and compression. The ratio Et / Ec will be approximately equal to
(a) 0.5 (b) 0.75
(c) 1.0 (d) 1.25

HPPSC Poly. Lect. 05.07.2021

Ans. (b) : 0.75

94. The modulus of rigidity of a material whose Young's modulus is 200 Nmm^{-2} and poisson's ratio is 0.5 is
(a) 133.33 Nmm^{-2} (b) 80.67 Nmm^{-2}
(c) 66.67 Nmm^{-2} (d) 242.67 Nmm^{-2}

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : Given,
$E = 200\ N/mm^2$
$\mu = 0.5$
We know,
$E = 2G(1+\mu)$
$200 = 2 \times G\ (1+0.5)$
$200 = 2G\ (1.5)$
Modulus of Rigidity, $G = 66.67\ N/mm^2$

95. Resilence is the
(a) energy stored in a body when strained within the elastic limit
(b) energy stored in a body when strained up to breaking point
(c) max strain energy stored
(d) none of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Resilence is the energy stored in a body when strained within the elastic limit.

96. In a bolt and tube assembly, due to the tightening of the nut on the bolt, _____ stress is developed in the bolt and _____ stress is developed in the tube.
(a) compressive, compressive
(b) tensile, compressive
(c) compressive, tensile
(d) tensile, tensile

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (b) : In a bolt and tube assembly, due to the tightening of the nut on the bolt tensile stress is developed in the bolt and compressive stress is developed in the tube.

97. A copper bar of rectangular section of 20 mm × 30 mm and a length of 500 mm is subjected to a compressive load of 60 kN. The compressive stress acting on the bar is _____ N/mm^2.
(a) 150 (b) 50
(c) 200 (d) 100

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : Given,
Area, A = 20 mm × 30 mm
$= 600\ mm^2$
Compressive Load, P = 60 kN, length, l = 500 mm
Compressive stress, $\sigma_c = \frac{P}{A} = \frac{60\times10^3}{600}$
$\sigma_c = 100\ N/mm^2$

98. A rod of length 2 m and diameter 50 mm is elongated by 5 mm when an axial force of 400 kN is applied. The modulus of elasticity of the material of rod will be nearly

Search on Telegram @apna_pdf

(a) 66 GPa (b) 72 GPa
(c) 82 GPa (d) 96 GPa

APGCL AM, 2021

Ans. (c) :

Given:-

$L = 2m,$

$P = 400kN$

$\delta L = 5mm$

$d = 50mm$

$$\text{Area} = \frac{\pi}{4}(50)^2$$

$$\sigma = \frac{\text{Load}}{\text{Area}} = \frac{400\times10^3}{\frac{\pi}{4}\times(50)^2}$$

$$\sigma = 203.82 \text{ MPa}$$

$$\text{Strain, } \varepsilon = \frac{\delta L}{L} = \frac{5}{2000} = 2.5\times10^{-3}$$

$$\text{Now stress, } \sigma = E\varepsilon$$

$$203.82 = E\times2.5\times10^{-3}$$

$$E = \frac{203.82}{2.5\times10^{-3}} = 81.5 \text{ GPa}$$

99. A tensile test was conducted on mild steel bar. The load at elastic limit was 250 kN and the diameter of steel bar was 3 cm. The value of stress is

(a) 35368×10^4 N/m^2
(b) 32463×10^4 N/m^2
(c) 35625×10^4 N/m^2
(d) 37562×10^4 N/m^2

APGCL AM, 2021

Ans. (a) : Given,

$P=250 \text{ kN} = 250 \times 10^3$ N

$d=3\text{cm}=3 \times 10^{-2}$m

$$\text{Stress}=\sigma = \frac{P}{A} = \frac{250\times10^3}{\frac{\pi}{4}\times\left(3\times10^{-2}\right)^2} = 353677.65 \times 10^3 \text{ N/m}^2$$

$$\approx 35368 \times 10^4 \text{ N/m}^2$$

100. An annealed copper strip, 9 inch (228mm) wide and 1 inch (25mm) is rolled to a thickness of 0.80 inch (20mm) in one pass.
The absolute value of true strain that the strip undergoes is :

(a) 0.20 (b) 0.25
(c) 0.223 (d) 0.225

JPSC AE 10.04.2021, Paper-II

Ans. (c) : Given, $t_i = 25mm$, $t_f = 20mm$

$$\text{True strain, } \varepsilon_T = \ln(1+\varepsilon) = \ln\left(\frac{t_f}{t_i}\right)$$

$$= \ln\left(\frac{25}{20}\right)$$

$$\boxed{\varepsilon_T = 0.223}$$

101. Aluminium rod with original length L_o is strained. The length of the rod at any instant is given by $L(t) = L_o(1+t^2)$, where t is in minutes. The true strain at the end of 3 minutes will be:

(a) 6 (b) 9
(c) 0.6 (d) 0.9

AAI Jr. Executive 26.03.2021

Ans. (*) :

$$\text{True strain at any instant } (\varepsilon_T) = \int\frac{dL}{L} = \int\frac{dL}{L_o(1+t^2)}$$

As, $L = L_o(1 + t^2)$

$dL = L_o 2tdt$

$$\varepsilon_T = \int\frac{dL}{L_o(1+t^2)} = \int\frac{2tdt}{(1+t^2)} = \ln[1+t^2]$$

$$\left[\begin{array}{l}\text{Let}, 1+t^2 = x,\\ dx = 2tdt\end{array}\right]$$

True strain at the end of 3 minutes will be

$\varepsilon_T = \ln[1 + (3)^2] = \ln 10 = 2.30$

Note-There is no option in the given question.

102. The relationship between conventional strain, ε_0 and true strain, εT is:

(a) $\varepsilon_0 = \{e^{\varepsilon T}\}$ (b) $\varepsilon_0 = \{e^{\varepsilon T}\} - 1$
(c) $\varepsilon_0 = \{e^{-\varepsilon T}\}$ (d) $\varepsilon_0 = \{e^{\varepsilon T}\} + 1$

AAI Jr. Executive 26.03.2021

Ans. (b) : Conventional strain/Engg. strain = ε_0

True strain = εT

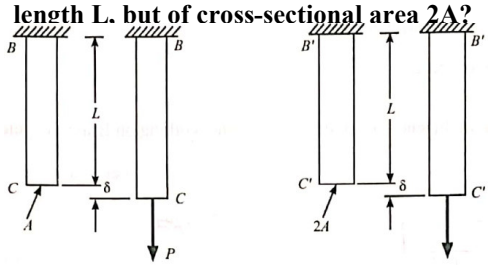
$\varepsilon T = \ln(1 + \varepsilon_0)$

$1 + \varepsilon_0 = e^{\varepsilon T}$

$\varepsilon_0 = e^{\varepsilon T} - 1$

$$\boxed{\varepsilon_0 = \{e^{\varepsilon T}\} - 1}$$

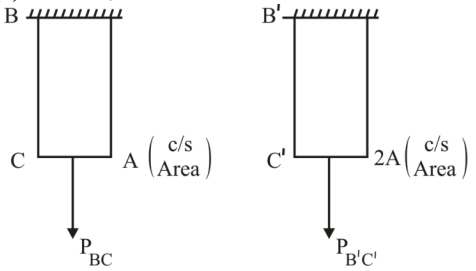
103. If a deformation δ is produced in the rod BC of cross-sectional area A of the figure below by a load P, what load is required to cause the same deformation in the rod B 'C' of the same length L, but of cross-sectional area 2A?



(a) 6P (b) 4P
(c) 2P (d) P

CGPSC AE 15.01.2021

Ans. (c) : Given,



$$\delta_{BC} = \frac{P_{BC}L}{AE}$$

$$\delta_{B'C'} = \frac{P_{B'C'}L}{2AE}$$

Acc to question, $\delta_{BC} = \delta_{B'C'}$

$$\frac{P_{BC}L}{AE} = \frac{P_{B'C'}L}{2AE}$$

$$\boxed{P_{B'C'} = 2P_{BC}}$$

Search on Telegram @apna_pdf

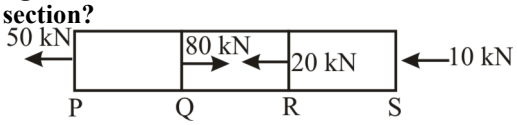
104. A steel rod of 30 mm diameter and 5 m long is connected to two grips and the rod is maintained at 95°C. Determine the stress induced in the rod when it is cooled to 30°C, if $E = 2 \times 10^5$ MN/m^2; $\alpha = 12 \times 10^{-6}$ /°C .

(a) 156 N/mm^2 (b) 65 N/mm^2
(c) 165 N/mm^2 (d) 185 N/mm^2

VIZAG Steel MT 24.01.2021

Ans. (a) : Given,
Diameter (d) = 30 mm
Length (ℓ) = 5 m
$T_1 = 95°C$, $T_2 = 30°C$
$E = 2 \times 10^5$ MN/m^2, $\alpha = 12 \times 10^{-6}$/°C
$\therefore$ Thermal stress (σ_T) = $\alpha \Delta T E$
$= 12 \times 10^{-6} \times (95 - 30) \times 2 \times 10^5 \times 10^6$
$= 12 \times 65 \times 2 \times 10^5$
$= 1560 \times 10^5$ N/m^2
$= 156$ N/mm^2

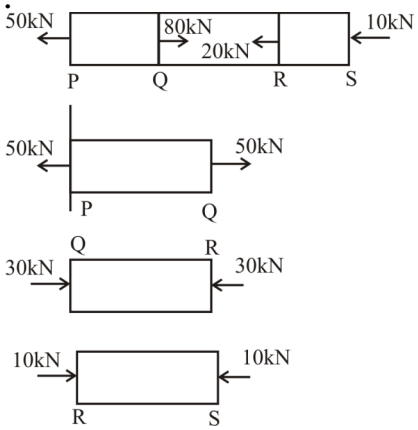
105. A bar, having 1000 mm^2 cross-sectional area, is subjected to axial loads as shown in the figure. What is the value of stress in QR section?



(a) 30 MPa Compressive
(b) 30 MPa Tensile
(c) 50 MPa Compressive
(d) 50 MPa Tensile

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (a) :



Stress in QR section

$$\sigma = \frac{P}{A}$$

$$= \frac{30 \times 10^3}{1000} = 30\,\text{MPa (Compressive)}$$

106. A steel rod, with all its surfaces free to deform, has young's modulus 'E', Poisson's ratio 'ν', coefficient of thermal expansion 'α'. If the rod is uniformly heated with 'ΔT' temperature rise, what is the pressure developed?

(a) $-\alpha\Delta T/(1 - 2\nu)$ (b) $\alpha\Delta T/(1 - 2\nu)$
(c) $E\alpha\Delta T/(1 - 2\nu)$ (d) 0

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I, GATE 2014

Ans. (d) : As we know, thermal stress occur only when there is resistance to its deformation. Since here its free to deform hence no thermal stress will be developed.

107. According to Hooke's law, when a material is loaded within its elastic limit, the stress is

(a) directly proportional to the strain
(b) inversely proportional to the strain
(c) proportional to the square of the strain
(d) proportional to the inverse of the square of the strain

Assam PSC AE (IWT) 14.03.2021

Ans. (a) : According to Hooke's law, when a material is loaded within its elastic limit the stress is directly proportional to the strain.

$$\sigma \propto \varepsilon$$

$$\boxed{\sigma = \varepsilon E}$$

108. The Poisson's ratio of an elastic material is 0.3, then the ratio of its young's modulus and bulk modulus is _____.

(a) 1.2 (b) 2.1
(c) 1.4 (d) 1.6

VIZAG MT, 14.12.2020

Ans. (a) : $\mu = 0.3$

$$\frac{E}{K} = ?$$

$$E = 3K(1 - 2\mu)$$

$$\frac{E}{K} = 3(1 - 2\mu)$$

$$= 3(1 - 2 \times 0.3)$$

$$\boxed{\frac{E}{K} = 1.2}$$

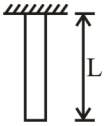
109. Maximum theoretical value of Poisson's ratio is

(a) infinity (b) 1
(c) 0.707 (d) 0.5

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : The Poisson's ratio of a stable, isotropic, linear elastic material must be between –1.0 to +0.5 because of the requirement for young's modulus, the shear modulus and bulk modulus to have positive values most material have poisson's ratio values ranging between 0.0 and 0.5.

110. A bar of steel of length L = 0.3m, fixed at one end and free at the other end as shown in the figure is uniformly heated by increasing its temperature by 40^{0}C. If the coefficient of thermal expansion is 12×10^{-6}/^{0}C and modulus of elasticity is 210 GPa, the thermal stress induced in the bar is



(a) -100.8 MPa (b) 100.8 GPa
(c) 100.8 N/m^2 (d) 0

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : Since the bar is free to expand. There are no stresses developed.

Search on Telegram @apna_pdf

111. A 8 m long round bar made of aluminium (Modulus of elasticity 70 GPa) carries a tensile load of 720 kN. If the maximum allowable elongation is 10 mm, the minimum required diameter of the bar is

(a) 103 mm (b) 30 mm
(c) 79 mm (d) 72 mm

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Given,

$P = 720 \times 10^3$ N

$l = 8$ m

$\delta l = 10 \times 10^{-3}$ m

$E = 70$ GPa $= 70 \times 10^9$ m

Elongation, $\delta l = \frac{Pl}{AE}$

$$10 \times 10^{-3} = \frac{720 \times 10^3 \times 8}{\frac{\pi}{4} D^2 \times 70 \times 10^9}$$

$D = 0.1023$ m

$D = 102.3$ mm ≈ 103 mm

112. Failure in the case of ductile materials in static tensile loading is due to

(a) Shear stress (b) Tensile stress
(c) Compressor stress (d) Contact stress

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Failure in case of ductile materials in static tensile loading is due to shear stress.

113. The value of Poisson's ratio depends upon:

(a) Material of the test specimen
(b) Nature of load, tensile or compressive
(c) Dimensions of the test specimen
(d) Magnitude of load

CIL MT 27.02.2020

Ans. (a) : The value of Poisson's ratio depends upon material of the test specimen.

114. A square bar of side 5 mm and 200 mm long, experience an extension of 0.01 mm upon a load of 100 N. Then Young's Modulus of the material is:

(a) 800 MPa (b) 200 GPa
(c) 400 MPa (d) 80 GPa

CIL MT 27.02.2020

Ans. (d) : Given, $\ell = 200$ mm

Side = 5 mm

In square bar $(A) = (\text{Side})^2$

$A = 25$ mm^2

$\delta\ell = 0.01$ mm

$P = 100$ N

Young modulus of material,

$$E = \frac{P\ell}{A\delta\ell}$$

$$E = \frac{100 \times 200}{25 \times 0.01}$$

$E = 80$ GPa

115. For a stress-strain diagram for ductile material, the work hardening starts after the _____.

(a) elastic limit
(b) upper yield point
(c) limit of proportionality
(d) lower yield point

UPRVUNL AE 05.07.2021

Ans. (b) : For a stress-strain diagram for ductile material, the work hardening starts after the upper yield point.

116. During plastic deformation, induced stress in the material is:

(a) greater than its proportional limit but lesser than lower yield strength
(b) greater than its lower yield strength but lesser than upper yield strength
(c) greater than its ultimate strength but lesser than its fracture strength
(d) greater than its yield strength but lesser than its fracture strength

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : Plastic deformation is the permanent distortion that occurs when a material is subjected to tensile, compressive bending or torsion stresses that exceed its yield strength and cause it to elongate compress buckle, bend or twist.
Induced stress is greater than its ultimate strength but lesser than its fracture strength.

117. The stress-strain curve of brittle material has:

(a) only upper yield point
(b) only lower yield point
(c) no clear yield point
(d) both lower and upper yield point

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : A stress strain curve for brittle material will be linear and no clear yield point for some materials such as concrete tensile strength is negligible compared to the compressive strength.

118. The temperature stress is a function of, 1. Coefficient of linear expansion 2. Temperature rise 3. Modulus of elasticity. The correct answer is

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : Thermal stress $= \alpha\Delta TE$

Where, α = Coefficient of thermal expansion

E = Young's modulus

ΔT = Temperature rise

119. Simple stress is often called

(a) direct stress (b) transverse stress
(c) total stress (d) complete stress

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : Simple stress is often called direct stress.

120. A rod of length 2 m and diameter 50 mm is elongated by 5 mm when an axial force of 400 kN is applied. The modulus of elasticity of the material of the rod will be nearly

(a) 66 GPa (b) 72 GPa
(c) 82 GPa (d) 96 GPa

ESE 2020

Ans. (c) : Elongation, $\delta = \frac{P\ell}{AE}$

$$5 = \frac{400 \times 10^3 \times 2000}{\frac{\pi}{4} \times 50^2 E}$$

$E = 81487.3$ MPa $= 81.5$ GPa ≈ 82 GPa

Search on Telegram @apna_pdf

121. A rod of 2m long at a temperature of 10°C is heated to 80°C. If the coefficient of thermal expansion of the rod is 0.000012/°C and E is 100 GPa, the thermal stress under the complete prevention of expansion is :

(a) 96MPa (b) 84 MPa
(c) 10 MPa (d) 12 MPa

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : Given, rod length (L) = 2m

$\Delta t = (80°C - 10°C)$

$\Delta t = 70°C$

The coefficient of thermal expansion (α) = 0.000012°C

Young modulus (E) = 100 GPa

$(E) = 100 \times 10^3$ MPa

Thermal stress $(\sigma_{th}) = \alpha E \Delta t$

$= 0.000012 \times 100 \times 10^3 \times 70$

$\boxed{\sigma_{th} = 84 \text{ MPa}}$

122. During a tensile test on a specimen of 1 cm^2 cross-section, maximum load observed was 8 tonnes and area of cross-section at neck was 0.5 cm^2. Ultimate tensile strength of specimen is

(a) 4 tonnes/cm^2 (b) 8 tonnes/cm^2
(c) 16 tonnes/cm^2 (d) 22 tonnes/cm^2

RPSC IOF, 2020

Ans. (b) : Ultimate tensile strength is the maximum load upon original area.

$$\sigma = \frac{F}{A}$$

$$\sigma = \frac{8}{1}$$

$\sigma = 8$ tonnes/cm^2

123. The elongation of a freely hanging uniform steel rope. If its length is doubled will increase in the ratio of

(a) 2 : 1 (b) 1 : 1
(c) 4 : 1 (d) 8 : 1

RPSC IOF, 2020

Ans. (c) : The elongation of the freely hanging bar

$$\delta l_1 = \frac{\rho g l^2}{2E}$$

$\delta l \propto l^2$

If its length is doubled

$$\delta l_2 = \frac{\rho g (2l)^2}{2E}$$

Ratio of the elongation $\Rightarrow \frac{\delta l_1}{\delta l_2} = \frac{l^2}{(2l)^2}$

$$\frac{\delta l_1}{\delta l_2} = \frac{1}{4}$$

$$\frac{\delta l_2}{\delta l_1} = \frac{4}{1}$$

124. A specimen of an alloy is made into a cylindrical bar of 12.00 mm diameter and 200mm length. This bar is loaded in axial tension up to the proportional limit when the load is 40 kN. At this load the length was measured as 201 mm and diameter was measured as 11.98 mm. What will be the Poisson's ratio?

(a) 0.25 (b) 0.29
(c) 0.33 (d) 0.38

APPSC Poly Lect. 13.03.2020

Ans. (c) : Given data;

$d_i = 12$ mm

$d_f = 11.98$ mm

$L_i = 200$ mm, $L_f = 201$ mm

Longitudinal strain $(\in_{long}) = \frac{L_f - L_i}{L_i}$

$$= \frac{201-200}{200} = \frac{1}{200} = 5 \times 10^{-3}$$

Lateral strain $(\in_{lat}) = \frac{d_f - d_i}{d_i}$

$$= = \frac{11.98-12}{12} = -1.666 \times 10^{-3}$$

$\therefore$ Poisson's ratio $(\mu) = \left|\frac{\text{Lateral strain}}{\text{Longitudinal strain}}\right|$

$$= \frac{1.666 \times 10^{-3}}{5 \times 10^{-3}}$$

$\Rightarrow \mu = 0.333 \quad \Rightarrow \boxed{\mu = 0.33}$

125. The stiffness of an axially loaded bar is defined as _____. [E = Modulus of elasticity, A = Area of cross-section of bar, L = Length of bar]

(a) $\frac{EA}{L}$ (b) $\frac{L}{EA}$
(c) $\frac{E}{AL}$ (d) $\frac{AL}{E}$

APPSC Poly Lect. 13.03.2020

Ans. (a) : We know that stiffness is the ratio of applied load to per unit elongation or deflection.

Stiffness for axially loaded bar (s)

$$= \frac{\text{Load}(P)}{\text{elongation}(\delta)}$$

$$= s = \frac{P}{PL/AE}$$

$$\Rightarrow \quad \boxed{\text{stiffness}(s) = \frac{AE}{L}}$$

126. A 1.25 cm diameter steel bar is subjected to a load of 2500 kg. The stress induced in the bar will be

(a) 200 MPa (b) 210 MPa
(c) 220 MPa (d) 230 MPa

ESE 2020

Ans. (a) : $\sigma = \frac{P}{A} = \frac{2500 \times 9.81}{\frac{\pi}{4}(12.5)^2} = 199.4 = 200 \text{ MPa}$

127. A copper rod 3mm in diameter when subjected to a pull of 495 N extends by 0.07 mm over a gauge length of 100 mm. The Young's Modulus for copper will be :

(a) 1×10^5 N/mm^2 (b) 1×10^6 N/mm^2
(c) 7×10^5 N/mm^2 (d) 1×10^7 N/mm^2

ISRO Scientist/Engineer (RAC), 10.03.2019

Search on Telegram @apna_pdf

Ans. (a) : Given,

$l = 100$ mm

$d = 3$mm

$P = 495$ N

$\delta = 0.07$ mm

Deflection, $(\delta) = \dfrac{PL}{AE}$

$$0.07 = \frac{495 \times 100}{\frac{\pi}{4} \times 3^2 \times E}$$

$$E = \frac{495 \times 100}{\frac{\pi}{4} \times 9 \times 0.07} = 100040.2499$$

$$\boxed{E = 1 \times 10^5 N/mm^2}$$

128. Engineering stress-strain curve and true stress-strain curve are equal up to :

(a) Proportional limit
(b) Elastic limit
(c) Yield point
(d) Tensile strength point

OPSC AEE 2019 Paper-I

Ans : (c) : Engineering stress-strain curve and true stress curve are equal upto yield point.

129. Strain is defined as the ratio of :

(a) Change in volume to original volume
(b) Change in length to original length
(c) Changes in cross-sectional area to original cross-sectional area
(d) Any one of these

OPSC AEE 2019 Paper-I

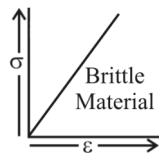
Ans : (d) : Strain is defined as the ratio of-

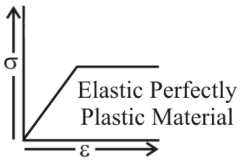
- Change in volume to original volume
- Change in length to original length.
- Change in cross-sectional area to original cross sectional area.

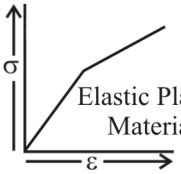
130. The stress-strain curve of an rigid-plastic material will be as :

(a) 
(b) 
(c) 
(d) 
OPSC AEE 2019 Paper-I

Ans : (b)







131. Failure of a material is called fatigue when it falls

(a) at the elastic limit
(b) below the elastic limit
(c) at the yield point
(d) below the yield point

Gujarat PSC AE 2019

Ans : (d) : Fatigue- When a material is subjected to repeated stress, it fails at stress below the yield point stress. Such type of failure of a material is known as fatigue.

132. Poisson's ratio of perfectly linear elastic material is

(a) 0 (b) 1
(c) 0.3 (d) 0.5

Gujarat PSC AE 2019

Ans : (d) : Volumetric strain for liner elastic material is given by

$$\epsilon_V = \frac{\Delta V}{V}$$

$$= \frac{(1-2\mu)}{E}\underline{(\sigma_x + \sigma_y + \sigma_z)}$$

$\Delta V = 0,$

$1 - 2\mu = 0;$

$$\boxed{\mu = 0.5}$$

133. A 10 mm diameter aluminium alloy test bar is subjected to a load of 500 N. If the diameter of the bar at this load is 8 mm, the true strain is

(a) 0.2 (b) 0.25
(c) 0.22 (d) 0.1

Gujarat PSC AE 2019

Ans : (*) : True strain is given as

$$\epsilon_t = \ln\left(\frac{A_0}{A_f}\right)$$

$$= 2\ln\left(\frac{d_o}{d_f}\right)$$

Since, $d_0 = 10$ mm

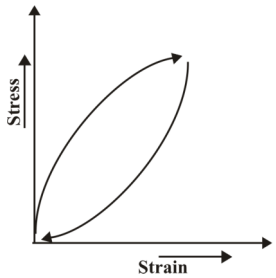
$d_f = 8$ mm

Therefore, we get,

$$\epsilon_t = 2\ln\left(\frac{10}{8}\right)$$

$$= 0.446$$

134. The following diagram is a stress-strain diagram of any material. Which kind of material is it?

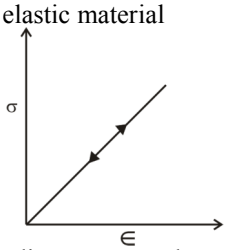


(a) Plastic (b) Linear Elastic
(c) Non-linear Elastic (d) Visco-elastic

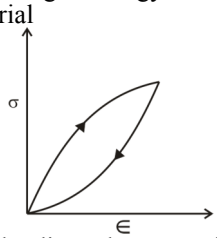
APPSC AEE SCREENING 17.02.2019

Search on Telegram @apna_pdf

Ans. (d) : Purely elastic material



Loading and unloading to energy loss.
Viscoelastic material



Loading and unloading the area inside the curve, hysteresis loop is energy loss.

135. A metal sphere of diameter D is subjected to a suniform increase in temperature ΔT. E, ν and α are the Young's modulus, Poisson's ratio and Coefficient of thermal expansion respectively. If the ball is free to expand, the hydrostatic stress developed within the ball due to temperature change is

(a) 0 (b) $\frac{\alpha \Delta T E}{1-2\nu}$

(c) $-\frac{\alpha \Delta T E}{1-2\nu}$ (d) $\frac{\alpha \Delta T E}{3(1-2\nu)}$

APPSC AEE SCREENING 17.02.2019

Ans. (a) : The hydrostatic stress developed within the ball due to temperature change is zero as the ball is free to expand.

136. Which mechanical property gets affected in an alloy, when it is over-aged condition :

(a) lower hardness
(b) low strain hardening rate
(c) higher yield strength
(d) higher tensile strength

BHEL ET 2019

Ans. (a) :
- The ageing phenomena are associated with aluminium alloy mainly.
- Age hardening curve of the alloy basically contain of initial hardness it maximum hardness subsequently decrease hardness with ageing time which called the under ageing.

137. After which point of the Stress-Strain Diagram does metal cutting start?

(a) Proportional point (b) Ultimate point
(c) Fracture point (d) Yield point

BHEL ET 2019

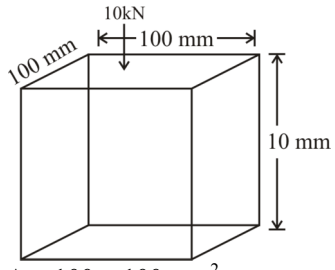
Ans. (c) : After fracture point of stress-strain diagram, metal cutting start.

138. A block is dimensions of upper surface 100 mm × 100 mm. The height of the block is 10 mm. A tangential force of 10 kN is applied at the centre of the upper surface. The block is displaced by 1 mm with respect to lower face. Direct shear stress in the element is :

(a) 10 MPa (b) 1 MPa
(c) 0.1 MPa (d) 100 MPa

BHEL ET 2019

Ans. (b) : Given - Dimension = 100 × 100 × 10



$A = 100 \times 100\ mm^2$

$P = 10 \times 10^3\ N$

Direct shear stress

$$\tau = \frac{P}{A} = \frac{10 \times 10^3}{100 \times 100} = 1 N/mm^2$$

$= 1$ MPa

139. A copper rod with initial length l_o is pulled by a force. The instantaneous length of the rod is given by $l = l_o$ (1 + $2e^{4t}$), where t represents time. True strain rate at t = 0 is :

(a) $\frac{1}{3}$ (b) $\frac{8}{3}$

(c) $\frac{4}{3}$ (d) $\frac{2}{3}$

BHEL ET 2019

Ans. (b) : Given - Initial length = l_o

Instantaneous length = $l = l_o (1 + 2e^{4t})$

at, t = 0

$l = l_o (1 + 2e^o)$

$l = l_o (1 + 2) = 3\ l_o$

True strain $\in_T = \int \frac{dl}{l}$

$$\in_T = \frac{\text{change in length}}{\text{Instantaneous length}}$$

Change in length $\frac{dl}{dt} = l_o \left(8e^{4t}\right)$

at, t = 0

$\frac{dl}{dt} = l_o \times 8$

True strain $\in_T = \frac{8\ l_o}{3\ l_o}$ $\boxed{\in_T = \frac{8}{3}}$

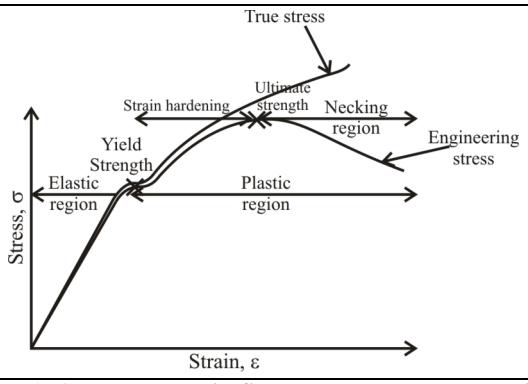
140. True stress experienced by a material is _____ than the engineering stress at a given load.

(a) lower
(b) higher
(c) equal
(d) higher or lower

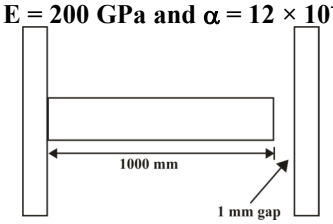
BHEL ET 2019

Ans. (b) : True stress experienced by a material is higher than the engineering stress at a given load.

Search on Telegram @apna_pdf



141. A 1m long rod is fixed at one end. There is a rigid wall at a distance 1 mm from the free end of the rod as depicted in the figure. What is the thermal stress generated in the rod if its temperature is increased by 100°C?
Take E = 200 GPa and $\alpha = 12 \times 10^{-6}$/°C



(a) 40 MPa (b) 80 MPa
(c) 120 MPa (d) 240 MPa

APPSC AEE SCREENING 17.02.2019

Ans. (a) : Free expansion = $l\,\alpha\,\Delta T$

$$\ell\alpha\Delta t - \Delta = \frac{\sigma}{E}$$

$\ell\alpha\Delta t = (1000)\,(12 \times 10^{-6})\,(100) = 1.2$ mm

Expansion prevented = 1.2 - 1 = 0.2 mm

$$0.2 = \frac{Pl}{AE}$$

$$\left(\because \sigma = \frac{P}{A}\right)$$

$$\frac{2}{10} = \frac{(\sigma)(1000)}{200\times10^3}$$

$\sigma = 40$ MPa

142. If a material is heated up, its Elastic modulus
(a) decreases (b) increases
(c) remains constant (d) None of the above

APPSC AEE SCREENING 17.02.2019

Ans. (a) : As the material is heated up, it becomes soft. It undergoes more strain for a given stress

$$\left(\because E = \frac{\sigma}{\in}\right)$$ The modulus of elasticity decreases.

143. A bar of 30 mm diameter is subjected to a pull of 60 kN. The measured extension on gauge length of 200 mm is 0.09 mm and change in diameter is 0.0039 mm. Find its Poisson's ratio.
(a) 0.309 (b) 0.299
(c) 0.289 (d) 0.279

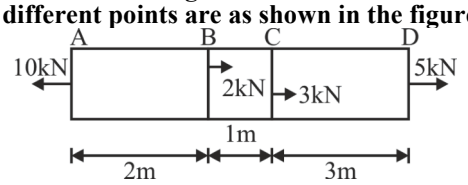
TNPSC AE 2019

Ans. (c) : Data given-
d = 30 mm, $\Delta d = 0.0039$ mm
$l = 200$ mm, $\Delta l = 0.09$ mm
P = 60 kN
we know that
Poisson's ratio

$$\mu = \frac{\left[\frac{\Delta d}{d}\right]}{\left[\frac{\Delta l}{l}\right]} = \frac{\left[\frac{0.0039}{30}\right]}{\left[\frac{0.09}{200}\right]}$$

$$\boxed{\mu = 0.2888}$$

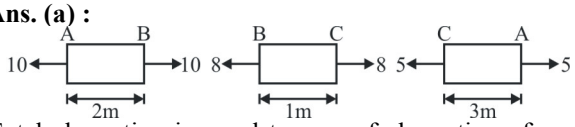
144. The loads acting on a 3 mm diameter bar at different points are as shown in the figure:



If E = 205 GPa, the total elongation of the bar will be nearly.
(a) 29.7 mm (b) 25.6 mm
(c) 21.5 mm (d) 17.4 mm

ESE 2019

Ans. (a) :



Total elongation is equal to sum of elongation of each bar

$$\delta = \delta_{AB} + \delta_{BC} + \delta_{CA}$$

$$= \frac{p_1\ell_1}{A_1E_1} + \frac{p_2\ell_2}{A_2E_2} + \frac{p_3\ell_3}{A_3E_3}$$

$A_1E_1 = A_2E_2 = A_3E_3 = AE$

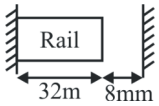
$$= \frac{10\times10^3\times2000}{AE} + \frac{8\times10^3\times1000}{AE} + \frac{5\times10^3\times3000}{AE}$$

$$= \frac{43\times10^6}{AE} = \frac{43\times10^6}{\frac{\pi}{4}\times3^2\times205\times10^3} = 29.68 \text{ mm}$$

145. Rails are laid such that there will be no stress in them at 24°C. If the rails are 32 m long with an expansion allowance of 8 mm per rail, coefficient of linear expansion $\alpha = 11\times10^{-6}$/°C and E = 205 GPa, the stress in the rails at 80°c will be nearly.
(a) 68 MPa (b) 75 MPa
(c) 83 MPa (d) 90 MPa

ESE 2019

Ans. (b) :



Given,
$\ell = 32$ m $\Delta = 8$ mm
$\alpha = 11 \times 10^{-6}$ /°C
$E = 205$ GPa $= 205 \times 10^3$ N/mm^2
$\Delta T = 80 - 24 = 56$°C
if Δ is the permissible expansion allowance then thermal

Search on Telegram @apna_pdf

$$\text{stress } \sigma = \frac{L\alpha\Delta t - \Delta}{L}$$

$$\ell\ \alpha\ \Delta T - \Delta = \frac{\sigma\ell}{E}$$

$$32 \times 10^3 \times 11 \times 10^{-6} \times 56 - 8 = \frac{\sigma \times 32 \times 10^3}{205 \times 10^3}$$

$$11.712 = 0.156\ \sigma$$

$$\sigma = 75.03\ \text{N/mm}^2$$

$$\sigma = 75.03\ \text{MPa}$$

146. When a load of 20 kN is gradually applied at a particular point in a beam, it produces a maximum bending stress of 20 MPa and a deflection of 10 mm. What will be the height from which a load of 5 kN should fall onto the beam at the same point if the maximum bending stress is 40 MPa?

(a) 80 mm (b) 70 mm
(c) 60 mm (d) 50 mm

ESE 2019

Ans. (c) : For 20 kN static load (P_1 = 20 kN)

δ_1 = 10 mm

$(\sigma_1)_{static}$ = 20 MPa

For 5 kN impact load (P_2 = 5 kN)

σ_{max} = 40 MPa

$(\sigma_2)_{static}$ = ? δ_2 = ?

From equation

$$\sigma = \frac{P}{A}$$

$$\sigma \propto P$$

$$\frac{(\sigma_2)_{static}}{(\sigma_1)_{static}} = \frac{P_2}{P_1}$$

$$(\sigma_2)_{static} = (\sigma_1)_{static} \times \frac{P_2}{P_1} = 20 \times \frac{5}{20} = 5\ \text{MPa}$$

deflection (δ) $\propto$ P

$$\frac{\delta_2}{\delta_1} = \frac{P_2}{P_1}$$

$$\delta_2 = \delta_1 \frac{P_2}{P_1} = 10 \times \frac{5}{20} = 2.5\ \text{mm}$$

As we know for impact load

$$\sigma_{max} = \sigma_{static}\left[1 + \sqrt{1 + \frac{2h}{\delta_{static}}}\right]$$

$$40 = 5\left[1 + \sqrt{1 + \frac{2h}{2.5}}\right]$$

h = 60 mm

147. A cylindrical specimen of steel having an original diameter of 12.8 mm is tensile tested to fracture and found to have engineering fracture strength σ_f of 460 MPa. If its cross sectional diameter at fracture is 10.7 mm, the true stress at fracture will be

(a) 660 MPa
(b) 645 MPa
(c) 630 MPa
(d) 615 MPa

ESE 2019

Ans. (a) : Given,

Initial diameter (d_i) = 12.8 mm

Final diameter (d_f) = 10.7 mm

Engineering fracture strength (σ_f) = 460 MPa

True stress at fracture

$$(\sigma_t) = \sigma_f \frac{A_i}{A_f}$$

$$= 460\left(\frac{d_i^2}{d_f^2}\right) = 460\left(\frac{12.8}{10.7}\right)^2$$

$$= 658.27\ \text{MPa} \approx 660\ \text{MPa}$$

148. If for a given material, E = 2G (E is modulus of elasticity, G is the shear modulus), then the bulk modulus K will be

(a) $\frac{E}{2}$ (b) $\frac{E}{3}$
(c) E (d) $\frac{E}{4}$

APPSC AEE SCREENING 17.02.2019

Ans. (b) : Given, E = 2G

We have, E = 2G (1 + μ)

2G = 2G (1 + μ)

μ = 0

and E = 3K (1 - 2μ)

E = 3K [1 - 2(0)]

E = 3K

$$\Rightarrow \quad K = \frac{E}{3}$$

149. Consider the state of stress at any point as σ_{xx} = 250 MPa, σ_{zz} = 250 MPa. The Young's modulus and Poisson's ratio of the material is considered as 2 GPa and 0.18 respectively. Determine the ε_{zz} at the point.

(a) -0.125 (b) 0.103
(c) -0.103 (d) 0.125

APPSC AEE SCREENING 17.02.2019

Ans. (b) : σ_{xx} = 250 MPa

σ_{yy} = 0

σ_{zz} = 250 MPa

E = 2 × 10^9 Pa

μ = 0.18

$$\varepsilon_{zz} = \frac{\sigma_{zz}}{E} - \mu\frac{\sigma_{yy}}{E} - \mu\frac{\sigma_{xx}}{E}$$

$$= \frac{\sigma_{zz}}{E} - \mu\frac{\sigma_{xx}}{E} = \frac{\sigma_{xx}}{E}(1-\mu)$$

$$(\because \sigma_{xx} = \sigma_{zz})$$

$$= \frac{250 \times 10^6}{2 \times 10^9}(1 - 0.18)$$

$$= 0.1025 = 0.103$$

150. Find out the Lame constants (λ and μ) for an isotropic material having modulus of elasticity (E) and Poisson's ratio (ν) as 200 GPa and 0.2, respectively.

(a) 80 GPa, 80 GPa
(b) 35.71 GPa, 166.6 GPa
(c) 55.55 GPa, 83.33 GPa
(d) 73.33 GPa, 66.66 GPa

APPSC AEE SCREENING 17.02.2019

Search on Telegram @apna_pdf

Ans. (c) : E = 200 GPa

Poisson's ratio ν = 0.2

$$\text{Lame constant } (\lambda) = \frac{E\nu}{(1+\nu)(1-2\nu)}$$

$$\lambda = \frac{200\times 0.2}{(1+0.2)(1-2(0.2))} = 55.55\,\text{GPa}$$

$$\mu = \frac{2E\nu}{(1+\nu)(1-\nu)} = \frac{2\times 200\times 0.2}{(1+0.2)(1-0.2)} = 83.33\ \text{GPa}$$

151. The deformation per unit length is called :

(a) Tensile stress (b) Poissons ratio

(c) Youngs modulus (d) Strain

MECON MT 2019

Ans. (d) : The deformation per unit length is called strain.

152. A bar of 20 mm diameter is subjected to pull of 50 kN. If the measured extension over the gauge length of 20 cm is 0.1 mm and the change in diameter is 0.0035 mm, Poisson's ratio and young's modulus are:

(a) 0.18, 200 GPa (b) 0.1, 108 GPa

(c) 0.25, 180 GPa (d) 0.35, 318 GPa

Oil India Ltd. Sr. Engg. (Production) 30.11.2019

Ans. (d) : Given,

Diameter of bar (d) = 20 mm

Pull load (F) = 50 kN

Gauge length (l_g) = 20 cm = 200 mm

Extension (δl) = 0.1 mm

Change in diameter (δd) = 0.0035 mm

$$\mu = \left|\frac{\epsilon_{\text{lateral}}}{\epsilon_{\text{longitudinal}}}\right| = \frac{\delta d/d}{\delta l/l_g} = \frac{0.0035/20}{0.1/200}$$

$$\mu = 0.35$$

$$E = \frac{\sigma}{\epsilon_{\text{longitudinal}}} = \frac{F/A}{\delta\ell/\ell_g} = \frac{F\times l_g}{A\times\delta l} = \frac{50\times 10^3\times 200}{\frac{\pi}{4}(20)^2\times 0.1}$$

$$= 318.31\,\text{GPa}$$

153. The statement "Total effect of several loads applied on a body is the sum of effects of individual loads applied separately" is known as :

(a) Generalized Hooke's law

(b) St. Venant's principle

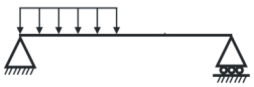
(c) Principle of superposition

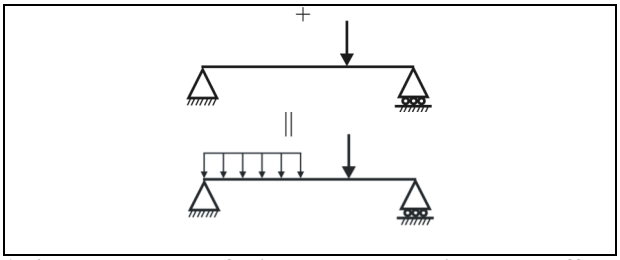
(d) Uniqueness theorem

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (c) : Principle of superposition- Simply states that on a linear elastic structure, the combined effect of several loads acting simultaneously is equal to the algebraic sum of the effects of each load acting individually.

In other words, for a linearly elastic member/structure the effect of several loads acting on a member is equal to the summation of the loads acting separately.





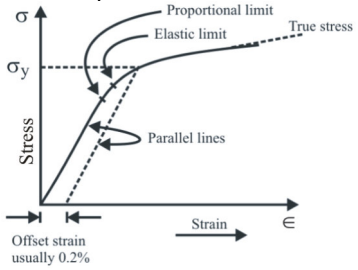
154. The value of yield stress obtained by offset method is known as :

(a) True stress (b) Elastic stress

(c) Proof stress (d) Breaking stress

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (c) : The value of yield stress obtained by offset method is known as proof stress.



155. The unit of strain is

(a) N-mm (b) N/mm

(c) mm (d) no unit

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (d) : As we know, strain is the ratio of change in length to the total length so it has no. dimension (unit).

$$\varepsilon = \frac{\Delta L}{L}$$

156. The modulus of elasticity for mild steel; is approximately equal to

(a) 10 kN/mm^2 (b) 80 kN/mm^2

(c) 100 kN/mm^2 (d) 210 kN/mm^2

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (d) : As we know, the modulus of elasticity for mild steel is approximately equal to 210 GPa or 210 kN/mm^2.

157. Two bars of different materials and same size are subjected to the same tensile force. If the bars have unit elongation in the ratio of 2 : 5, then the ratio of modules of elasticity of the two materials will be

(a) 2:5 (b) 5:2

(c) 4:3 (d) 3:4

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (b) : As we know,

$$E = \frac{PL}{A\Delta L} \qquad \therefore \frac{\Delta L_1}{\Delta L_2} = \frac{2}{5}$$

So, $$E_1 \propto \frac{1}{\Delta L_1}$$

$$\frac{E_1}{E_2} = \frac{\Delta L_2}{\Delta L_1} = \frac{5}{2}$$

158. When a bar is cooled to –50°C, it will develop

(a) no stress (b) shear stress

(c) tensile stress (d) compressive stress

Nagaland PSC (CTSE) 2018, Paper-I

Search on Telegram @apna_pdf

Ans. (c) : When a bar is cooled to –5 temperature, it must goes to tensile stress, as the bar will resists to expand, so tensile stress will developed.

159. If the modules of elasticity for a given material is twice its modules of rigidity, then bulk modules is equal to

(a) 2C (b) 3C
(c) 2C/3 (d) 3C/2

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (c) : We know, $E = \frac{9KC}{C+3K}$

Given, $E = 2C$

$\Rightarrow \quad 2C = \frac{9KC}{3K+C}$

$\Rightarrow \quad 2C(3K + C) = 9\,KC$

$\Rightarrow \quad 6KC + 2C^2 = 9\,KC$

$\Rightarrow \quad 2C^2 = 3\,KC$

$2C = 3\,K$

$\therefore \quad K = \frac{2C}{3}$

160. Consider a bar of length 'L', breadth 'b' and thickness 't' subjected to an axial pull or tension 'P'. The resulting volumetric strain will be equal to

(a) $\in(1-2\mu)$ (b) $2\in(1-2\mu)$
(c) $\in(1+2\mu)$ (d) 3

GPSC Executive Engineer 23.12.2018

Ans. (a) : $\in_v = \in_x + \in_y + \in_z = \left(\frac{\sigma_x + \sigma_y + \sigma_z}{E}\right)(1-2\mu)$

$\in_v = \in(1-2\mu)$

161. If Poisson's ratio of a material is 0.75, then the elastic modulus for the material is

(a) 3.5 times its shear modulus
(b) 4 times shear modulus
(c) equal to its shear modulus
(d) 5 times its shear modulus

GPSC Executive Engineer 23.12.2018

Ans. (a) : Given,

$\mu = 0.75$

$E = 2G(1+\mu)$

$= 2G\,(1+0.75)$

$= 2 \times G \times 1.75$

$= 3.50\,G$

$\boxed{E = 3.5G}$

162. Lateral strain $(\in)$ can be expressed as

(a) $\frac{\delta l}{l}$ (b) $\frac{l}{\delta l}$
(c) $\gamma \in$ (d) $-\gamma \in$

TNPSC AE 2018

Ans. (d) : Lateral strain $(\in')$

$= -\gamma \times$ longitudinal strain

$= -\gamma \times \in$

where $\gamma \rightarrow$ poisson ratio

$= \frac{\text{lateral strain}}{\text{longitudnal strain}}$

163. Allotropic metal,

(a) exists in more than one type of lattice structure depending upon temperature
(b) has equal stresses in all directions
(c) has only one lattice structure of all temperature
(d) gives equal strain in all direction

TNPSC AE 2018

Ans. (a) : Allotropic metal, exists in more than one type of lattice structure depending upon the temperature.

164. Which of the following is correct relation among elastic constants E (modulus of elasticity), G (modulus of rigidity), ν (Poisson's ratio) and K (bulk modulus)?

(a) $E = 3K(1-\nu) = 2G(1+\nu)$
(b) $E = 2G(1-\nu) = 3K(1+\nu)$
(c) $E = 3K(1-2\nu) = 2G(1+\nu)$
(d) $E = 2K(1-2\nu) = 3G(1+\nu)$
(e) $E = 3K(1+2\nu) = 2G(1-\nu)$

CGPSC AE 25.02.2018

Ans. (c) : We know that

$E = 3K\,[1 - 2\nu)$

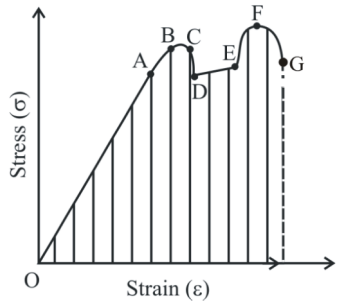
$E = 2G\,[1 + \nu)$

165. The area of under the stress-strain diagram up to the rupture point is known as

(a) Proof resilience
(b) Modulus of toughness
(c) Modulus of elasticity
(d) Modulus of resilience

HPPSC AE 2018

Ans. (b) :



Point A – Proportionality limit
Point B – Elastic limit
Point C – Upper yield Point
Point D – Lower yield Point
DE – Yielding Region
EF – Strain hardening region
F – Ultimate point
FG – Necking region
G – Breaking [Rupture point]

Modulus of Toughness [M.O.T.]–Modulus of Toughness is defined as energy observed by a component per unit volume just before its rupture.

M.O.T.–Total area of stress vs strain curve per unit volume.

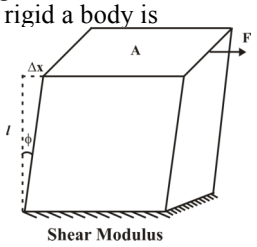
166. Modulus of Rigidity is related to-

(a) Length (b) Shape
(c) Size (d) Volume

RPSC AE 2018

Search on Telegram @apna_pdf

Ans. (b) : Modulus of Rigidity—The modulus of rigidity is the elastic coefficient when a shear force is applied resulting in lateral deformation. It gives us a measure of how rigid a body is



Shear Modulus

$$G = \frac{\tau_{xy}}{\gamma_{xy}} = \frac{\left(\frac{F}{A}\right)}{\left(\frac{\Delta x}{l}\right)}$$

$$= \frac{F \times l}{A\,\Delta x}$$

where

- $\tau_{xy} = \frac{F}{A}$ is shear stress.
- F is the force acting on the object.
- $\gamma_{xy} = \frac{\Delta x}{l}$ is the shear strain.
- Δx is the transverse displacement.

167. Detrimental property of a material for shock load application is-

(a) High density (b) Low toughness
(c) High strength (d) Low hardness

RPSC AE 2018

Ans. (b) : Detrimental property of a material for shock load application is low toughness.

168. A metallic rod of length 2.5 m and cross-section of 20 mm^2 is elongated by a load of 500 kN. If Poisson ratio is 0.25, then the increase in volume is: (assume E = 2 × 10^5 N/mm^2)

(a) 3000 mm^3 (b) 2125 mm^3
(c) 2000 mm^3 (d) 3125 mm^3

AAI Jr. Executive 29.11.2018

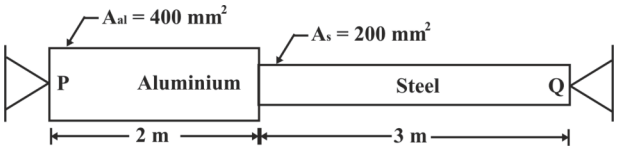
Ans. (d) : Given,
L = 2.5 m
A = 20 mm^2
P = 500 kN
μ = 0.25
E = 2 × 10^5 N/mm^2

$$\epsilon_v = \frac{(1-2\mu)(\sigma_x)}{3E} = \frac{\Delta V}{V}$$

$$\frac{(1-0.25\times 2)}{3\times 2\times 10^5} \times \frac{500\times 10^3}{20} = \frac{\Delta V}{V} = \frac{\Delta V}{20\times 2500}$$

$$\boxed{\Delta V = 3125 mm^3}$$

169. A composite bar made of aluminum and steel is fixed rigidly at supports P and Q as shown in figure. When the temperature of the bar is increased by 10°C, the reactions at the supports are (given E_{al} = 70 GPa, E_s = 210 GPa, α_{al} = 11E-6 mm/mm°C and α_s = 12 E-6 mm/mm°C)



(a) 4060 N (b) 6780 N
(c) 12240 N (d) 2412 N

ISRO Scientist/Engineer 22.04.2018

Ans. (a): After Increasing the temperature of composite bar. Total deflection due to temperature rise is given by

$$\delta_{Total} = (\alpha t l)_s + (\alpha t l)_{Al}$$

$$= 12\times 10^{-6}\times 10\times 3000 + 11\times 10^{-6}\times 10\times 2000$$

$$\delta_{Total} = 0.58 mm .....(1)$$

Another way to finding total elongation

$$\delta_{Total} = \frac{PL_s}{(AE)_s} + \frac{PL_A}{(AE)_{Al}}$$

$$\delta_{Total} = \frac{P\times 3000}{200\times 210\times 10^3} + \frac{P\times 2000}{400\times 70\times 10^3}$$

$$\delta_{Total} = \frac{P}{7000} .....(2)$$

$$P = 7000 \times \delta_{Total}$$

$$P = 7000 \times 0.5 = 4060 \text{ N}$$

170. A round uniformly tapered bar of length *L* and Young's modulus *E* has diameter of '*d*' at one end and '2*d*' at the other end. If the bar is pulled by an axial force *F*, the extension produced will be

(a) $\frac{2FL}{\pi Ed^2}$ (b) $\frac{4FL}{\pi Ed^2}$
(c) $\frac{8FL}{\pi Ed^2}$ (d) $\frac{16FL}{\pi Ed^2}$

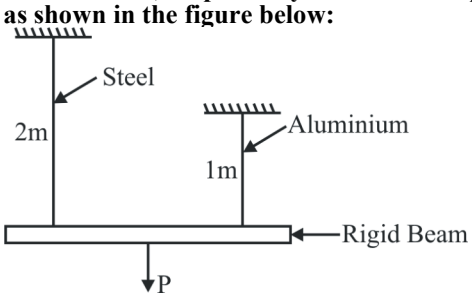
ISRO Scientist/Engineer 22.04.2018

Ans. (a): Extension produced in tapered bar

$$\delta = \frac{4FL}{\pi d\times 2d\times E}$$

$$\delta = \frac{2FL}{\pi Ed^2}$$

171. A rigid beam of negligible weight is supported in a horizontal position by two rods of steel and aluminium, 2 m and 1 m long, having values of cross sectional areas 100 mm^2 and 200 mm^2, and young's modulus of 200 GPa and 100 GPa, respectively. A load P is applied as shown in the figure below:



If the rigid beam is to remain horizontal then

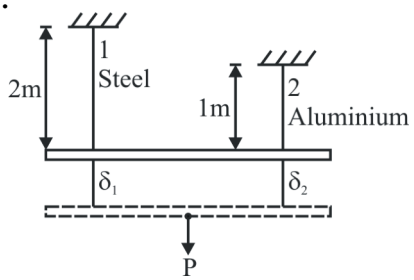
(a) the force P must be applied at the centre of the beam
(b) the force on the steel rod should be twice the force on the aluminium rod

Search on Telegram @apna_pdf

(c) the force on the aluminium rod should be twice the force on the steel rod
(d) the forces on both the rods should be equal

ESE 2018

Ans. (c) :



Let P_1 = Force in steel
P_2 = Force in aluminium

From the given condition that the rigid beam to remain horizontal.

$A_1 = 100\ mm^2$
$A_2 = 200$
$L_1 = 2\ m = 2000\ mm$
$L_2 = 1\ m = 100\ mm$
$E_1 = 200\ GP$
$E_2 = 100\ GP$
$\delta_1 = \delta_2$

$$\frac{P_1L_1}{A_1E_1} = \left(\frac{P_2L_2}{A_2E_2}\right)$$

$$\frac{P_1 \times 2000}{100 \times 200} = \frac{P_2 \times 1000}{100 \times 200}$$

$$2P_1 = P_2$$

172. The percentage elongation of a material as obtained from static tension test, depends on
(a) diameter of the test specimen
(b) gauge length of the specimen
(c) nature of end grips of the testing machines
(d) geometry of the test specimen

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : The percentage elongation of a material as obtained from static tension test, depends on gauge length of the specimen (% Elongation $= \frac{\Delta\ell}{\ell} \times 100$).

173. A heavy uniform rod of length 'L' and material density δ is hung vertically with its top end rigidly fixed. How is the total elongation of the bar under its own weight expressed?

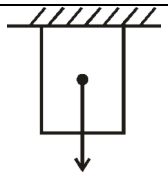
(a) $\frac{2\delta L^2 g}{E}$ (b) $\frac{\delta L^2 g}{E}$

(c) $\frac{\delta L^2 g}{\sqrt{2E}}$ (d) $\frac{\delta L^2 g}{2E}$

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : Given :
Length of uniform rod = 'L'
Material density = δ
Let weight of rod be w
Total elongation of rod under its own weight

$$= \frac{WL}{2AE}$$



$W = x \times A \times L$ (x- specific weight N/m^3)
$W = (\delta h) \times A \times L$

$$\therefore \text{ Total elongation } = \frac{\delta g A \times L \times L}{2AE}$$

$$= \frac{\delta g L^2}{2E}$$

174. A round bar length *l*, elastic modulus E and Poisson's ratio is subjected to an axial pull μ, is subjected to an axial pull 'P'. What would be the change in volume of the bar?

(a) $\frac{Pl}{(1-2\mu)E}$ (b) $\frac{Pl(1-2\mu)}{E}$

(c) $\frac{Pl\mu}{E}$ (d) $\frac{Pl\mu}{(1-\mu)E}$

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : Volumetric strain for cylinder

$$e_v = e_\ell + 2e_d$$

$$e_\ell = \frac{P/A}{E}$$

$$e_d = -\mu\ \frac{P/A}{E}$$

$$\therefore e_v = \frac{P}{AE}(1-2\mu)$$

$$e_v = \frac{\Delta V}{V} = \frac{P}{AE} = \frac{P}{AE}(1-2\mu)$$

$$\Rightarrow \Delta V = (A \times \ell)\ \frac{P}{AE}(1-2\mu)$$

$$\Delta V = \frac{P\ell}{E}(1-2\mu)$$

175. A 2m long rod of diameter 2 mm is subjected to an axial pull of 12 kN. The rod is extended by 0.5 cm. What is the approximate value of the modulus of elasticity of the material of the rod?
(a) 12 GPa (b) 180 GPa
(c) 125 GPa (d) 200 GPa

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (*) : Given data is wrong
Length of rod 'ℓ' = 2 m
Diameter 'd' = 2 mm = 2×10^{-3} m
Axial pull 'P' = 12 kN
Changed in length '$\Delta\ell$' = 0.5 cm = 0.5×10^{-2} M

$$\Delta\ell = \frac{P\ell}{AE}$$

$$E = \frac{P\ell}{A\Delta\ell} = \frac{\left(12\times10^3\right)\times 2}{\frac{\pi}{4}\left(2\times10^{-3}\right)^2 \times \left(0.5\times10^{-2}\right)}$$

$= 1520 \times 10^9\ N/m^2$
$= 1520\ GPa$

Search on Telegram @apna_pdf

176. If a material has numerically the same value for its modulus of rigidity and bulk modulus, then what is Poisson's ratio?
(a) 0.25 (b) 0.2
(c) 0.15 (d) 0.125
TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : Given :
Modulus of rigidity = Bulk modulus
$G = K$
Also
$2G(1 + \mu) = 3K(1 - 2\mu)$
$2 + 2\mu = 3 - 6\mu$
$8\mu = 1$
$\mu = \frac{1}{8} = 0.125$

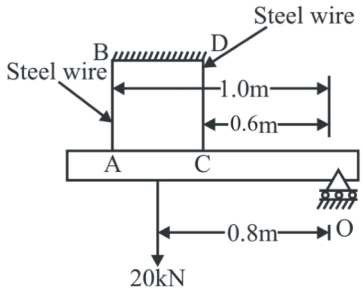
177. What is the maximum possible value of Poisson's ratio for a non-dilatants material?
(a) 0.67 (b) 0.50
(c) 0.33 (d) 0.25
TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c) : For non dilatants material, maximum value of poisson's ratio is 0.33.

178. Modulus of elasticity and Poisson's ratio of a material are 2.1×10^5 Nmm^2 and 0.25 respectively. What is the value of modulus of rigidity of the same material in 10^5 N/mm^2?
(a) 0.84 (b) 0.70
(c) 1.40 (d) 0.50
TSPSC AEE 28.08.2017 (Civil/Mechanical)

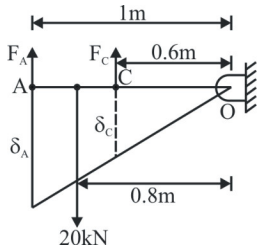
Ans. (a) : $E = 2G(1 + \mu)$
$2.1 \times 10^5 = 2G(1 + 0.25)$
$G = \frac{2.1 \times 10^5}{2 \times 1.25} = 0.84\,N/mm^2$
$G = 0.84 \times 10^5$ N/mm^2

179. A rigid bar ACO as shown is hinged at O and is held in a horizontal position by two identical vertical steel wires AB and CD. A point load of 20 kN is hung at the position shown. The tensions in wires AB and CD are



(a) 15.2 kN and 7.1 kN (b) 11.8 kN and 7.1 kN
(c) 15.2 kN and 5.0 kN (d) 11.8 kN and 5.0 kN
ESE 2017

Ans. (b) :



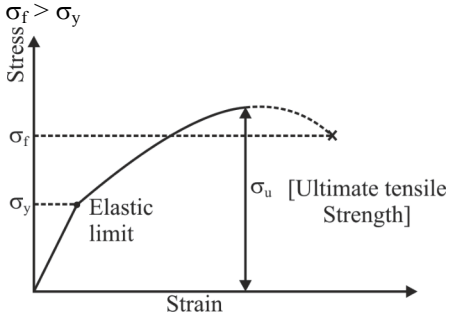
From similar triangle
$\frac{\delta_A}{\delta_C} = \frac{1}{0.6}$
$\frac{\left(\frac{F_A \cdot L}{AE}\right)}{\left(\frac{F_C \cdot L}{AE}\right)} = \frac{1}{0.6}$
$\frac{F_A}{F_C} = \frac{1}{0.6}$
$F_C = 0.6\,F_A$ .....(1)
Now $\sum M_o = 0$
$(F_A \times 1) + (F_C \times 0.6) = 20 \times 0.8$
$F_A + 0.6\,F_C = 16$ .....(2)
On solving equation (1) & (2)
$F_A = 11.76$ kN
$F_C = 7.05$ kN

180. A steel rod, 2 m long and 20 mm × 20 mm in cross section, is subjected to a tensile force of 40 kN. What will be elongation of the rod when the modulus of elasticity is 200×10^3 N/mm^2?
(a) 0.5 mm (b) 1.0 mm
(c) 1.5 mm (d) 2.0 mm
(e) 2.5 mm
(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : Data given;
$L = 2\text{ m} = 2 \times 10^3$ mm
$A = 20 \times 20$ mm^2
$F = 40$ kN
$E = 200 \times 10^3$ N/mm^2
$\delta\ell = ?$
We know that,
Elongation, $\delta\ell = \frac{F \times L}{A \times E} = \frac{40 \times 10^3 \times 2 \times 10^3}{20 \times 20 \times 200 \times 10^3}$

181. For copper, the yield stress σ_y and the brittle fracture stress σ_f are related as:
(a) $\sigma_f > \sigma_y$ (b) $\sigma_y > \sigma_f$
(c) $\sigma_y = \sigma_f$ (d) $\sigma_f << \sigma_y$
TRB Polytechnic Lecturer 2017

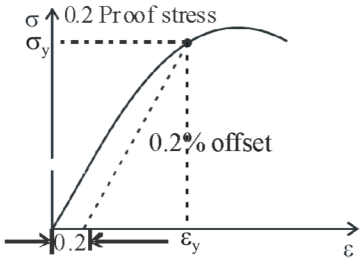
Ans. (a) : For copper
$\sigma_f > \sigma_y$



182. Proof stress–
(a) Is the safe stress
(b) Cause a specified permanent deformation in a material usually 0.1% or less
(c) Is used in connection with acceptance tests for materials
(d) Does not exist
Nagaland PSC CTSE 2017, Paper-I

Search on Telegram @apna_pdf

Ans. (b) : When material such as aluminium does not have an obvious yield point and yet undergoes large strain after the proportional limit is exceeded, an arbitrary yield stress may be determined by the offset of 0.1 or 0.2% of strain.

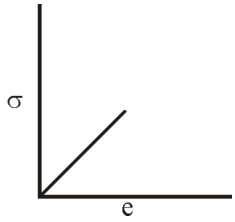


183. The stress strain curve for glass rod during tensile test would exhibit–

(a) A straight line (b) A parabola
(c) A sudden break (d) None of the above

Nagaland PSC CTSE 2017, Paper-I

Ans. (c) : Stress-strain curve for a glass rod during tensile test would exhibit, a sudden break. point Occur (due to a glass becomes a Brittle material).



184. A bar of mild steel 200 mm long and 50 mm × 50 mm in cross section is subjected to an axial load of 200 kN. If E is 200 GPa, the elongation of the bar will be

(a) 0.16 mm (b) 0.08 mm
(c) 0.04 mm (d) 0.02 mm

JWM 2017

Ans. (b) : Length of bar, L = 200 mm

Area of bar, $A = 50 \times 50\ mm = 250\ mm^2$

Axial load, $P = 200 \times 10^3\ N$

$E = 200 \times 10^3\ N/mm^2$

Elongation of bar,

$$\delta = \frac{PL}{AE} = \frac{200\times10^3\times200}{50\times50\times200\times10^3}$$

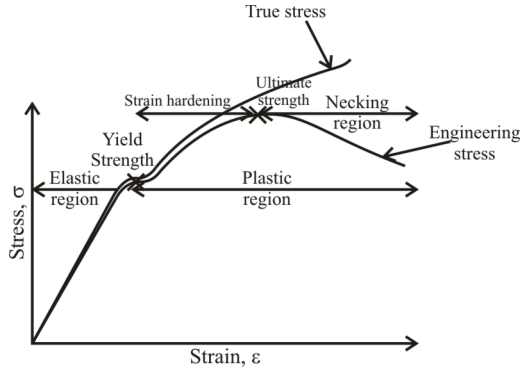
$\delta = 0.08mm$

185. The stress-strain plot for ductile materials exhibits peak at ultimate strength

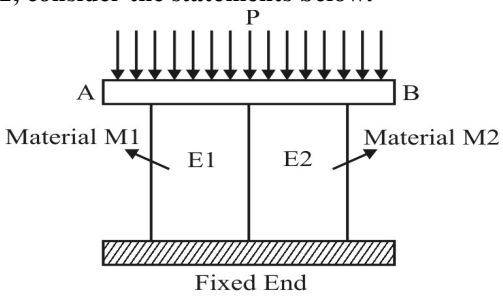
(a) because necking begins to occur where by engineering stress becomes less than the true stress
(b) because the material starts becoming weaker at microstructural level
(c) due to strain softening of the material
(d) None of the above

BPSC AE Mains 2017 Paper - VI

Ans : (a) : Because necking begins to occur, where by engineering stress becomes less than the true stress.



186. Two dimensionally equal blocks made of material M1 and M2 are placed on a flat horizontal surface as shown in figure below. Young's modulus of the materials are E1 & E2 resp. A uniform pressure 'p' is applied over the blocks through a thick plate (AB) symmetrically placed over the blocks. For E1 > E2, consider the statements below.



(a) Stress in both blocks are same
(b) Strain in both blocks are same
(c) Plate AB tilts and point B moves downward
(d) Plate AB tilts and point A moves downward

ISRO Scientist/Engineer 17.12.2017

Ans. (c) : Deflection $(\Delta) = \frac{P\ell}{AE}$

$$\Delta \propto \frac{1}{E}$$

as $E_1 > E_2$

$\Delta_1 < \Delta_2$

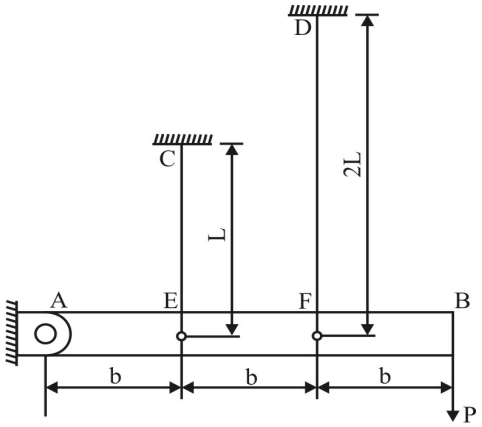
Hence AB tilts and B moves downward

$$\text{Stress} = \frac{P}{A} \qquad \text{(Independent of E)}$$

As two blocks are dimensionally equal having equal stresses.

187. A horizontal bar AB assumed to be rigid, is supported by two wires CE & DF, having lengths L and 2L respectively and pinned at A. If each wire has cross sectional area A, the tensile stress σ_1 and σ_2 in wires CE and DF are respectively.

Search on Telegram @apna_pdf

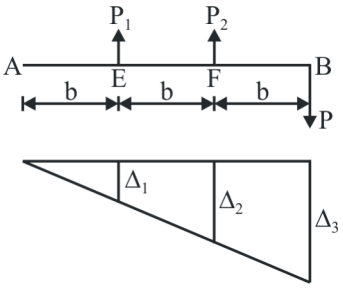


(a) $\frac{3P}{5A}$ and $\frac{6P}{5A}$ (b) $\frac{2P}{5A}$ and $\frac{4P}{5A}$

(c) $\frac{3P}{A}$ and $\frac{6P}{A}$ (d) $\frac{P}{A}$ each

ISRO Scientist/Engineer 17.12.2017

Ans. (d) :



Taking moment about point A

$P \times 3b - P_2 \times 2b - P_1 \times b = 0$

$3P = P_1 + 2P_2$ .....(1)

$\Delta_2 = 2\Delta_1$

$\frac{P_2 \times 2L}{AE} = 2\frac{P_1 \times L}{AE}$

$P_2 = P_1$ .....(2)

From equation (1) and (2)

$P = P_1 = P_2$

Tensile stresses in CE and DF

$\sigma_1 = \frac{P}{A}$

$\sigma_2 = \frac{P}{A}$

188. Two bolts A and B of same material and length are subjected to identical tensile load. If the elastic strain energy stored in bolt A is 16 times that of the bolt B and the mean diameter of bolt A is 13 mm, the mean diameter of bolt B (mm) is

(a) 52 (b) 36

(c) 24 (d) 16

ISRO Scientist/Engineer 07.05.2017

Ans. (a) : Given,

$P_A = P_B$

$U_A = 16\ U_B$

$\Rightarrow$ (Strain energy)$_A$ = 16 (Strain energy)$_B$

$SE = \frac{1}{2}P\delta \qquad \left[\because \delta = \frac{PL}{AE}\right]$

$= \frac{1}{2} \times P \times \frac{PL}{AE} = \frac{P^2L}{2AE} \qquad \left[\because A = \frac{\pi}{4}d^2\right]$

$\Rightarrow \frac{1}{2}\frac{P_A^2 L_A}{A_A E_A} = \frac{1}{2}\frac{P_B^2 L_B}{A_B E_B} \times 16$

$\frac{1}{A_A} = \frac{1}{A_B} \times 16$

$A_B = 16A_A$

$\frac{\pi}{4}d_B^2 = \frac{\pi}{4} \times 16 \times d_A^2$

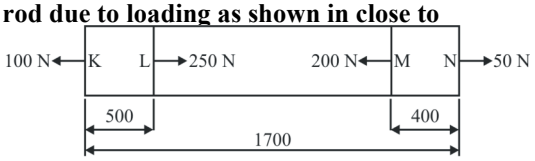
$d_B^2 = 16 d_A^2$

$d_B = \sqrt{16 \times (13)^2}$

$d_B = 4 \times 13$

$= 52$ mm

189. The figure shows an Aluminium rod of 25 mm^2 cross sectional area. It is loaded at four points, K, L, M and N. Assume E = 67 GPa for Aluminium. The total change in length of the rod due to loading as shown in close to



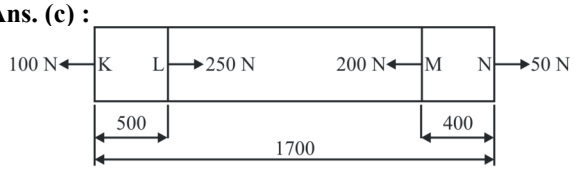
All dimensions are in mm

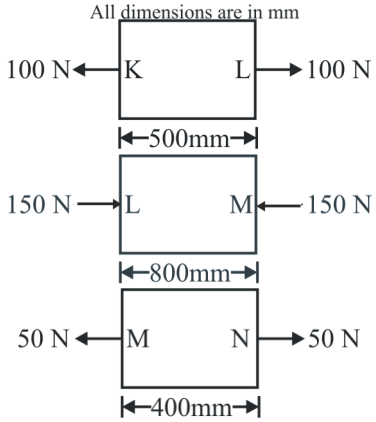
(a) 30 μm (b) −10 μm

(c) −30 μm (d) 10 μm

ISRO Scientist/Engineer 07.05.2017

Ans. (c) :





Let, change in length of the 'rod' is ΔL

So, $\Delta L_{KL} = \left(\frac{PL}{AE}\right)_{KL}$

$= \frac{100 \times 500}{25 \times 67 \times 10^3}$

$= \frac{50}{25 \times 67}$

$(\Delta L)_{KL} = \frac{50}{1675} = 0.0298$ (Tension) ≈ 0.03

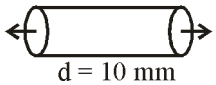
Search on Telegram @apna_pdf

$$(\Delta L)_{LM} = \left(\frac{PL}{AE}\right)_{LM}$$
$$= \frac{150 \times 800}{25 \times 67 \times 10^3}$$
$$= \frac{120}{1675} = 0.07 \text{ (Compression)}$$
$$(\Delta L)_{MN} = \left(\frac{PL}{AE}\right)_{MN}$$
$$= \frac{50 \times 400}{25 \times 67 \times 10^3}$$
$$= \frac{20}{1675} = 0.01 \text{ (Tension)}$$
Total change in length $(\Delta L) = (\Delta L)_{KL} + (\Delta L)_{LM} + (\Delta L)_{MN}$
$= 0.03 - 0.07 + 0.01$
$= -0.03$ mm
$(\Delta L) = -30$ μm

190. A 10 mm diameter bar of mild steel of elastic modulus 200×10^9 Pa is subjected to a tensile load of 50000N, taking it just beyond its yield point. The elastic recovery of strain that would occur upon removal of tensile load will be
(a) 1.38×10^{-3} (b) 2.68×10^{-3}
(c) 3.18×10^{-3} (d) 4.62×10^{-3}

ESE 2017

Ans. (c) : Given,
d = 10 mm
$E = 200 \times 10^9$ Pa $= 200 \times 10^3$ MPa
P = 50000 N
$$\text{stress } (\sigma) = \frac{P}{A} = \frac{P}{\frac{\pi}{4}d^2} = \frac{4P}{\pi d^2}$$
The bar under loading



d = 10 mm
$$= \frac{4 \times 50000}{\pi \times 10^2}$$
$= 636.94$ N/mm^2
$= 636.94$ MPa
$\sigma = E\in$
$$\in = \frac{636.94}{200 \times 10^3}$$
$= 3.18 \times 10^{-3}$

191. A bar produces a lateral strain of magnitude 60×10^{-5} m/m when subjected to a tensile stress of magnitude 300 MPa along the axial direction. What is the elastic modulus of the material if the Poisson's ratio is 0.3?
(a) 200 GPa (b) 150 GPa
(c) 125 GPa (d) 100 GPa

ESE 2017

Ans. (b) : Given,
Lateral strain $= 60 \times 10^{-5}$
$\sigma = 300$ MPa
$\mu = 0.3$
We know that
Lateral strain = μ × longitudinal strain = $\mu \times \in_\ell$
$$\in_\ell = \frac{60 \times 10^{-5}}{0.3} = 200 \times 10^{-5}$$
$\sigma = \in E$
$$E = \frac{300}{200 \times 10^{-5}} = 150 \text{ GPa}$$

192. The modulus of rigidity of an elastic material is found to be 38.5% of the value of its Young's modulus. The Poisson's ratio μ of the material is nearly
(a) 0.28 (b) 0.30
(c) 0.33 (d) 0.35

ESE 2017

Ans. (b) : Given, G = 0.385 E
We know that $E = 2G(1 + \mu)$
$$1 + \mu = \frac{E}{2G} = \frac{1}{2 \times 0.385}$$
$1 + \mu = 1.297$
$\mu = 0.297$

193. Material Stress-strain relationship expressed by $\sigma = K\varepsilon^n$; where in K & n are :
(a) K is strength coefficient & n is yield strain
(b) K is yield stress & n is work hardening exponent
(c) K is strength coefficient & n is work hardening exponent
(d) None of the above

Punjab PSC SDE 12.02.2017

Ans. (c) : $\sigma = K\in^n$
Where,
K is strength coefficient
n is work hardening exponent

194. An aluminum bar (E = 72 GPa, ν = 0.33) of diameter 50mm cannot exceed a diameter of 50.1mm when compressed by axial force P. The maximum acceptable compressive load P is approximately.
(a) 190 kN (b) 200 kN
(c) 470 kN (d) 860 kN

HPPSC Asstt. Prof. 20.11.2017

Ans. (d) : Given,
E = 72 GPa, Poisson ratio (ν) = 0.33, d_0 = 50mm, d_f=50.1mm
$$\in_{lat.} = \frac{\delta d}{d_0} = \frac{d_f - d_0}{d_0} = \nu\frac{\sigma}{E} = \nu\frac{P}{A.E}$$
$$\frac{d_f - d_0}{d_0} = \nu\frac{P}{\frac{\pi}{4}d_0^2.E}$$
$$P = \frac{(d_f - d_0)}{d_0} \times \frac{\pi}{4} \times \frac{d_0^2 \times E}{\nu}$$
$$P = \frac{0.1}{50} \times \frac{\pi}{4} \times \frac{(50)^2 \times 72 \times 10^3}{0.33} = 856.79\text{kN}$$
≈ 860 kN

195. A copper tube with wall thickness of 8mm must carry an axial tensile force of 175 kN. The allowable tensile stress is 90 MPa. The minimum required outer diameter is approximately.
(a) 60 mm (b) 72 mm
(c) 85 mm (d) 93 mm

HPPSC Asstt. Prof. 20.11.2017

Search on Telegram @apna_pdf

Ans. (c) :

$$\text{Stress}(\sigma) = \frac{P}{A} = \frac{P}{\frac{\pi}{4}(D_2^2 - D_1^2)} \quad \boxed{D_2 = D_1 + 2t}$$

$$D_2^2 - (D_2 - 2t)^2 = \frac{4 \times P}{\pi \times \sigma}$$

$$D_2^2 - (D_2 - 2 \times 8)^2 = \frac{4 \times 175 \times 10^3}{\pi \times 90}$$

$$\boxed{D_2 \approx 85\text{mm}}$$

196. A nylon bar (E = 2.1 GPa) with diameter 12mm, length 4.5 m, and weight 5.6 N hangs vertically under its own weight. The elongation of the bar at its free and is approximately?

(a) 0.05 mm (b) 0.07 mm
(c) 0.11 mm (d) 0.17 mm

HPPSC Asstt. Prof. 20.11.2017

Ans. (a) : Given, $E = 2.1 \times 10^9$ Pa, d = 12mm, L = 4.5m, W = 5.6 N.

$$\text{Elongation due to self weight } (\delta_{\text{Self-Weight}}) = \frac{WL}{2AE}$$

$$\delta_{\text{Self-Weight}} = \frac{5.6 \times 4.5}{2 \times \frac{\pi}{4} \times (12)^2 \times 2.1 \times 10^9}$$

$$\delta_{\text{Self-Weight}} = \frac{25.2}{1899.072 \times 10^3}$$

$$\delta_{\text{Self-Weight}} = 5.305 \times 10^{-5}\ \text{m} = 0.053\text{mm}$$

197. A copper bar (d = 10 mm, E = 110 GPa) is loaded by tensile load P = 11.5 kN. The maximum shear stress in the bar is approximately.

(a) 73 MPa (b) 87 MPa
(c) 145 MPa (d) 150 MPa

HPPSC Asstt. Prof. 20.11.2017

Ans. (a) : Given, P = 11.5kN, d = 10mm

$$\text{Normal stress } (\sigma_t) = \frac{P}{A} = \frac{11.5 \times 10^3}{\frac{\pi}{4} \times (10)^2}$$

$$= 146.42\text{MPa}$$

$$\text{Maximum shear stress } (\tau_{max}) = \frac{\sigma_t}{2} = \frac{146.42}{2}$$

$$= 73.21\text{MPa}$$

198. The 'Modular ratio' is the ratio of :

(a) Stress and strain
(b) Strain and stress
(c) Elasticity of two materials
(d) Change in length to original length

GMB AAE 25.06.2017

Ans. (c) : Modular ratio is defined as the ratio between modulus of elasticity of steel and modulus of elasticity of concrete it is used to finding losses in pre-stress because of the influence of creep.

199. What is the unit of Young's Modulus ?

(a) N/m^2 (b) N.m
(c) N/m^3 (d) N/m^4

GMB AAE 25.06.2017

Ans. (a) : Young's modulus (E) $= \frac{\text{Stress}}{\text{Strain}}\ (N/m^2)$

200. True stress is

(a) average load/original area
(b) average load/minimum area
(c) average load/ average area
(d) instantaneous load/instantaneous area

WBPSC AE, 2017

Ans. (d) : • True stress represents the ratio of instantaneous load to instantaneous area.

$$\sigma_T = \frac{W_i}{A_i}$$

• Engineering stress represents the ratio of average load to original cross-section of the specimen.

$$\sigma_{\text{Engineering}} = \frac{W}{A_o}$$

201. A load of 10000 kg is applied to copper cylinder 20cm long and 5cm in diameter causes the length to increase 0.4mm and diameter to decreases 0.04 mm. The Poisson ratio for copper would be

(a) 0.23 (b) 0.25
(c) 0.33 (d) 0.4

WBPSC AE, 2017

Ans. (d) : Poisson ratio $(\mu) = -\frac{\text{Lateral strain}}{\text{Longitudinal strain}}$

$$\mu = \frac{0.04/50}{0.4/200} = \frac{0.04}{0.1} = 0.4$$

202. A reinforced concrete beam is considered as made of

(a) Homogeneous material
(b) Heterogeneous material
(c) Isotropic material
(d) Clad material

WBPSC AE, 2017

Ans. (b) : A reinforced concrete beam is considered as made of heterogeneous material.

203. The compressive lateral strain when a cube is subjected to mutually perpendicular tensile stresses of equal magnitude is given by

(a) $\frac{1}{\sigma} \times \frac{E}{m}$ (b) $\frac{1}{\sigma} \times \frac{m}{E}$
(c) $\frac{1}{m} \times \frac{\sigma}{E}$ (d) None of the above

Where, σ = stress, E = Young's modulus, and $\frac{1}{m}$ = Poisson's ration

Karnataka PSC AE, 10.09.2017

Ans. (c) :

$$\mu = \left| \frac{\text{lateral strain}}{\text{Longitudinal strain}} \right|$$

$$\text{Lateral strain} = \mu\left(\frac{\Delta L}{L}\right)$$

$$= \frac{\mu\sigma}{E} = \frac{\sigma}{mE}$$

Search on Telegram @apna_pdf

204. If the modulus of elasticity of a material is twice to its modulus of rigidity, then the Poisson's ratio of the material is equal to_____

(a) One (b) Zero
(c) 0.25 (d) 0.5

GPSC EE Pre, 28.01.2017

Ans. (b) : Given-
Modulus of elasticity (E) = 2 × modulus of rigidity (G)
$\therefore$ $E = 2G$
From, $E = 2G(1 + \mu)$
$2G = 2G(1 + \mu)$
$1 + \mu = 1$
Poisson's ratio, $\mu = 0$

205. A steel bar of 500 mm length is under tensile stress of 100 N/mm^2. If the modulus of elasticity is 2×10^{11} N/m^2, then the total elongation of the bar will be

(a) 0.25 mm (b) 2.50 mm
(c) 5.00 mm (d) 0.50 mm

APPSC AEE Screening Test 2016

Ans. (a)
Given,
length (ℓ) = 500 mm
$\sigma = 100$ N/mm^2
$E = 2 \times 10^{11}$ N/m^2 $= 2 \times 10^{11} \times 10^{-6}$ N/mm^2
$= 2 \times 10^5$ N/mm^2
We know that,

$$\text{elongation } (\delta\ell) = \frac{PL}{AE} = \frac{\sigma L}{E} = \frac{100\times500}{2\times10^5} = \frac{5}{20} = \frac{1}{4} = 0.25 \text{ mm}$$

206. An axial load P is applied on circular section of diameter D. If the same load is applied on a hollow circular shaft with inner diameter as D/2, the ratio of stress in two cases would be

(a) 4/3 (b) 9/8
(c) 1 (d) 8/3

Nagaland PSC CTSE 2016 Paper-I

Ans. (a) : Axial load (P) on circular section & diameter (D) if the same load is applied on a hollow circular shaft with inner diameter as (D/2), then ratio of stress will be,
d = D/2

$$\sigma_1 = \frac{P}{A_1} \quad \sigma_1 = \frac{P}{\frac{\pi}{4}D^2}$$

$$\sigma_2 = \frac{P}{A_2} \quad \sigma_2 = \frac{P}{\frac{\pi}{4}(D^2 - d^2)}$$

$$\frac{\sigma_1}{\sigma_2} = \frac{\frac{P}{\frac{\pi}{4}(D^2)}}{\frac{P}{\frac{\pi}{4}\frac{(4D^2 - D^2)}{4}}} = \frac{D^2}{D^2 - \left(\frac{D}{2}\right)^2} = \frac{4D^2}{3D^2} = \frac{4}{3}$$

207. A compound bar having two members X and Y of length L when subjected to tensile force P would have elongation equal to (in usual notations)

(a) $\frac{PL}{A_XE_X + A_YE_Y}$ (b) $\frac{PL}{A_XE_X} + \frac{PL}{A_YE_Y}$
(c) $\frac{PL}{A_XE_X - A_YE_Y}$ (d) $\frac{PL}{A_XE_X} - \frac{PL}{A_YE_Y}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : We know,

$$\varepsilon = \frac{PL}{AE}, \quad \therefore \text{ [P \& L Remains constant]}$$

So for X & Y member

$$\varepsilon = E_X + E_Y = \frac{PL}{A_XE_X + A_YE_Y}$$

208. A vertical prismatic bar fixed at the top end loaded with P at the bottom free end, is having a unit weight of W and its length is L. If σ is the working stress, the safe cross sectional area for the when P and self weight are considered is given by

(a) $\frac{P}{\sigma + WL}$ (b) $\frac{P}{\sigma - WL}$
(c) $\frac{\sigma + WL}{P}$ (d) $\frac{\sigma - WL}{P}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : We Know, stress = $\frac{P}{A}$
So, Total stress = $\sigma - WL$

$$\sigma - WL = \frac{P}{A}$$

$$\boxed{A = \frac{P}{\sigma - WL}}$$

209. If temperature changes from t_0 to t in a simple bar with both ends constrained and having modulus of elasticity E and thermal coefficient α, the thermal stress due to the temperature rise is

(a) $E\frac{(t - t_0)}{\alpha}$ (b) $\alpha\frac{(t - t_0)}{E}$
(c) $E\alpha(t - t_0)$ (d) $\frac{E\alpha}{(t - t_0)}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : We know,
$t - t_0 = \alpha\,\Delta\,T$, '$\alpha$' thermal expansion
$t = t_0(1 + \alpha\,\Delta\,T) \Rightarrow$ thermal stress = $\frac{F}{A} = t \times \text{strain}$
So, $= E\,\alpha\,(t - t_0)$

210. Volumetric strain of a sphere of diameter increasing from d_1 to d_2 is equal to

(a) $\frac{d_2 - d_1}{d_1}$ (b) $3\frac{(d_2 - d_1)}{d_1}$
(c) $3\frac{d_2 + d_1}{2d_1}$ (d) $\frac{d_2 + d_1}{2d_1}$

APPSC AEE Mains 2016 (Civil Mechanical)

Search on Telegram @apna_pdf

Ans. (b) : As, We know,

$$\text{Volumetric strain} = \frac{\text{Change in volume}}{\text{Original volume}}$$

$$\text{'}\varepsilon_v\text{' for sphere} = 3\times\frac{\text{Change in diameter}}{\text{Diameter}}$$

$$= 3\times\frac{(d_2 - d_1)}{d_1}$$

211. If a circular rod having Poisson's ratio μ is subjected to an axial pull and if the strain is e, then the lateral strain is equal to

(a) $-\mu e$ (b) μe

(c) $-e/\mu$ (d) e/μ

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : For a circular section,

$$\text{Poisson's ratio} = -\frac{\text{Lateral strain}\,(L)}{\text{Longitudinal strain}\,(e)}$$

Lateral strain (L) = $-\mu \times e$

$$\left[\because \text{For circular section, Lateral strain} = \frac{d_f - d_0}{d_0}\right]$$

212. If a timber beam 8 cm wide and 16 cm deep is to be converted into an equivalent steel section of the same depth for analysis purpose, then the width of the equivalent section for a modular ratio of 20 will be

(a) 160 cm (b) 2.5 cm

(c) 0.4 cm (d) 12 cm

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : We know, Elasticity

$$\text{Modular Ratio} = \frac{\text{Modulus of Elasticity of steel}}{\text{Modulus of Elasticity timber}}$$

$$20 = \frac{E_s}{E_t} \Rightarrow 20\ E_t = E_s$$

So, We know,

$A_s \times E_s = E_t \times A_t$

$$b_s = \frac{E_s}{20}\times\frac{16\times 8}{16\times E_s} = 0.4\text{cm}$$

213. The value of Poisson's ratio for which bulk modulus of a material will be equal to its Young's modulus

(a) 0.33 (b) 0.15

(c) 0.45 (d) 0.25

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : We know,

K = Bulk Modulus

E = Young's Modulus

$E = 3K(1-2\mu)$

So, E = K, substitute Above eq.

We get

$$\frac{1}{3} = 1 - 2\mu$$

$$\mu = \frac{1}{3} = 0.33$$

214. A brass tube has enclosed a steel bar and they equal cross-sectional area. The Young's modulus of elasticity is 200 GPa and 100 GPa for steel and brass respectively. Then the ratio of stress developed in the steel bar to that in the brass tube compression is

(a) 0.5 (b) 1

(c) 1.5 (d) 2

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : As we know,

$A_s = A_b$,

$E_s = 200$ GPa

$E_b = 100$ GPa

As we know,

$$\frac{\sigma_b A_b}{\sigma_s A_s} = \frac{E_b}{E_s} = \frac{100}{200}$$

So, $\dfrac{\sigma_s}{\sigma_b} = 2$

215. Two bars of same area and length but of different materials are subjected to same tensile force. If the bars have their axial elongation in the ratio of 4:6, then the ratio of modulus of elasticity of the two materials would be

(a) 4 : 6 (b) 6 : 4

(c) $2:\sqrt{6}$ (d) $\sqrt{6}:2$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know,

$$\text{Elongation, } \delta L_1 = \frac{P_1 L_1}{A_1 E_1}$$

So for $\delta L_2 = \dfrac{P_2 L_2}{A_2 E_2}$ $\quad \therefore \begin{bmatrix} L_1 = L_2 \\ A_1 = A_2 \\ P_1 = P_2 \end{bmatrix}$

Elongation ratio

$$\frac{\delta L_1}{\delta L_2} = \frac{P_1 L_1}{A_1 E_1}\times\frac{A_2 E_2}{P_2 L_2}$$

$$\frac{\delta L_1}{\delta l_2} = \frac{E_2}{E_1}$$

$$\frac{E_1}{E_2} = \frac{\delta L_2}{\delta L_1} = \frac{6}{4}$$

$$\boxed{\frac{E_1}{E_2} = \frac{6}{4}}$$

216. The bulk modulus of elasticity of a materials is twice its modulus of rigidity. The poisson's ratio of the material is

(a) 1/7 (b) 2/7

(c) 3/7 (d) 4/7

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : We know,

$$E = 2G(1+\mu)\ \&\ E = 3K(1-2\mu)$$

$$\mu = \frac{3K - 2G}{2G + 6K} \qquad \text{Given} : \Rightarrow \boxed{K = 2G}$$

So, $\mu = \dfrac{6G - 2G}{2G + 12G} = \dfrac{4G}{14G} = \dfrac{2}{7}$

Search on Telegram @apna_pdf

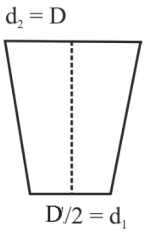
217. The diameter of a tapering rod varies from 'D' to 'D/2' in length of 'L' m. If it is subjected to an axial tension of 'P' the change in length is

(a) $4\,PL / (\pi ED^2)$
(b) $8\,PL / (\pi ED^2)$
(c) $2\,PL / (\pi ED^2)$
(d) None of the given answers

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : We know, for prismatic bar

Elongation, $\delta\ell = \dfrac{PL}{AE}$



For taper bar,

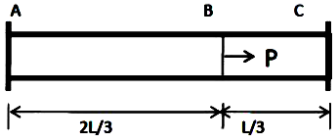
$$\delta\ell = \frac{PL}{\frac{\pi}{4}d_1 d_2 E} = \frac{PL}{\frac{\pi}{4}D \times \frac{D}{2} \times E}$$

[Given, $d_2 = D$, $d_1 = D/2$]

Elongation, $\delta\ell = \dfrac{PL}{\frac{\pi}{4}\left(\frac{D^2}{2}\right) \times E}$

$$\boxed{\delta\ell = \frac{8PL}{\pi D^2 E}}$$

218. The ratio of load shared by parts 'AB' and 'BC' of the bar shown below is

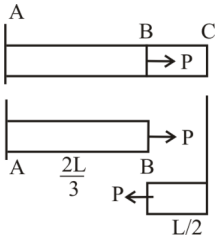


(a) 1 : 1 (b) 2 : 1
(c) 3 : 1 (d) 1 : 2

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : We know,

$$\delta\ell = \delta\ell_1 + \delta\ell_2 = 0$$



So, $\delta\ell_1 = \dfrac{P_1 L_1}{AE}$

$\delta\ell_2 = \dfrac{P_2 L_2}{AE}$

$$\boxed{\frac{P_1}{P_2} = \frac{L_2}{L_1} = \frac{L/3}{\left(\frac{2L}{3}\right)} = \frac{1}{2}}$$

219. Let the strain produced in length and diameter of cylindrical rod be 0.02 and 0.005 respectively. Then the volumetric strain is given by

(a) 0.03 (b) 0.025
(c) 0.015 (d) 0.01

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : Volumetric strain $\varepsilon_v = \varepsilon_l + 2\varepsilon_d$
$= 0.02 + 2 \times 0.005 = 0.03$

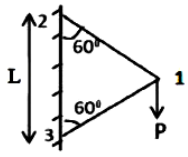
220. A material with large deformation at failure is termed

(a) Brittle (b) Elastic
(c) Ductile (d) Elasto-plastic

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : The material in which large deformation in possible before the absolute failure or rupture is termed as ductile.

221. A system of two prismatic bars of equal length (L) and equal cross-section (A) carries a vertical load P as shown in the figure given below. If their modulus of elasticity is E, the vertical displacement of the hinge 1 is



(a) $\dfrac{PL}{AE}$ (b) $\dfrac{2\,PL}{AE}$
(c) $\dfrac{3PL}{AE}$ (d) $\dfrac{2.5PL}{AE}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know,

Elongation, $\delta\ell = \dfrac{PL}{AE}$

Here, P at 1 is twice the load

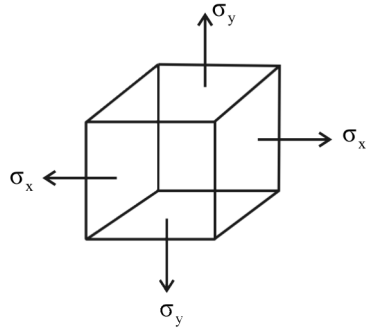
So, $\boxed{\delta\ell = 2 \times \dfrac{PL}{AE}}$

222. Which of the following is true (μ = Poisson's ratio):

(a) $0 < \mu < {}^1/_2$ (b) $1 < \mu < -1$
(c) $1 < \mu < 0$ (d) $\infty < \mu < -\infty$

UJVNL AE 2016

Ans : (a)



Total strain in x-x direction

Search on Telegram @apna_pdf

$$e_x = \frac{\sigma_x}{E} - \mu.\frac{\sigma_y}{E} - \mu\frac{\sigma_z}{E}$$

$$e_x = \frac{\sigma_x}{E} - \mu\left(\frac{\sigma_y}{E} + \frac{\sigma_z}{E}\right)$$

Where $\sigma_x = \sigma_y = \sigma_z = \sigma$

$$e_x = \frac{\sigma}{E} - \mu\left(\frac{\sigma}{E} + \frac{\sigma}{E}\right)$$

$$e_x = \frac{\sigma}{E} - 2\mu\left(\frac{\sigma}{E}\right)$$

$$e_x = \frac{\sigma}{E}(1 - 2\mu)$$

$$e_x + e_y + e_z = e_v$$

$$e_v = \frac{3\sigma}{E}(1 - 2\mu)$$

$$\frac{\delta v}{v} = \frac{3\sigma}{E}(1 - 2\mu)$$

This limits 2μ to maximum of 1 or the poisson's ratio lie to 0.5. No material is known to have a higher Value for poisson's ratio although μ for materials like rubber approaches this value.

Poisson's ratio

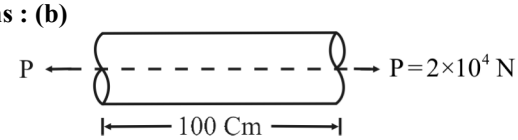
$$0 < \mu < {}^1/_2$$

223. A steel rod of 100 cm long and 1 sq cm cross sectional area has a young's modulus of elasticity 2×10^6 kgf/cm^2. It is subjected to an axial pull of 2000 kgf. The elongation of the rod will be.

(a) 0.05 cm (b) 0.1cm
(c) 0.15cm (d) 0.20cm

UJVNL AE 2016

Ans : (b)



l = 100 cm =1m, A = 1×10^{-4}m^2

P = 2×10^4 N.

E = 2×10^6kgf/cm^2 = 2×10^{11}N/m^2

$$\delta l = \frac{Pl}{AE}$$

$$\delta l = \frac{2\times10^4 \times 1}{1\times10^{-4}\times2\times10^{11}}$$

$$\delta l = 0.1cm.$$

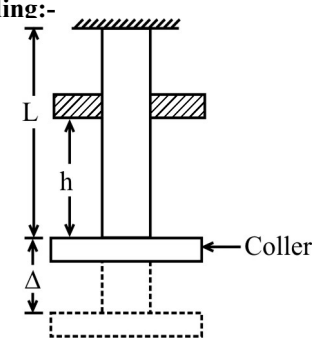
224. A test used to determine the behavior of materials when subjected to high rates of loading is known as :

(a) Hardness test (b) Impact test
(c) Fatigue test (d) Torsion test

HPPSC W.S. Poly. 2016

Ans : (b) A test used to determine the behavior of materials when subjected to high rate of loading for small time is known as impact test.

Impact loading:-



$$\sigma_{impact} = \frac{W}{A}\left[1 + \sqrt{1 + \frac{2h}{\delta}}\right]$$

225. A steel bar 10mm×10mm cross section is subjected to an axial tensile load of 20 kN. If the length of bar is 1 m and E = 200 GPa, then elongation of the bar is :

(a) 1 mm (b) 0.5 mm
(c) 0.75 mm (d) 1.5 mm

Kerala PSC IOF 19.04.2016

Ans. (a) Given,
Area = 10 × 10 = 100 mm^2
Length = 1 m = 1000 mm
Load, P = 20 kN

$$\text{Elongation } (\delta) = \frac{PL}{AE}$$

$$= \frac{20\times10^3\times1000}{100\times200\times10^3} = 1\text{mm}$$

226. The modulus of rigidity and Poisson's ratio of a material are 80GPa and 0.3 respectively, Its Young's Modulus will be:

(a) 160 GPa (b) 208 GPa
(c) 120 GPa (d) 104 GPa

Kerala PSC IOF 19.04.2016

Ans. (b) : Given, G = 80 GPa, μ = 0.3
We know, E = 2G(1 + μ)
E = 2 × 80 (1 + 0.3)
Modulus of Elasticity, E = 208 GPa

227. Yield point in fatigue loading as compared to static loading is ..... .

(a) same
(b) higher
(c) lower
(d) depends on other factors

GWSSB DEE 07.07.2016

Ans. (c) : Yield point in fatigue loading as compared to static loading is lower.

228. Residual stress in the materials ..... .

(a) acts when external load is applied
(b) becomes zero when external load is removed
(c) is independent of external
(d) is always be harmful

GWSSB DEE 07.07.2016

Ans. (c) : Residual stressess are locked in stresses within a metal object, even though the object is free of external forces.
These stresses are the result of one region of the metal being constrained by adjacenet regions from expanding, contracting, or releasing stresses can be tensile or compressive.

Search on Telegram @apna_pdf

229. Ability of material to resist fracture due to high impact load is called ..... .

(a) toughness (b) stiffness
(c) plasticity (d) hardness

GWSSB DEE 07.07.2016

Ans. (a) : Ability of material to resist fracture due to high impact load is called toughness.

230. Which of the following statement is correct?

(a) The stress is the pressure per unit area
(b) The strain is expressed in mm
(c) Hook's law holds good up to the breaking point
(d) Stress is directly proportional to strain within elastic limit

UP Jal Nigam AE 2016

Ans. (d) : Stress is directly proportional to strain within elastic limit.

231. Area under the stress-strain curve when load is gradually applied in tension represents the

(a) Strain energy
(b) Strain energy density
(c) Strain energy per unit weight
(d) Strain energy per unit area

RPSC LECTURER 16.01.2016

Ans. (b) : Area under the stress-strain curve when load is gradually applied in tension represents the strain energy density.

232. For ductile materials, the largest value of tensile stress that can be sustained by material before breaking is known as:

(a) Modulus of elasticity
(b) Ultimate tensile strength
(c) Yield strength
(d) Toughness

UPRVUNL AE 07.10.2016

Ans. (b) : For ductile materials, the largest value of tensile stress that can be sustained by material before breaking is known as ultimate tensile strength.

233. When the temperature of a solid metal increases-

(a) strength of the metal decreases but ductility increases
(b) both strength and ductility decrease
(c) both strength and ductility increase
(d) strength of the metal increases but ductility decreases

RPSC 2016

Ans : (a) Strength of the metal decreases but ductility increases. When the temperature of a solid metal increases, then its intermolecular bonds breaks and strength of solid metal decreases. Due to decreases its strength, the elongation of the metal increases, when we apply the load i.e. ductility increases.

234. A rod is subjected to a uniaxial load with in linear elastic limit. When the change in the stress is 200 MPa, the change in strain is 0.001. If the Poisson's ratio of the rod is 0.3, the modulus of rigidity (in GPa) is–

(a) 75.31 (b) 76.92
(c) 77.23 (d) 76.11

RPSC 2016

Ans : (b)

$$E = \frac{\text{stress}}{\text{strain}} = \frac{200\times10^6}{0.001} = 2\times10^{11}\ \text{Pa}$$

$\mu = 0.3 \Rightarrow$

$$E = 2G(1+\mu)$$

$$2\times10^{11} = 2G\,(1+0.3)$$

$$G = 7.69\times10^{10}\ \text{Pa}$$

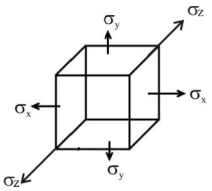
$$\boxed{G = 76.62\,\text{GPa}}$$

235. When a body is subjected to stress in all the directions, the body is said to be under..... strain.

(a) compressive (b) tensile
(c) shear (d) volumetric

(HPPSC LECT. 2016)

Ans : (d)



When a body is subjected to stress in all the direction, the body is said to be under volumetric strain.

236. Hooke's law is applicable:

(a) Plastic range, strain is proportional to stress
(b) Elastic range, strain is proportional to stress
(c) In both elastic and plastic range, strain is proportional to stress
(d) None of the above

(HPPSC LECT. 2016)
KPCL AE 2016

Ans : (b) Hooke's law is applicable up to elastic range, strain is proportional to stress.
Hooke's law:- The slope of this line is the ratio of stress to strain and in constant for a material. In this range, the material also remains elastic. When a material behaves elastically and also exhibits a linear relationship between stress and strain, it is called linearly elastic.
The slope of stress- strain curve is called the modulus of Elasticity

237. The ratio of modulus of rigidity to bulk modulus for a Poisson's ratio of 0.25 would be:

(a) 2/3 (b) 2/5
(c) 3/5 (d) 1.0

HPPSC W.S. Poly. 2016

Ans : (c) $E = 3K(1-2\mu)$ ..... (i)

$E = 2G(1+\mu)$ ..... (ii)

$3K(1-2\mu) = 2G(1+\mu)$

$$\frac{G}{K} = \frac{3(1-2\mu)}{2(1+\mu)}$$

G = Modulus of rigidity
K = Bulk modulus
E = Modulus of Elasticity
μ = Poission's ratio

$$\frac{G}{K} = \frac{3(1-2\times0.25)}{2(1+0.25)}$$

$$G/K = 3/5$$

Search on Telegram @apna_pdf

238. Two steel rails each of 12 m length are laid with a gap of 1.5 mm at ends at a temperature of 24°C. The thermal stress produced at a temperature of 40°C is (take E = 2 × 10^5 N/mm^2, coefficient of thermal expansion = 12 × 10^{-6} /°C)

(a) 10.5 N/mm^2 (b) 12.5 N/mm^2
(c) 13.4 N/mm^2 (d) 15.5 N/mm^2

ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Given, L = 12 m = 12 × 10^3 mm
λ = gap between rails
$\Delta T = (40 - 24) = 16°C$
E = 2 × 10^5 N/mm^2
$\alpha = 12 \times 10^{-6}/°C$

Then, $\boxed{\sigma_{thermal} = \frac{(\alpha TL - \lambda)}{L} E}$

$$\sigma_{th} = \frac{(12\times10^{-6}\times16\times12\times10^3 - 1.5)}{12\times10^3}\times2\times10^5$$

σ_{th} = 13.4 N/mm^2

239. An aluminum tensile test specimen has a diameter, d_o = 25 mm and a gauge length of L_o = 250 mm. If a force of 175 kN elongates the gauge length by 1.25 mm, the modulus of elasticity of the material is nearly

(a) 71 GPa (b) 71 MPa
(c) 142 GPa (d) 142 MPa

ISRO Scientist/Engineer 03.07.2016

Ans. (a) : Given,
L_0 = 250 mm,
P = 175 kN
= 175 × 10^3 N
$\Delta\ell$ = 1.25 mm
d_0 = 25 mm

$$A = \frac{\pi}{4}(d_0)^2 = \frac{\pi}{4}\times(25)^2$$

$$A = \frac{\pi}{4}\times(625)$$

Elongation $\boxed{\Delta\ell = \frac{PL}{AE}}$

$$1.25 = \frac{175\times10^3\times250}{\frac{\pi}{4}\times625\times E}$$

$$1.25 = \frac{4\times7\times10^3\times10}{\pi\times E}$$

$$E = \frac{28\times10^4}{1.25\times\pi}$$

E = 71301.41 N/mm^2
E = 71.301 × 10^3 N/mm^2
$\boxed{E = 71\,GPa}$

240. Hoop stress for a wooden with steel flat tyre in terms of outside diameter of the wheel D, inside diameter of the tyre d and Young's modulus E is

(a) E(D-d)/d (b) E(D/d)
(c) E(D/(D-d)) (d) E(d/D)

APPSC AEE Screening Test 2016

Ans. (a) : Given,
Inside diameter (ID) = d
Outside diameter (OD) = D

Hoop stress (σ_h)

$\boxed{(\sigma_h) = E \times strain}$

So, strain = $\left(\frac{D-d}{d}\right)$

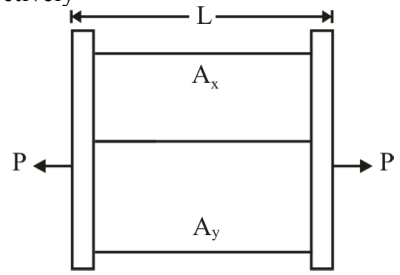
$\boxed{\sigma_h = E\times\left(\frac{D-d}{d}\right)}$

241. A tensile force of P is applied on a compound bar having two members X and Y. Then the load shared by the member X is

(a) $\frac{PA_XE_X}{A_XE_X + A_YE_Y}$ (b) $\frac{PA_YE_Y}{A_XE_X + A_YE_Y}$
(c) $\frac{P}{2}$ (d) $\frac{PE_X}{E_Y}$

APPSC AEE Screening Test 2016

Ans. (a) : Let us consider a compound bar having two member x and y and their corresponding area Ax and Ay respectively



Let the load shared by x - section be P_x and similarly for y - section be P_y.
∴ $P_x + P_y$ = total load i.e. P ---------- (1)
If the compound bars are connected in parallel, the axial deflection in both the sections x and y will be the same.
∴ Deflection in x - section = deflection in y - section

$$\frac{P_xL}{A_x.E_x} = \frac{P_yL}{A_yE_y}$$

Therefore, $P_y = \frac{P_x.A_y.E_y}{A_x.E_x}$ ---------- (2)

From (1) and (2)

$P_x + P_y = P$

$$P = P_x + \frac{P_xA_yE_y}{A_x.E_x}$$

$$P = \frac{P_xA_xE_x + P_xA_yE_y}{A_x.E_x}$$

$P_x [A_xE_x + A_yE_y] = PA_xE_x$

$$\boxed{P_x = \frac{PA_xE_x}{A_xE_x + A_yE_y}}$$

242. Stress concentration may be caused by

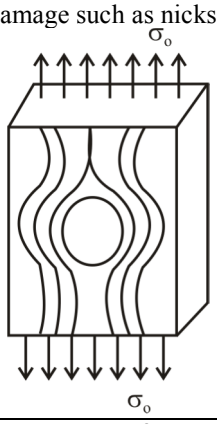
(a) Change in cross sectional area
(b) Change in shape

Search on Telegram @apna_pdf

(c) Change in dimension
(d) A hole or a notch in the body

APPSC AEE Screening Test 2016

Ans. (d) : Stress concentrations occur when there are irregularities in the geometry or material of a structural component that cause on interruption to the flow of stress. This arises from such details as hole, grooves, notches and fillets. Stress concentration may also occur from accidental damage such as nicks and scratches.



243. What is the amount of stress induced in a 5 mm steel bar of length 2 m when heated from 20° C to 140° C while it is free to expand?
(a) 600 Pa (b) 1200 Pa
(c) 48 Pa (d) None of these

KPCL AE 2016

Ans. (d) : Thermal stress = $\alpha\Delta TE$
$\because$ For free to expand a thermal stress always zero.

244. Value of Poisson's ratio for ionic solids is in the range of:
(a) 0.1 (b) 0.3
(c) 0.4 (d) 0.2

UPRVUNL AE 21.08.2016

Ans. : (d) Value of poission's ratio for ionic solids is in the range of 0.2.

245. Find the modulus of elasticity for a rod which tapers uniformly from 30 mm to 15mm diameter in a length of 350mm. The rod is subjected to an axial load of 5.5 kN and extension of the rod is 0.025 mm
(a) 2.78×10^5 N/mm^2 (b) 2.18×10^5 N/mm^2
(c) 3.18×10^5 N/mm^2 (d) 3.78×10^5 N/mm^2

UPRVUNL AE 21.08.2016

Ans. : (b) Given,
$F = 5.5 \times 10^3$ N
$l = 350$ mm
$d_1 = 350$ mm
$d_2 = 15$ mm
$\Delta l = 0.025$ mm
uniformly tapers bars–

$$\Delta l = \frac{4Fl}{\pi E d_1 d_2}$$

$$E = \frac{4Fl}{\pi \times d_1 d_2 \times \Delta l}$$

$$E = \frac{4 \times 5.5 \times 10^3 \times 350}{\pi \times 350 \times 15 \times 0.025}$$

$E = 2.18 \times 10^5$ N/mm^2

246. It is desired to shrink a thin steel tyre on to a rigid wheel of 3600 mm diameter. What is the internal diameter of the tyre, if after fitting the hoop stress in the tyre is 95 N/mm^2. Take E=2×10^5 MPa
(a) 3598.29 mm (b) 3592.46 mm
(c) 3614.27 mm (d) 3618.38 mm

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Given, D = 3600 mm, σ_H = 95 N/m^2
$E = 2 \times 10^5$ MPa
According to Hooke's law

$$\sigma = E\varepsilon$$

$$\varepsilon = \frac{\sigma}{E} = \frac{95}{2 \times 10^5}$$

$$\varepsilon = 4.75 \times 10^{-4}$$

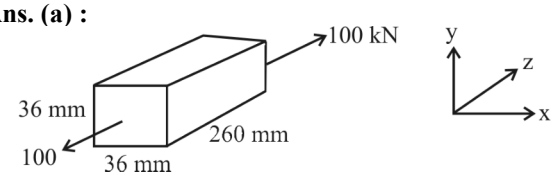
$$\frac{\delta D}{D} = \varepsilon = 4.75 \times 10^{-4}$$

$\delta D = 4.75 \times 10^{-4} \times 3600$
$\delta D = 1.71$ mm
$D - d = 1.71$ mm
$d = D - 1.71$
$d = 3600 - 1.71$
$d = 3598.29$ mm

247. A bar 36 mm × 36 mm × 260 mm long is subjected to a pull of 100 kN, in the direction of length. The decrease in each lateral dimension is 0.004 mm. The lateral strain is
(a) 1.11×10^{-4} (b) 1.25×10^{-4}
(c) 1.32×10^{-4} (d) 1.45×10^{-4}

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Decrease in lateral dimension = 0.004 m (Given)

$$\text{Lateral strain} = \frac{\text{change in length of lateral dimension}}{\text{Original length of lateral dimension}}$$

$$\varepsilon_y = \frac{0.004}{36} = \boxed{1.11 \times 10^{-4}}$$

248. The shear strength of a metal is usually
(a) greater than its tensile strength
(b) less than its tensile strength
(c) equal to its tensile strength
(d) none of these

GPSC Lect. 23.10.2016

Ans. (b) : Shear strength is the load acting along a plane that is parallel to the direction of the force. The ratio of shear stress to the corresponding shear strain for shear stresses below the proportional limit of the material. So, shear strength of a metal is usually less than its tensile strength.

249. During tensile test on a specimen of 1 cm^2 cross-section, maximum load observed was 80 kN and area of cross-section at neck was 0.5 cm^2. U.T.S. of the specimen is:
(a) 400 MPa (b) 800 MPa
(c) 1600 MPa (d) 2200 MPa

RPSC VPITI 14.02.2016

Search on Telegram @apna_pdf

Ans. (b) : Given,
Maximum load = 80×10^3 N
Original cross-section area = 100 mm^2

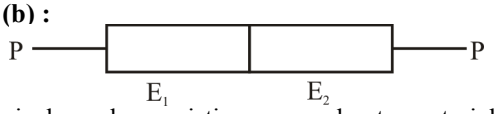
$$\text{U.T.S.} = \frac{\text{Maximum load}}{\text{Cross} - \text{section area}} = \frac{80 \times 10^3}{1 \times 100} \text{N/mm}^2$$

UTS = 800 MPa

250. Two wires of different materials but of same diameter are connected end to end and a force is applied which stretches them by 1 cm. The two wires will have the
(a) Same stress and strain
(b) Same stress but different strain
(c) Same strain but different stress
(d) Different stress and strain

RPSC VPITI 14.02.2016

Ans. (b) :



Stress is depend on resisting area and not a material.

$$\sigma_1 = \sigma_2 = \frac{P}{A}$$

$$\text{Strain} = \frac{\Delta L}{L} = \frac{\text{Stress}}{E}$$

So, strain depends on modulus of elasticity which is property of material.
So strain will be different in different wires.

251. For the bar of composite section
(a) The extension in different materials is different
(b) The total external load is equal to the total sum of the loads carried by different materials
(c) The compression in different materials is different
(d) Strain in all materials is unequal

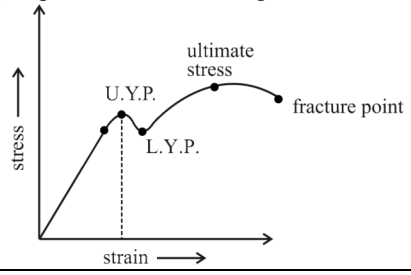
Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : For the bar of composite section the total external load is equal to the total sum of loads carried by different materials.

252. The maximum stress a material can stand before it breaks is called the
(a) Working stress
(b) Ultimate tensile stress
(c) Compressive stress
(d) Transverse stress

Rajasthan Nagar Nigam AE 2016, Shift-II

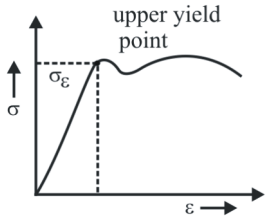
Ans. (b) : Ultimate tensile stress i.e. defined as the maximum stress that material can withstand when a force is applied. When the material are pushed beyond UTS they experience the cracking.



253. Yield strength of a material represents the stress below which the deformation is :
(a) almost elastic (b) plastic
(c) zero (d) none of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Yield strength of a material represents the stress below which the deformation is almost elastic.



254. A specimen of steel, 20 mm diameter with a gauge length of 200 mm is tested to destruction. It has an extension of 0.25 mm under a load of 80 kN and the load at elastic limit is 102 kN. The modulus of elasticity is
(a) 203718 N/mm^2 (b) 259740 N/mm^2
(c) 209740 N/mm^2 (d) 253718 N/mm^2
(e) 222718 N/mm^2

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : diameter (d) = 20 mm
length (l) = 200 mm
extension (δ) = 0.25 mm
load (P) = 80 kN = 80,000 N
load at elastic limit = 102 kN
We know that

$$\delta = \frac{Pl}{AE}$$

$$E = \frac{Pl}{A\delta} = \frac{Pl}{\frac{\pi}{4}d^2 \times \delta} = \frac{80000 \times 200}{\frac{\pi}{4} \times (20)^2 \times 0.25}$$

E = 203718.32 N/mm^2

255. A circular road of 25 mm diameter and 500 mm long is subjected to a tensile force of 60 kN. Determine modulus of rigidity and bulk modulus if Poisson's ratio = 0.3 and Young's modulus E = 2 × 10^5 N/mm^2
(a) 0.7692 × 10^5 N/mm^2 and 1.667 × 10^5 N/mm^2
(b) 0.667 × 10^5 N/mm^2 and 1.857 × 10^5 N/mm^2
(c) 0.1852× 10^5 N/mm^2 and 1.6567 × 10^5 N/mm^2
(d) 0.4692× 10^5 N/mm^2 and 1.545 × 10^5 N/mm^2
(e) 1.7562× 10^5 N/mm^2 and 1.117 × 10^5 N/mm^2

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : Data given as
d = 25 mm, l = 500 mm
F = 60 kN, E = 2 × 10^5 N/mm^2
We know that
E = 2 G (1 + μ)

$$G = \frac{2 \times 10^5}{2 \times (1 + 0.3)} = 0.7692 \times 10^5 \text{ N/mm}^2$$

$$\boxed{G = 0.7692 \times 10^5 \text{ N/mm}^2}$$

E = 3 K (1–2μ)

$$K = \frac{2 \times 10^5}{3 \times (1 - 2 \times 0.3)}$$

$$\boxed{K = 1.667 \times 10^5 \text{ N/mm}^2}$$

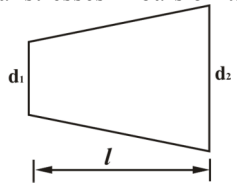
Search on Telegram @apna_pdf

256. The steel bar AB varies linearly in diameter from 25 mm to 50 mm in a length 500 mm. It is held between two unyielding supports at room temperature. What is the stress induced in the bar, if temperature rises by 25ºC? Take E = 2 × 10^5 N/mm^2 and α = 1.667× 10^{-6}/ºC

(a) 110 N/mm^2 (b) 140 N/mm^2
(c) 120 N/mm^2 (d) 150 N/mm^2
(e) 170 N/mm^2

CGPSC AE 26.04.2015 Shift-I

Ans. (c) : Thermal stresses in bars of tapering section



Given
length of bar (l) = 500 mm
dia of smaller end of bar (d_1) = 25 mm
dia of bigger end of bar (d_2) = 50 mm
change in temperate (Δt) = 25ºC
Co-efficient of thermal expansion (α) = 12 × 10^{-6}/ºC
Young's Modulus (E) = 2 × 10^5 N/mm^2

$$\sigma = E\alpha\Delta t\frac{d_2}{d_1}$$

$$= 2\times10^5\times12\times10^{-6}\times25\times\frac{50}{25} = 120 \text{ N/mm}^2$$

257. For a circular cross section beam is subjected to a shearing force F, the maximum shear stress induced will be (where d = diameter)

(a) F/πd^2 (b) 4F/πd^2
(c) 2F/πd^2 (d) F/4d^2

TSPSC AEE 2015

Ans. (b) : $\tau_{max} = \frac{\text{shear force}}{\text{shear area}}$

$$= \frac{F}{\left[\frac{\pi}{4}\right]d^2}$$

$$\tau_{max} = \frac{4F}{\pi d^2}$$

258. Two identical circular rods made of cast iron and mild steel are subjected to same magnitude of axial force. The stress developed is within proportional limit. Which of the following observation is correct ?

(a) Both roads elongate by same amount
(b) MS rod elongates more
(c) Cl rod elongates more
(d) Both stress and strain are equal in both roads

OPSC AEE 2015 Paper-I

Ans : (c) Two identical circular rods made of cast iron and mild steel are subjected to same magnitude of axial force. The stress developed is within proportional limit. CI rod elongates more, because in proportional limit cast iron elasticity is less than mild steel elasticity.

259. The change in length due to tensile or compressive force acting on a body is given by (with usual notations)

(a) δl = AE/ Pl (b) δl = Pl/AE
(c) δl = PE/Al (d) δl= P/AlE

TSPSC AEE 2015

Ans : (b)

Hooke's low:-
Stress ∝ strain

$$\sigma = E\varepsilon$$

$$\sigma = \frac{P}{A}$$

$$e = \frac{p}{AE}$$

$$\frac{\delta\ell}{\ell} = \frac{p}{AE}$$

$$\delta l = \frac{p\ell}{AE}$$

260. A steel bar 100 mm long is subjected to a tensile stress σ. If change in length of bar is 0.05 mm what is the value of σ?
E = 200 GPa

(a) 200 MPa (b) 100 MPa
(c) 80 MPa (d) 150 MPa

TANGEDCO AE 2015

Ans. (b) : $\sigma = \in E$

$$\boxed{\sigma = \frac{\delta L}{L}\cdot E}$$

$$\sigma = \frac{0.05\text{mm}}{100\text{mm}}\times 200\,\text{GPa}$$

$= 5 \times 10^{-4} \times 200 \times 10^9$ Pa
$= 1000 \times 10^5$ Pa
σ = 100 MPa

261.The value of modulus of elasticity for steel is

(a) 70 GPa (b) 100 GPa
(c) 125 GPa (d) 200 GPa

Assam PSC CCE Pre 2015

Ans. (d)

Material	Modulus of Elasticity (E)
• Steel	200 to 220 GPa
• Wrought iron	190 to 200 GPa
• Cast iron	100 to 160 GPa
• Copper	90 to 110 GPa
• Brass	80 to 90 GPa
• Aluminium	60 to 80 GPa

262.Bulk modulus is measured in terms of

(a) N/m (b) N/m^2
(c) N-m/s (d) N-s/m^2

Assam PSC CCE Pre 2015

Ans. (b) : We know that,

$$\text{Bulk Modulus (K)} = \frac{\text{Direct stress}(\sigma)}{\text{Volumetric strain}(\in_v)}$$

Bulk modulus is measured in terms of N/m^2.

263. Which of the following materials has the least elasticity?

(a) Mild steel (b) Aluminium
(c) Rubber (d) Zinc

KPSC ADF 2015

Search on Telegram @apna_pdf

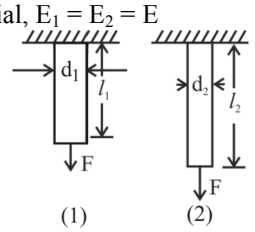
Ans. (c) : The word elastic means to regain its original position after load is removed, the highest load that can bear is steel and it is most elastic. While rubber has the least elasticity and rubber has least elastic.

264. Two wires A & B are of the same materials. Their lengths are in the ratio 1 : 2 and the diameters are in the ratio 2 : 1. If they are pulled by the same force, their increase in length will be in the ratio of :

(a) 2 : 1 (b) 1 : 4
(c) 1 : 8 (d) 8 : 1

KPSC ADF 2015

Ans. (c) :
Given data : $l_1 : l_2 = 1 : 2$
Diameter; $d_1 : d_2 = 2 : 1$
For same material, $E_1 = E_2 = E$



$\because \quad \frac{l_1}{l_2} = \frac{1}{2} \Rightarrow l_2 = 2l_1$

And $\quad \frac{d_1}{d_2} = \frac{2}{1} \Rightarrow d_1 = 2d_2$

$\therefore \quad \delta_1 = \frac{Fl_1}{A_1E}$ and $\delta_2 = \frac{Fl_2}{A_2E} \qquad \left[\because A = \frac{\pi}{4}d^2\right]$

$\therefore \quad \frac{\delta_1}{\delta_2} = \frac{Fl_1 \Big/ \frac{\pi}{4}d_1^2E}{Fl_2 \Big/ \frac{\pi}{4}d_2^2E} = \frac{l_1d_2^2}{l_2d_1^2}$

$\frac{\delta_1}{\delta_2} = \frac{l_1d_2^2}{2l_1 \times 4d_2^2} = \frac{1}{8}$

$\Rightarrow \quad \boxed{\delta_1 : \delta_2 = 1 : 8}$

265. Specific modulus of a composite is given by :
(or)
The specific stiffness is defined as a ratio of :

(a) Square root of Young's modulus/density
(b) Young's modulus/density
(c) Ultimate strength/density
(d) Square root of strength/density

APPSC Poly Lect. 13.03.2020
KPSC ADF 2015

Ans. (b) : Specific modulus is a materials property consisting of the elastic modulus per mass density. It is also known as the stiffness to weight ratio or specific stiffness.

Specific modulus $= \frac{\text{Young's Modulus}}{\text{Density}} = \frac{E}{\rho}$

266. A rigid body is very slowly dropped on another body and a deflection δ_{st} occurs in the second body. If the body be placed suddenly, the value of the impact factor will be :

(a) 0 (b) 1.0
(c) ∞ (d) 2.0

BPSC Asstt. Prof. 29.11.2015

Ans. (d) : $\sigma_{gradual} = \frac{P}{A}$, *and* *Load* $\frac{P+0}{Z}$

$\sigma_{Sudden} = \frac{2P}{A}$

$\sigma_{impact} = \frac{2P}{A}$

$= \frac{P}{A}\left[1 + \sqrt{1 + \frac{h \times AE}{Pl}}\right]$

267. Bulk modulus for a material is 200 GPa and the Poisson's ratio is 0.3. Young's modulus for that material will be

(a) 120 GPa (b) 160 GPa
(c) 210 GPa (d) 240 GPa

TSGENCO AE 14.11.2015

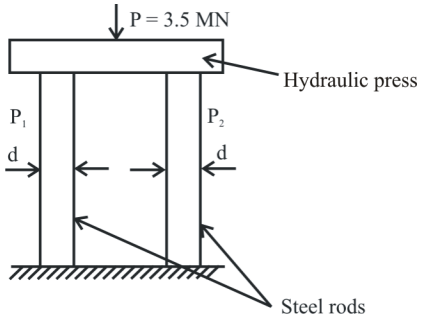
Ans. (d) : Bulk modulus (K) = 200 GPa
Poisson's ratio (μ) = 0.3
Young's modulus (E) = 3K (1–2μ)
= 3 × 200 (1–2 ×0.3)
= 600 (1–0.6)
= 600 × 0.4 = 240 GPa

268. A hydraulic press exerts a total load of 3.5 MN. This load is carried by two steel rods, supporting the upper head of the : press. The safe stress is 85 MPa and E = 210 kN/mm^2. The diameter of the rod will be

(a) 160 mm (b) 161 mm
(c) 162 mm (d) 165 mm

MPPSC AE 08.11.2015

Ans. (c) : Given data :



safe stress (σ) = 85 MPa
$= 85 \times 10^6$ N/m^2
Total load (P) = 3.5 MN = 3.5×10^6 N
Let, P_1 and P_2 load distributed equally in the steel rods

i.e., $P_1 = P_2 = \frac{P}{2} = \frac{3.5 \times 10^6 \text{ N}}{2} = 1.75 \times 10^6 \text{ N}$

Let, d = diameter of each steel rods

$\therefore \text{ stress}(\sigma) = \frac{\text{load}}{\text{cross} - \text{section area of steel rod}}$

$\Rightarrow \sigma = \frac{P_1}{\frac{\pi}{4}d^2} \Rightarrow 85 \times 10^6 \text{ N/m}^2 = \frac{1.75 \times 10^6 \text{ N}}{\pi/4\, d^2}$

$\Rightarrow d^2 = \frac{4 \times 1.75}{85\pi} m^2 = 0.0262$

$\Rightarrow d = 0.1619\text{m} \approx 0.162\text{m}$

$\Rightarrow d = 162$ mm

Search on Telegram @apna_pdf

269. If all the dimension of a prismatic bar be increased in the ratio of k:1, then maximum stress produced in the bar due to its own weight will increase in the following ratio

(a) 1:k (b) k^2:1
(c) k^3:1 (d) k:1

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (d) Max. stress is given as

$\sigma = \rho g x$

for max $x = \lambda$

$(\sigma_{max})_1 = \rho g \ell$

max. stress $(\sigma_{max})_2$ when $\lambda_2 = k\lambda$

$(\sigma_{max})_2 = \rho g k \ell$

$\frac{(\sigma_{max})_2}{(\sigma_{max})_1} = k : 1$

270. In a tensile testing experiment on a specimen of 1 cm^2 area, the maximum load observed was 5 tones and neck area 0.25 cm^2. The ultimate tensile strength of specimen is-

(a) 2.5 tones/cm^2 (b) 10 tones/cm^2
(c) 5 tones/cm^2 (d) 20 tones/cm^2

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c) The ultimate tensile strength of specimen

$$\sigma = \frac{\text{max.load}}{\text{Initial Area}}$$

$$\sigma = \frac{5}{1}$$

σ =5 tones/cm^2

Always take initial area to calculate the value of stress except value of true stress.

271. For a given material assume, Young's modulus E= 300 GN/m^2 and modulus of rigidity G= 150 GN/m^2. Its bulk modulus K will be-

(a) 120 GN/m^2 (b) 100 GN/m^2
(c) 200 GN/m^2 (d) 250 GN/m^2

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (b) $E = \frac{9KG}{3K + G}$

or

$$K = \frac{EG}{3[3G - E]} = \frac{300 \times 10^9 \times 150 \times 10^9}{3[3 \times 150 - 300] \times 10^9}$$

$\boxed{K = 100 \text{ GN/m}^2}$

272. A steel wire hangs vertically under its own weight. If its density is 10000 kg/m^3 and allowable stress is 3000 kg/cm^2 then how much length it can sustain.

(a) 2500 m (b) 1250 m
(c) 3000 m (d) 5000 m

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c) Given, density (ρ) = 10000 kg/m^3 allowable stress = 3000 kg/cm^2

We know that stress in a member hangs vertically under its own weight

$$\sigma = \rho \times x$$

For length $x = \frac{3000 \times 10^4}{10000} = 3000$ m

273. The elongation of a Conical bar under its own weight is_____that of prismatic bar of the same length.

(a) Equal to (b) Half
(c) One-third (d) Two-third

TSPSC Managers, 2015

Ans. (c) : Elongation of conical bar under self weight is $\frac{1}{3}$ of the elongation of identical prismatic bar under its self weight

$$(\delta_L) = \frac{\gamma L^2}{6E} \Rightarrow \frac{1}{3} \times \frac{\gamma L^2}{2E} \qquad \left[\because \gamma = \text{Specific weight}, \ \gamma = \rho g\right]$$

Where, $\frac{\gamma L^2}{2E}$ = Prismatic elongation

274. The Poisson's ratio for cast iron varies from:

(a) 0.23 to 0.27 (b) 0.25 to 0.33
(c) 0.31 to 0.34 (d) 0.32 to 0.42

TSPSC Managers, 2015

Ans. (a) : The Poisson's ratio
For cast iron is 0.23 to 0.27
For steel is 0.25 to 0.33
For concrete is 0.2

275. The use of compound tubes subjected to internal pressure are made to :

(a) even out the stresses
(b) increases the thickness
(c) increases the diameter of the tube
(d) increase the strength

HPPSC AE 2014

Ans : (a) The use of compound tubes subjected to internal pressure are made to even out the stresses.
- So to obtain a more uniform hoop stress distributing compounding tubes are used.

276. When a bar is subjected to a change of temperature and its deformation is prevented, the stress induced in the bar is called

(a) tensile stress (b) compressive stress
(c) shear stress (d) thermal stress

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (d) : When the temperature of the bar is raised and the bar tries to expand and exerts axial pressure on wall. At the some time wall puts equal and opposite pressure on the bar which will develop compressive stress in bar. There is no mention of heating or cooling of bar. So thermal stress is correct option.

277. In a tensile test of a specimen, the ratio of maximum load to the original cross sectional area of the test piece is called

(a) ultimate stress (b) safe stress
(c) breaking stress (d) permissible stress

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (a) : In a tensile test of a specimen, the ratio of maximum load to the original cross-sectional areas of the test piece is called ultimate stress.

278. The shear stress required to cause plastic deformation of solid metal is called

(a) proof stress (b) flow stress
(c) ultimate stress (d) none of these

Mizoram PSC AE/SDO 2014, Paper-II

Search on Telegram @apna_pdf

Ans. (b) : The shear stress required to cause plastic deformation of solid metal is called flow stress.

279. Consider the following statements :

Assertion (A) : An isotropic material is always homogeneous.

Reason (R) : An isotropic material is one in which all the properties are same in all the directions at every point.

of these statements,

(a) both (A) and (R) are true and (R) is the correct explanation of (A)

(b) both (A) and (R) are true but (R) is not a correct explanation of (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TNPSC AE 2014

Ans. (d) :

280. What would be the value of Young's modulus (Modulus of rigidity), for Poisson's ratio to be 0.4?

(a) 5/12 (b) 11/5

(c) 14/5 (d) 1/12

UPRVUNL AE 2014

Ans : (c) $E = 2G(1+\mu)$

$$E = 2G(1+0.4)$$

$$\frac{E}{G} = 2\times1.4 = 2.8 = \frac{28}{10} = \frac{14}{5}$$

281. A uniform rod of cross sectional area 2 mm^2 is heated from 0^0C to 40^0C. What would be the value of energy stored per unit volume if Young's modulus is 10^{11} N/m^2 and linear expansion coefficient is 12×10^{-6} per ^0C?

(a) 10250 J/m^3 (b) 12500 J/m^3

(c) 11520 J/m^3 (d) 55120 J/m^3

UPRVUNL AE 2014

Ans : (c) Given

$A = 2mm^2$ $\Delta t = 40^oC$, $E = 10^{11} N/m^2$, $\alpha = 12\times10^{-6}/^oC$

Thermal stress $((\sigma_{th}) = \alpha\,\Delta tE$

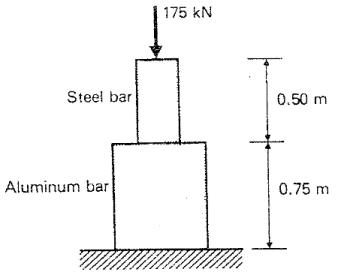
$$\sigma_{th} = 12\times10^{-6}\times40\times10^{11}$$

$$\sigma_{th} = 48\times10^6$$

Energy store per unit volume $(U) = \frac{(\sigma_{th})^2}{2E}$

$$= \frac{(48\times10^6)^2}{2\times10^{11}} = 11520\,J/m^3$$

282. A 0.75 meter aluminium bar 25×10^{-4} m^2 in cross-sectional area is attached to a 0.50 meter steel bar 15×10^{-4} m^2 in cross-sectional area, as shown in the figure. Take E (Young's modulus) value of 200 GPa for steel & 70 GPa for aluminium. Total shortening due to an axial compressive force of 175 kN is



(a) $\frac{157}{168}mm$ (b) $\frac{175}{168}mm$

(c) $\frac{175}{186}mm$ (d) $\frac{157}{186}mm$

ISRO Scientist/Engineer 24.05.2014

Ans. (b) : Length of Aluminium bar

$l_{Al} = 0.75$ m

$A_{Al} = 25 \times 10^{-4} m^2$

Length of steel bar

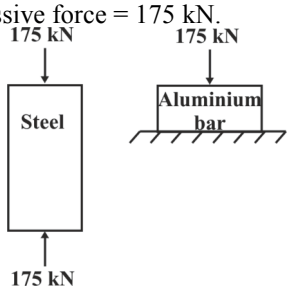
$l_{st} = 0.50$ m

$A_{st} = 15 \times 10^{-4} m^2$

$E_{steel} = 200$ GPa

$E_{Al} = 70$ GPa

Axial compressive force = 175 kN.



$$\delta_{st} = \frac{P_{st}L_{st}}{A_{st}E_{st}}$$

$$= \frac{175\times10^3\times0.5}{15\times10^{-4}\times200\times10^9}$$

$= 2.9167 \times 10^{-4}$ m (compression)

$$\delta_{Al} = \frac{P_{Al}L_{Al}}{A_{Al}E_{Al}}$$

$$= \frac{175\times10^3\times0.75}{25\times10^{-4}\times70\times10^9}$$

$= 7.5 \times 10^{-4}$ m (compression)

$\delta = \delta_{st} + \delta_{Al}$

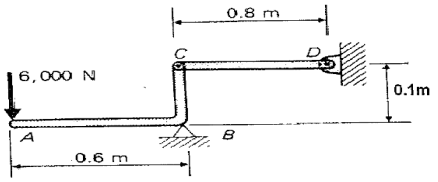
$= (2.9167 + 7.5) \times 10^{-4}$ m

$= 10.4167 \times 10^{-4}$ m

$= 1.04167$ mm $= \frac{175}{168}$ mm

283. Member CD of the assembly shown is an aluminium bar 0.80 meter long. Cross-sectional dimension of the bar is such that, its width is three times its thickness. For functional design of the bar CD, the allowable axial stress is 70 MPa, and the total elongation is not to exceed 0.72 mm. E value for aluminium is 70 GPa. Assume the connection at C does not reduce the net area of the bar. The thickness of the bar in metre is

Search on Telegram @apna_pdf

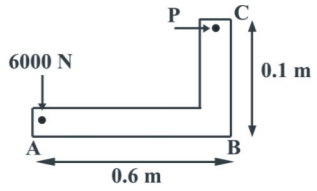


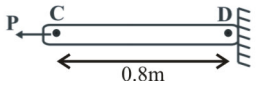
(a) $\frac{2}{\sqrt{21\times10^5}}m$ (b) $\frac{5}{\sqrt{21\times10^5}}m$

(c) $\frac{2}{\sqrt{21\times10^3}}m$ (d) $\frac{3}{\sqrt{21\times10^3}}m$

ISRO Scientist/Engineer 24.05.2014

Ans. (c) :





Taking moment at B.

$\sum M_B = 0$

$6000 \times 0.6 = P \times 0.1$

$P = 36000$ N

$$\delta_{CD} = \frac{PL}{AE}$$

or $$A = \frac{PL}{E\,\delta_{CD}}$$

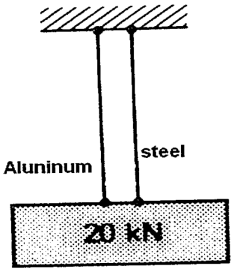
$$= \frac{36000\times0.8\times10^3}{70\times10^9\times0.72} = \frac{4}{7\times10^3}$$

$$3t^2 = \frac{4}{7\times10^3}$$

$$t^2 = \frac{4}{21\times10^3}$$

$$t = \frac{2}{\sqrt{21\times10^3}}m$$

284. A 20 kN weight is suspended by two wires as shown in the figure. The length of each wire is 2 meter. The steel wire (E value 200GPa) has an cross-sectional area of 60 × 10^{-6} m^2 and the aluminium wire (E value 70GPa) has an cross-sectional area of 120 × 10^{-6} m^2. The stress in aluminium wire is



(a) $\frac{17}{102}$ GPa (b) $\frac{7}{120}$ GPa

(c) $\frac{17}{120}$ GPa (d) $\frac{7}{102}$ GPa

ISRO Scientist/Engineer 24.05.2014

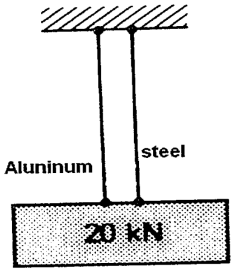
Ans. (d) : Given, P = 20 kN

L_{Al} = 2m, L_{st} = 2m

E_{Al} = 70 GPa, E_{st} = 200 GPa

$A_{Al} = 120 \times 10^{-6} m^2$

$A_{st} = 60 \times 10^{-6} m^2$



Its parallel connected-

So, $\delta_{Al} = \delta_{st}$

$$\frac{P_{AL}L_{AL}}{A_{AL}E_{AL}} = \frac{P_{st}.L_{st}}{A_{st}.E_{st}}$$

or $$\frac{P_{AL}}{P_{st}} = \frac{L_{st}}{L_{AL}}\times\frac{A_{AL}}{A_{st}}\times\frac{E_{AL}}{E_{st}}$$

$$= 1\times\frac{120\times10^{-6}}{60\times10^{-6}}\times\frac{70}{200}$$

$$= \frac{7}{10}$$

For in Parallel,

$$P_{AL} + P_{st} = P$$

$$P_{AL} + P_{st} = 20$$

or $$P_{AL} = \frac{140}{17}kN$$

$$\sigma_{AL} = \frac{P_{AL}}{A_{AL}} = \frac{140\times10^3}{17\times120\times10^{-6}}$$

$$= \frac{14}{12\times17}\times10^9\,N/m^2$$

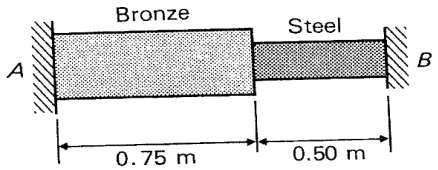
$$\sigma_{AL} = \frac{7}{6\times17}GPa = \frac{7}{102}GPa$$

285.A bar of bronze and a bar of steel are placed between two immovable supports, A and B as shown in the figure. The physical constants are: (where L= length of bars, A = cross-sectional area, α = linear co-efficient of thermal expansion, E = Young's modulus)

Steel	Bronze
L = 0.5m	L=0.75m
A = 6 × 10^{-4} m^2	A = 12 × 10^{-4} m^2
α = 12 × 10^{-6}/ºC	α = 20 × 10^{-6}/ºC
E = 200 GPa	E = 100 GPa

The stresses in the steel & bronze, when temperature drops by 50ºC is

Search on Telegram @apna_pdf

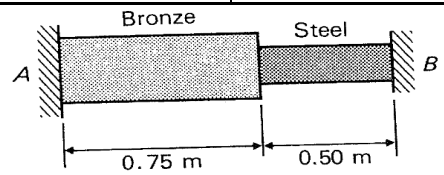


(a) Tension (b) Compression
(c) Shear (d) None of these

ISRO Scientist/Engineer 24.05.2014

Ans. (a) :

Steel	Bronze
L = 0.5m	L = 0.75m
$A = 6 \times 10^{-4} m^2$	$A = 12 \times 10^{-4} m^2$
$\alpha = 12 \times 10^{-6}/^oC$	$\alpha = 20 \times 10^{-6}/^oC$
E = 200 GPa	E = 100 GPa

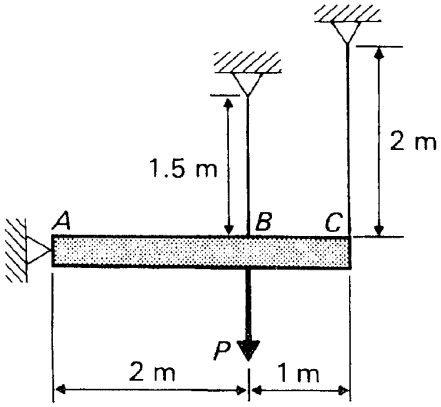


In series,

$$\Delta = \Delta_b + \Delta_s$$
$$= \alpha_b L_b \Delta t + \alpha_s L_s \Delta t$$
$$= 20 \times 10^{-6} \times 0.75 \times 50 + 12 \times 10^{-6} \times 0.5 \times 50$$
$$= 1.05\text{m (shortening)} < (0.75 + 0.5 = 1.25)$$

Note:-Due to rigid support, the shortening is prevented and tensile stresses are developed in each bars.
As temperatures the bar tends to gets shortens, to present shortening tensile stress will develop.

286. A rigid bar with wires at B & C is shown in the figure below. The cross sectional area of the wire at B is 3×10^{-4} m^2 at C is 2×10^{-4} m^2. The wires are elasto-plastic with strength 250 MPa and E value 200 GPa. The ultimate load P that can be applied to the rigid bar, as shown is



(a) 50 kN (b) 75 kN
(c) 100 kN (d) 150 kN

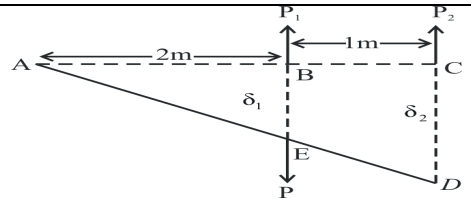
ISRO Scientist/Engineer 24.05.2014

Ans. (d) : Given, Cross-section Area of wire 'B' = $3 \times 10^{-4} m^2$

Cross-section Area of wire 'C' = $2 \times 10^{-4} m^2$

$\sigma_{ultimate} = 250\,MPa$

$E = 200\,GPa$



By Geometry,
In ΔABE and ΔACD

$$\frac{\delta_1}{2} = \frac{\delta_2}{3}$$

OR $3\delta_1 = 2\delta_2$

$$\frac{\delta_1}{\delta_2} = \frac{2}{3} \qquad \left[\because \delta_1 = \frac{P_1 L_1}{A_1 E_1}, \quad \delta_1 = \frac{P_2 L_2}{A_2 E_2}\right]$$

$$\frac{\frac{P_1 L_1}{A_1 E_1}}{\frac{P_2 L_2}{A_2 E_2}} = \frac{2}{3}$$

$$\frac{P_1}{P_2} = \frac{2}{3} \times \left(\frac{A_1}{A_2}\right)\left(\frac{E_1}{E_2}\right)\left(\frac{L_2}{L_1}\right)$$

$$\frac{P_1}{P_2} = \frac{2}{3} \times \left(\frac{3 \times 10^{-4}}{2 \times 10^{-4}}\right) \times \left(\frac{200}{200}\right) \times \left(\frac{2}{1.5}\right)$$

$$\frac{P_1}{P_2} = \frac{2}{3} \times \frac{3}{2} \times \frac{2}{1.5} = \frac{4}{3} \text{ ----------(1)}$$

Taking a moment about A. $\sum M_A = 0$

$P \times 2 = P_1 \times 2 + P_2 \times 3$
Or $2P_1 + 3P_2 = 2P$ ----------(2)
P_1 (Based on strength criterion)
$= \sigma_{ultimate} \times A_1$
$= 250 \times 10^6 \times 3 \times 10^{-4}$
$P_1 = 75$ kN
P_2 (Based on strength criterion)
$= \sigma_{ultimate} \times A_2$
$= 250 \times 10^6 \times 2 \times 10^{-4}$
$= 500 \times 10^2$
$P_2 = 50000 = 50$ kN
According to Equation (1) -

$$\frac{P_1}{P_2} = \frac{4}{3}$$

$$P_1 = \frac{4}{3} \times P_2 = \frac{4}{3} \times 50$$

= 66.67 kN
From Equation (2)-
$2P = 2P_1 + 3P_2$
$2P = 2 \times 66.67 + 3 \times 50$
$= 283.44$
P = 141.67 kN
The closest answer is option (d) 150 kN.

Search on Telegram @apna_pdf

287. Stress and strain are linearly related by Hooke's law in the ____ region.
(a) plastic
(b) elastic
(c) both elastic and plastic
(d) Neither elastic nor plastic

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : Stress and strain are linearly related by Hooke's law in the elastic region, but Hooke's law holds good upto proportionality limit only.

288. The thermal stress in terms of coefficient of linear expansion (α), rise in temperature (ΔT) and the modulus of elasticity (E) is given by
(a) ΔT (b) $1/(E\alpha\Delta T)$
(c) $E\Delta T/\alpha$ (d) $E\alpha\Delta T$

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
APPSC Poly. Lect. 2013

Ans. (d) : Thermal stress (σ_T) = $E\alpha\Delta T$
Thermal strain (ε_T) = $\alpha\Delta T$

289. Strain energy is the
(a) energy stored in a body when strained within elastic limits
(b) energy stored in a body when strained upto the breaking of a specimen
(c) maximum strain energy which can be stored in a body
(d) proof resilience per unit volume of a material

Haryana PSC Civil Services Pre, 2014

Ans. (a) : Strain energy– When a body is subjected to external load it undergoes some deformation and stores some amount of energy. This stored energy will release when load is removed is known as strain energy.
Energy stored by body when, it is strained within elastic limit is known as strain energy.

290. For a given material, Young's modulus is 1×10^6 N/m^2 and modulus of rigidity is 0.4×10^6 N/m^2 The bulk modulus of elasticity will be.
(a) 5×10^6 N/m^2 (b) 0.67×10^6 N/m^2
(c) 67×10^6 N/m^2 (d) 6.7×10^6 N/m^2

MPPSC State Forest Service Exam, 2014

Ans. (b) : As we know,
$G = 0.4 \times 10^6$ N/m^2

$$E = \frac{9 \times KG}{3K + G}$$

$E = 1 \times 10^6$ N/m^2

$$1 \times 10^6 = \frac{9 \times K \times 0.4 \times 10^6}{3 \times K + 0.4 \times 10^6}$$

$$\boxed{K = 0.67 \times 10^6 \, N/m^2}$$

291. The no. of elastic constants in Triclinic material is:
(a) 36 (b) 9
(c) 2 (d) 21

HPPSC Asstt. Prof. 2014

Ans. (d) :

No. of elastic constant	Material
Isotropic	2
Anisotropic (Triclinic)	21
Orthotropic	9

292. The Poisson's ratio (μ) of bottle cork is:
(a) 0.5 (b) 0.3
(c) 0.25 (d) 0

HPPSC Asstt. Prof. 2014

Ans. (d) :

Material	Poisson's ratio
Cork	0
Rubber	0.5
Mild steel	0.3
Cast Iron	0.25

293. If D is the diameter of a sphere, then volumetric strain is equal to
(a) 2 times the strain of D
(b) 1.5 times the strain of D
(c) 3 times the strain of D
(d) strain of D

APPSC Poly. Lect. 2013

Ans. (c) : If D is the diameter of a sphere, then the volumetric strain is equal to three times of strain of D.

$$\text{Volumetric strain} = \frac{\delta V}{V} = \frac{3\delta D}{D} \qquad V = \frac{4}{3}\pi r^3$$

$$V = \frac{\pi}{6} D^3 \ldots\ldots(1) \quad r = \frac{D}{2}$$

$$\epsilon_v = \frac{\delta V}{V} = \frac{3\delta D}{D}$$

294. For a material with the Poisson's ratio ν, the modulus of elasticity (E) and the bulk modulus of elasticity (K) are same. Which of the following is correct?
(a) The material has $\nu = 0$
(b) The material has $\nu = 1/2$
(c) The material has $\nu = 1/3$
(d) The material has $\nu = 3/4$

RPSC AEN Pre-2013

Ans. (c) : Given, Poisson's ratio = ν
Modulus of elasticity = E
Bulk modulus = K
E = K (given)
According to,

$$E = 3K(1 - 2\nu)$$

$$E = 3E(1 - 2\nu)$$

$$1 - 2\nu = \frac{1}{3}$$

$$1 - \frac{1}{3} = 2\nu$$

$$2\nu = \frac{2}{3}$$

$$\boxed{\nu = \frac{1}{3}}$$

295. A solid cube faces similar equal normal force on all faces. Ratio of volumetric strain to linear strain on any of three axes will be:
(a) 1 (b) 2
(c) 3 (d) $\sqrt{3}$

SJVN ET 2013

Ans. (c) :

$$\epsilon_v = \frac{\delta V}{V} = \frac{3\sigma}{E}(1 - 2\mu)$$

$$\epsilon_v = 3\epsilon\,(1 - 2\mu) \qquad \left[\because \epsilon = \frac{\sigma}{E}\right]$$

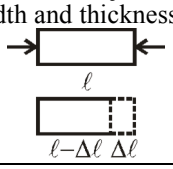
• It is 3 times because cube is subjected to 3 mutually perpendicular stress.

Search on Telegram @apna_pdf

296. When a bar is subjected to a push of P, its
(a) length, width and thickness increase
(b) length, width and thickness decrease
(c) length increases, width and thickness decrease
(d) length decreases, width and thickness increase

SJVN ET 2013

Ans. (d) : When a bar is subjected to a push of P, its length decreases width and thickness increases.



297. In a tensile test, when a material is stressed beyond elastic limit, the tensile strain ___ as compared to the stress.
(a) decreases slowly
(b) increases slowly
(c) decreases more quickly
(d) increases more quickly

JPSC AE 2013, Paper-V

Ans : (d) : In a tensile test, when a material is stressed beyond elastic limit the tensile strain increases more quickly as compared to the stress.

298. A uniform taper rod of diameter 30 mm to 15 mm, length of 314 mm is subjected to 4500 N. The Young's modulus of the material is 2×10^5 N/mm^2. Extension of the bar is
(a) 0.05 mm (b) 0.5 mm
(c) 0.25 mm (d) 0.005 mm

TNPSC AE 2013

Ans. (*) : Data given-
D = 30 mm d = 15 mm
L = 314 mm P = 4500 N
$E = 2 \times 10^5$ N/mm^2
We know that extension of the taper bar.

$$\delta = \frac{4\,P.L}{\pi\, Dd.E}$$

$$\delta = \frac{4\times4500\times314}{3.14\times30\times15\times2\times10^5}$$

$$\delta = 0.02\text{mm}$$

299. A load of 4000 N has to be placed at the end of a vertical rod with stress induced is 80 N/mm^2. The diameter of the rod is :
(a) 79.79 mm (b) 7.979 mm
(c) 18.181 mm (d) 81.81 mm

TNPSC AE (Industries) 09.06.2013

Ans. (b) : Load, P = 4000 N
Stress, $\sigma = 80$ N/mm^2

$$\sigma = \frac{P}{A} = \frac{4P}{\pi d^2}$$

$$80 = \frac{4\times4000}{\pi d^2} \Rightarrow d = 7.979\,\text{mm}$$

300. A steel rod of 1 sq. cm cross-sectional area is 1 m long and has a Young's modulus of elasticity 2×10^6 kg/cm^2. It is subjected to an axial pull of 2000 kgf. The elongation of the rod will be
(a) 0.1 cm (b) 0.05 cm
(c) 0.20 cm (d) 0.15 cm

APPSC AEE 2012

Ans. (a) : Given, A = 1 cm^2, L = 1m
E = 2×106 kg/cm^2, P = 2000 kgf

$$\text{Elongation } \delta = \frac{PL}{AE} = \frac{2000\times1}{1\times2\times10^6} = 10^{-3}$$

$\delta = 1\text{mm} = 0.1\text{cm}$

301. If a material has a modulus of elasticity of 2×10^6 kg/cm^2 and a modulus of rigidity of 0.8×10^6 kg/cm^2, then the approximate value of the Poisson's ratio of the material will be
(a) 0.26 (b) 0.31
(c) 0.45 (d) 0.2

APPSC AEE 2012

Ans. (a) : $E = 2G(1 + \mu)$

$$2\times10^6 = 2\times0.8\times10^6\,(1+\mu)$$

$$(1+\mu) = \frac{\left(2\times10^6\right)}{\left(2\times0.8\times10^6\right)} = 1.25$$

$\mu = 0.25$

302. The ratio of the deformation of a bar due to its own weight, to the deformation due to axial load equal to its weight, is :
(a) 1 (b) 1/2
(c) 2 (d) 4

APPSC AE 04.12.2012

Ans. (b) : We know that -

Deformation of a bar due to its own weight $(\Delta_1) = \frac{WL}{2AE}$

Deformation due to axial load equal to its weight $(\Delta_2) = \frac{WL}{2AE}$

$$\therefore \frac{\Delta_1}{\Delta_2} = \frac{WL/2AE}{WL/AE} = \frac{1}{2}$$

303. To measure _____ strain, strain rosettes are used :
(a) Linear (b) Shear
(c) Volumetric (d) Any of the above

APPSC AE 04.12.2012

Ans. (a) : • Strain rosettes method is used to measure Linear strain

304. A localised compressive stress at the area of contact between two members is known as :
(a) Shear (b) Crushing
(c) Bending (d) Tensile

APPSC AE 04.12.2012

Ans. (b) : A localised compressive stress at the area of contact between two member is known as crushing.

305. A square section with side 'X' of a beam is subjected to a shear force 'S'. The magnitude of shear stress at the top edge of the square is :
(a) $\frac{1.5S}{X^2}$ (b) $\frac{S}{X^2}$
(c) $\frac{0.5S}{X^2}$ (d) Zero

APPSC AE 04.12.2012

Search on Telegram @apna_pdf

Ans. (d) : At the top edge of the square, the magnitude of the shear stress should be zero. Because shear stress is a surface phenomena.

306. Stress-strain analysis is conducted to know which of the following properties of material?
(a) Physical properties
(b) Optical properties
(c) Mechanical properties
(d) Magnetic properties

BPSC AE 2012 Paper - VI

Ans : (c) : Mechanical properties.

307. The ratio between tensile stress and tensile strain or compressive stress and compressive strain is termed as
(a) modulus of rigidity
(b) modulus of elasticity
(c) bulk modulus
(d) modulus of subgrade reaction

APPSC AEE 2012

Ans : (b) According to Hooke's law
stress $\propto$ strain (upto proportionality limit)
$\sigma \propto \varepsilon$

$$\frac{\sigma}{\varepsilon} = E$$

E = Modulus of Elasticity.
where stress and strain both are tensile or compressive nature.

308. A prismatic bar has
(a) maximum ultimate strength
(b) maximum yield strength
(c) varying cross-section
(d) uniform cross-section

BPSC AE 2012 Paper - VI

Ans : (d) : A prismatic bar or beam is a straight structural piece that has the same cross section through its length.

309. The failure criterion for ductile materials is based on
(a) yield strength (b) ultimate strength
(c) shear strength (d) limit of proportionality

BPSC AE 2012 Paper - VI

Ans : (a) : The failure criterion for ductile materials is based on yield strength.

310. The elongation of a conical bar due to its self weight is
(a) $\frac{\gamma \ell^2}{6E}$ (b) $\frac{\gamma \ell^2}{2E}$
(c) $\frac{\gamma \ell^2}{2E}$ (d) $\frac{\gamma \ell^2}{E}$

Where γ = unit weight of the material.

APPSC AEE 2012

Ans : (a) Elongation of conical bar due to self weight.

$$\Delta = \frac{\gamma \ell^2}{6E} = \frac{1}{3} \times \text{Deflection of prismatic bar}$$

γ = Specific weight
l = length of bar
E = Modulus of Elasticity.

311. Two bars A and B are of equal length but B has an area half that of A and bar A has young's modulus double that of B. When a load 'P' is applied to the two bars, the ratio of deformation between A and B is
(a) $\frac{1}{2}$ (b) 1
(c) 2 (d) $\frac{1}{4}$

APPSC AEE 2012

Ans : (d)

Bar 'A'	Bar 'B'
$\ell_1 = \ell$	$\ell_2 = \ell$
$A_1 = A$	$A_2 = A/2$
$E_1 = 2E$	$E_2 = E$
$P_1 = P$	$P_2 = P$
$\delta\ell_1 = \frac{P_1\ell_1}{A_1E_1}$	$\delta\ell_2 = \frac{P_2\ell_2}{A_2E_2}$
$\delta\ell_1 = \frac{P\ell}{2AE}$	$\delta\ell_2 = \frac{2P\ell}{AE}$
$\frac{\delta\ell_1}{\delta\ell_2} = \frac{1}{4}$	

312. The elongation of beam of length 'l' and cross-sectional area 'A' subjected to a load 'P' is δl. If the modulus of elasticity is halved, the new elongation will be
(a) $\frac{\delta\ell}{2}$ (b) $2(\delta\ell)$
(c) $\delta\ell$ (d) $\sqrt{2}\delta\ell$

APPSC AEE 2012

Ans : (b) Case 1st :-
Elongation of beam

$$\delta\ell_1 = \frac{P\ell}{AE}$$

Case 2nd :-
Modulus of elasticity is halved $E' = \frac{E}{2}$

$$\delta\ell_2 = \frac{2P\ell}{AE}$$

$$\boxed{\delta\ell_2 = 2 \times \delta\ell_1}$$

313. A 16mm diameter central hole is bored out of a steel rod of 40mm diameter and length 1.6m. The tensile strength because of this operation
(a) increases (b) remains constant
(c) decreases (d) None of these

APPSC AEE 2012

Ans : (c) A 16mm diameter central hole is bored out of a steel rod of 40mm diameter and length 1.6m. The tensile strength because of this operation decreases.

314. The relationship between Young's modulus and shear modulus when $\frac{1}{m} = 0$, is
(a) E = 2G
(b) E = 3G
(c) E = 2G+1
(d) G = 2E

APPSC AEE 2012

Search on Telegram @apna_pdf

Ans : (a) We know

$$E = 2G\left(1+\frac{1}{m}\right) \quad .....(i)$$

$$E = 3K\left(1-\frac{2}{m}\right) \quad .....(ii)$$

If $\frac{1}{m} = 0$ then

$E = 2G$

$E = 3K$

315. If a rigidly connected bar of steel and copper is heated, the copper bar will be subjected to

(a) compression (b) shear

(c) tension (d) None of these

APPSC AEE 2012

Ans : (a) If a rigidly connected bar of steel and copper is heated, the copper bar will be subjected to compression.

• Because $\alpha_{copper} > \alpha_{steel}$.

316. Which of the following has no unit ?

(a) Kinematic viscosity

(b) Strain

(c) Surface Tension

(d) Bulk Modulus

UKPSC AE 2012 Paper-I

Ans. (b) : Strain = $\frac{\delta L}{L}$

317. In a static tension tests of a low carbon steel sample, the gauge length affects

(a) yield stress

(b) ultimate tensile stress

(c) percentage elongation

(d) percentage reduction in cross-sectional area

UKPSC AE 2012 Paper-I

Ans. (c) : In a static tension test of a law carbon steel sample, the gauge length affects the percentage elongation.

318. One end of a metallic rod is fixed rigidly and its temperature is raised. It will experience

(a) zero stress

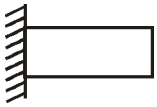
(b) tensile stress

(c) compressive stress

(d) None of the above

UKPSC AE 2012 Paper-I

Ans. (a) : zero stress



319. A metallic cube is subjected to equal pressure (P) on its all the six faces. If ϵ_v is volumetric strain produced, the ratio $\frac{P}{\epsilon_v}$ is called

(a) Elastic modulus

(b) Shear modulus

(c) Bulk modulus

(d) Strain-Energy per unit volume

UKPSC AE 2012 Paper-I

Ans. (c) : Bulk modulus

320. Select the proper sequence for the following :

1. Proportional limit
2. Elastic limit
3. Yield point
4. Fracture/failure point

(a) 1-2-3-4 (b) 2-1-3-4

(c) 1-2-4-3 (d) 2-1-4-3

UKPSC AE 2012 Paper-I

Ans. (a) : 1-2-3-4

321. A test specimen is stressed slightly beyond yield point then unloaded. Its yield strength will

(a) decreases

(b) increase

(c) remain same

(d) become equal to ultimate tensile strength

TRB Poly. Lect., 2012

Ans. (b) : A test specimen is stressed slightly beyond the yield point and then unloaded its yield strength will increase because the specimen is strain hardened due to plastic deformation.

322. A mild steel bar 1 m long, 100 mm in diameter is subjected to an axial tensile load, so that change in its length is 0.1 mm. If Poisson's ratio of mild steel is 0.3, what is the change in its diameter :

(a) 1 micron (b) 0.3 micron

(c) 0.03 micron (d) None of these

PSPCL AE, 2012

Ans. (d) : Poisson ratio 'μ' = $\frac{\frac{\delta d}{d}}{\frac{\delta l}{l}}$ or $0.3 = \frac{\delta d/100}{0.1/1000}$

or $\delta d = \frac{0.3\times100\times0.1}{1000}$

$= 3 \times 10^{-3}$ = 3 micron

323. A steel cube of volume 8×10^6 mm^3 is subjected to all round stress of 135 N/mm^2. The bulk modulus of the material is 1.35×10^5 N/mm^2. The volumetric change is :

(a) 8000 mm^3 (b) 800 mm^3

(c) 80 mm^3 (d) 8 mm^3

APGENCO AE 2012

Ans. (a) : Given, Volume (V) = $8 \times 10^6 mm^3$

$\sigma = 135$ N/mm^2

Bulk modulus of material (K) = 1.35×10^5 N/mm^2

$$\text{Bulk modulus (K)} = \frac{\sigma}{\frac{dV}{V}}$$

$$dV = \frac{\sigma V}{K}$$

$$dV = \frac{135\times8\times10^6}{1.35\times10^5}$$

$dV = 8000 mm^3$

324. A steel bar 2 m length is fixed at both ends at 20°C. The coefficient of thermal expansion is 12×10^{-6}/°C. The modulus of elasticity is $2 \times 10^5 N/mm^2$ If the temperature is reduced to 18°C, the bar will experience a stress of :

Search on Telegram @apna_pdf

(a) 2.4 MPa (compressive)
(b) 2.4 MPa (tensile)
(c) 4.8 MPa (tensile)
(d) 4.8 MPa (compressive)

APGENCO AE 2012

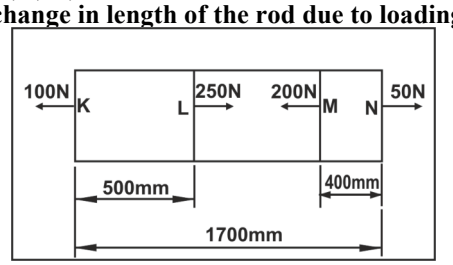
Ans. (c) : Given, length (l) = 2m
Temperature reduce (ΔT) ↓ from 20°C to 18°C
So, (ΔT)↓ – It will tensile stress
$\alpha = 12 \times 10^{-6}$ /°C, $E = 2 \times 10^5$ N/mm^2
Thermal stress (σ_T) = $\alpha \Delta T E$
$= 12 \times 10^{-6} \times (20-18) \times 2 \times 10^5$
$= 12 \times 10^{-6} \times 2 \times 2 \times 10^5$
$= \frac{48 \times 1}{10} = 4.8$ MPa (Tensile)

325. A bar of 40mm diameter is subjected to an axial load of 4kN. The extension of the bar over a gauge length of 200 mm is 0.3 mm. The decrease in diameter is 0.018mm. The Poisson's ratio is :
(a) 0.33 (b) 0.35
(c) 0.30 (d) 0.25

APGENCO AE 2012

Ans. (c) : Given, $\frac{\delta d}{d} = \frac{0.018}{40}$
$= 4.5 \times 10^{-4}$
$\frac{\delta l}{l} = \frac{0.3}{200} = 0.0015 = 15 \times 10^{-4}$
$\because$ Poisson's ratio $(\mu) = \frac{\frac{\delta d}{d}}{\frac{\delta l}{l}} \frac{4.5 \times 10^{-4}}{15 \times 10^{-4}} = 0.30$

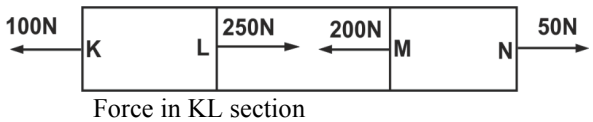
326. The figure below shows a steel rod of 25 mm^2 cross sectional area. It is loaded at four points, K,L,M,N. Assume E steel = 200 GPa. The total change in length of the rod due to loading is



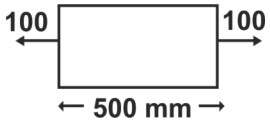
(a) 1μm (b) -10μm
(c) 10μm (d) -20μm

ISRO Scientist/Engineer 2012
GATE-2004

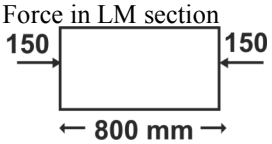
Ans. (b) : Given-
Cross-section Area of K,L,M,N section each is 25mm^2
Assume E_{steel} = 200 GPa.



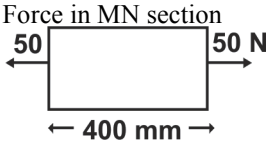
Force in KL section



Force in LM section



Force in MN section



Total change in length $= \sum \frac{PL}{AE}$
"Its applied when cross-section area of each section and 'E' is same."
$= \frac{100 \times 500 - 150 \times 800 + 50 \times 400}{25 \times 200 \times 10^3}$
$= \frac{-50000}{25 \times 200 \times 10^3}$
$= -10$ μm

327. A circular rod of 100 mm diameter and 500 mm length is subjected to a tensile force of 1000 kN. Determine the modulus of rigidity (G) if E = 2 × 10^5 N/mm^2 and Poisson's = 0.3
(a) 0.335 ×10^5 N/mm^2
(b) 0.521 ×10^5 N/mm^2
(c) 0.7692 ×10^5 N/mm^2
(d) 0.2256 ×10^5 N/mm^2

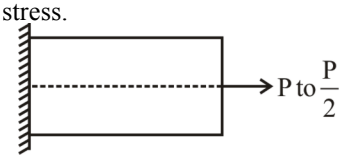
ISRO Scientist/Engineer 2011

Ans. (c) : $E = 2 \times 10^5$ N/mm^2
Poisson's ratio $\mu = 0.3$
$E = 2G(1 + \mu)$
$2 \times 10^5 = 2G(1 + 0.3)$
$G = \frac{1 \times 10^5}{1.3}$
$G = 0.7692 \times 10^5$ N/mm^2

328. What is the stress which varies from a minimum value to a maximum value of the same nature called as ?
(a) Repeated stress (b) Yield stress
(c) Fluctuating stress (d) Alternating stress

VIZAG STEEL MT 2011

Ans. (c) : The stress which varies from a minimum value to a maximum value of the same nature called as fluctuating stress.



Fluctuating fatigue load
(i.e. only magnitude of load change)

329. The highest stress that a material can withstand for a specific length of time without excessive deformation is called :
(a) Fatigue strength (b) Endurance strength
(c) Creep rupture (d) Creep strength

J&K PSC Civil Services Pre, 2010

Ans. (d) : Creep Strength – Creep strength is the maximum stress that the material can withstand for a specific length of time without excessive deformation.
Creep Rupture Strength– Creep rupture strength is the maximum stress that the material can withstand for a specific length of time without rupture.

Search on Telegram @apna_pdf

330. A cast iron specimen when tested in compression just fails at a compressive stress of 320 N/mm^2. The shear strength of cast iron is :

(a) 320 N/mm^2 (b) 160 N/mm^2
(c) 140 N/mm^2 (d) 80 N/mm^2

UPSC JWM Advt. No.-52/2010

Ans. (b) : Solution : Shear strength (τ)

$$= \frac{\text{Compressive Strength of cast Iron}}{2}$$

$$= \frac{(\sigma_c)_{ult}}{2}$$

$$= \frac{320}{2} = 160 N/mm^2$$

331. A bar of length L, area A and Young's modulus E is subjected to a pulling force P. The strain energy stored in the bar is

(a) $\frac{PL^2}{AE}$ (b) $\frac{PL^2}{2EI}$
(c) $\frac{P^2L}{2AE}$ (d) $\frac{P^2L}{AE}$

ISRO Scientist/Engineer 2009

Ans. (c) : Given,
Length = L
Area = A
Young modulus = E
Applied force = P

$$\text{Strain energy} = \frac{1}{2} \times P \times \delta$$

$$= \frac{1}{2} \times P \times \frac{PL}{AE} \quad \left[\because \delta = \frac{PL}{AE}\right]$$

$$= \frac{P^2L}{2AE}$$

332. A bar of 20 mm dia is tested in tension. It is observed that when a load of 38 kN is applied the extension measured over a gauge length of 200 mm is 0.12 mm and contraction in diameter is 0.0036 mm. Find the Poisson's ratio

(a) 0.2 (b) 0.3
(c) 0.25 (d) 0.33

ISRO Scientist/Engineer 2009

Ans. (b) : Given, $\Delta l = 0.12$ mm
$l = 200$ mm
$\Delta d = 0.0036$, d = 20 mm
Poisson's ratio

$$= \left(\frac{\Delta d}{d}\right) / \left(\frac{\Delta l}{l}\right) = \frac{0.0036/20}{0.12/200}$$

$$= 0.3$$

333. A steel cube of 1 m × 1 m × 1 m is subjected to hydorstatic pressure of 1 MPa. If for steel Young's modulus is 200 GPa and Poisson's ratio is 0.3, the approximate change in volume of the cube due to the hydrostatic pressure will be

(a) -6×10^{-6} m^3 (b) -2×10^{-6} m^3
(c) -1×10^{-6} m^3 (d) -0.5×10^{-6} m^3

DRDO Scientists 2009

Ans. (a) : E = 200 GPa $\quad v \cong 0.3$, Volume V = 1 m^3

$$K = \frac{E}{3(1-2v)}$$

$$= \frac{200}{3(1-0.6)} = 166.66 \text{ GPa}$$

$$K = -\frac{PV}{\Delta V}$$

$$166.66 \times 10^9 = \frac{1}{\Delta V}$$

$$\Delta V = -6 \times 10^{-6} \text{ m}^3$$

334. A steel rod of length 300 mm is held between two fixed supports so that the rod cannot elongate or contract in the axial direction. If the temperature of the rod is raised by 20°C, the axial stress induced in the rod due this rise in temperature is (for steel, E = 200 GPa and α = 11.5 × 10^{-6}/°C

(a) 46 MPa tension
(b) 46 MPa compression
(c) 23 MPa tension
(d) 23 MPa compression

DRDO Scientists 2009

Ans. (b) : $\Delta L = (\alpha \Delta T) L$

$$\frac{\Delta L}{L} = \alpha \Delta T$$

$$E = \frac{\sigma}{\alpha \Delta T}$$

$$\sigma_{th} = E \alpha \Delta T$$

$$= 200 \times 10^3 \times 11.5 \times 10^{-6} \times 20$$

= 46 MPa compression

335. Consider the following statements :
State of stress at a point when completely specified enables one to determine the :
(I) principal stresses at the point
(II) maximum shearing stress at the point
(III) stress components on any plane containing the point
Of these statements :
(a) I, II and III are correct
(b) I and III are correct
(c) II and III are correct
(d) I and II are correct

APPSC IOF, 2009, ESE-1996

Ans. (a) : The state of stress at a point when completely specified enables one to determine, principal stresses at the point, maximum shearing stress at the point and stress components on any arbitrary plane containing that point.

336. Proof resilience is the greatest energy at

(a) limit of proportionally (b)elastic limit
(c) plastic limit (d) none of these

TNPSC AE, 2008

Ans. (b) : Proof resilience is the maximum energy stored at elastic limit.

337. The ultimate tensile strength and yield strength of most of the metals, when temperature falls from 0 to -150°C will

Search on Telegram @apna_pdf

(a) Increase
(b) Decrease
(c) Remain same
(d) First increase and then decrease

ISRO Scientist/Engineer 2008

Ans. (a) : **Ultimate tensile stress**—It is the maximum nominal stress attained by a test specimen during a simple tensile test the ultimate strength of the materials increase with decrease in temperature.
Stainless steel has high strength and mostly preferred at Cryogenic applications.
Yield stress—It is the stress at which the strain of a material shows a rapid increase in stress, when subjected to a simple tensile test.

338. At a point in a body the normal stresses are $\sigma_x = \sigma$ and $\sigma_y = \sigma$. E is the Young's modulus and v is the Poisson's ratio of the material of the body. Assuming the material to be linearly elastic and isotropic, for plane stress condition the ratio of σ_x to $\square_x$ is

(a) $\frac{E}{1-v}$ (b) E
(c) $\frac{E}{v}$ (d) $\frac{E}{1+v}$

DRDO Scientists 2008

Ans. (a) : $\epsilon_x = \frac{\sigma_x - \nu(\sigma_y)}{E}$

$\epsilon_x = \frac{(1-\nu)\,\sigma_x}{E}$

$\frac{\sigma_x}{\epsilon_x} = \frac{E}{1-v}$

339. The linear relation between the stress and strain of a material is valid until

(a) fracture stress (b) elastic limit
(c) ultimate stress (d) proportional limit

DRDO Scientists 2008

Ans. (d) : The linear relation between the stress and strain of a material is valid until proportional limit.

340. A material has a Poisson's ratio of 0.5. If a body is made of this material and subjected to external forces (within the elastic limit) then the final volume of the body is

(a) thrice that of the initial volume of the body
(b) twice that of the initial volume of the body
(c) zero
(d) equal to the initial volume of the body

DRDO Scientists 2008

Ans. (d) : Bulk hardness of rigidity

$E = 3K(1 - 2\mu)$

$K \to \infty$ for $\mu = 0.5$ where μ is Poisson's ratio

It means material is rigid so no volume change occurs.

341. When a uniaxial tensile load is applied to a rod fixed at one end.

(a) both engineering stress and true stress in the rod depend on the type of material of the rod
(b) engineering stress in the rod depends on the type of material of the rod, but true stress in the rod does not depend on the type of material of the rod
(c) true stress in the rod depends on the type of material of the rod, but engineering stress in the rod does not depend on the type of material of the rod
(d) both engineering stress and true stress in the rod does not depend on the type of material of the rod

DRDO Scientists 2008

Ans. (c) : $\sigma_E = \frac{P}{A}$ ← Independent of material property

Engineering stress σ_E, True stress σ_T,
Engineering strain ϵ_E

$\left.\begin{aligned}\sigma &= \sigma_E(1+\epsilon_E)\\ \epsilon_E &= \frac{\sigma_E}{E}\end{aligned}\right\}$ ← Dependent on material property

342. The extension of a mild steel bar 4m long, 2000 mm^2 cross section under the action of an axial load of 20kN, if $E = 2\times10^5$ N/mm^2, is

(a) 2mm (b) 0.2mm
(c) 0.5mm (d) 0.05mm

ISRO Scientist/Engineer 2007

Ans. (b) : Given data
l = 4m = 4000 mm
A = 2000 mm^2
P = 20 kN
E = 2×10^5 N/mm^2

$\Delta L = \frac{PL}{AE}$

$= \frac{20\times10^3\times4000}{2000\times2\times10^5} = 0.2$ mm

343. The elongation produced in a bar due to its self-weight is given by

(a) $\frac{9.81\rho l^2}{E}$ (b) $\frac{9.81\rho l^2}{2E}$
(c) $\frac{9.81\rho l}{E}$ (d) $\frac{9.81\rho^2 l}{2E}$

UKPSC AE 2007 Paper -I

Ans. (b) : $\frac{9.81\rho l^2}{2E}$

344. Which of the following is not the characteristic of stress-strain curve for mild steel?

(a) The stress is proportional to the strain up to the proportional limit
(b) Percentage reduction in area may be as high as 60-70%.
(c) A neck is formed due to high stress level
(d) During plastic stage no strain hardening takes place

UKPSC AE 2007 Paper -I

Ans. (d) : During plastic stage no strain hardening takes place.

345. When a body is in a state of equilibrium under the action of any force system, the normal stress at a point within the body depends upon

(a) elementary area ΔA surrounding the point
(b) elemental force ΔF acting normal to ΔA
(c) the plane orientation containing the point
(d) all the above three

UKPSC AE 2007 Paper -I

Ans. (d) : All the above three

Search on Telegram @apna_pdf

346. A steel bolt passes centrally through a copper tube. At the ends nuts and washers are provided. The area of cross-section of both bolt and tube is same. If the young's modulus of steel is twice that of copper and if the assembly is tightened by rotating a nut through 60^0 on the thread of pitch 3.6 mm, then the contraction of the tube is

(a) 0.6 mm (b) 0.4 mm
(c) 0.2 mm (d) 0.1 mm

WBPSC AE, 2007

Ans. (b) : Given,

$A_s = A_c = A$

$E_s = 2E_c$ Pitch, P = 3.6 mm

The nut is rotated by 60^0

The number of turns, $n = \frac{\theta}{360^0}$

$= \frac{60}{360} = \frac{1}{6}$

Total tensile force in bolt

= Total compressive force in copper tube.

$\sigma_s A_s = \sigma_c A_c$

$\boxed{\sigma_s = \sigma_c}$

Total axial movement of nut is equals to the elongation of steel bolt + contraction of copper tube.

$$np = \frac{\sigma_s}{E_s}L + \frac{\sigma_c}{E_c}L$$

$$\frac{1}{6}\times 3.6 = \frac{\sigma_c}{\alpha E_c}L + \frac{\sigma_c}{E_c}L$$

$$0.6 = \frac{3\sigma_c L}{2E_c}$$

$$\frac{\sigma_c . L}{E_c} = \frac{2\times 0.6}{3} = 0.4\text{mm}$$

347. The area under the stress-strain curve represents:

(a) breaking strength of material
(b) toughness of material
(c) hardness of material
(d) energy required to cause failure

J & K PSC Screening, 2006

Ans. (d) : • The area under the stress strain curve represents energy required to cause failure.

• Area under stress strain curve upto fracture is known as modulus of toughness.

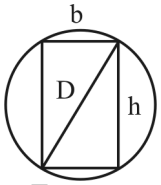
• Area under stress strain curve upto elastic limit is the modulus of resilience.

348. The width and depth of the strongest beam of rectangular section that can be cut out of a cylindrical log of wood whose diameter is 30 cm are

(a) $10\sqrt{3}$ cm and 10 cm
(b) 10 cm and $10\sqrt{2}$ cm
(c) $10\sqrt{3}$ cm and $10\sqrt{6}$ cm
(d) 10 cm and $10\sqrt{3}$ cm

OPSC Civil Services Pre 2006

Ans. (c) :



For max strength $h = \sqrt{2}\,b$

$b^2 + h^2 = D^2$

$b^2 + 2b^2 = D^2$

or $b = \frac{D}{\sqrt{3}}$

$$h = \frac{\sqrt{2}}{\sqrt{3}}\times D = \sqrt{2}b$$

$$b = \frac{30}{\sqrt{3}} = \frac{10\times\sqrt{3}\times\sqrt{3}}{\sqrt{3}} = 10\sqrt{3}$$

$$h = \sqrt{2}\times b = 10\sqrt{6}$$

349. Stiffness of a material is expressed in terms of :

(a) mass density
(b) hardness number
(c) modulus of elasticity
(d) impact strength

J & K PSC Screening, 2006

Ans. (c) : modulus of elasticity–

$$\text{stiffness}(k) = \frac{AE}{\ell}$$

Where, AE = Axial rigidity

350. If the area, length and the stress to which a bar is subjected be all doubled, then the elastic strain energy of the bar will become

(a) doubled (b) halved
(c) eight times (d) four times

WBPSC AE 2003

Ans. (d) : The strain energy formula (U)

$$U = \frac{1}{2}P\delta \qquad \left[\because\ \delta = \frac{PL}{AE}\right]$$

$$= \frac{1}{2}\,P\times\frac{PL}{AE}$$

$$= \frac{1}{2}\times\frac{P^2 L}{AE}$$

$$= \frac{1}{2}\times\frac{\sigma^2\times AL}{E}$$

$$U = \frac{\sigma^2}{2E}\times(\text{Volume})$$

Hence, If the area, length and the stress to which a bar is subjected be all doubled, then the elastic strain energy of the bar will become four times.

351. The iron bar which is fixed at both ends are heated to higher temperature. Then it is cooled slowly. During cooling, what kind of thermal stress is produced in the rod ?

(a) Tensile stress (b) Shear stress
(c) Compressive stress (d) Yield stress

TNPSC AE (Industries) 09.06.2013

Ans. (a) : Tensile stress

Search on Telegram @apna_pdf

352. A steel bar of 40 mm × 40 mm square cross-section is subjected to an axial compressive load of 200 kN. If the length of the bar is 2 m and E = 200 GPa, the contraction in mm of the bar will be :

(a) 1.25 (b) 2.7
(c) 4.05 (d) 5.4

HPPSC Asstt. Prof. 18.11.2016

Ans. (a) : $\delta_L = \dfrac{PL}{AE}$

Where, P = 200 km $\Rightarrow 200 \times 10^3$ N
L = 2 m = 2000 mm
E = 200 GPa = 200×10^3 MPa
A = 40×40 mm^2

$$\delta_L = \frac{200\times10^3\times2000}{40\times40\times200\times10^3}$$

$$\boxed{\delta_L = 1.25\,\text{mm}}$$

353. Property of absorbing large amount of energy before fracture is known as:-

(a) Ductility
(b) Toughness
(c) Elasticity
(d) Hardness

UKPSC AE-2013, Paper-I

Ans. (b) : Property of absorbing large amount of energy before fracture is known as Toughness.

354. A 200 × 100 × 50 mm steel block is subjected to a hydrostatic pressure of 15 MPa. The Young's modulus and Poisson's ratio of the material are 200 GPa and 0.3 respectively. The change in the volume of the block in mm^3 is

(a) 85 (b) 90
(c) 100 (d) 110

VIZAG Steel MT 18.08.2013
VIZAG Steel MT 10.06.2012
Gate 2007

Ans. (b) : $\sigma_1 = \sigma_x = \sigma_y = \sigma_z = -15 \times 10^6$ Pa (Compression)

Now, Longitudinal strain-

$$\therefore \quad \varepsilon_x = \frac{\sigma_x}{E} - \frac{\mu\sigma_y}{E} - \frac{\mu\sigma_z}{E} \qquad (\mu = \text{Poisson's ratio})$$

$$= \frac{\sigma_1}{E}(1-2\mu)$$

$$= \frac{15\times10^6}{200\times10^9}(1-2\times0.3)$$

$$\varepsilon_x = \frac{6}{200\times10^3} = 3\times10^{-5}$$

Volumetric strain, $\varepsilon_v = \dfrac{\Delta V}{V} = 3\varepsilon_x$

$$\Delta V = 3\times3\times10^{-5}\times200\times100\times50$$

$$\boxed{\Delta V = 90\ \text{mm}^3}$$

2. Principle Stress and Strain

355. On principal plane the shear stress is.....

(a) zero
(b) unity
(c) double the value of principal stress
(d) half the value of principal stress

APPSC AEE 2012
APPSC AEE Mains 2016 (Civil/Mech.)
APPSC AE 04.12.2012

Ans : (a) on principal plane the shear stress is zero.

Principal Stresses and Strains:-

It has been observed that at any point in a strained material, there are three planes, mutually perpendicular to each other, which carry direct stresses only, and no shear stress. A little consideration will show that out of these three direct stresses; one will be maximum, the other minimum and the third an intermediate between the two. These particular planes, which have no shear stress, are known as principal planes. The magnitude of direct stress, across a principal plane, is known as principal stress.

356. Maximum shear stress in Mohr's circle is equal to

(a) Radius of circle
(b) Diameter of circle
(c) Center of circle from y-axis
(d) Chord of circle

Gujarat PSC AE 2019

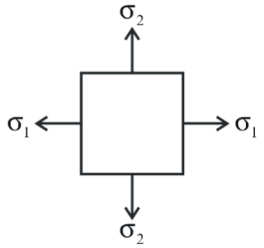
σ_1 = 100 MPa
σ_2 = 40 MPa



Maximum shear stress

$$\tau_{max} = \frac{\sigma_1 - \sigma_2}{2} = \frac{100 - 40}{2}$$

$$\boxed{\tau_{max} = 30\text{MPa}}$$

360. For a general two dimensional stress system, what are the co-ordinates of the centre of Mohr's circle?

(a) $\frac{\sigma_x - \sigma_y}{2}, 0$ (b) $0, \frac{\sigma_x + \sigma_y}{2}$

(c) $\frac{\sigma_x + \sigma_y}{2}, 0$ (d) $0, \frac{\sigma_x - \sigma_y}{2}$

UJVNL AE 2016
UKPSC AE-2013, Paper-I
APPSC AEE 2012
ESE 2007

Ans : (c)

$$Centre\ of\ Mohr's\ circle = \left(\frac{\sigma_x + \sigma_y}{2}, 0\right)$$

$$Radius = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + (\tau_{xy})^2}$$

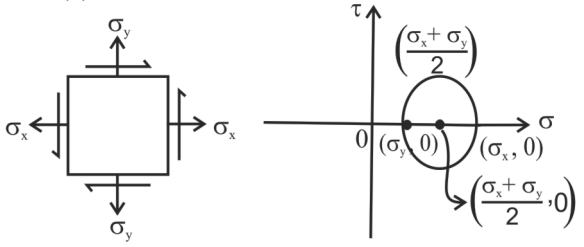
361. In Mohr's circle drawn for a general case of biaxial stresses, the distance of centre of circle from the Y-axis is

(a) $\frac{\sigma_x - \sigma_y}{2}$ (b) $\frac{\sigma_x + \sigma_y}{2}$

(c) $\sqrt{\frac{\sigma_x + \sigma_y}{2}}$ (d) $\sqrt{\frac{\sigma_x - \sigma_y}{2}}$

APGCL AM, 2021
WBPSC AE, 2017
Nagaland PSC CTSE 2016, Paper-I

Ans. (b) :



362. When two mutually perpendicular principal stresses are unequal but alike, the maximum shear stress is represented by

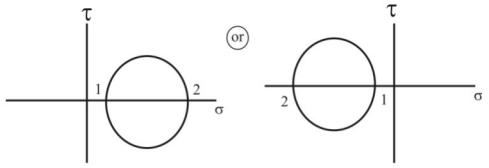
Search on Telegram @apna_pdf

(a) the diameter or Mohr's circle
(b) half the diameter of Mohr's circle
(c) one-third the diameter of Mohr's circle
(d) one-fourth the diameter of Mohr's circle

TSPSC Managers, 2015
TRB Asstt. Prof., 2012
APPSC IOF, 2009, ESE 1994

Ans. (b) : Radius = $\tau_{maximum} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

Centre of Mohr's circle = $\left(\frac{\sigma_x + \sigma_y}{2}, 0\right)$



τ

- Maximum shear stress is represented by half the diameter of Mohr's circle.

363. If σ_1 and σ_2 be the major and minor tensile stresses, then maximum value of tangential stress is equal to-

(a) σ_2 (b) $\sigma_1 - \sigma_2$
(c) $\sigma_1 + \sigma_2$ (d) $\frac{\sigma_1 - \sigma_2}{2}$

Assam Engg. College AP/Lect. 18.01.2021
CIL MT 26.03.2017
ISRO Scientist/Engineer (RAC) 29.11.2015
GATE 2018
PPSC Asstt. Municipal Engineer 15.06.2021

Ans : (d) Maximum value of tangential stress–

$$\tau_{max.} = \frac{\sigma_1 - \sigma_2}{2}$$

364. The minimum number of strain gauges in a strain rosette is

(a) One (b) Two
(c) Three (d) Four

HPPSC AE 2018
HPPSC Asstt. Prof. 2014
MPPSC State Forest Service Exam, 2014
APPSC AEE 2012

Ans. (c) : The minimum number of strain gauge in a strain rosette is Three.
Strain Gauge Rosette–A strain gauge rosette is a term for an arrangement of two or more strain gauge that are positioned closely to measure strains along different

365. If the centre of Mohr's stress circle coincides with the origin on the σ - τ coordinates, then

(a) $\sigma_x + \sigma_y = 0$ (b) $\sigma_x - \sigma_y = 0$
(c) $\sigma_x + \sigma_y = 1/2$ (d) $\sigma_x - \sigma_y = 1/2$

Gujarat PSC AE 2019
TNPSC AE 2019
BPSC Main 2017 Paper-VI

Ans : (a) :

By centre of Mohr's circle lie at $\frac{\sigma_x + \sigma_y}{2}$

It's coincide with origin

i.e., $\frac{\sigma_x + \sigma_y}{2} = 0$ or $\sigma_x + \sigma_y = 0$

$$\boxed{\sigma_x + \sigma_y = 0}$$

Principle stresses are σ_x and $-\sigma_y$. Hence they are equal in magnitude but unlike in direction.

366. When a thick plate is subjected to external loads:

1. **State of plane stress occurs at the surface**
2. **State of plane strain occurs at the surface**
3. **State of plane stress occurs in the interior part of the plate**
4. **State of plane strain occurs in the interior part of the plate**

Which of these statements are correct?

(a) 1 and 3 (b) 2 and 4
(c) 1 and 4 (d) 2 and 3

Gujarat PSC AE 2019
ESE 2013

Ans : (c) : For a plain strain case for a given load the strain in the thickness direction is negligible because more material is available in thickness direction which will resist any deformation in that direction (due to Poisson's effect) so strain in thickness direction in thick plate is assumed to be zero.
If you thick a cracked body (part through crack) loaded in tension, the crack front in the interior will have plane strain (as the mid section is surrounded by sufficient volume of material thus making it analogous to thick section) whereas crack front at the surface will have plane stress.

367. A rectangular plate in plane stress is subjected to normal stresses σ_x = 35 MPa, σ_y = 26 MPa, and shear stress τ_{xy} = 14 MPa. The ratio of the magnitudes of the principal stresses (σ_1/σ_2) is approximately :

(a) 0.8 (b) 1.5
(c) 2.1 (d) 2.9

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (d) : Given,

$\sigma_x = 35\,MPa$

$\sigma_y = 26\,MPa$

$\tau_{xy} = 14$ MPa

$$\sigma = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{35+26}{2} + \sqrt{\left(\frac{35-26}{2}\right)^2 + 14^2}$$

$$= \frac{61}{2} + \sqrt{\left(\frac{9}{2}\right)^2 + (14)^2}$$

$= 45.205$ MPa

$$\sigma_2 = \frac{\sigma_x + \sigma_y}{2} - \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

Search on Telegram @apna_pdf

$$\sigma_2 = \frac{61}{2} - \sqrt{\left(\frac{9}{2}\right)^2 + (14)^2}$$
$= 15.79$ MPa

The ratio of the magnitude of principal stress,

$$\frac{\sigma_1}{\sigma_2} = \frac{45.205}{15.790} = 2.86$$
≈ 2.9

368. For an element in pure shear $(+\tau_{xy})$, the principal stresses will be given as :

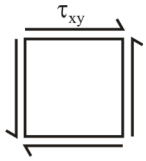
(a) $\sigma_{1,2} = \pm\tau_{xy}$ (b) $\sigma_{1,2} = \pm\tau_{xy}/\sqrt{2}$

(c) $\sigma_{1,2} = \pm\tau_{xy}\sqrt{2}$ (d) $\sigma_{1,2} = 0 + \tau_{xy}$

CIL MT 26.03.2017
UPRVUNL AE 07.10.2016

Ans. (a) : We know that

For an element in pure shear $(\pm\tau_{xy})$, then principal stresses.



$\sigma_x = \sigma_y = 0$ (Pure shear)

Then principal stresses

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$$

$$\boxed{\sigma_{1,2} = \pm\tau_{xy}}$$

369. The normal stresses at a point are σ_x = 10 MPa, σ_y = 2 MPa, and the shear stress at the at this point is 3 MPa. The maximum principal stress at this point would be

(a) 15 MPa (b) 13 MPa

(c) 11 MPa (d) 09 MPa

JWM 2017
J&K PSC Civil Services Pre, 2010
ESE 1998

Ans. (c) : Maximum principle stress,

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$\sigma_x = 10$ MPa

$\sigma_y = 2$ MPa

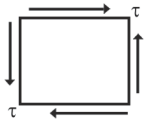
$\tau_{xy} = 3$ MPa

$$\sigma_1 = \frac{10+2}{2} + \sqrt{\left(\frac{10-2}{2}\right)^2 + 3^2}$$

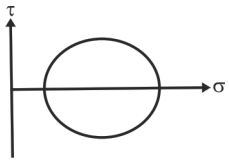
$$= 6 + \sqrt{16+9} = 6 + 5 = 11 \text{ MPa}$$

$$\boxed{\sigma_1 = 11 \text{ MPa}}$$

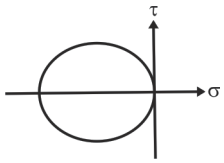
370. Which one of the following figures is the correct sketch of Mohr's circle of the given state of stress



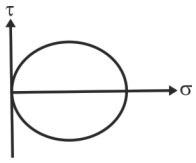
(a)



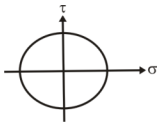
(b)



(c)

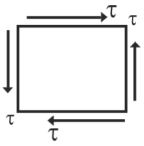


(d)



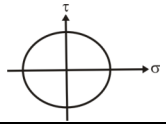
APPSC AEE SCREENING 17.02.2019
ISRO Scientist/Engineer 2011
BPSC Asstt. Prof. 29.11.2015
ESE 1996

Ans. (d) : State of stress



"Pure shear"

Mohr's circle diagram



371. If a Mohr's circle is drawn for a fluid element inside a fluid body at rest, it would be :

(a) a circle not touching the origin

(b) a circle touching the origin

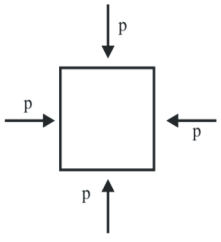
(c) a point on the normal stress axis

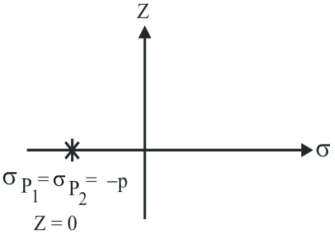
(d) a point on the shear stress axis

RPSC ACF & FRO, 26.02.2021
CGPSC AE 26.04.2015 Shift-I
TSPSC AEE 28-08-2014 (Civil/Mech.)

Ans. (c) : Mohr's circle for a fluid element inside a fluid body at rest it would be a point on the normal stress axis.

Mohr's circle reduces to a point in case of hydrostatic loading.





Search on Telegram @apna_pdf

372. If the principal stresses corresponding to a two-dimensional state of stress are σ_1 and σ_2. When σ_1 is greater than σ_2 and both are tensile, then which of the following would be correct criterion for failure by yielding, according to maximum shear stress theory?

(a) $\frac{\sigma_1-\sigma_2}{2}=\pm\frac{\sigma_{yp}}{2}$ (b) $\frac{\sigma_1}{2}=\pm\frac{\sigma_{yp}}{2}$

(c) $\frac{\sigma_2}{2}=\pm\frac{\sigma_{yp}}{2}$ (d) $\sigma_1=\pm2\sigma_{yp}$

RPSC IOF, 2020
Punjab PSC (Lect.) 06.08.2017

Ans. (b) : According to maximum shear stress theory for plane condition,

Absolute, τ_{max} = Larger of $\left[\frac{\sigma_1-\sigma_2}{2},\frac{\sigma_1}{2},\frac{\sigma_2}{2}\right]$

(1) If, σ_1 and σ_2 are alike in nature and $\sigma_1>\sigma_2$

Then, absolute $\tau_{max}=\frac{\sigma_1}{2}=S_{sy}$

(2) If, σ_1 and σ_2 are unlike in nature,

Then, absolute $\tau_{max}=\frac{\sigma_1-\sigma_2}{2}=S_{sy}$

According to maximum shear stress theory,

$$\frac{\sigma_{yp}}{S_{sy}}=2\Rightarrow S_{sy}=\frac{\sigma_{yp}}{2}$$

So, $\boxed{\frac{\sigma_1}{2}=\pm\frac{\sigma_{yp}}{2}}$ (Because σ_1 and σ_2 are alike in nature)

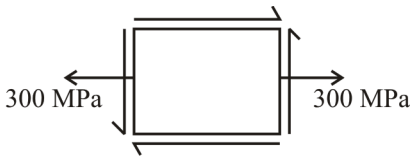
373. A body is subjected to a direct tensile stress of 300 MPa in one plane accompanied by a simple shear stress of 200 MPa. What would be the maximum normal stress?

(a) –100 MPa (b) 250 MPa

(c) 300 MPa (d) 400 MPa

GPSC DEE, Class-2 (GWSSB) 04.07.2021
RPSC IOF 2020
VIZAG STEEL MT 2011
ESE 2016

Ans. (d) :



Given, $\sigma_x=300$ MPa

$\sigma_y=0$

$\tau_{xy}=200$ MPa

Maximum normal stress,

$$\sigma_1=\frac{\sigma_x+\sigma_y}{2}+\sqrt{\left(\frac{\sigma_x-\sigma_y}{2}\right)^2+\tau_{xy}^2}$$

$$\sigma_1=\left(\frac{300+0}{2}\right)+\sqrt{\left(\frac{300-0}{2}\right)^2+(200)^2}$$

$$=150+\sqrt{(150)^2+(200)^2}$$

$$=400\text{ MPa}$$

374. Under uniaxial strain, the ratio of maximum shearing strain to uniaxial strain is–

(a) 2.0 (b) 0.5

(c) 1.0 (d) 1.5

GPSC AE (Part-B Civil) 2018
Nagaland PSC CTSE 2017, Paper-I

Ans. (c) :

Stress, $\sigma_1/\sigma_2=\frac{\sigma_x+\sigma_y}{2}+\sqrt{\left(\frac{\sigma_x-\sigma_y}{2}\right)^2+\tau_{xy}^2}$

$$\tau_{max}=\sqrt{\left(\frac{\sigma_x-\sigma_y}{2}\right)^2+\tau_{xy}^2}$$

Strain, $\epsilon_1/\epsilon_2=\frac{\epsilon_x+\epsilon_y}{2}\pm\sqrt{\left(\frac{\epsilon_x-\epsilon_y}{2}\right)^2+\left(\frac{\phi_{xy}}{2}\right)^2}$

$$\frac{\phi_{max}}{2}=\sqrt{\left(\frac{\epsilon_x-\epsilon_y}{2}\right)^2+\left(\frac{\phi_{xy}}{2}\right)^2}$$

In question $\epsilon_x=\epsilon$, $\epsilon_y=\phi_{xy}=0$

So, $\epsilon_1=\frac{\epsilon_x}{2}$ and $\frac{\phi_{max}}{2}=\frac{\epsilon_x}{2}$ or $\phi_{max}=\epsilon_x$

ϵ_x = uniaxial strain

ϕ_{max} = max shearing strain

Ratio $=\frac{\phi_{max}}{\epsilon_x}=1$

As, $\epsilon_x=\phi_{max}$

375. A body is subjected to a tensile stress of 1200 MPa on one plane and another tensile stress of 600 MPa on a plane at right angles to the former. It is also subjected to a shear stress of 400 MPa on the same planes. What would be the maximum normal stress?

(a) 400 MPa (b) 500 MPa

(c) 900 MPa (d) 1400 MPa

TNCSC AE 2020
JPSC AE 2013, Paper- V
VIZAG STEEL MT 2011

Ans. (d) : Given, $\sigma_x=1200$ MPa, $\sigma_y=600$ MPa

$\tau_{xy}=400$ MPa

Maximum normal stress,

$$\sigma_1=\left(\frac{\sigma_x+\sigma_y}{2}\right)+\sqrt{\left(\frac{\sigma_x-\sigma_y}{2}\right)^2+\tau_{xy}^2}$$

$$=\left(\frac{1200+600}{2}\right)+\sqrt{\left(\frac{1200-600}{2}\right)^2+(400)^2}$$

$$=900+\sqrt{(300)^2+(400)^2}$$

$$\sigma_1=900+500$$

$$\boxed{\sigma_1=1400\text{ MPa}}$$

376. A plane stressed element is subjected to the state of stress given by $\sigma_x=\tau_{xy}=100$kgf/cm^2 and $\sigma=0$. Maximum shear stress in the element is equal to

(a) $50\sqrt{3}$ kgf/cm^2 (b) 100 kgf/cm^2

(c) $50\sqrt{5}$ kgf/cm^2 (d) 150 kgf/cm^2

APPSC AE 04.12.2012, ESE 1997

Search on Telegram @apna_pdf

Ans. (c) : $\sigma_x = \tau_{xy} = 100\ \text{kgf/cm}^2,\ \sigma_y = 0$

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\frac{100}{2}\right)^2 + 100^2}$$

$$= \sqrt{50^2 + 100^2} = 50\sqrt{1+4}$$

$$\tau_{max} = 50\sqrt{5}\ \text{kgf/cm}^2$$

377. Principal stresses at a point in plane stressed element are $\sigma_x = \sigma_y = 500\ \text{N/mm}^2$. Normal stress on the plane inclined at 45° angle to x-axis will be

(a) 0 N/mm^2 (b) 700 N/mm^2
(c) 500 N/mm^2 (d) 1000 N/mm^2

UKPSC AE 2013 Paper-I
APPSC AEE 2012, ESE 1993

Ans. (c) : $\sigma_\theta = \frac{\sigma_x + \sigma_y}{2} + \frac{\sigma_x - \sigma_y}{2}\cos 2\theta$

$$= \frac{500+500}{2} + \frac{500-500}{2}\cos 90$$

$$\boxed{\sigma_\theta = 500\,\text{N/mm}^2}$$

378. If a body carries two unlike principal stresses, the maximum shear stress is given by

(a) sum of the principal stresses
(b) difference of the principal stresses
(c) half the difference of the principal stresses
(d) half the sum of the principal stresses

CGPSC AE 15.01.2021
TSPSC AEE 2015
APPSC AEE 2012

Ans. (c) If a body carries two unlike principal stresses, the maximum shear stress is given by half the difference of the principal stresses.

Or

If a body carries two unlike principal stresses the maximum shear stress is given by half the sum of the principal stresses.

379. Mohr's circle can be used to determine following stress on inclined surface

(a) Normal stress (b) Principal stress
(c) Tangential stress (d) All of the above

UJVNL AE 2016
UKPSC AE-2013, Paper-I

Ans : (d) Mohr's circle can be used to determine Normal stress, principal stress, and tangential stress.

Mohr's Circle of Stresses:-

The Mohr's circle is a graphical method of finding the normal, tangential and resultant stresses on an inclined plane. It is drawn for the following two cases:-

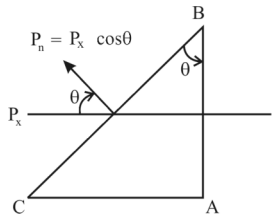
(i) When the two mutually perpendicular principal stresses are unequal and like.
(ii) When the two mutually perpendicular principal stresses are unequal and unlike.

380. Normal stress on a plane, the normal..... Which is inclined at an angle θ with the line of action of applied un axial stress σ_x is given by

(a) $\sigma_x / \sin^2\theta$ (b) $\sigma_x / \cos^2\theta$
(c) $\sigma_x \cos^2\theta$ (d) $\sigma_x \sin^2\theta$

GPSC Engg. Class-II Pre-19.01.2020
UPPSC AE 12.04.2016 Paper-I

Ans : (c)



BC –A plane which is inclined at an angle (90–θ) with the line of action of applied un-axial stress σ_x

$P_x = \sigma_x \times AB \quad [t = 1 \text{ assume}]$

$P_n = P_x \times \cos\theta = \sigma_x \times AB \times \cos\theta$

The normal stress at inclined plan BC

$$\sigma_n = \frac{P_n}{BC} = \frac{\sigma_x \times AB \times \cos\theta}{\left[\frac{AB}{\cos\theta}\right]} \quad \left[\cos\theta = \frac{AB}{BC},\ BC = \frac{AB}{\cos\theta}\right]$$

$$\boxed{\sigma_n = \sigma_x \cos^2\theta}$$

381. For a plane stress case, $\sigma_1 = 50\,\text{MPa}$, $\sigma_2 = -100\,\text{MPa}$, $\tau_{12} = 40\,\text{MPa}$, the maximum and minimum principal stresses are, respectively,

(a) 60 MPa, – 110 MPa,
(b) 50 MPa, – 110 MPa
(c) 40 MPa, – 120 MPa
(d) 70 MPa, – 130 MPa,

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (a) : $\sigma_1 = 50\ MP_a$ $\sigma_2 = -100\ MP_a$ $\sigma_{12} = 40\ MP_a$

Max and Min principal stresses

$$\sigma_{max,\,min} = \frac{\sigma_1 + \sigma_2}{2} \pm \sqrt{\left(\frac{\sigma_1 - \sigma_2}{2}\right)^2 + \tau_{12}^2}$$

$$= \frac{50-100}{2} \pm \sqrt{\left(\frac{50-(-100)}{2}\right)^2 + 40^2}$$

$$= -25 \pm 85$$

$\sigma_{max,\,min} = -25+85$ & $-25-85$

$\sigma_{max,\,min} = 60, -110$

$\sigma_{max} = -110\text{MPa}$, $\sigma_{min} = 60\text{MPa}$

382. The tensile stresses at a point across two mutually perpendicular planes are 120 MPa and 60 MPa. The normal stress on a plane inclined at 30° to the axis of the minor axis is _____.

(a) 110 Mpa (b) 60 Mpa
(c) 45 Mpa (d) 105 Mpa

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : Given,

$\sigma_x = 120$ MPa

$\sigma_y = 60$ MPa

$\theta = 30°$

Figure

Normal stress, $(\sigma_n)_\theta = \frac{1}{2}(\sigma_x + \sigma_y) + \frac{1}{2}(\sigma_x - \sigma_y)\cos 2\theta$

$$= \frac{1}{2}(120+60) + \frac{1}{2}(120-60)\cos 60°$$

$$= 90 + \frac{1}{2} \times 60 \times \frac{1}{2} = 90 + 15 = 105\ \text{MPa}$$

Search on Telegram @apna_pdf

383. The stresses on two perpendicular planes through a point in a body are 100 MPa and 40 MPa both tensile along with a shear stress of 40 MPa. The maximum failure stress as per maximum normal stress theory is _____.

(a) 180 MPa (b) 110 MPa
(c) 70 MPa (d) 120 MPa

VIZAG Steel MT 24.01.2021

Ans. (d) : Given,

$\sigma_x = 100$ MPa
$\sigma_y = 40$ MPa
$\tau_{xy} = 40$ MPa

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{100+40}{2} \pm \sqrt{\left(\frac{100-40}{2}\right)^2 + (40)^2}$$

$$= 70 \pm \sqrt{(30)^2 + (40)^2}$$

$\sigma_{1,2} = 70 \pm 50$

Maximum (σ_1) = 70 + 50 = 120 MPa
Minimum (σ_2) = 70 – 50 = 20 MPa
Hence, the maximum failure stress as per maximum normal stresses (σ_1 = 120 MPa)

384. If a body is subjected to stresses in xy plane with stresses of 100 N/mm^2 and 20 N/mm^2 acting along x and y axes respectively. Also the shear stress acting is 30 N/mm^2. Find the maximum amount of shear stress in N/mm^2 to which the body is subjected.

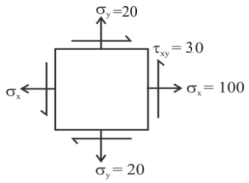
(a) $30\sqrt{5}$ (b) 50
(c) $10\sqrt{5}$ (d) Zero

APGCL AM, 2021

Ans. (b) :

Given

$\sigma_x = 100 N/mm^2$
$\sigma_y = 20 N/mm^2$
$\tau_{xy} = 30 N/mm^2$



Maximum Shear Stress e.

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \sqrt{\left(\frac{100-20}{2}\right)^2 + (30)^2}$$

$$= \sqrt{(40)^2 + (30)^2}$$

$\tau_{max} = 50 N/mm^2$

385. If a cylindrical rod of cross section A is applied with uniaxial tension P, the maximum shear stress in the rod will be :

(a) 0 (b) $\frac{1}{2}\frac{P}{A}$
(c) $\frac{P}{A}$ (d) $\frac{2P}{A}$

JPSC AE 10.04.2021, Paper-II

Ans. (b) :

Given,

$\sigma_x = \frac{P}{A}$
$\sigma_y = 0$
$\tau_{xy} = 0$

Maximum shear stress (τ_{max}) $= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

$$= \sqrt{\left(\frac{\frac{P}{A} - 0}{2}\right)^2 + 0^2}$$

$$\boxed{\tau_{max} = \frac{P}{2A}}$$

386. Mohr's circle for membrane stresses in a thin walled spherical pressure vessel with radius r and wall thickness t, under internal pressure p will be:

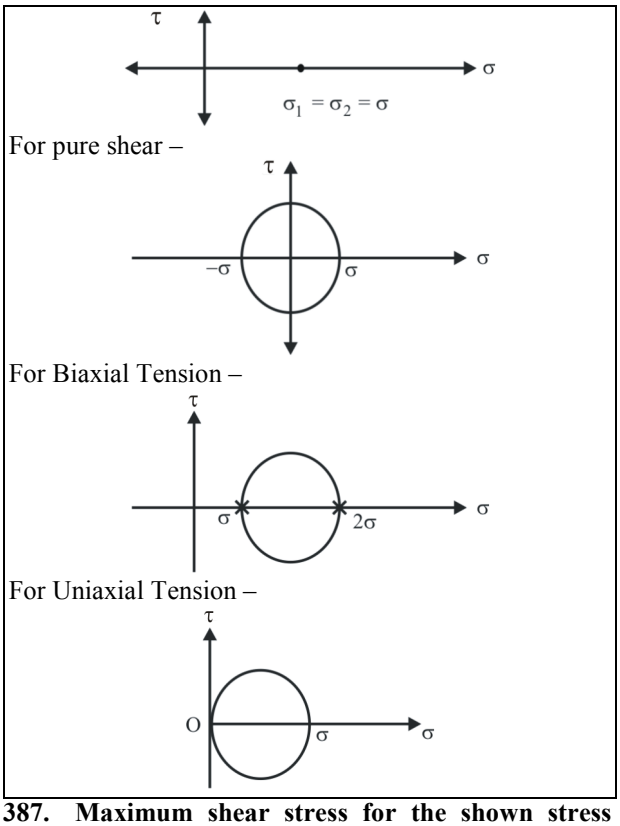
(a) 
(b) 
(c) 
(d) 
JPSC AE 10.04.2021, Paper-II

Ans. (c) : For thin spherical pressure vessel

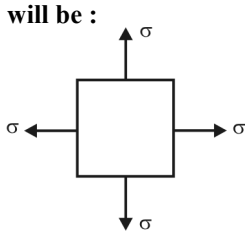
$$\boxed{\sigma_h = \sigma_L = \frac{Pd}{4t}}$$

$$\boxed{\sigma_1 = \sigma_2 = \frac{Pd}{4t}}$$

Search on Telegram @apna_pdf



387. Maximum shear stress for the shown stress condition will be :



(a) σ/2 (b) σ
(c) 2σ (d) 0

JPSC AE 10.04.2021, Paper-II

Ans. (d) : Given,

$\sigma_x = \sigma$

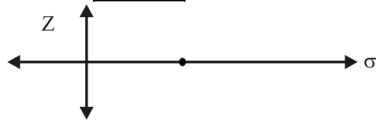
$\sigma_y = \sigma$

$\tau_{xy} = 0$

Maximum shear stress $= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

$= \sqrt{\left(\frac{\sigma - \sigma}{2}\right)^2 + 0^2}$

$\boxed{\tau_{max} = 0}$



Mohr's circle will be point.

388. When an element is in a state of simple shear, maximum direct stresses are induced on

(a) mutually parallel planes which are at 45^0 to the planes of pure shear
(b) mutually perpendicular planes which are parallel to the planes of pure shear
(c) mutually perpendicular planes which are perpendicular to the planes of pure shear
(d) mutually perpendicular planes which are at 45^0 to the planes of pure shear

GPSC DEE, Class-2 (GWSSB) 04.07.2021

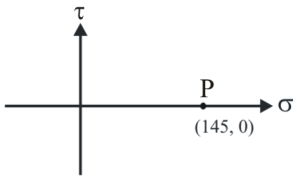
Ans. (d) : When an element is in a state of simple shear, maximum direct stresses are induced on mutually perpendicular planes which are at 45^0 to the planes of pure shear.

389. The state of stress at a point P in a two dimensional loading is such that the Mohr's circle is a point located at 145 MPa on the positive normal stress axis. The maximum and minimum principal stresses respectively from the Mohr's circle are :

(a) 0, 0
(b) 0, –145 MPa
(c) + 145 MPa, + 145 MPa
(d) + 145 MPa, – 145 MPa

RPSC ACF & FRO, 26.02.2021

Ans. (c) :



Maximum principle stress = 145 MPa
Minimum principle stress = 145 MPa
Maximum /minimum shear stress = 0 MPa

390. Principal strains occur on three planes which are

(a) inclined to one another at 45°
(b) mutually perpendicular to each other
(c) inclined to one another at 22½°
(d) None of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (b) : For the three-dimensional case it is now demonstrated that three planes of zero shear stress exist, that these planes are mutually perpendicular and that on these planes the normal stresses have maximum or minimum values.

391. A spherical container made of steel has a 5m outside diameter and a 10mm uniform wall thickness. If the internal pressure is 400 kPa, the maximum normal stress and maximum shear stress in the container are :

(a) σ_{max} = 77.4 MPa, τ_{max} = 38.7 MPa
(b) σ_{max} = 89.0 MPa, τ_{max} = 44.5 MPa
(c) σ_{max} = 49.8 MPa, τ_{max} = 2.91 MPa
(d) σ_{max} = 38.7 MPa, τ_{max} = 51.9 MPa

CGPSC AE 15.01.2021

Ans. (*) : Given, diameter of spherical container = 5m
thickness (t) = 10 mm
Internal pressure (p) = 400 kPa

Max. Normal stress, $\sigma_C = \frac{Pd}{4t}$

$= \frac{400 \times 5}{4 \times 10 \times 10^{-3}}$

Search on Telegram @apna_pdf

$= 50 \times 10^3$ kPa
$= 50$ MPa

Max. shear stress, $\tau_{max} = \frac{\sigma_C}{2} = \frac{50}{2}$
$\simeq 25$ MPa

Note- Official answer is (c).

392. Consider a linear elastic rectangular thin sheet of metal, subjected to uniform uniaxial tensile stress of 100 MPa along the length direction. Assume plane stress condition in the plane normal to the thickness. Young's modulus E = 200 MPa and Poisson's ratio ν = 0.3. The principal strains in the plane of sheet are_____

(a) (0.5, – 0.15) (b) (0.5, – 0.5)
(c) (0.5, 0.0) (d) (0.35, –0.15)

Assam Engg. College AP/Lect. 18.01.2021

Ans. (a) : (0.5, – 0.15)

$\sigma_x = 100$
$\sigma_y = 0$
$\nu = 0.3$

$\varepsilon_x = \frac{\sigma_x}{E} - \nu\frac{\sigma_y}{E}$ $\varepsilon_y = \frac{\sigma_y}{E} - \nu\frac{\sigma_x}{E}$

$= \frac{100}{200} - 0.3 \times 0$ $= 0 - 0.3 \times \frac{100}{200}$

$\varepsilon_x = 0.5$ $\varepsilon_y = -0.15$

393. A strain gauge rosette is used when :

(a) direction of strain is known
(b) only magnitude of stress is known
(c) both magnitude and direction of strains are unknown
(d) magnitude is known but the direction is unknown

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : A strain gauge rosette is a term for an arrangement of two or more strain gauges that are positioned closely to measure strains along different direction of the component under evaluation. Single strain gauge can only measure strain effectively in one direction so the use of multiple strain gauges enables more measurements to be taken. Providing a more precise evaluation of strain on the surface being measured.

394. The gauge factor of a semiconductor gauge compared to a wire strain gauge is :

(a) high (b) the same
(c) infinite (d) low

APPSC Poly Lect. Automobile Engg., 2020

Ans. (a) : The strain gauge should have a high value of gauge factor. As high gauge factor indicates a large change in resistance that leads to high sensitivity. The gauge resistance should be high so as to minimize the effect of undesirable variation of resistance in measurement circuit.

395. Consider a two dimensional state of stress for an element
Where, σ_x = 200 MPa
σ_y = –100 MPa
The co-ordinates of the centre of Mohr's circle are

(a) (0, 0) (b) (100, 200)
(c) (200, 100) (d) (50, 0)

UPPSC AE 13.12.2020, Paper-I

Ans. (d) : Co-ordinate of the centre of Mohr's circle is

$\left[\left(\frac{\sigma_x + \sigma_y}{2}\right), 0\right]$

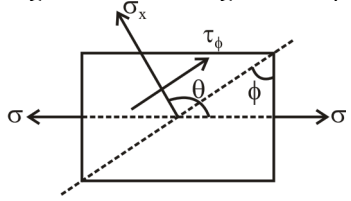
Centre $= \left[\frac{200 - 100}{2}, 0\right] = (50, 0)$

396. When a member is subjected to a direct stress (σ) in one plane, then the tangential stress on an oblique plane which is inclined at an angle Φ with the normal cross section is _____ .

(a) $\sigma(\sin^2\phi)$ (b) $\frac{\sigma(\sin 2\phi)}{2}$
(c) $\frac{\sigma(\cos 2\phi)}{2}$ (d) $\frac{\sigma(\cos^2 \phi)}{2}$

VIZAG MT, 14.12.2020

Ans. (b) : Tangential stress along inclined plane



$\tau_\phi = -\left(\frac{\sigma_x - \sigma_y}{2}\right)\sin 2\theta + \tau_{xy}\cos 2\theta$

$\tau_{xy} = 0$
$\sigma_x = \sigma$ $\theta = (90 + 90 - \phi)$
$\sigma_y = 0$ $= (180 - \phi)$

$\tau_\phi = -\left(\frac{\sigma - 0}{2}\right)\sin 2(180 - \phi)$

$\boxed{\tau_\phi = \frac{\sigma}{2}\sin 2\phi}$

397. If a element is subjected to uniform equal compressive stresses of 1 MPa in all directions so that $\sigma_x = \sigma_y = \sigma_z$. The Mohr's circle for this state of stress is a

(a) Circle with infinite radius
(b) Circle with zero radius
(c) Circle with unit radius
(d) None of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (b) : $\sigma_x = \sigma_y = \sigma_z$ the radius of Mohr's circle will be zero.

$R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right) + (\tau_{xy})^2}$

$R = \sqrt{0 + 0} = 0$

398. For an element in plane stress, if the larger of the principal stresses is 3 times that of the smaller one, the value of the maximum shear stress is equal to

(a) the smaller principal stress
(b) the larger principal stress
(c) half of the higher principal stress
(d) sum of the two principal stress

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Search on Telegram @apna_pdf

Ans. (c) : $\sigma_1 = 3\sigma$

$\sigma_2 = \sigma$

$\sigma_3 = 0$

Shear stress $(\tau) = \dfrac{\sigma_1 - \sigma_3}{2}$

$\tau = \dfrac{3\sigma - 0}{2} = \dfrac{1}{2}\sigma_1$

$\tau = \dfrac{1}{2}$ higher principal stress

399. For an element in plane stress, the planes of algebraically maximum shear stress occur at

(a) At 90^0 to the principal planes
(b) At the principal planes
(c) At 45^0 to the principal planes
(d) None of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II
TSPSC AEE 28.08.2017 (Civil/Mech.)

Ans. (c) : Plane of max shear stress is at 45^0 to the principal plane.

400. A strain gauge oriented in a direction at an angle θ with x-axis, measures:

(a) $\varepsilon_x \sin^2\theta + \varepsilon_y \cos^2\theta + \tau_{xy}\cos\theta\sin\theta$
(b) $\varepsilon_x \cos^2\theta + \varepsilon_y \sin^2\theta + \tau_{xy}\cos\theta\sin\theta$
(c) $\varepsilon_x \cos^2\theta + \varepsilon_y \sin^2\theta - \tau_{xy}\cos\theta\sin\theta$
(d) $\varepsilon_x \cos^2\theta + \varepsilon_y \sin^2\theta + 2\tau_{xy}\cos\theta\sin\theta$

CIL MT 27.02.2020

Ans. (b) : A strain gauge oriented in a direction at an angle θ with x-axis measures

$= \varepsilon_x \cos^2\theta + \varepsilon_y \sin^2\theta + \tau_{xy}\cos\theta.\sin\theta$

401. A wheat stone bridge is used for electrical strain gauges, because it has:

(a) high sensitivity (b) zero sensitivity
(c) low sensitivity (d) infinite sensitivity

CIL MT 27.02.2020

Ans. (a) : A wheat stone bridge circuit has high sensivity for detecting very small variation in the values of resistance.
We can connect the strain gauge in one of the arms of a wheat stone bridge and measure the strain in term of variation in resistance.

402. If normal stress on a normal plane is σ, the maximum shear stress on a plane inclined 45 degree to the normal plane will be

(a) σ/2 (b) σ
(c) σ sin θ (d) σ cos θ

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : σ/2

403. At a point in a strained material, tensile stress of 100 MPa and compressive stress of 60 MPa are found to be principal stresses. Maximum shear stress at that point is :

(a) 20 MPa (b) 40 MPa
(c) 80 MPa (d) 60 MPa

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : Given,

$\sigma_1 = +100\text{MPa}(\text{Tensile})$

$\sigma_2 = -60\text{MPa}(\text{Compressive})$

Maximum shear stress $\tau_{max} = \dfrac{\sigma_1 - \sigma_2}{2}$

$= \dfrac{100 - (-60)}{2} = 80\,\text{MPa}$

404. Mohr's circle for the state of stress defined by $\begin{bmatrix} 20 & 0 \\ 0 & 20 \end{bmatrix}$ **is a circle with :**

(a) Centre at (0, 0) and radius 20 MPa
(b) Centre at (0, 0) and radius 40 MPa
(c) Centre at (20, 0) and radius 20 MPa
(d) Centre at (20, 0) and radius zero radius

OPSC AEE 2019 Paper-I

Ans : (d) :
Data given as-

$\sigma_x = 20\,\text{MPa}$

$\sigma_y = 20\,\text{MPa}$

$\tau_{xy} = 0$ MPa

Center of Mohr's circle

$= \left(\dfrac{\sigma_x + \sigma_y}{2}, 0\right) = \left[\left(\dfrac{20+20}{2}\right), 0\right] = (20, 0)$

and we know that

$\tau_{max} = \sqrt{\left(\dfrac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2} = \sqrt{\left(\dfrac{20-20}{2}\right)^2 + 0^2} = 0$

405. The state of stress at a point in a 2-D loading is such that the Mohr's circle is a point located at 175 MPa on the positive normal stress axis. The maximum and minimum principle stress, respectively, from Mohr's circle are :

(a) 0; 0 MPa
(b) + 175 MPa; + 175 MPa
(c) + 175 MPa; – 175 MPa
(d) + 175 MPa; 0 MPa

BHEL ET 2019
GATE 2003

Ans. (b) : $\sigma_x = 175\,\text{MPa}(\text{Tensile})$

$\sigma_y = 175\,\text{MPa}(\text{Tensile})$

$\sigma = \dfrac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\dfrac{\sigma_x - \sigma_y}{2}\right)^2 + (\tau_{xy})^2}$

$= \dfrac{175+175}{2} \pm \sqrt{\left(\dfrac{175-175}{2}\right) + 0}$

σ maximum = 175 MPa
σ minimum = 175 MPa

406. A point in a structural member is subjected to normal stresses (σ_x and σ_y) along two mutually perpendicular directions and shear (τ_{xy}) in xy plane. The orientation of first principal plane (θ_{p1}) is expressed as :

(a) $\tan^{-1}\left(\dfrac{2\tau_{xy}}{\sigma_x - \sigma_y}\right)$ (b) $\dfrac{1}{2}\tan^{-1}\left(\dfrac{2\tau_{xy}}{\sigma_x - \sigma_y}\right)$

(c) $2\tan^{-1}\left(\dfrac{\sigma_x - \sigma_y}{2\tau_{xy}}\right)$ (d) $\dfrac{1}{2}\tan^{-1}\left(\dfrac{\sigma_x - \sigma_y}{2\tau_{xy}}\right)$

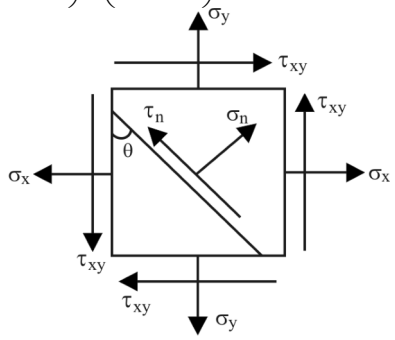
Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (b) : Given,
By using force equilibrium along an a perpendicular to the inclined plane

Search on Telegram @apna_pdf

We get,

$$\sigma_n = \left(\frac{\sigma_x + \sigma_y}{2}\right) + \left(\frac{\sigma_x - \sigma_y}{2}\right)\cos 2\theta + \tau_{xy}\sin 2\theta$$



$$\tau_n = -\left(\frac{\sigma_x - \sigma_y}{2}\right)\sin 2\theta + \tau_{xy}\cos 2\theta$$

We know that on the principal planes shear stress always zero.

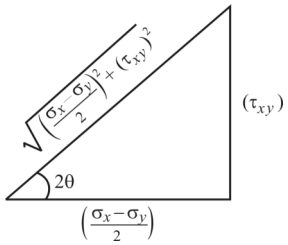
$$\therefore \quad -\left(\frac{\sigma_x - \sigma_y}{2}\right)\sin 2\theta + \tau_{xy}\cos 2\theta = 0$$

$$\left(\frac{\sigma_x - \sigma_y}{2}\right)\sin 2\theta = \tau_{xy}\cos 2\theta$$

$$\tan 2\theta = \frac{2\tau_{xy}}{(\sigma_x - \sigma_y)}$$

$$\theta = \frac{1}{2}\tan^{-1}\left(\frac{2\tau_{xy}}{\sigma_x - \sigma_y}\right)$$

So, the orientation of first principal planes (θ_{p_1}) is expresses as :



$$\theta_{p_1} = \frac{1}{2}\tan^{-1}\left(\frac{2\tau_{xy}}{\sigma_x - \sigma_y}\right)$$

407. What is the number of non-zero strain components for a plane stress problem?

(a) 6 (b) 4
(c) 3 (d) 2

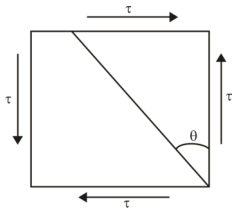
APPSC AEE SCREENING 17.02.2019

Ans. (c) : In a plane stress (2D) problem the number of non-zero strain components are $\in_x$, $\in_y$ and ϕ_{xy}

Total three number.

The 2D tensor is $\begin{bmatrix} \in_x & \phi_{xy} \\ \phi_{yx} & \in_y \end{bmatrix}$

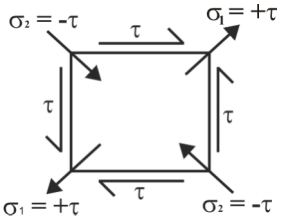
408. The state stress at a point is shown below. θ represents the principal plane corresponding to principal stress σ_1 and σ_2 ($\sigma_1 > \sigma_2$). Values of θ, σ_1, and σ_2 are



(a) 0°, 90°, τ and –τ
(b) 30°, 120°, τ and –τ
(c) 45°, 135°, τ and –τ
(d) 45°, 135°, $\frac{\tau}{2}$ and $-\frac{\tau}{2}$

APPSC AEE SCREENING 17.02.2019

Ans. (c) :



Due to pure shear diagonal tension ($\sigma_1 = +\tau$) and diagonal compression ($\sigma_2 = -\tau$) develops.
The angle between principal planes is 90°.
$\therefore \quad \theta_1 = 45°, \theta_2 = 135°, \sigma_1 = \tau, \sigma_2 = -\tau$

409. Where does principal stress occur in a component?

(a) Along the plane
(b) Perpendicular to the plane
(c) On mutually perpendicular planes
(d) Along the direction of load

TNPSC AE 2019

Ans. (c) : On mutually perpendicular planes principal stress does occur in a component.
• Shear stress τ = 0

410. A body is subjected to a direct tensile stress of 300 MPa in one plane accompanied by a simple shear stress of 200 MPa. The maximum shear stress will be

(a) 150 MPa (b) 200 MPa
(c) 250 MPa (d) 300 MPa

JPSC AE PRE 2019

Ans. (c) : Given,

$\sigma_x = 300$ MPa
$\sigma_y = 0$
$\tau_{xy} = 200$ MPa

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\sigma_2 = \frac{\sigma_x + \sigma_y}{2} - \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\sigma_1 = \frac{300 + 0}{2} + \sqrt{\left(\frac{300 - 0}{2}\right)^2 + (200)^2}$$

$$= 150 + \sqrt{(150)^2 + (200)^2}$$

$$= 150 + 250$$

$$= 400 \text{ MPa}$$

Search on Telegram @apna_pdf

$$\sigma_2 = \frac{300+0}{2} - \sqrt{\left(\frac{300-0}{2}\right)^2 + (200)^2}$$
$$= 150 - \sqrt{(150)^2 + (200)^2}$$
$$= 150 - 250$$
$$= -100 \text{ MPa}$$
$$\tau_{max} = \frac{\sigma_1 - \sigma_2}{2}$$
$$= \frac{400 - (-100)}{2}$$
$$= 250 \text{ MPa}$$

411. At a point in a stressed body there are normal stresses of 1N/mm^2 (tensile) on a vertical plane and 0.5 N/mm^2 (tensile) on a horizontal plane. The shearing stresses on these planes are zero. What will be the normal stress on a plane making an angle 50^o with vertical plane? [Given, (cos 50^o)^2 = 0.413]

(a) 0.6015 N/mm^2 (b) 0.4139 N/mm^2
(c) 0.5312 N/mm^2 (d) 0.7065 N/mm^2

SJVN ET 2019

Ans. (d) : Given as,

$\sigma_x = 1\text{Pa}, \sigma_y = 0.5\text{Pa}, \tau_{xy} = 0$

$\theta = 50^o$

We know that, $[\sigma_n]_{\theta=50^o} = \frac{\sigma_x + \sigma_y}{2} + \frac{\sigma_x - \sigma_y}{2}\cos 2\theta$

$[\sigma_n]_{\theta=50^o} = \left(\frac{1+0.5}{2}\right) + \left(\frac{1-0.5}{2}\right)\cos(2\times 50^o)$

$= 0.7065\text{Pa}$

412. Assertion (A): A plane state of stress always results in a plane state of strain.
Reason (R) : A uniaxial state of stress results in a three-dimensional state of strain.

(a) Both A and R are individually true and R is the correct explanation of A.
(b) Both A and R are individually true and R is not the correct explanation of A.
(c) A is true but R is false
(d) A is false but R is true

Gujarat PSC AE 2019
ESE 2010

Ans : (d) :
■ In a plane stress condition, the stress in the perpendicular direction to the plane is zero. But strain in that direction need not to be zero. Thus assertion is wrong.

413. Radius of Mohr's circle is represented as : [where $\sigma_{p1} > 0$ and $\sigma_{p2} > 0$ are the major and minor value of principle stresses]

(a) $\sigma_{p1} - \sigma_{p2}$ (b) $\frac{\sigma_{p1} - \sigma_{p2}}{2}$
(c) $\sigma_{p1} + \sigma_{p2}$ (d) $\frac{\sigma_{p1} + \sigma_{p2}}{2}$
(e) $\frac{\sigma_{p1} \times \sigma_{p2}}{2}$

CGPSC AE 25.02.2018

Ans. (b) : Radius of Mohr's circle is represented by

$$R = \frac{\sigma_{p1} - \sigma_{p2}}{2}$$

414. If principle stress σ_{p1} = 100 N/mm^2 (tensile) σ_{p2} = 40 N/mm^2 (compressive), then maximum shear stress will be:

(a) 70 N/mm^2 (b) 50 N/mm^2
(c) 30 N/mm^2 (d) 10 N/mm^2
(e) 5 N/mm^2

CGPSC AE 25.02.2018

Ans. (a) : Data given-

σ_{p1} = 100 N/mm^2, σ_{p2} = – 40 N/mm^2

Then max, shear stress is given as

$$\tau_{max} = \text{Radius of Mohr's circle} = \frac{\sigma_{p1} - \sigma_{p2}}{2}$$
$$\tau_{max} = \frac{100 - [-40]}{2} = 70\text{N/mm}^2$$

415. In a 3-D state of stress, the independent stress components required to define state-of-stress at a point are -

(a) 3 (b) 6
(c) 12 (d) 9

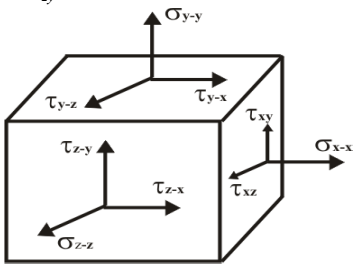
RPSC AE 2018

Ans. (b) :

$$\begin{bmatrix} \sigma_{xx} & \tau_{xy} & \tau_{xz} \\ \tau_{yx} & \sigma_{yy} & \tau_{yz} \\ \tau_{zx} & \tau_{zy} & \sigma_{zz} \end{bmatrix}$$

then,

$\sigma_{x-x}, \sigma_{y-y}, \sigma_{z-z}$
$\tau_{xy} = \tau_{yx}$
$\tau_{xz} = \tau_{zx}$
$\tau_{yz} = \tau_{zy}$



In a 3-D state of stress, the independent stress components required to define state of stress at a point is six (three normal stress and three shear stress).

416. A state of plane stress consists of a uni-axial tensile stress of magnitude 8 kPa, exerted on vertical surface and of unknown shearing stresses. If the largest stress is 10 kPa, then the magnitude of the unknown shear stress will be

(a) 6.47 kPa (b) 5.47 kPa
(c) 4.47 kPa (d) 3.47 kPa

UPPSC AE 13.12.2020 Paper-I
ESE 2018

Ans. (c) : Given,

σ_x = 8 kPa, σ_1 = 10 kPa

σ_y = 0

Maximum principal stress is given by

Search on Telegram @apna_pdf

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$10 = \frac{8+0}{2} + \sqrt{\left(\frac{8-0}{2}\right)^2 + \tau_{xy}^2}$$

$$10 = 4 + \sqrt{4^2 + \tau_{xy}^2}$$

$$\tau_{xy} = \sqrt{20}$$

$$\tau_{xy} = 4.47 \text{ kPa}$$

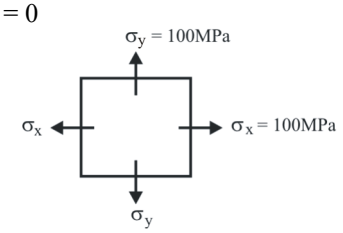
417. In a bi-axial stress problem, the stresses in x and y direction are σ_x = 100 MPa, σ_y = 100 MPa respectively. The maximum principal stress in MPa, is :

(a) 50 (b) 100
(c) 150 (d) 200

Vadodara Muncipal Corp. DEE, 2018

Ans. (b) : Given,

$\sigma_x = 100$MPa
$\sigma_y = 100$MPa
$\tau_{xy} = 0$



maximum principal stress

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{100+100}{2} + \sqrt{\left(\frac{100-100}{2}\right)^2 + 0^2}$$

$$\boxed{\sigma_1 = 100} \text{ MPa}$$

418. Consider the following statements :

1 . Two-dimensional stresses applied to a thin plate in its own plane represent the plane stress condition.

2. Under plane stress condition, the strain in the direction perpendicular to the plane is zero.

3. Normal and shear stresses may occur simultaneously on a plane

Which of the above statements is /are correct?

(a) 1 only (b) 1 and 2
(c) 2 and 3 (d) 1 and 3

GPSC ARTO Pre 30.12.2018
ESE 2009

Ans. (d) : The correct statements are –

(i) Two –dimensional stress applied to a thin plate in its own plane represents the plane stress condition.

(ii) Under plane stress condition, the strain in the direction perpendicular to the plane is not zero.

(iii) Normal and shear stress may occurs simultaneously on a plane.

419. A piece of material is subjected, to two perpendicular tensile stresses of 70 MPa and 10 MPa. The magnitude of the resultant stress on a plane in which the maximum shear stress occurs is

(a) 70 MPa (b) 60 MPa
(c) 50 MPa (d) 10 MPa

GPSC EE Pre, 28.01.2017
ESE 2012

Ans. (c) : Given-

$\sigma_x = 70$ MPa
$\sigma_y = 10$ MPa
$\tau_{xy} = 0$
$\theta = 45°$

Normal stress (σ_x)

$$\sigma_x = \frac{\sigma_x + \sigma_y}{2} + \frac{\sigma_x - \sigma_y}{2}\cos 2\theta + \tau_{xy}\sin 2\theta$$

$$\sigma_x = \frac{70+10}{2} + \frac{70-10}{2} \times \cos 90° + 0 \times \sin 90°$$

$$(\sigma_x) = \frac{80}{2} = 40 \text{ MPa}$$

Shear stress (τ) $= \frac{\sigma_x - \sigma_y}{2}\sin 2\theta - \tau_{xy}\cos 2\theta$

$$= \frac{70-10}{2}\sin(90°) - 0 \times \cos(90°)$$

$$\tau = \frac{60}{2} = 30 \text{ MPa}$$

Resultant stress (σ_r) $= \sqrt{(\sigma_x)^2 + (\tau)^2}$

$$= \sqrt{(40)^2 + (30)^2} = \sqrt{1600 + 900}$$

$= 50$ MPa

420. A horizontal beam under bending has a maximum bending stress of 100 MPa and maximum shear stress of 20 MPa. What is the maximum principal stress in the beam?

(a) 20 (b) 50
(c) $50 + \sqrt{2900}$ (d) 100

HPPSC Asstt. Prof. 18.09.2017
CSE Pre-2004

Ans. (c) : Given,

$\sigma_b = 100$ MPa
$\tau_{max} = 20$ MPa

Max. Principle stress, $\sigma = \frac{\sigma_b}{2} + \sqrt{\left(\frac{\sigma_b}{2}\right)^2 + \tau_{xy}^2}$

$$= \left(\frac{100}{2}\right) + \sqrt{\left(\frac{100}{2}\right)^2 + (20)^2}$$

$$= 50 + \sqrt{(50)^2 + (20)^2}$$

$$\sigma = 50 + \sqrt{2900} \text{ MPa}$$

421. What is the normal stress on a plane inclined at 45° to the axis of a square rod of side a subjected to an axial tensile force of T

(a) T/a^2 (b) $T/2a^2$
(c) $T/4a^2$ (d) $T/8a^2$

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) :

$$\sigma_\theta = \left(\frac{\sigma_x + \sigma_y}{2}\right) + \left(\frac{\sigma_x - \sigma_y}{2}\right)\cos 2\theta + \tau_{xy}\sin 2\theta$$

$$\sigma_x = \frac{T}{a^2}$$

$\sigma_y = 0$, $\tau_{xy} = 0$

Search on Telegram @apna_pdf

$$\therefore \sigma_\theta = \frac{\sigma_x}{2} + \frac{\sigma_x}{2}\cos 2\theta$$

$$\sigma_{45^\circ} = \frac{T}{2a^2} + \frac{T}{2a^2}\cos 90^\circ$$

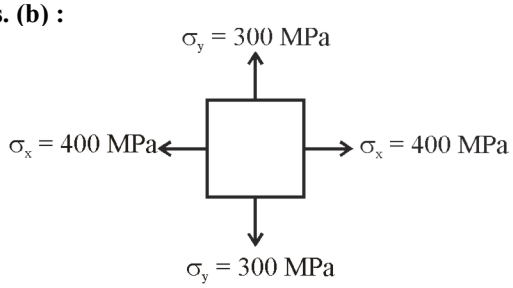
$$\sigma_{45^\circ} = \frac{T}{2a^2}$$

422. Principal stresses at a point in a stressed solid are 400 MPa and 300 MPa respectively. The normal stress on plane inclined at ± 45° to the principal planes will be

(a) 200 MPa and 5 MPa
(b) 350 MPa and both planes
(c) 100 MPa and 600 MPa
(d) 1500 Mpa and 500 MPa

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2000

Ans. (b) :



$$\sigma_\theta = \frac{(\sigma_x + \sigma_y)}{2} + \frac{\sigma_x + \sigma_y}{2}\cos 2\theta + \tau_{xy}\sin 2\theta$$

$\tau_{xy} = 0$

Normal stress on plane inclined at 45°

$$\sigma_\theta = \frac{400+300}{2} + \frac{400+300}{2} \times \cos 90^\circ$$

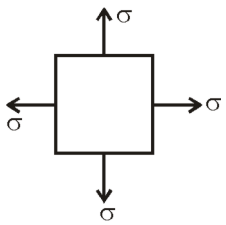
$= 350$ MPa on both planes.

423. When the two principal stresses are equal and like, the resultant stress on any plane is

(a) equal to principal stress
(b) zero
(c) one half of the principal stress
(d) one third of the principal stress

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : When two principal stresses are equal and like



Resultant stress on any plane

$$\sigma_R = \sqrt{\sigma_\theta^2 + \tau_\theta^2}$$

$\sigma_\theta = \sigma$ (irrespective of any plane)

$\tau_\theta = 0$

$\sigma_R = \sigma$ (Magnitude of principal stress)

424. The ratio of the maximum shear stress to the difference of the two principal stresses is

(a) 1/2 (b) 1/3
(c) 1/4 (d) 1.6

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : Maximum shear stress on any plane

In plane $\tau_{max} = \frac{\sigma_1 - \sigma_2}{2}$

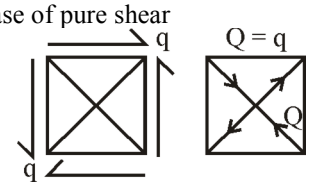
$$\frac{\tau_{max}}{\sigma_1 - \sigma_2} = \frac{\sigma_1 - \sigma_2}{2(\sigma_1 - \sigma_2)} = 1 : 2$$

425. A specimen is subjected to pure shear, the shear stress being q. Tensile and compressive stresses of intensity Q occur on planes inclined at 45° to the shear stress. What is the value of the ratio Q/q?

(a) 2 (b) 1.5
(c) 1.25 (d) 1

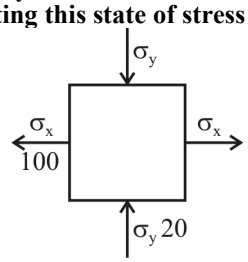
TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : Case of pure shear



$$\therefore \frac{Q}{q} = 1$$

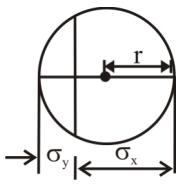
426. Following figure shows the state of stress at a certain point in a stressed body. The magnitudes of normal stresses in the x and y directions are 100 MPa and 20 MPa respectively. The radius of Mohr's stress circle representing this state of stress is



(a) 120 (b) 80
(c) 60 (d) 40

TSPSC AEE 2017

Ans. (c) :



$$r = \frac{\sigma_x - \sigma_y}{2} = \frac{100 - (-20)}{2} = 60\,\text{MPa}$$

So, Radius of Mohr's circle = 60 MPa

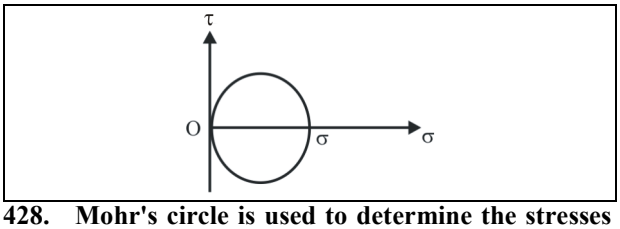
427. Under which loading condition Mohr's circle touches the origin of shear stress axis and having one positive principal stress?

(a) Uniaxial compression
(b) Uniaxial tension
(c) Pure torsion
(d) None of the above

Punjab PSC SDE 12.02.2017

Ans. (b) : For Uniaxial Tension Mohr's circle touches the origin of shear stress axis and having one positive principal stress.

Search on Telegram @apna_pdf



428. Mohr's circle is used to determine the stresses on an oblique section of a body subjected to :
(a) Direct tensile stress in one plane accompanied by a shear stress
(b) Direct tensile stress in two mutually perpendicular directions
(c) Direct tensile stress in two mutually perpendicular directions accompanied by a simple shear stress
(d) All of the above

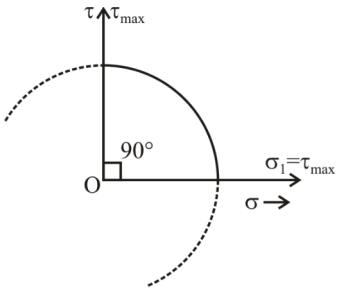
Punjab PSC SDE 12.02.2017

Ans. (d) : Mohr's circle is used to determine the stresses on an oblique section of a body subjected to.
(i) Direct tensile stress in one plane accompanied by a shear stress.
(ii) Direct tensile stress in two mutually perpendicular directions.
(iii) Direct tensile stress in two mutually perpendicular directions accompanied by a simple shear stress.

429. A shaft with a circular cross-section is subjected to pure twisting moment. The ratio of the maximum shear stress to the largest principal stress is
(a) 2.0 (b) 1.0
(c) 0.5 (d) 0

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) :



Pure twisting means pure shear, we have

$$\sigma_1 = \tau_{max}$$

Where, σ_1 is largest principle stress.
So, Ratio is equal to 1.

430. At a point in a bi-axially loaded member, the principal stresses are found to be 60 MPa and 80 MPa. If the critical stress of the material is 240 MPa, what could be the factor of safety according to the maximum shear stress theory?
(a) 2 (b) 3
(c) 4 (d) 5

JWM 2017

Ans. (b) : Principle stress, $\sigma_1 = 80$ MPa
$\sigma_2 = 60$ MPa
$\sigma_3 = 0$ MPa
Critical stress, $\sigma_y = 240$ MPa
According to maximum shear stress theory-

$$\left[\left|\frac{\sigma_1-\sigma_2}{2}\right| \text{or} \left|\frac{\sigma_2-\sigma_3}{2}\right| \text{or} \left|\frac{\sigma_3-\sigma_1}{2}\right|\right]_{max} = \frac{\sigma_y}{2\times N}$$

$$\frac{80}{2} = \frac{240}{2\times N}$$

Factor of safety N = 3

431. The principle stresses σ_1, σ_2 and σ_3 at a point respectively are 80 MPa, 30 MPa and – 40 MPa. The maximum shear stress is:
(a) 60 MPa (b) 55 MPa
(c) 35 MPa (d) 25 MPa

TRB Polytechnic Lecturer 2017

Ans. (a) : Given as,
$\sigma_1 = 80$ MPa
$\sigma_2 = 30$ MPa
$\sigma_3 = -40$ MPa
We know that maximum shear stress will be,
$\tau_{max.}$ = Maximum of

$$\left|\left(\frac{\sigma_1-\sigma_2}{2}\right),\left(\frac{\sigma_2-\sigma_3}{2}\right),\left(\frac{\sigma_3-\sigma_1}{2}\right)\right|$$

$$= \text{Max. of } \left|\left[\frac{80-30}{2}\right],\left[\frac{30-(-40)}{2}\right],\left[\frac{-40-80}{2}\right]\right|$$

$\tau_{max.} = 60$ MPa

432. Consider a plane stress case, where $\sigma_x = 3$ Pa, $\sigma_y = 1$ Pa and $\tau_{xy} = 1$ Pa. One of the principal directions w.r.t. x-axis would be
(a) 0° (b) 15°
(c) 22.5° (d) 45°

BPSC AE Mains 2017 Paper - VI

Ans : (c) : Given,
$\sigma_x = 3$ Pa
$\sigma_y = 1$ Pa
$\tau_{xy} = 1$ Pa

$$\tan 2\theta = \frac{2\tau_{xy}}{\sigma_x-\sigma_y} = \frac{2\times 1}{3-1}$$

$$= 1$$

$\tan 2\theta = \tan 45°$
$\theta = 22.5°$

433. An elastic body is subjected to a tensile stress X in a particular direction and a compressive stress Y in its perpendicular direction. X and Y are unequal in magnitude. On the plane of maximum shear stress in the body there will be:
(a) No normal stress
(b) Also the maximum normal stress
(c) The minimum normal stress
(d) Both normal and shear stress

HPPSC Asstt. Prof. 18.11.2016

Ans. (d) : Maximum shear stress plane
Normal stress on maximum shear stress plane

$$= \frac{\sigma_1+\sigma_2}{2} = \frac{\sigma_x+\sigma_y}{2}$$

Shear stress on maximum shear stress plane
$(\tau_{max})_{in\ plane} = \pm$ Radius of Mohr's circle.

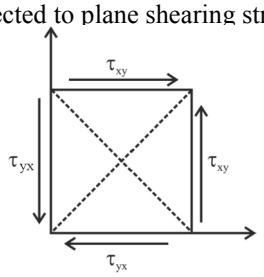
Search on Telegram @apna_pdf

434. The maximum tangential stress acting on a plane inclined to the direction of the axial stress (P) in a tensile bar is equal to
(a) P (b) 2P
(c) P/2 (d) 3P/2
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : We know that maximum tangential stress occur at 45°, So the Axial Stress P/2→ R_{max} for 45°.

435. If an element in a body is in equilibrium under shearing stresses only, such a state of stress is called
(a) Pure rotation
(b) Pure shear
(c) Pure bending
(d) None of the given answers
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : When only two Normal stresses are present the state of stress is called Biaxial. In pure shear, the element is subjected to plane shearing stresses only.



436. An element is subjected to σ_x = 35 (Mpa (tensile) and σ_y = 20 MPa (tensile) and shear stress τ = 7.5 MPa. Then the direction of principal stresses is
(a) 45° (b) 22.5°
(c) 30° (d) 15°
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : We know that,

$$\tan 2\theta = \frac{2\tau}{\sigma_1 - \sigma_2}$$

$$\tan 2\theta = \frac{2\times 7.5}{35-20}$$

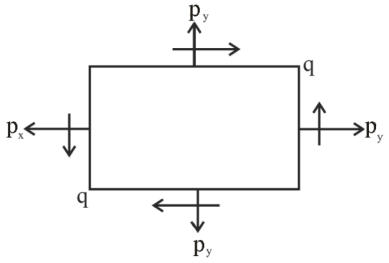
$$\tan 2\theta = 1$$

$$2\theta = 45^\circ \Rightarrow \theta = 22.5^\circ$$

437. If normal stresses of same nature p_x and p_y and shear stress q are acting on two perpendicular plans and $q = (p_x\, p_y)^{1/2}$, then the major and minor principal stresses respectively are
(a) $p_x + p_y$ and $p_x - p_y$
(b) p_x and $p_x - p_y$
(c) $0.5\,(p_x + p_y)$ and $0.5(p_x - p_y)$
(d) $p_x + p_y$ and zero
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) :

$$\left.\begin{matrix}\sigma_1\\ \sigma_2\end{matrix}\right\} = \frac{p_x + p_y}{2} \pm \sqrt{\frac{(p_x - p_y)^2}{4} + q^2}$$



$$= \frac{p_x + p_y}{2} \pm \sqrt{\frac{p_x^2 + p_y^2 - 2p_xp_y + 4p_xp_y}{4}}$$

$$= \frac{p_x + p_y}{2} \pm \sqrt{\left(\frac{p_x + p_y}{2}\right)^2}$$

$$\sigma_1 = \frac{p_x + p_y}{2} + \frac{p_x + p_y}{2} = p_x + p_y$$

$$\sigma_2 = \frac{p_x + p_y}{2} - \frac{p_x + p_y}{2} = 0$$

438. The maximum shearing stress produced by shrinkfit between two cylinders (mounted one inside the other) of $E=2\times10^6$ kg(f)/m^2 and shrinkage factor = 0.002, is equal to
(a) 2000 kg(f)/m^2 (b) 2500 kg(f)/m^2
(c) 4000 kg(f)/m^2 (d) 1000 kg(f)/m^2
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : j

439. The three dimensional state of stress at a point is given by:

$$[\sigma] = \begin{bmatrix} 60 & 20 & -20 \\ 20 & 0 & 40 \\ -20 & 40 & 0 \end{bmatrix} \text{MN/m}^2$$

What is the shear stress in the xy-plane at the same point?
(a) –20 MN/m^2 (b) –40 MN/m^2
(c) 20 MN/m^2 (d) 40 MN/m^2
(e) 300 MN/m^2
CGPSC Asstt. Workshop Supt., 17.07.2016

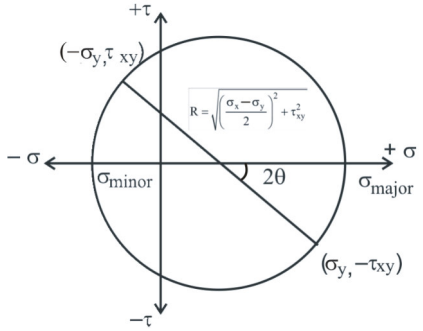
Ans. (c) : As, we know,
Three dimensional state of stress, of a point is given by–

$$\begin{bmatrix} \sigma_x & \tau_{xy} & \tau_{xz} \\ \tau_{yx} & \sigma_y & \tau_{yx} \\ \tau_{zx} & \tau_{xy} & \sigma_z \end{bmatrix} = \begin{bmatrix} 60 & 20 & -20 \\ 20 & 0 & 40 \\ -20 & 40 & 0 \end{bmatrix}$$

So, $\tau_{yx} = \tau_{xy} = 20$ MN/m^2

440. When the principal stresses are unlike, in Mohr's circle, the normal resultant stresses will be
(a) Negative for points on the circle to the left of the vertical axis through the origin
(b) Negative for points on the circle to the right of the vertical axis through the origin
(c) Positive for points on the circle to the left of the vertical axis through the origin
(d) Either negative or positive depends on the shear stress and radius of the Mohr's circle.
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Mohr's circle for unlike principle stresses–



Search on Telegram @apna_pdf

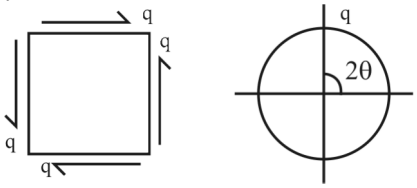
When the principal stresses are unlike in Mohr's circle, the normal and resultant stresses will be negative for points on the circle to the left of the vertical axis through the origin.

441. Complementary shear stresses of intensity q are induced at a point on a body, the plane carrying the maximum shear stress are at the following angle with the principle planes

(a) 45^0 (b) 30^0
(c) 60^0 (d) 90^0

APPSC AE Subordinate Service Civil/Mech. 2016
HPPSC Workshop Suptd. 08.07.2021
HPPSC Lect. 2016

Ans. (a) :



From mohr circle for max shear

$2\theta = 90^0$

$\theta = 45^0$

Alternatively by analytical method

$$\tau_{xy} = \frac{\sigma_1 - \sigma_2}{2} \times \sin 2\theta$$

For τ_{xy} to be max,

$\sin 2\theta = 1$ (Numerically)

$2\theta = 90^0$ or 270^0

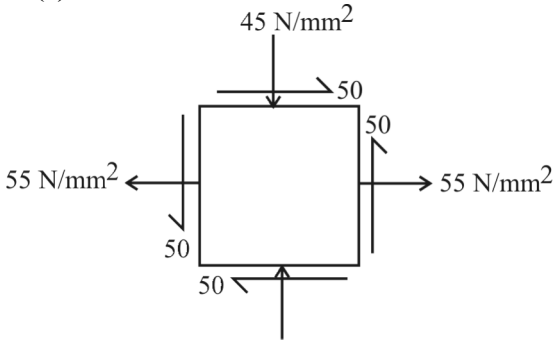
$\theta = 45^0$ or 135^0

442. The normal stresses of 55 N/mm^2 tensile and 45 N/mm^2 compressive on two mutually perpendicular planes are acting at a point in a piece of elastic material. These planes also carry shear stresses of 50 N/mm^2. The minor principal stress will be

(a) 65.71 N/mm^2 compressive
(b) 75.71 N/mm^2 tensile
(c) 65.71 N/mm^2 tensile
(d) 75.71 N/mm^2 compressive

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Sign conversion, Tensile = + ve

Comp. = –ve

$$\sigma_{major/minor} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau^2_{xy}}$$

Considering positive sign for major principle stress and negative sign for minor principle stress.

$\sigma_x = 55$ N/mm^2, $\sigma_y = -45$ N/mm^2, $\tau_{xy} = 50$ N/mm^2

$$\sigma_{minor} = \frac{55 + (-45)}{2} - \sqrt{\left[\frac{55 - (-45)}{2}\right]^2 + 50^2}$$

$\sigma_{minor} = 5 - 70.71 = -65.71$ N/mm^2

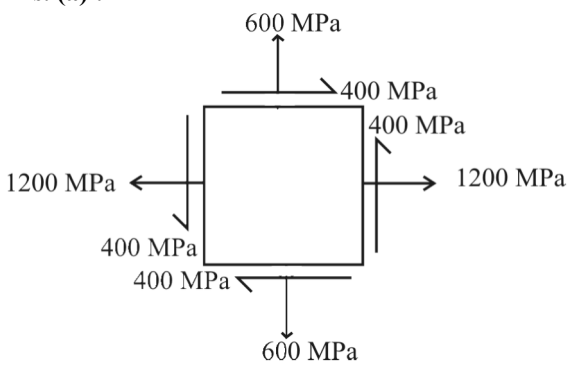
$\boxed{\sigma_{minor} = 65.71 \text{ N/mm}^2 \text{ (compressive)}}$

443. A body is subjected to tensile stress of 1200 MPa on one plane and another tensile stress of 600 MPa on a plane at right angles to the former. It is also subjected to a shear stress of 400 MPa on the same planes. The maximum shear stress will be

(a) 500 MPa (b) 1400 MPa
(c) 900 MPa (d) 400 MPa

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



$$\tau_{max} = \frac{\sigma_1 - \sigma_2}{2}$$

$$\sigma_1 = \sigma_{major} = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{1200 + 600}{2} + \sqrt{\left(\frac{1200 - 600}{2}\right)^2 + 400^2}$$

$= 900 + 500 = 1400$ MPa

$$\sigma_2 = \sigma_{minor} = \frac{\sigma_x + \sigma_y}{2} - \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right) - \tau^2_{xy}}$$

$= 900 - 500 = 400$ MPa

$$\tau_{max} = \frac{1400 - 400}{2} = 500 \text{ MPa}$$

444. For an inclined plane in a rectangular block subjected to two mutually perpendicular normal stresses 100 MPa and 400 MPa and shear stresses 400 MPa, the maximum normal stress will be

(a) 1200 MPa (b) 700 MPa
(c) 600 MPa (d) 200 MPa

APPSC AEE Screening Test 2016

Ans. (*) : Given,

$\sigma_x = 100$ MPa

$\sigma_y = 400$ MPa

$\tau_{xy} = 400$ MPa

Maximum normal stress $(\sigma_1)_{max}$

Search on Telegram @apna_pdf

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{100 + 400}{2} \pm \sqrt{\left(\frac{(100 - 400)}{2}\right)^2 + (400)^2}$$

$$= 250 \pm \sqrt{(150)^2 + (400)^2}$$

σ_1 = 677.2 MPa (maximum normal stress)

σ_2 = 177.2 MPa (minimum normal stress)

445. The principal strains at a point in a body under biaxial state of stress are 1000×10^{-6} and -600×10^{-6}. What is the maximum shear strain at that point?

(a) 200×10^{-6} (b) 800×10^{-6}

(c) 1000×10^{-6} (d) 1600×10^{-6}

RPSC 2016
ESE 2009
GATE 1996

Ans : (d) Given,

$\in_1 = 1600 \times 10^{-6}$

$\in_2 = -600 \times 10^{-6}$

Maximum Shear strain is given by

$$\frac{\gamma_{max}}{2} = \frac{\in_1 - \in_2}{2}$$

$$\therefore \gamma_{max} = \in_1 - \in_2$$

$$= 1000 \times 10^{-6} - (-600 \times 10^{-6})$$

$$= 1600 \times 10^{-6}$$

446. Mohr's circle construction is valid for both stresses as well as the area moment of inertia, because

(a) both are tensors of first-order

(b) both are tensors of second- order

(c) both are axial vectors

(d) both occur under plane stress condition

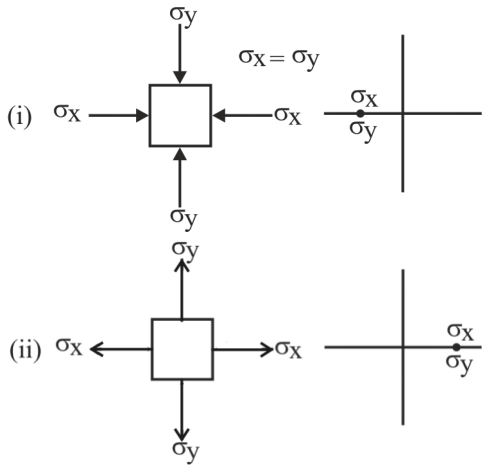
BPSC Poly. Lect. 2016

Ans : (b) Mohr's circle construction is valid for both stresses as well as the area moment of inertia because both are tensors of second order.

447. In which of the following two dimensional state of stress, Mohr's stress circle takes the shape of a point.

(a) 
(b) 
(c) 
(d) 
UPPSC AE 12.04.2016 Paper-I
CSE Pre-1996

Ans : (c) Draw Mohr's circle like equal normal stress without shear stress :-



In both condition Mohr's stress circle takes the shape of a point.

448. The state of stress at a point under plane stress conditions is σ_{xx} = 40 MPa, σ_{yy} = 100 MPa; τ_{xy} = 40 MPa (notations have usual meaning). The radius of the Mohr's circle representing the given state of stress in MPa is

(a) 40 (b) 50

(c) 60 (d) 100

OPSC AEE 2019 Paper-I
RPSC ADE 2016
GATE 2012, ESE 2005

Ans. (b) : Radius of Mohr's circle = max shear stress

$$= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \sqrt{\left(\frac{40 - 100}{2}\right)^2 + 40^2}$$

= 50 MPa

449. On principal plane the principal stress is :

(a) Maximum/Minimum

(b) Zero

(c) Unity

(d) Depends on applied strain.

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : Principle plane is a plane on which principal stress is either maximum or minimum but shear stress on this is plane is zero. such plane is known as principal plane or plane of zero shear stress.

450. The Mohr's circle for the following loading condition has center coincide with the origin of the normal stress-shear stress co-ordinate system

(a) Uni-axial tension

(b) Uni-axial compression

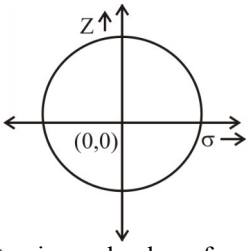
(c) Bi-axial tension

(d) Pure torsion

GPSC Asstt. Prof. (Prod.) 21.08.2016

Search on Telegram @apna_pdf

Ans. (d) :

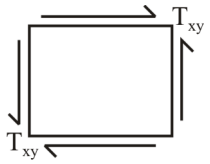


In case of pure torsion only shear force will come into play.
Then centre of circle (Mohr's) will be origin of stress shear stress co-ordinate system.

451. A cylindrical elastic body subjected to pure torsion about its axis develops :
(a) Tensile stress in a direction 45° to the axis
(b) No tensile or compressive stress
(c) Max shear stress along the axis of shaft
(d) Max shear stress at 45° to the axis

HPPSC Asstt. Prof. 18.11.2016

Ans. (a) :



$$\sigma_{1,2} = \frac{1}{2}\left[\sigma_x + \sigma_y \pm \sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}\right]$$

$$\sigma_{1,2} = \frac{1}{2}\left[0 \pm \sqrt{4\tau_{xy}^2}\right]$$

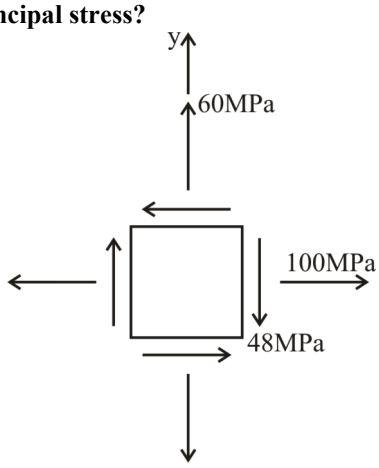
$$\sigma_{1,2} = \pm \tau_{xy}$$

$$\tan(2\theta_p) = \frac{2\tau_{xy}}{\sigma_x - \sigma_y} = \infty$$

$$2\theta = \frac{\pi}{2}$$

$$\theta = 45°$$

452. For the state of plane surface shown, determine the principal planes and the principal stress?



(a) $\theta_p = 35.7°$ and $\sigma_{max} = +132$ MPa, $\sigma_{min} = +28$ MPa
(b) $\theta_p = 33.7°$ and $\sigma_{max} = +122$ MPa, $\sigma_{min} = +28$ MPa
(c) $\theta_p = 33.7°$ and $\sigma_{max} = +132$ MPa, $\sigma_{min} = +22$ MPa
(d) $\theta_p = 33.7°$ and $\sigma_{max} = +132$ MPa, $\sigma_{min} = +28$ MPa
(e) None of these

CGPSC AE 16.10.2016

Ans. (d) : As we know that,
Principal stresses are :

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

And $$\tan 2\theta_p = \left(\frac{2\tau_{xy}}{\sigma_x - \sigma_y}\right)$$

So, $$\theta_p = \frac{1}{2}\tan^{-1}\left(\frac{2\times 48}{100-60}\right) = 33.7°$$

$$\sigma_{1,2} = \frac{100+60}{2} \pm \sqrt{\left(\frac{100-60}{2}\right)^2 + 48^2}$$

$\sigma_{max} = 132$ MPa $\quad$ $\sigma_{min} = 28$ MPa

453. At a point in two-dimensional stress system $\sigma_x = 100$ N/mm^2, $\sigma_y = \tau_{xy} = 40$ N/mm^2. What is the radius of the Mohr circle for stress drawn with a scale of : 1 cm = 10 N/mm^2?
(a) 3 cm (b) 4 cm
(c) 5 cm (d) 6 cm
(e) None of the above

CGPSC Poly. Lect. 22.05.2016
ESE 2005

Ans. (c) : Given
$\sigma_x = 100$ N/mm^2
$\sigma_y = \tau_{xy} = 40$ N/mm^2

Radius Mohr's circle, $(R) = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

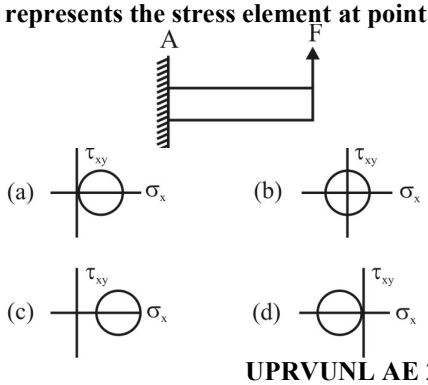
$$= \sqrt{\left(\frac{100-40}{2}\right)^2 + (40)^2}$$

$$= \sqrt{(30)^2 + (40)^2}$$

$$= \sqrt{900+1600} = \sqrt{2500}$$

$= 50$ N/mm^2
[$\because$ given, 1cm = 10N/mm^2]
$\boxed{R = 5\text{cm}}$

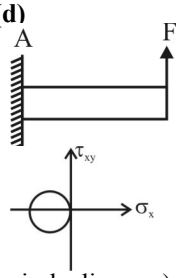
454. A cantilever beam is loaded as shown here. Which one of the Mohr's circle shown here represents the stress element at point A?



UPRVUNL AE 21.08.2016

Search on Telegram @apna_pdf

Ans. : (d)



(Mohr's circle diagram)

455. A body is subjected to a pure tensile stress of 200 units. What is the maximum shear produced in the body at some oblique plane due to the above?

(a) 0 units (b) 50 units
(c) 100 units (d) 150 units
(e) 200 units

CGPSC AE 26.04.2015 Shift-I

Ans. (c) : Maximum shear stress

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

here $\sigma_y = 0$, $\tau_{xy} = 0$, $\sigma_x = 200$ units

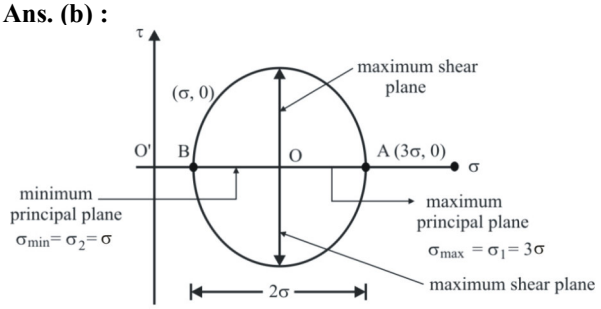
$$\tau_{max} = \frac{\sigma_x}{2} = \frac{200}{2} = 100 \text{ units}$$

456. Plane stress at a point in a body is defined by principal stresses 3σ and σ. The ratio of the normal stress to the maximum shear stresses on the plane the maximum shear stress is :

(a) 1 (b) 2
(c) 3 (d) 4

TSPSC Managers, 2015
ESE 2000

Ans. (b) :



Maximum shear stress $(\tau_{max}) = \frac{3\sigma - \sigma}{2} = \sigma$

Normal stress $(\sigma_n) = \frac{3\sigma + \sigma}{2} = 2\sigma$

(At maximum shear stress) Now,

$$\frac{\sigma_n}{\tau_{max}} = \frac{2\sigma}{\sigma} = 2$$

457. The state of stress at a point is given as

$\sigma_x = 100 N/mm^2$

$\sigma_y = 40 N/mm^2$

and $\tau_{xy} = 40 N/mm^2$

If the yield strength S_{yt} of the material is 300 MP_a, the factor of safety using maximum shear stress

(a) 3 (b) 2.5
(c) 7.5 (d) 1.25

VIZAG MT 2015

Ans. (a) : Given,

$\sigma_x = 100 N/mm^2$

$\sigma_y = 40 N/mm^2$

$\tau_{xy} = 40 N/mm^2$

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{100 + 40}{2} \pm \sqrt{\left(\frac{100 - 40}{2}\right)^2 + (40)^2}$$

$$= 70 \pm \sqrt{(30)^2 + (40)^2}$$

$\sigma_{1,2} = 70 \pm 50$

$\sigma_1 = 120 N/mm^2$

$\sigma_2 = 20 N/mm^2$

$$\frac{\sigma_1 - \sigma_2}{2} \le \frac{S_{yt}}{2 FOS}$$

$$(120 - 20) \le \frac{300}{FOS}$$

$$FOS = \frac{300}{100}$$

$\boxed{FOS = 3}$

458. A machine element is subjected to the normal stress of 80 MPa and shear stress of 60 MPa. The yield strength of material is 320 MPa. The factor of safety using maximum shear stress theory will be

(a) 2.85 (b) 4
(c) 2.29 (d) none of these

VIZAG MT 2015

Ans. (c) : Given $\sigma_x = 80 MPa$

$\sigma_y = 0$

$\tau_{xy} = 60 MPa$

$$\sigma_{1,2} = \frac{80 - 0}{2} \pm \sqrt{\left(\frac{80 - 0}{2}\right)^2 + (60)^2}$$

$\sigma_1 = 112.11 N/mm^2$

$\sigma_2 = -32.11 N/mm^2$

$$\frac{\sigma_1 - \sigma_2}{2} \le \frac{S_{yt}}{2FOS}$$

$$\frac{112.11 - (-32.11)}{2} \le \frac{320}{2FOS}$$

$$FOS = \frac{320}{144.22}$$

$FOS = 2.21 \approx 2.29$

The closest answer is option (c).

459. For any state of stress it is always possible to define a new co-ordinate system, which has axis perpendicular to the planes on which the .....

Search on Telegram @apna_pdf

(a) maximum compressive stress act
(b) maximum shear stress act
(c) maximum normal stress act
(d) None of the above

KPSC ADF 2015

Ans. (b) : The orientations of maximum and minimum shear planes are at right angles to each other.
Maximum shear stress, it can be seen that the planes of maximum and minimum shear stress occur at an angle of 45^0 and 135^0 with respect to the plane of maximum and minimum normal stress respectively.

460. The co-ordinate of any point on Mohr's circle represent :
(a) State of stress at a point with reference to any arbitrary set of orthogonal axes passing through that point
(b) Principal stresses at a point
(c) One of the two direct stresses and shearing stress at a point
(d) Two direct stresses at a point

(HPPSC AE 2014)

Ans : (c) The coordinate of any point on Mohr's circle represent one of the two direct stresses and shearing stress at a point.

461. Ellipse of stress can be drawn only when a body is acted upon by :
(a) one normal stress
(b) two normal stresses
(c) one shear stress
(d) two normal stresses and one shear stress

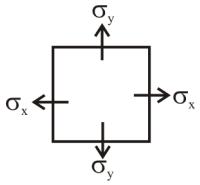
(HPPSC AE 2014)

Ans : (b) Ellipse of stress is used to find resultant stress and the angle of obliquity on any plane within a stressed body. In 2-D, it is called Ellipse of stress. In 3-D it is called Ellipsoid of stress.
The axis of ellipse are the two principle stresses.

462. State of plane stress in x-y plane is accompanied by strains along:
(a) x, y and z- axes (b) x and y- axes
(c) x and z- axes (d) y and z- axes

HPPSC Asstt. Prof. 2014

Ans. (a) :

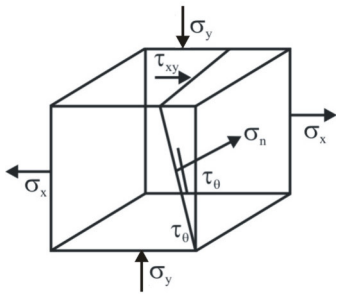


stresses
In plane stress condition, $\sigma_x \neq 0$, $\sigma_y \neq 0$, but $\sigma_z = 0$
and strains
$\varepsilon_x \neq 0$, $\varepsilon_y \neq 0$ & $\varepsilon_z \neq 0$
i.e. stain along x, y and z all exist.

463. Normal stresses of equal magnitude "p" but of opposite signs, act at a point of strained material in perpendicular direction. What is the magnitude of the resultant normal stress on plane inclined at 45^0 to the applied stresses?
(a) 2p (b) p/2
(c) p/4 (d) 0

UPRVUNL AE 2014, ESE 2005

Ans : (d)



$$(\sigma_n)_{max} = \left(\frac{\sigma_x + \sigma_y}{2}\right) + \left(\frac{\sigma_x - \sigma_y}{2}\right)\cos 2\theta + \tau_{xy}\sin 2\theta$$

$(\sigma_n)_{max}$ = Maximum Normal stress

τ_{xy} = Shear stress

Given $\sigma_x = \sigma_y = p$ and $\theta = 45^0$

$\sigma_x = p, \quad \sigma_y = -p$

$$(\sigma_n)_{max} = \left(\frac{p-p}{2}\right) + \left(\frac{p+p}{2}\right)\cos 90^0 - 0$$

$$\boxed{(\sigma_n)_{max} = 0}$$

464. The shear strength of every materials tends to be about ____ their tensile strength
(a) half (b) equal
(c) double (d) one third

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (a) : Shear strength

$$\tau_{sy} = \frac{\sigma_{yt}}{2} = 0.5\sigma_{yt} \text{ (Guest \& Tresca's theory)}$$

$$\tau_{sy} = \frac{\sigma_{yt}}{\sqrt{3}} = 0.577\sigma_{yt} \text{ (Von-Mises theory)}$$

465. Strain gauge transducers are used to measure :
(a) Tensile Torsion and Compressive forces
(b) Tensile forces alone
(c) Compressive forces alone
(d) Torsional forces alone

TNPSC AE (Industries) 09.06.2013

Ans. (a) : Strain gauge transducers are used to measure tensile torsion and compressive forces.

466. The principal stresses at a point across two perpendicular planes are 75 MN/m^2 (Tensile) and 35 MN/m^2 (Tensile). Find the tangential stress and it's obliquity on a plane at 20° with the major principal plane :
(a) 40 sin 40° (b) 20 sin 40°
(c) 40 sin 20° (d) 20 sin 20°

TNPSC AE (Industries) 09.06.2013

Ans. (b) : Given,
$\sigma_x = 75$ MPa (tensile)
$\sigma_y = 35$ MPa (tensile)

$$\tau = \left(\frac{\sigma_x - \sigma_y}{2}\right)\sin 2\theta$$

$$= \left(\frac{75-35}{2}\right)\sin(2\times 20) = 20 \sin 40°$$

Search on Telegram @apna_pdf

467. The normal stresses on two perpendicular planes through a point in a stressed material are 80 MPa (tensile) and 20 MPa (tensile) respectively. A shear stress of 40 MPa is also acting on these planes. What is the value of maximum shear stress at the point?

(a) 50 MPa (b) Zero
(c) 40 MPa (d) 60 MPa

RPSC AEN Pre-2013
GATE 2015

Ans. (a) : $\sigma_x = 80$ MPa (Tensile)
$\sigma_y = 20$ MPa (Tensile), $\tau_{xy} = 40$ MPa
Maximum shear stress τ_{max} in plane–

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + (\tau_{xy})^2}$$

$$= \sqrt{\left(\frac{80-20}{2}\right)^2 + (40)^2}$$

$$= \sqrt{(30)^2 + (40)^2}$$

$$= 50 \text{ MPa}$$

468. A solid circular shaft is subjected to a maximum shear stress of 140MPa. Magnitude of maximum normal stress developed in the shaft is:-

(a) 60 MPa (b) 90 MPa
(c) 110 MPa (d) 140 MPa

UKPSC AE-2013, Paper-I
CSE Pre-1995
APPSC AEE 2012
APPSC AE 04.12.2012

Ans. (d) : Maximum normal stress,

$$\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$$

$$\sigma_x = 0, \sigma_y = 0, \tau_{xy} = 140 \text{ MPa}$$

$$\sigma_{1,2} = 0 \pm \frac{1}{2}\sqrt{4 \times (140)^2}$$

$$\sigma_{1,2} = \pm 140 \text{ MPa}$$

Then, Maximum normal stress is 140 MPa.

469. The state of plane-stress at a point is given by σ_x = –200 MPa, σ_y = 100 MPa and τ_{xy} = 100 MPa. The maximum shear stress in MPa is

(a) 111.8 (b) 150.1
(c) 180.3 (d) 223.6

Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2010

Ans. (c) : Given, $\sigma_x = -200$ MPa, $\sigma_y = 100$ MPa
$\tau_{xy} = 100$ MPa

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\tau_{max} = \sqrt{\left(\frac{-200-100}{2}\right)^2 + (100)^2}$$

$$= \sqrt{150^2 + 100^2}$$

$$\tau_{max} = 180.3 \text{ MPa}$$

470. A shaft subjected to torsion experiences a pure shear stress on the surface. The maximum principle stress on the surface which is at 45° to the axis will have a value

(a) $\tau\cos45°$ (b) $2\tau\cos45°$
(c) $2\tau\sin45°\cos45°$ (d) $\tau\cos^2 45°$

Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2003

Ans. (c) : It is a pure shear stress case,
$\sigma_x = \sigma_y = 0$ and $\tau_{xy} = \tau$ and $\theta = 45°$
Maximum principal stress,

$$\sigma_p = \frac{(0+0)}{2} + \left(\frac{0-0}{2}\right)\cos(2\times 45°) + \tau \times \sin(2\times 45°)$$

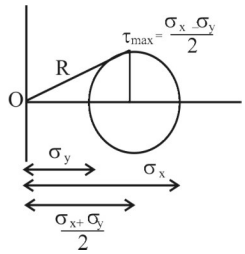
$\sigma_p = \tau.\sin2 \times 45°$
$\sigma_p = 2\tau.\sin45°.\cos45°$ $(\sin2\theta = 2.\sin\theta.\cos\theta)$
$\therefore$ The resulting normal stress (tensile or compressive) on planes inclined at 45° to the direction of the shear stresses is equal to τ.

471. If the principal stresses at a point in a strained body are σ_x and $\sigma_y (\sigma_x > \sigma_y)$, resultant stress on a plane carrying the maximum shear stress is equal to

(a) $\sqrt{\sigma_x^2 + \sigma_y^2}$ (b) $\sqrt{\sigma_x^2 - \sigma_y^2}$
(c) $\sqrt{\frac{\sigma_x^2 + \sigma_y^2}{2}}$ (d) $\frac{\sqrt{\sigma_x^2 - \sigma_y^2}}{2}$

APPSC AEE 2012

Ans : (c) If the principal stresses at a point in strained body are σ_x and σ_y then the resultant stress on a plane.
Center of Mohr's Circle



$$\left[\frac{\sigma_x + \sigma_y}{2}, 0\right]$$

Resultant stress on a plane

$$\sigma_R = \sqrt{\sigma_n^2 + \tau_{max}^2}$$

$$\sigma_R = \sqrt{\left[\frac{\sigma_x + \sigma_y}{2}\right]^2 + \left[\frac{\sigma_x - \sigma_y}{2}\right]^2}$$

$$\sigma_R = \sqrt{\left[\frac{\sigma_x^2 + \sigma_y^2 + 2\sigma_x\sigma_y + \sigma_y^2 + \sigma_y^2 - 2\sigma_x\sigma_y}{4}\right]}$$

$$\sigma_R = \sqrt{\frac{2\left[\sigma_x^2 + \sigma_y^2\right]}{4}} = \sqrt{\frac{\sigma_x^2 + \sigma_y^2}{2}}$$

472. Angle between the principal planes is

(a) 270^0 (b) 180^0
(c) 90^0 (d) 45^0

APPSC AEE 2012

Ans : (c) Angle between the principal plane is 90^0.

Search on Telegram @apna_pdf

473. $\sigma_x + \sigma_y = \sigma_{x'} + \sigma_{y'} = \sigma_1 + \sigma_2$
The above relation is called
(a) independency of normal stresses
(b) constancy of normal stresses
(c) first invariant of stress
(d) all the above three

UKPSC AE 2012 Paper-I

Ans. (c) : first invariant of stress

474. **When a body is subjected to direct tensile stresses (σ_x and σ_y) in two mutually perpendicular directions, accompanied by a simple shear stress τ_{xy}, then in Mohr's circle method, the circle radius is taken as**

(a) $\frac{\sigma_x - \sigma_y}{2} + \tau_{xy}$

(b) $\frac{\sigma_x + \sigma_y}{2} + \tau_{xy}$

(c) $\frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$

(d) $\frac{1}{2}\sqrt{(\sigma_x + \sigma_y)^2 + 4\tau_{xy}^2}$

UKPSC AE 2012 Paper-I

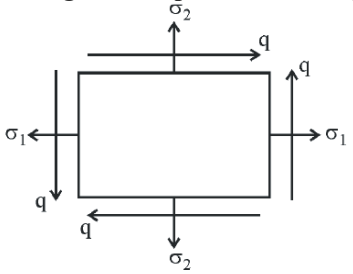
Ans. (c) : $R = \frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$

475. **Choose the correct relationship in the given statements of Assertion (A) and Reason (R).**
Assertion (A) : A plane state of stress does not necessarily result into a plane state of strain.
Reason (R) : Normal stresses acting along X and Y directions will also result into strain along the Z-direction.
Code :
(a) Both (A) & (R) are correct. (R) is the correct explanation of (A).
(b) Both (A) & (R) are correct. (R) is not the correct explanation of (A).
(c) (A) is true, but (R) is false.
(d) (A) is false, but (R) is true.

UKPSC AE 2012 Paper-I

Ans. (a) : Both (A) & (R) are correct. (R) is the correct explanation of (A).

476. **A body is subjected to two unequal like direct stresses σ_1 and σ_2 in two mutually perpendicular planes along with simple shear stress q**



Which among the following is then a wrong statement ?

(a) The principal stresses at a point are
$P_1, P_2 = \frac{\sigma_1 + \sigma_2}{2} \pm \sqrt{\left[\left(\frac{\sigma_1 - \sigma_2}{2}\right)^2 + q^2\right]}$

(b) The position of principal planes with the plane of stress σ_1, are
$\theta_1 = \frac{1}{2}\tan^{-1}\frac{2q}{\sigma_1 - \sigma_2}; \theta_2 = \theta_1 + 45°$

(c) Maximum shear stress is $(\sigma_t)_{max}$ = $\pm\sqrt{\left[\left(\frac{\sigma_1 - \sigma_2}{2}\right)^2 + q^2\right]}$

(d) Planes of maximum shear are inclined at 45° to the principal planes.

UKPSC AE 2012 Paper-I

Ans. (b) : The position of principal planes with the plane of stress σ_1, are
$\theta_1 = \frac{1}{2}\tan^{-1}\frac{2q}{\sigma_1 - \sigma_2}; \theta_2 = \theta_1 + 45°$

477. **A tension member with a cross-sectional area of 30 mm^2 resists a load of 60 kN. What is the normal stress induced on the plane of maximum shear stress ?**
(a) 2 kN/mm^2 (b) 1 kN/mm^2
(c) 4 kN/mm^2 (d) 3 kN/mm^2

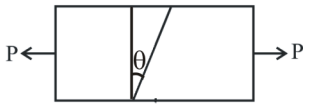
UKPSC AE 2012 Paper-I

Ans. (b) : Given, A = 30 mm^2
P = 60 kN
$\sigma_x = \frac{P}{A} = \frac{60}{30} = 2\ N/mm^2$
$\sigma_y = 0$
$\tau_{max} = \frac{\sigma_x - \sigma_y}{2} = \frac{2-0}{2} = 1 kN/mm^2$

478. **In an axially loaded bar of magnitude P and cross sectional Area A, the shear stress on an inclined plane at an angle θ is**
(a) Zero (b) P/A
(c) P/A cos (2 θ) (d) P/A sin θ cos θ

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (d) : The shear stress



$\tau = \frac{\sigma_x - \sigma_y}{2}\sin 2\theta + \tau_{xy}\cos 2\theta$

$\tau = \frac{P}{2A}\sin 2\theta \qquad \left\{\sigma_x = \frac{P}{A},\ \sigma_y \text{ and } \tau_{xy} = 0\right\}$

$\tau = \frac{P}{2A}(2\sin\theta.\cos\theta)$

$\tau = \frac{P}{A}\sin\theta.\cos\theta$

479. **If the Mohr's circle for a state of stress becomes a point, the state of stress is**
(a) Pure shear state of stress
(b) Uniaxial state of stress

Search on Telegram @apna_pdf

(c) Identical principal stresses
(d) None of the above

UKPSC AE 2012 Paper-I

Ans. (c) : Identical principal stresses

480. In a stressed field, the change in angle between two initially perpendicular lines is called
(a) Normal strain (b) Shear strain
(c) Principal strain (d) Poisson's ratio

UKPSC AE 2012 Paper-I

Ans. (b) : Shear strain

481. A body is subjected to a pure tensile stress of 100 units. What is the maximum shear produced in the body at some oblique plane due to the above?
(a) 100 units (b) 75 units
(c) 50 units (d) 0 unit

TRB Asstt. Prof., 2012
ESE 2006

Ans. (c) :

$\sigma = 100$ units

Max shear stress, $\tau_{max} = \frac{\sigma}{2} = \frac{100}{2}$

$\tau_{max} = 50$ Units

482. At a point on a plane there is normal stress + 100 MPa and a shear stress 'q', on another plane perpendicular to this plane there is normal stress + 20 MPa and a shear stress 'q'. If the maximum principal stress at the point is 110 MPa, what is maximum shear stress at the point :
(a) 50 MPa (b) 30 MPa
(c) 10 MPa (d) None of these

PSPCL AE, 2012

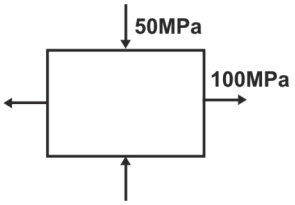
Ans. (a) : Max principal stress,

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \text{radius of mohr circle}$$

$$110 = \frac{100+20}{2} + \text{Radius}$$

Radius of mohr's circle = max. shear stress = 50 MPa

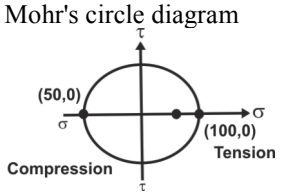
483. For the state of stress shown in the above figure, normal stress acting on the plane of maximum shear stress is



(a) 25 MPa tension
(b) 75 MPa compression
(c) 25 MPa compression
(d) 75 MPa tension

ISRO Scientist/Engineer 2011
ESE 2015

Ans. (a) : State of stress
Mohr's circle diagram



Normal stress on plane of maximum shear stress
= Normal stress at the centre of mohr circle
= Radius of Mohr circle

$$= \frac{100-50}{2} = \frac{50}{2}$$

= 25 MPa

484. A short cast iron cylindrical piece of cross-sectional area 100 mm^2 and length 25 mm is tested in compression and fails at a load of 50 kN. The shear strength of cast iron is.
(a) 500 N/mm^2 (b) 400 N/mm^2
(c) 300 N/mm^2 (d) 250 N/mm^2

UPSC JWM Advt. No.-50/2010

Ans. (d) : As we know,
Maximum shear stress given by–

$$\tau_{max} = \frac{\sigma_1 - \sigma_2}{2} \quad \Rightarrow \quad \therefore \ \sigma_2 = 0$$

$$\tau_{max} = \frac{\sigma_1}{2} = \frac{50\times10^3}{2\times100} = 250\,\text{N/mm}^2 \quad [\sigma_1 = P/A]$$

485. The two-dimensional state of stress at a point is σ_x = 100 N/mm^2, σ_y = 20 N/mm^2 and τ_{zy}. If the larger principal stress at the point is 110 N/mm^2, the smaller principal stress will be
(a) 10 N/mm^2 (b) 15 N/mm^2
(c) 16 N/mm^2 (d) 18 N/mm^2

UPSC JWM Advt. No.-50/2010

Ans. (a) : Given, $\sigma_x = 100$ N/mm^2, $\sigma_y = 20$ N/mm^2
$\sigma_1 = 110$ N/mm^2, $\sigma_2 = ?$

$$\sigma_1 = \frac{\sigma_x + \sigma_y}{2} + \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$110 = \frac{100+20}{2} + \sqrt{\left(\frac{100-20}{2}\right)^2 + \tau_{xy}^2}$$

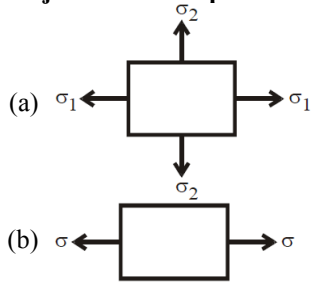
$\tau_{xy} = 30$ N/mm^2

$$\sigma_2 = \frac{\sigma_x + \sigma_y}{2} - \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= 60 - \sqrt{40^2 + 30^2} = 60 - 50$$

$$\boxed{\sigma_2 = 10\,\text{N/mm}^2}$$

486. Which one of the following represents the state of stress on a surface element of a shaft subjected to a torque?

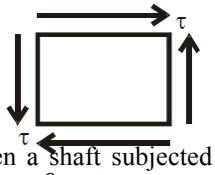


Search on Telegram @apna_pdf

(c)

(d) 
UPSC JWM Advt. No.-50/2010

Ans. (d) : Pure shear stress only –



As we know, when a shaft subjected to torque should have only shear stress & not any normal stress.
So, the correct option is (d).

487. Which one of the following statements is true?
(a) In the principal planes, both normal and shear stresses are always zero
(b) In the principal planes, shear stress may or may not be zero and in the maximum shear planes, normal stresses may or may not be zero
(c) In the principal planes, shear stress is always zero and in the maximum shear planes, normal stresses are always zero
(d) In the principal planes, shear stresses are always zero but in the maximum shear planes, normal stresses may or may not be zero

DRDO Scientists 2009

Ans. (d) : In the principal planes, shear stresses are always zero but in the maximum shear stress planes, normal stress may or may not be zero.

488. At a point on a component loaded under plane stress condition, the stresses are σ_x = 120 MPa, σ_y = 40 MPa and τ_{xy} = 30 MPa. The possible principal stresses are
(a) 130 MPa and –30 MPa
(b) 150 MPa and –50 MPa
(c) 130 MPa and 30 MPa
(d) 150 MPa and 50 MPa

DRDO Scientists 2009

Ans. (c) : $$\sigma_1, \sigma_2 = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \frac{120+40}{2} \pm \sqrt{\left(\frac{120-40}{2}\right)^2 + 30^2}$$

σ_1 = 130 MPa; σ_2 = 30 MPa

489. A Rosette gauge is employed for the measurement of
(a) absolute pressure
(b) low pressure variations
(c) strain in one direction
(d) strain in more than one direction

TNPSC AE, 2008
TNPSC AE 2017

Ans. (d) : A strain gauge only measures strain in one direction in order to get principal strains it is necessary to use a strain rosette. A strain rosette is a cluster of 3 strain gauges oriented at different angles. A strain gauge rosette is an arrangement of two or more closely positioned the normal strains along different directions in the underlying surface of the test part.

490. Principal planes are the planes, on which the resultant stress is the
(a) shear stress (b) normal stress
(c) tangential stress (d) none of these

TNPSC AE, 2008

Ans. (b) : Principal planes are the planes, on which the shear stress is the zero and resultant stress is the normal stress.

491. If at a point in a body σ_x = 70 MPa, σ_y = 60 MPa and τ_{xy} = –5 MPa then the radius of the Mohr's circle is equal to
(a) $5\sqrt{5}$ MPa (b) $2\sqrt{5}$ MPa
(c) $5\sqrt{2}$ MPa (d) 25 MPa j

DRDO Scientists 2008

Ans. (c) : Radius of Mohr circle

$$= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy^2}}$$

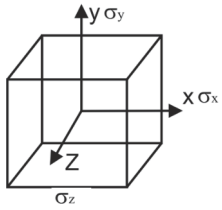
$$= \sqrt{\left(\frac{70-60}{2}\right)^2 + 25}$$

$$= 5\sqrt{2} \text{ MPa}$$

492. For a body subjected to direct stresses σ_x, σ_y and σ_z the direct strain ε_x is x direction is (where E and γ are Young's Modulus and Poisson's ratio respectively)
(a) $\varepsilon_x = \frac{1}{E}\{\sigma_x + \gamma(\sigma_y - \sigma_z)\}$
(b) $\varepsilon_x = \frac{1}{E}\{\sigma_x - \gamma(\sigma_y + \sigma_z)\}$
(c) $\varepsilon_x = \frac{1}{E}\{\sigma_x - \gamma(\sigma_y - \sigma_z)\}$
(d) $\varepsilon_x = \frac{1}{E}\{\sigma_x + \gamma(\sigma_y + \sigma_z)\}$

ISRO Scientist/Engineer 2007

Ans. (b) :



E and γ are young's modulus and Poisson ratio.
So, strain in 3-direction in a body.

$$\varepsilon_x = \frac{1}{E}[\sigma_x - \gamma(\sigma_y + \sigma_z)]$$

$$\varepsilon_y = \frac{1}{E}[\sigma_y - \gamma(\sigma_x + \sigma_z)]$$

$$\varepsilon_z = \frac{1}{E}[\sigma_z - \gamma(\sigma_x + \sigma_y)]$$

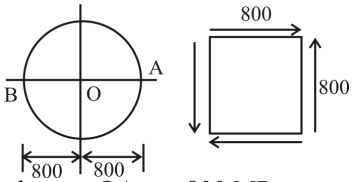
Search on Telegram @apna_pdf

493. The state of stress at a point in a loaded member is of pure shear stresses of ± 800 MPa on two given planes at right angles to each other. The principal stresses are

(a) 800 MPa and – 800 MPa
(b) 800 MPa and 800 MPa
(c) – 800 MPa and – 800 MPa
(d) 1600 MPa and – 1600 MPa

OPSC Civil Services Pre 2006

Ans. (a) :



Max principal stress OA = + 800 MPa
Min. principal stress OB = – 800 MPa

494. If principal stress of a point in plane stressed element are $\sigma_x = \sigma_y = 5000$ N/cm^2, then the normal stress on the plane inclined at 45° to x-axis.

(a) 0 (b) 5000 N/cm^2
(c) 7070 N/cm^2 (d) 500 N/cm^2

WBPSC AE 2003
Punjab PSC (Lect.) 06.08.2017

Ans. (b) : Given, $\sigma_x = \sigma_y = 5000$ N/cm^2

Normal stress on the plane at 45°

$$(\sigma_n)_\theta = \sigma_x \cos^2\theta + \sigma_y \sin^2\theta \quad [\text{also } \sigma_n = \sigma\cos^2\theta]$$

$$= \sigma_x \cos^2(45°) + \sigma_y \sin^2(45°)$$

$$= 5000 \times \left(\frac{1}{\sqrt{2}}\right)^2 + 5000 \times \left(\frac{1}{\sqrt{2}}\right)^2$$

$$= 5000 \text{ N/cm}^2$$

495. The maximum shear stress induced in a member which is subjected to an axial load is equal to

(a) Maximum normal stress
(b) Twice the maximum normal stress
(c) Thrice the maximum normal stress
(d) Half of maximum normal stress
(e) None of the above

CGPSC AE 16.10.2016
HPPSC AE (PWD) 10.09.2016

Ans. (d) : We know that shear stress on an oblique plane at an angle 'θ' to the cross-section of a body, which is subjected to a direct tensile stress 'σ' is equal to $\frac{\sigma}{2}\sin 2\theta$.

Thus maximum value of θ = 45°.

$$\tau_{max} = \frac{\sigma}{2}\sin 90° = \frac{\sigma}{2} = \frac{\sigma_1 - \sigma_2}{2}$$

496. The maximum shear due to an axial compression of 100 MPa is

(a) 50 MPa (b) 100 MPa
(c) 150 MPa (d) 75 MPa

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Given – Axial compression = 100 MPa

$$\tau_{max} = \frac{\sigma}{2} = \frac{100}{2} = 50 \text{ MPa}$$

3. Shear Force and Bending Moment Diagram

497. The point of contraflexure is a point, where

(a) shear force changes sign
(b) bending moment changes sign
(c) shear force is maximum
(d) bending moment is maximum

APPSC AEE SCREENING 17.02.2019

UKPSC AE-2013, Paper-I
APPSC AEE 2012

Ans. (c) :
Relation between shear force (V) & bending moment (M)

$$V = \frac{dM}{dx}$$

If shear force is zero (V = 0) means first derivative of bending moment is zero means at that point bending moment will be maximum.

501. The point of contraflexure occurs in :

(a) Cantilever beam only
(b) Simply supported beam only
(c) Overhanging beam only
(d) Continuous beam only

HPPSC ADF 05.03.2019
OPSC AEE 2019 Paper-I
RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017
WBPSC AE, 2017
UPPSC AE 2016
UKPSC AE-2013, Paper-I
APPSC AEE 2012

Ans. (c) : The point of contraflexure occurs mainly in overhanging beam in which there is opposite magnitude moment acting on another side of overhanging part which makes the net moment to change its sign, by virtue of this the point of contraflexure come into picture.

But it is not always in overhanging beam it can also occur in simply supported and fixed beam and point of contraflexure always occurs in fixed beam.

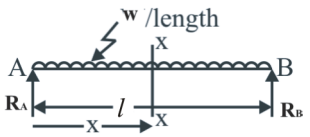
502. A simply supported beam of length *l* carries a uniformly distributed load of *w* per unit length. It will have maximum bending moment at midpoint of beam and the value will be:

(a) $\frac{wl^2}{2}$ (b) $\frac{wl^2}{4}$
(c) $\frac{wl^2}{6}$ (d) $\frac{wl^2}{8}$
(e) $\frac{wl^2}{16}$

CGPSC AE 15.01.2021
ISRO Scientist/Engineer (RAC), 10.03.2019
(CGPSC Polytechnic Lecturer 2017)
CGPSC AE 26.04.2015 Shift-I
UKPSC AE-2013, Paper-I
J & K PSC Screening, 2006

Ans. (d) : We know that

$$R_A = R_B = \frac{wl}{2}$$



Taking a section x-x from a point A at a distance x.
Then taking moment at x-x

$$M_{x\text{-}x} = R_A x - wx \cdot \frac{x}{2}$$

$$M_{x\text{-}x} = \frac{wl}{2}x - w\frac{x^2}{2}$$

For max. bending moment

$$\frac{dM_{x-x}}{dx} = 0$$

$$\frac{wl}{2} - 2w\frac{x}{2} = 0$$

$$\frac{wl}{2} = wx$$

Search on Telegram @apna_pdf

$$\boxed{x = \frac{l}{2}}$$

At $x = \frac{l}{2}$ [at mid] bending moment will be max. so

$$M_{x=\frac{l}{2}} = \frac{wl}{2} \times \frac{l}{2} - \frac{w \times l^2}{4 \times 2}$$

$$M_{\frac{l}{2}} = \frac{wl^2}{4} - \frac{wl^2}{8}$$

$$\boxed{M_{l/2} = \frac{wl^2}{8}}$$

503. At point of contraflexure in beam subjected to loading :

(a) Shear force is zero
(b) Bending moment is zero
(c) Bending moment is maximum
(d) Shear force is unity

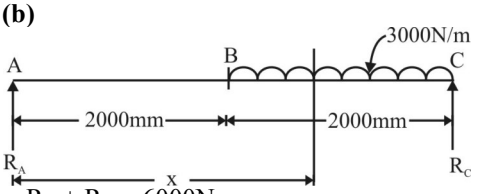
GATE 2010

Search on Telegram @apna_pdf

Ans : (b)



$R_A + R_C = 6000N$

Taking moment about A

$6000 \times 3 - R_C \times 4 = 0$

$R_C = 4500$ N

$R_A = 1500$ N

Taking any section from A

Shear force = $1500 - 3000\ (x - 2)$

and maximum bending moment occur where shear force = 0

$1500 - 3000\ (x - 2) = 0$

$x = 2.5$ m

or 2500 mm from A

511. The moment diagram for a cantilever beam whose free end is subjected to a bending moment

(a) Triangle (b) Rectangle

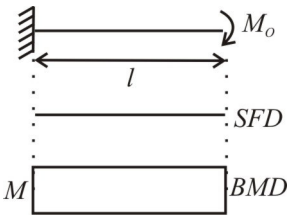
(c) Parabola (d) Cubic parabola

Vizag Steel (MT) 2017

Nagaland PSC CTSE 2016, Paper-I

WBPSC AE 2003

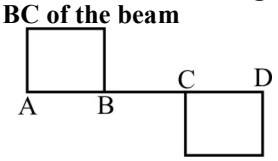
Ans. (b) :



The shear force will be zero all along the span.

The bending moment will be constant all along the span and equal to M.

512. The given figure shows the shear force diagram for the beam ABCD. Bending moment in the portion BC of the beam



(a) is zero

(b) varies linearly from B to C

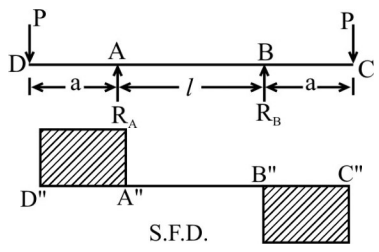
(c) parabolic variation between B and C

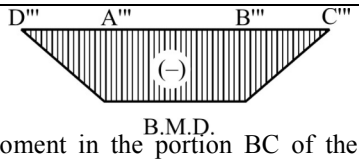
(d) is a non–zero constant

APPSC AEE 2012

ISRO Scientist/Engineer 2008

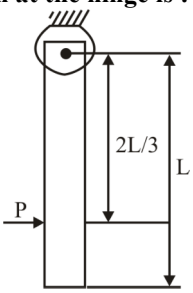
Ans : (d)





Bending moment in the portion BC of the beam is a non-zero constant.

513. A uniform rigid rod of mass 'm' and length 'L' is hinged at one end as shown in the figure. A force 'P' is applied at a distance of $\frac{2L}{3}$ from the hinge so that the rod swings to the right. The reaction at the hinge is :



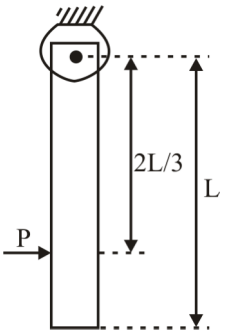
(a) – P (b) 0

(c) P/3 (d) 2P/3

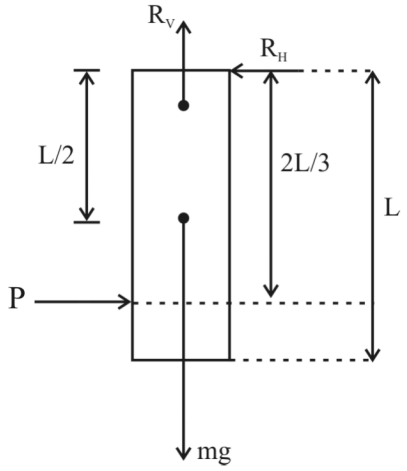
OPSC Civil Services Pre. 2011

GATE-2009

Ans. (b) :



F B D



Considering rotational moment about support

$T = I \times \alpha$

$$P \times \frac{2L}{3} = \frac{mL^2}{3} \times \alpha$$

Search on Telegram @apna_pdf

$$\alpha = \frac{a}{r}$$

$$\left(I_{endpoint} = \frac{mL^2}{12} + mK^2, K = \frac{L}{2}, I = \frac{mL^2}{3}\right)$$

and $r = \frac{L}{2}$ therefore, $\alpha = \frac{2a}{L}$

$$P \times \frac{2L}{3} = \frac{mL^2}{3} \times \frac{2a}{L}$$

$$a = \frac{P}{m}$$

considering horizontal equilibrium

$$\Rightarrow P - R_H = m \times a$$

$$\Rightarrow -R_H + P = m \times \frac{P}{m}$$

$$\boxed{R_H = 0}$$

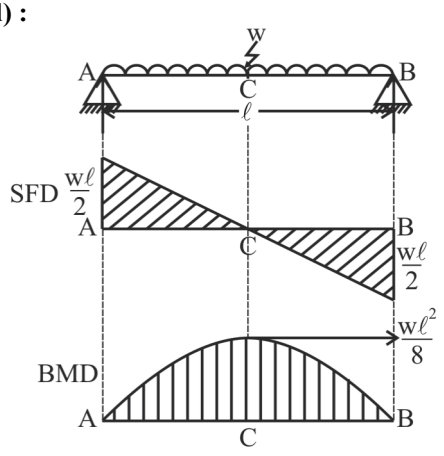
514. The maximum bending moment in a simply supported beam carrying total load W uniformly distributed on the entire span ℓ, is equal to

(a) $W\ell/2$ (b) $W\ell/3$

(c) $W\ell/4$ (d) $W\ell/8$

WBPSC AE, 2017
Mizoram PSC AE/SDO 2014, Paper-II

Ans. (d) :



$$(BM)_{max} = \frac{w\ell}{2} \times \frac{\ell}{2} - \frac{w\ell}{2} \times \frac{\ell}{4}$$

$$= \frac{w\ell^2}{2}\left(\frac{1}{2} - \frac{1}{4}\right)$$

$$= \frac{w\ell^2}{8}$$

$(\because w\ell = W)$

$$(BM)_{max} = \frac{W\ell}{8}$$

515. Which one of the following statement is correct? If the SF diagram for a beam is a right angled triangle having its base representing the length of the beam, the beam is :

(a) a cantilever having a concentrated load at its free end

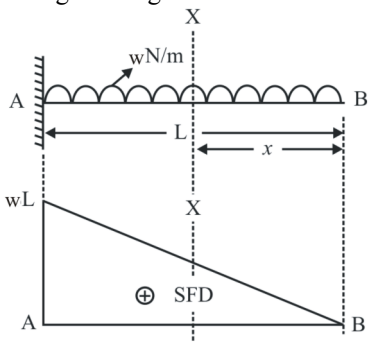
(b) a cantilever having udl over its whole length

(c) simply supported beam with a concentrated load at its mid-length

(d) simply supported beam having udl over its whole length.

TSPSC AEE 28.08.2017 (Civil/Mechanical)
UPSC JWM Adv. No-16/2009, CSE PRE 2005

Ans. (b) : For a cantilever beam having uniform distributed load (UDL) over its whole length, the shear force (SF) diagram is a right angled triangle having its base representing the length of the beam.



(Right angled Triangle)

Shear Force (F_x) = wx

at $x = 0$; $F_B = 0$

& at $x = L$; $F_A = wL$

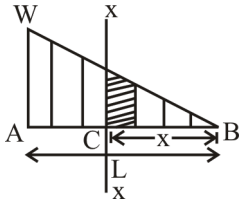
516. A simply supported beam of span *l* carries a uniformly variable load of intensity w_0x over its entire span. Maximum bending moment in the beam is

(a) $\frac{w_0 l^2}{27}$ (b) $\frac{w_0 l^2\sqrt{3}}{27}$

(c) $\frac{w_0 l^2\sqrt{2}}{9}$ (d) $\frac{w_0 l^2}{9}$

UPPSC AE 13.12.2020, Paper-I
RPSC VPITI 14.02.2016

Ans. (b) : $BM_{at\ x} = \frac{Wx^3}{6L} - \frac{WLx}{6}$



For maximum bending moment, $\frac{dM}{dx} = 0$

So, $\frac{dBM}{dx} = \frac{d}{dx}\left[\frac{Wx^3}{6L} - \frac{WLx}{6}\right]$

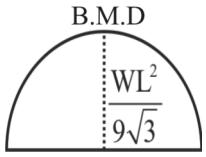
Shear force $= \frac{-3Wx^2}{6L} + \frac{WL}{6}$

$$-\frac{3Wx^2}{6L} + \frac{WL}{6} = 0$$

$$x = \frac{L}{\sqrt{3}}$$

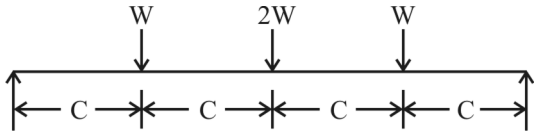
Search on Telegram @apna_pdf

$$(BM)_{maximum} = \frac{-W\frac{L^3}{3\sqrt{3}}}{6L} + \frac{WL \times \frac{L}{\sqrt{3}}}{6}$$



$$(BM)_{max} = +\frac{WL^2}{9\sqrt{3}} \text{ or } \frac{w_0\ell^2\sqrt{3}}{27}$$

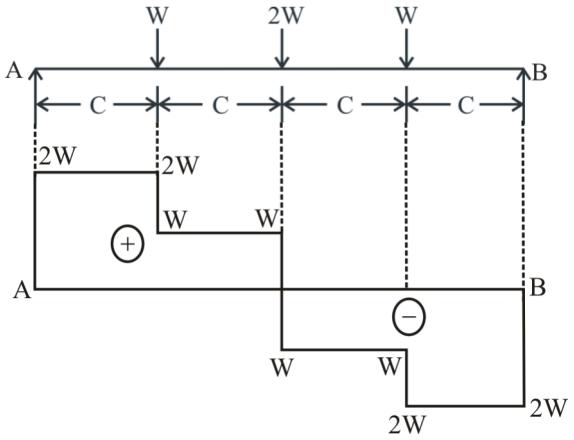
517. A simply supported beam is loaded as shown in fig. The maximum shear force in the beam will be :



(a) Zero (b) W
(c) 2W (d) 4W

APPSC AE 04.12.2012
APPSC AEE 2012, ESE 1998

Ans. (c) : A simply supported beam -



(Shear force Diagram- SFD)

From the figure -

→ Let reaction at A and B in the beam is R_A and R_B respectively.

∴ Due to symmetrical loading - $R_A = R_B$ … (i)

& $R_A + R_B = 4W$ … (ii)

∴ From equation (i) & (ii)

$R_A = R_B = 2W$

Therefore, from SFD; maximum shear force = 2W

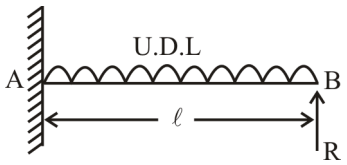
518. The reaction at the prop in a propped cantilever beam subjected to u.d.*l.* is :

(a) $\frac{Wl}{4}$ (b) $\frac{3Wl}{8}$

(c) $\frac{5Wl}{8}$ (d) $\frac{6Wl}{7}$

APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (b) : Draw a propped cantilever beam subjected to U.D.L.



Let,
W = Uniform distributed load.
ℓ = Length of cantilever beam
R = Reaction at the prop
∴ Deflection at point B due to U.D.L. in cantilever beam in downward direction

$$\delta_B = \frac{W\ell^4}{8EI}(\downarrow)$$

Deflection at point B due to reaction (R) in upward direction

$$\delta_B' = \frac{R\ell^3}{3EI}(\uparrow)$$

∴ At equilibrium condition - $\delta_B' = \delta_B$

$$\Rightarrow \frac{R\ell^3}{3EI} = \frac{W\ell^4}{8EI} \Rightarrow \boxed{R = \frac{3W\ell}{8}}$$

519. The point of contraflexure is also called as :
(a) the point of inflexion
(b) a virtual hinge
(c) Either of the above
(d) None of the above

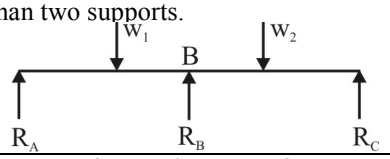
APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (c) : The point of contraflexure is also called as- the point of inflection or a virtual hinge.
Because at the point of contraflexure Bending moment changes sign and Bending moment is zero.

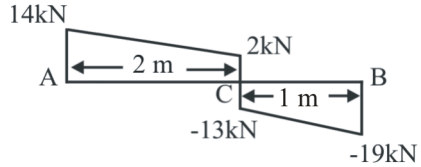
520. A continuous beam is one which is
(a) fixed at one end and free at the other end
(b) fixed at one end and free at the other end
(c) supported on more than two supports
(d) extending beyond the supports

OPSC AEE 2019 Paper-1
TSPSC AEE 2015

Ans : (c) A continuous beam is one which is supported on more than two supports.



521. The shear force diagram of a loaded beam is shown in the following figure. The maximum bending moment in the beam is

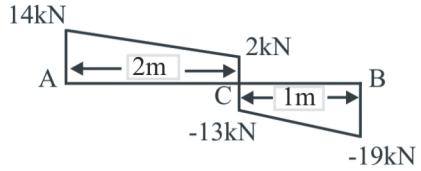


(a) 16-kN-m (b) 11-kN-m
(c) 18-kN-m (d) 18-kN-m

UPPSC AE 12.04.2016 Paper-I
CSE Pre-1997

Search on Telegram @apna_pdf

Ans : (a)



Maximum Bending Moment:-

$(BM)_{max} = 16kN-m$

We know that

$\frac{dM}{dx} = \text{shear force}(S)$

$dM = Sdx$

$\int_A^C dM = \text{Area under Shear force diagram}$

$(M_C - M_A) = 2\times2 + \frac{1}{2}\times2\times12$

$= 4 + 12 = 16$ kN-m

$M_A = 0$ [At Reaction]

So $\boxed{M_C = 16kN-m}$

and also

$M_B - M_C = -13\times1 + \left[\frac{1}{2}\times1\times(-6)\right]$

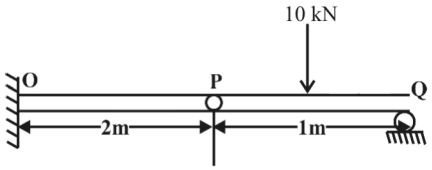
$= -13 - 3 = -16$ kN-m

$M_B = 0$ [At reaction]

$\boxed{M_C = 16\ kN-m}$

So maximum bending moment will be 16 kN-m at point C.

522. A cantilever OP is connected to another beam PQ with a pin joint as shown in figure. A load of 10 kN is applied at the mid-point of PQ. The magnitude of bending moment in (kNm) at fixed end O is–

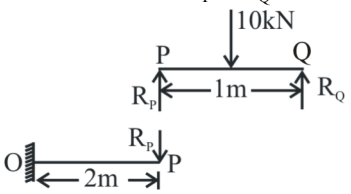


(a) 2.5 (b) 5
(c) 10 (d) 25

PPSC Asstt. Municipal Engineer 15.06.2021
RPSC 2016
GATE 2020

Ans : (c) By similarity,

$R_P = R_Q = 5kN$

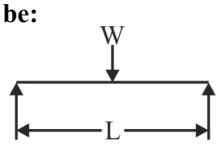


From FBD

Moment at point O

$M_o = R_P \times 2 = 5 \times 2 = 10$ kN-m

523. The BM diagram of the beam shown in the figure will be:

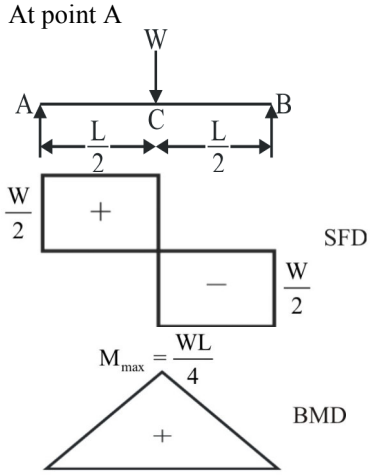


(a) A rectangle (b) A triangle
(c) A trapezium (d) A parabolic
(e) A hyperbolic

Nagaland PSC CTSE 2017, Paper-I
(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : $R_A = R_B = \frac{W}{2}$

Shear force S, At point A



$S_A = +\frac{W}{2}$

$S_C = +\frac{W}{2}$

$S_C = +\frac{W}{2} - W = -\frac{W}{2}$

$S_B = -\frac{W}{2}$

$S_B = -\frac{W}{2} + \frac{W}{2} = 0$

Bending Moment diagram

$M_A = M_B = 0$

$M_C = R_A \times \frac{L}{2} = \frac{W\times L}{4}$

524. In a beam where shear force is maximum the bending moment will be–

(a) maximum
(b) zero
(c) minimum
(d) there no such relation between the two

Nagaland PSC CTSE 2017, Paper-I
Nagaland PSC CTSE 2016, Paper-I

Ans. (d) : There no such relation between the two

525. Variation of bending moment in a cantilever carrying a load, the intensity of which varies uniformly from zero at the free end to w per unit run at the fixed end, is by :

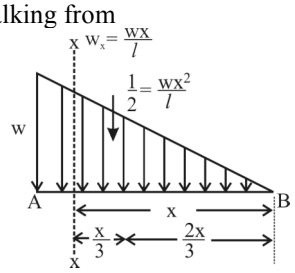
(a) cubic law (b) parabolic law
(c) linear law (d) none of these

WBPSC AE, 2017
(HPPSC AE 2014)

Search on Telegram @apna_pdf

Ans : (a) Variation of bending moment in a cantilever carrying a load, the intensity of which varies uniformly from zero at the free end to w per unit run at the fixed end is by cubic law.

Section x–x talking from



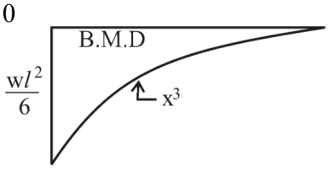
Taking moment at x–x

$$M_{x-x} = \frac{1}{2}\frac{wx^2}{l} \times \frac{x}{3}$$

$$\boxed{M_{x-x} = \frac{wx^3}{6l}}$$

Bending moment at B

$x = 0,\ M_B = 0$



Bending Moment at A

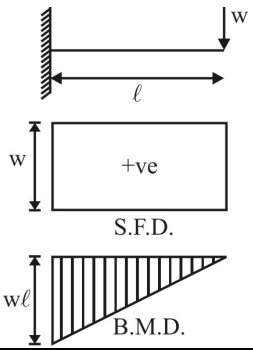
$x = l$

$$M_A = \frac{wl^2}{6}$$

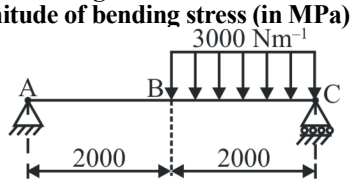
526. The shear force of a cantilever beam of length 'L' with a point load 'W' at its free end is in the shape of the following:

(a) 
(b) 
(c) 
(d) 
UJVNL AE 2016
TSPSC AEE 2015

Ans : (a)



527. A massless beam has a loading pattern as shown in the figure. The beam is of rectangular cross section with a width of 30 mm and height of 100 mm. The maximum magnitude of bending stress (in MPa) is given by

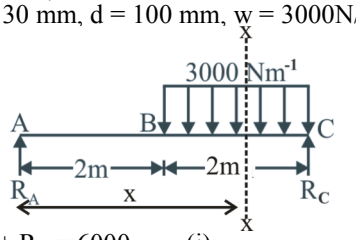


(a) 60.0 (b) 67.5
(c) 200 (d) 225

ISRO Scientist/Engineer 11.10.2015
GATE 2010

Ans. (b) : Given,

b = 30 mm, d = 100 mm, w = 3000N/m



$R_A + R_C = 6000$ .....(i)

Taking moment about point 'C'

$R_A \times 4 = 6000$

$$R_A = \frac{6000}{4} = 1500 \text{ N}$$

$R_A + R_C = 6000$

$R_C = 6000 - 1500 = 4500$ N

Taking moment about x – x

$$M_{xx} = R_A \cdot x - \frac{w(x-2)^2}{2}$$

$$\frac{dM}{dx} = R_A - \frac{2w(x-2)}{2}$$

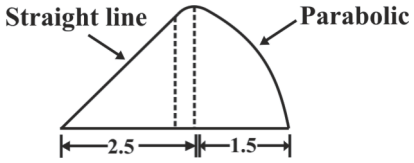
For maximum bending moment,

$$\frac{dM}{dx} = 0 \Rightarrow R_A = w(x-2)$$

$$\frac{1500}{3000} + 2 = x$$

$x = 2.5$

Maximum bending moment M at x = 2.5 m from point A.



$$M = (1500 \times 2.5) - 3000 \times \frac{(0.5)^2}{2}$$

M = 3375 N-m

Where $\boxed{Z = \frac{I}{y}}$

$$\text{Section modulus } (Z) = \frac{I}{y} = \frac{bd^3}{12 \times \frac{d}{2}}$$

$$= \frac{\frac{30}{1000} \times \left(\frac{100}{1000}\right)^3 \times 2000}{12 \times 100}$$

Search on Telegram @apna_pdf

$$= \frac{2.5\times10^{-6}}{100}\times 2000\times m^3 = 5\times10^{-5}\ m^3$$

Bending stress, $\sigma_{max.}$

$$\sigma_{max} = \frac{M_{max}}{Z} = \frac{3375}{5\times10^{-5}} = 67.5\times10^6\ N/m^2$$

$$= 67.5\ MPa$$

528. For a particular load distribution and support condition in a beam of length 'L', bending moment at any section 'x' (0 < x < L) is given by M(x) = Ax - Bx^2, where A and B are constants. The shear force in the beam will be zero at 'x' equal to

(a) A/2B (b) A/B
(c) 2A/B (d) A^2/B

ISRO Scientist/Engineer 12.05.2013
DRDO Scientists 2009

Ans. (a) : Bending moment

$$M = Ax - Bx^2;\quad [0 < x < L]$$

Shear force $F = \frac{dM}{dx}$

$$\frac{dM}{dx} = A - 2Bx$$

If shear force of beam (F) = 0

$$F = \frac{dM}{dx} = A - 2Bx = 0$$

$$A - 2Bx = 0$$

$$x = \frac{A}{2B}$$

529. Shear force is

(a) Rate of change of loading
(b) Sum of bending moments
(c) Rate of change of bending moment
(d) None of the above

MPSC HOD (Govt. Poly. Colleges) 04.10.2014
ISRO Scientist/Engineer 2010, 2007

Ans. (c) : Shear force is rate of change of bending moment.

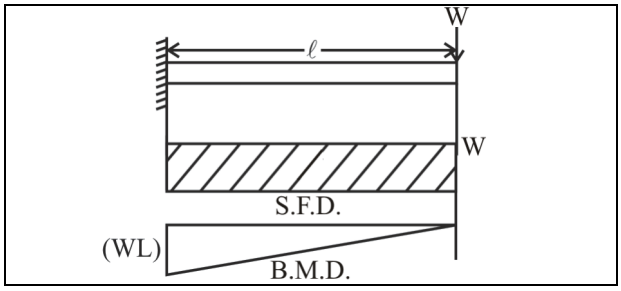
$$\text{Shear force (V)} = \frac{dM}{dx}$$

530. A cantilever of length L carries a point load W at the free end. The bending moment diagram will be a

(a) Parabola with maximum ordinate at centre of the beam
(b) Parabola with maximum ordinate at the cantilever end
(c) Triangle with maximum ordinate at the free end
(d) Triangle with maximum ordinate at the cantilever end
(e) None of the above

CGPSC AE 15.01.2021
CGPSC AE 16.10.2016

Ans. (d) : The maximum bending moment of a cantilever beam of length 'L' & carrying a point load at free end, is lies at fixed end & straight in nature.



531. If for a beam $\frac{dM}{dx} = 0$ for its whole length, the beam is a cantilever.

(a) Subjected to *udl* extending from fixed end to its mid-length.
(b) Subjected to *udl* over its whole length
(c) Subjected to an end moment
(d) Having a concentrated load at its free end

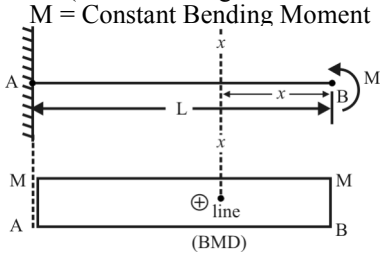
TSPSC AEE 28.08.2017 (Civil/Mechanical)
UPSC JWM Advt. No.-52/2010, CSE Pre 2007

Ans. (c) : Given,

Change in bending moment, $\frac{dM}{dx} = 0$

(for whole length of a cantilever beam)

where, M = Constant Bending Moment



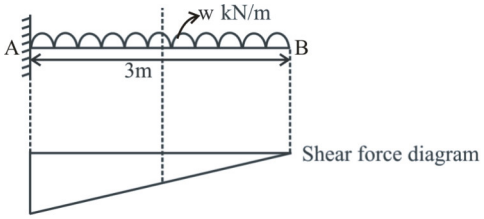
If for a beam $\frac{dM}{dx} = 0$ for it whole length, the beam is cantilever which is subjected to an end moment. Shear force is zero throughout whole length.

532. A uniformly distributed load (UDL) (in kN/m) is acting over the entire length of a 3m long cantilever beam. If the shear force at the midpoint of cantilever is 6 kN, what is the value of UDL (in kN/m)?

(a) 2 (b) 3
(c) 4 (d) 5

OPSC AEE 2019 Paper-I
GPSC ARTO Pre 30.12.2018, ESE 2009

Ans. (c) :



At mid point of cantilever beam, shear force is 6 kN

$$w\times\frac{L}{2} = 6$$

$$w\times\frac{3}{2} = 6$$

$$\boxed{w = 4\ kN/m}$$

Search on Telegram @apna_pdf

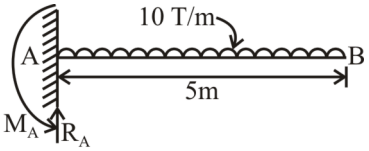
533. A cantilever beam having 5m length is so loaded that it develops a shearing force of 20 T and a bending moment of 20 T-m at a section 2m from the free end. Maximum shearing force and maximum bending moment developed in the beam under this load are respectively 50 T and 125 T-m. The load on the beam is :

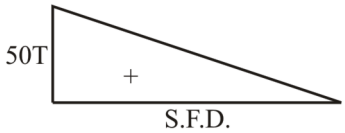
(a) 25 T concentrated load at free end
(b) 20 T concentrated load at free and
(c) 5 T concentrated load at free end and 2 T/m load over entire length
(d) 10 T/m uniformly distributed load over entire length

GPSC ARTO Pre 30.12.2018
APPSC AEE 2012
ESE 1995

Ans. (d) : By observing data, we see shear force is varying with length. Hence option (a) and (b) get eliminated for concentrated load at the ends of cantilever, shear force remains constant.

Now, considering option (d).





$R_A = 10 \times 5 = 50T$

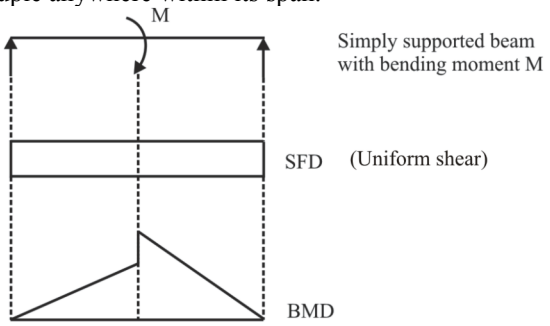
$M_A = 10 \times 5 \times \frac{5}{2} = 125T\text{-m}$

534. For the shear force to be uniform throughout the span of a simply supported beam, it should carry which one of the following loadings?

(a) A concentrated load at mid-span
(b) UDL over the entire span
(c) A couple anywhere within its span
(d) Two concentrated loads equal in magnitude and placed at equal distance from each support.

GPSC ARTO Pre 30.12.2018
TSPSC AEE 28.08.2017 (Civil/Mechanical)
MPPSC State Forest Service Exam, 2014

Ans. (c) : For the shear force to be uniform throughout the span of simply supported beam, it should carry a couple anywhere within its span.



535. A simply supported beam of length 3 m carries a concentrated load of 12 kN at a distance of 1m from left support. The maximum bending moment in the beam is.

(a) 12 kNm (b) 24 kNm
(c) 8 kNm (d) 16 kNm

ISRO Scientist/Engineer (RAC), 10.03.2019
MPPSC State Forest Service Exam, 2014

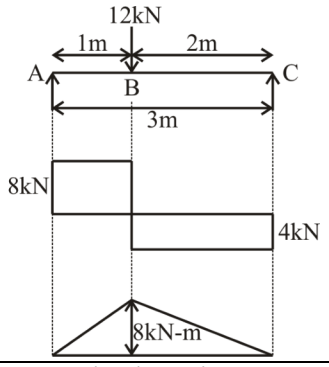
Ans. (c) :

$R_A = \frac{12 \times 2}{3} = 8kN$

$R_C = \frac{12 \times 1}{3} = 4kN$

$M_{max} = M_B = 8 \times 1$

$= 8kN\text{-m}$



536. A beam under pure bending is subjected to

(a) Same bending stress at all sections
(b) No shearing stress at any section
(c) Same shearing stress at all sections
(d) Uniformly increasing bending moment from the support to the mid-section

Karnataka PSC AE, 10.09.2017
WBPSC AE 2008

Ans. (b) : For pure bending there should be no presence of shear stress ($\tau = 0$) at any sections.

537. Bending moment at any point on a beam subjected to transverse loading will be equal to

(a) Algebraic sum of moments of forces and moments of reactions on one side of the section (point)
(b) Algebraic sum of moments of forces and moments of reaction on both sides of the section (point)
(c) Algebraic sum of moments of forces on both sides of the section (point)
(d) Algebraic sum of moments of reaction on both sides of the section (point)

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Bending moment at any point on a beam subjected to transverse loading will be equal to algebraic sum of moments of forces and moments of reactions on one side of the section (point).

Search on Telegram @apna_pdf

538. Which of the following are the statically determinate beams?

(a) Cantilevers (b) SSB
(c) Overhanging beams (d) All of the above

APPSC AEE 2012

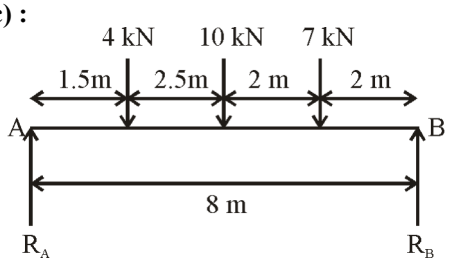
Ans. (d) : Examples of determinate structures are-
- Simply supported beams (SSB)
- Cantilever beams
- Single and double overhanging beams
- Three hinges arches etc.

539. A simply supported beam of span 8 meters carry concentrated loads of 4 kN, 10 kN and 7 kN at distances of 1.5 meters, 4 meters and 6 meters from the left support. The shear force at right support will be

(a) 4 kN (b) 10 kN
(c) 11 kN (d) 7 kN

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) :



$R_A + R_B = 21$ kN

$\sum M_A = 0$

$R_B \times 8 = 4 \times 1.5 + 10 \times 4 + 7 \times 6$

$R_B \times 8 = 6 + 40 + 42$

$R_B = 11$ kN

$R_A = 21 - R_B$

$R_A = 21 - 11 = 10$ kN

The shear force at right support will be 11 kN.

540. The differential equation $EI\,(d^4y/dx^4)$ gives

(a) Bending moment (b) Shear force
(c) Deflection (d) Rate of loading

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : EI (y) – deflection

$EI\left(\frac{dy}{dx}\right)$ – slope

$EI\frac{d^2y}{dx^2}$ – Bending moment

$EI\frac{d^3y}{dx^3}$ – shear force

$EI\frac{d^4y}{dx^4}$ – Rate of loading

541. In case of simply supported beam, if the position of point of application of bending moment is changed towards left, over the length of the beam, the value of the reactive force at the left end of the beam will

(a) remain unchanged.
(b) increase.
(c) decrease.
(d) be doubled of the previous value.

PPSC Asstt. Municipal Engineer 15.06.2021

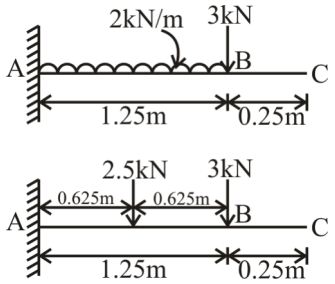
Ans. (a) : In case of simply supported beam, if the position of point of application of bending moment is changed towards left, over the length of the beam, the value of the reactive force at the left end of the beam will remain unchanged.

542. A cantilever beam 1.5 long is loaded with a uniformly distributed load of 2 kN/m run over a length of 1.25 m from the free end. It also carries a point load of 3 kN at a distance 0.25 m from the free end. The shear force acting on the fixed end is _____.

(a) 7.5 kN (b) 2 kN
(c) 3.5 kN (d) 5.5 kN

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) :



Shear force at fixed point 'A',

$(SF)_A = 3 + 2.5 = 5.5$ kN

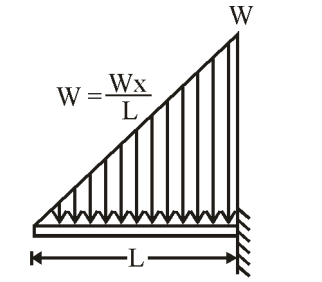
543. Maximum bending on a cantilever beam of length 'L' carrying a uniformly varying load zero at free end and 'w' per metre length

(a) $M_{max} = \frac{W.L^2}{9}$ (b) $M_{max} = \frac{W.L}{6}$

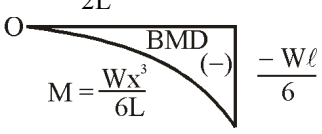
(c) $M_{max} = \frac{W.L^2}{6}$ (d) $M_{max} = \frac{W.L^2}{9\sqrt{3}}$

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) :



Shear force (SF) = $\frac{Wx^2}{2L}$



Search on Telegram @apna_pdf

544. A 250 mm diameter pulley is mounted on the shaft midway between two supporting bearings that are 750 mm apart. The pulley is driven by a belt, both strands pulling vertically upwards. If the tension in the tight side of the belt is 2.7 kN and the slack side is 900 N, what is maximum bending moment?

(a) 225 N-m (b) 675 N-m
(c) 300 N-m (d) 1000 N-m

CGPSC AE 15.01.2021

Ans. (b) : Given,
dia of pulley = 250 mm = 0.25 m
L = 750 mm = 0.75 m
Total load on pulley = 2.7 kN + 900 N
(W) = 2700 + 900
(W) = 3600 N

$$\text{Max. Bending Moment} = \frac{WL}{4} = \frac{3600 \times 0.75}{4}$$

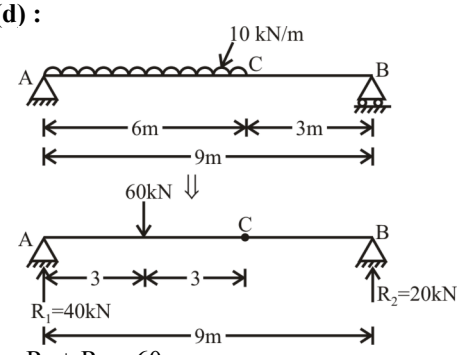
$$(BM)_{max} = 675 N - m$$

545. A simply supported beam of length 9 m carrying a uniformly distributed load of 10 kN/m for a distance of 6 m from the left end. The bending moment acting on the beam at 6 m from its left end is _____.

(a) 40 kNm (b) 80 kNm
(c) 120 kNm (d) 60 kNm

VIZAG Steel MT 24.01.2021

Ans. (d) :

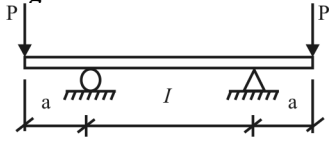


$R_1 + R_2 = 60$
$\therefore \quad \sum M_A = 0$
$60 \times 3 = R_2 \times 9$

$$R_2 = \frac{60 \times 3}{9} = 20 kN$$

$R_1 = 60 - 20 = 40$ kN
$\therefore$ The bending moment on beam at 6m from left end
$(BM) = R_1 \times 6 - 60 \times 3$
$= 40 \times 6 - 60 \times 3$
$= 240 - 180$
$= 60$ kN-m

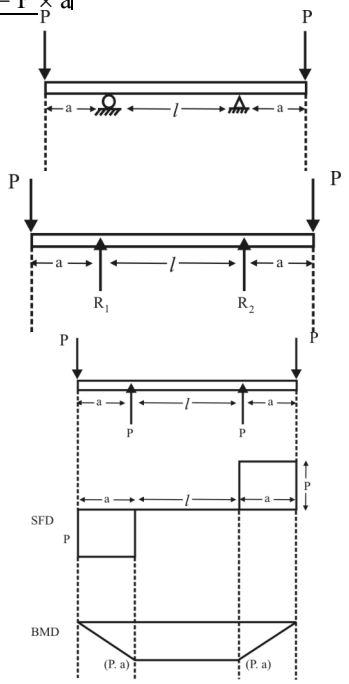
546. Maximum bending moment for the shown overhang beam with loads will be :



(a) $P\left(a + \frac{l}{2}\right)$ (b) $P.\frac{l}{2}$
(c) Pa (d) P (2a + *l*)

JPSC AE 10.04.2021, Paper-II

Ans. (c) : P. a
Beam is symmetrically loaded
So, $R_1 = R_2 = P$
Maximum Bending moment
$M = P \times a$



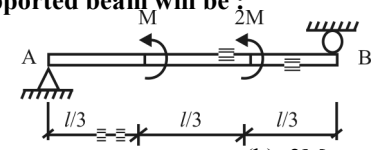
547. The part of a member is said to be in pure bending if

(a) no bending moment exists in that part
(b) no shear force and no bending moment extra in that part
(c) shear force and bending moment are maximum
(d) No shear force exists in that part

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : The part of a member is said to be in pure bending if no shear force exists.

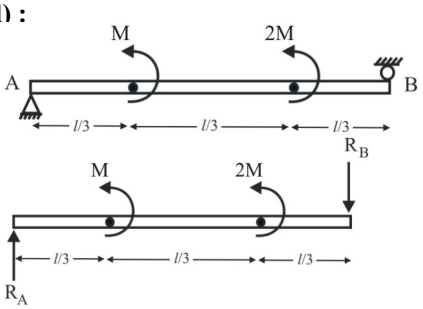
548. Reaction R_B at support B for the shown simply supported beam will be :



(a) zero (b) 3M
(c) M*l* (d) 3 M/*l*

JPSC AE 10.04.2021, Paper-II

Ans. (d) :

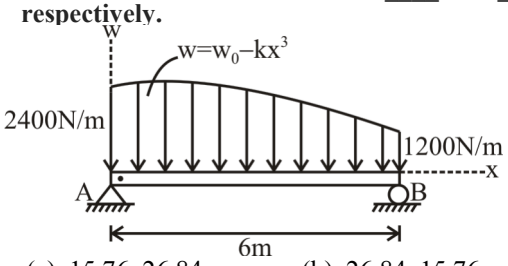


$\Sigma M_A = 0$
$M + 2M = R_B \times l$

$$R_B = \frac{3M}{l}$$

Search on Telegram @apna_pdf

549. The beam shown here has variable load. The reactions at A and B in kN are ____ and ____, respectively.



(a) 15.76, 26.84 (b) 26.84, 15.76
(c) 6.84, 5.76 (d) 5.76, 6.84

AAI Jr. Executive 26.03.2021
BHEL ET 2019

Ans. (c) : $w = w_o - kx^3$

At $x = 0, w = w_o = 2400$

At $x = 6, w = 1200$

$1200 = 2400 - k(6)^3$

$k = 5.55$

Now, $-w_{xx} = \frac{d^2M}{dx^2}$

Shear force, SF $\frac{dM}{dx} = -\int (w_{xx})dx$

$= -\int (w_o - kx^3)dx$

$\frac{dM}{dx} = \frac{kx^4}{4} - w_o x + c_1$

$M = \frac{kx^5}{20} - \frac{w_o x^2}{2} + c_1 x + c_2$

At $x = 0, M = 0$

$c_2 = 0$

At $x = 6, M = 0$

$c_1 = 6840.036$

$\therefore \quad SF = \frac{kx^4}{4} - w_o x + 6840.036$

Reaction at A, $x = 0$

$R_A = (SF)_A = 6.84$ kN

Reaction at B, $x = 6$,

$R_B = (SF)_B = 5.76$ kN

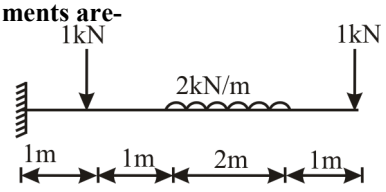
550. In a cantilever beam subjected to a point load at its free end has maximum bending moment _____.

(a) fixed end of the beam
(b) at a distance of 0.6 × length of the beam
(c) free end of the beam
(d) mid span of the beam

HPPSC Workshop Suptd. 08.07.02021

Ans. (a) : fixed end of the beam

551. For a cantilever, loaded as shown in figure, maximum shear force and maximum bending moments are-



(a) 4kN, 14 kN-m sagging
(b) 4kN, 14 kN-m hogging
(c) 6kN, 18 kN-m sagging
(d) 6kN, 18 kN-m hogging

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) :
Shear force, V = 1 + 2 × 2 + 1
= 6 kN (max)
Max. Bending moment occurs at the fixed end
M_{max} = 1 × 5 + 2 × 2 × 3 + 1 × 1
= 5 + 12 + 1
= 18 kN-m (hogging)

552. If a beam is subjected to a constant bending moment along its length then the shear force will

(a) be maximum at the center and zero at the ends
(b) zero at the center and maximum at the ends
(c) be zero at all sections along the beam
(d) has a constant value everywhere along its length

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
ESE 1997

Ans. (c) : The shear force will zero along the beam at all section, there is no shear force only it is a pure bending.

Shear force $V = \frac{dM}{dx}$

Given, M = Constant

So shear force $\boxed{V = 0}$ $\left[\because \frac{dM}{dx} = 0\right]$

553. Support is non-yielding means

(a) Slope of beam at support is zero
(b) Support is frictionless
(c) support holds the member firmly
(d) None of the above

GPSC Engineer, Class-II Pre-19.01.2020

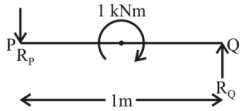
Ans. (a) :

554. A simply supported beam PQ is loaded by a moment of 1 kN-m at the mid span of the beam of length 1m. The reaction forces R_P and R_Q at supports P and Q respectively are

(a) 1 kN downward, 1 kN upward
(b) 0.5 kN upward, 0.5 kN downward
(c) 0.5 kN downward, 1 kN upward
(d) 0.5 kN upward, 0.5 kN upward

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) :



$\sum F_v = 0$
$R_P - R_Q = 0$
$\sum M_P = 0$
$R_Q \times 1 - 1 = 0$
$R_Q = 1$ kN (↑)
$R_P = 1$ kN (↓)

555. In a beam where shear force changes its sign, the bending moment will be

(a) minimum (b) zero
(c) maximum (d) same as shear force

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) : Shear force $= \frac{dM}{dx}$ changes its sign, the bending moment will be maximum.

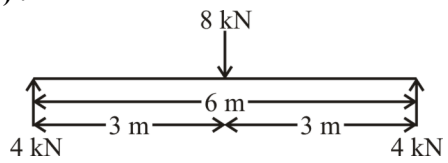
Search on Telegram @apna_pdf

556. A simply supported beam of length 6 m carries a point load of 8 kN at the middle of its span. The bending moment at the middle of the span is ____ .

(a) 6 kNm
(b) 24 kNm
(c) 12 kNm
(d) 8 kNm

VIZAG MT, 14.12.2020

Ans. (c) :



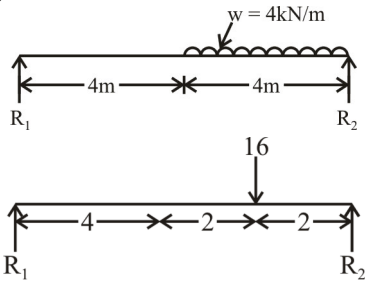
M at mid point = 4 × 3
= 12 kN-m

557. A simply supported beam of span 8 m is carrying a uniformly distributed load of 4 kN/m over a length of 4 m from its right end. The support reactions are _____.

(a) 12 kN right support, 4 kN left support
(b) 6 kN left support, 10 kN right support
(c) 4 kN left support, 12 kN right support
(d) 8 kN left support, 8 kN right support

VIZAG MT, 14.12.2020

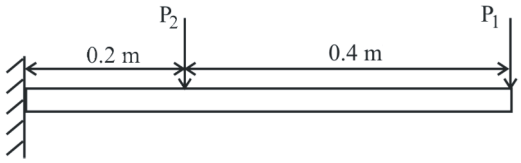
Ans. (c&a) :



$$R_1 = \frac{16 \times 2}{8} = 4\,kN$$

$$R_2 = \frac{16 \times 6}{8} = 12\,kN$$

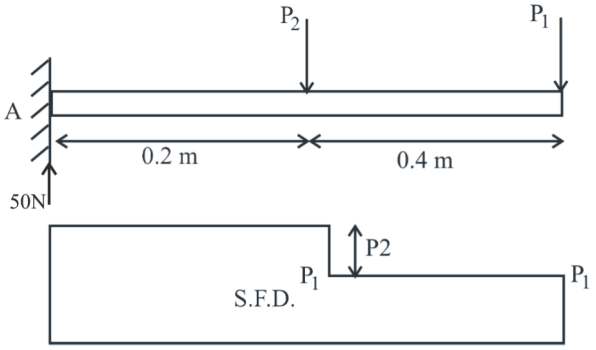
558. For the cantilever AB shown in the following figure, if the reaction force at the fixed support A is 50 N and the area of the shear force diagram is 16 N-m, the value of the concentrated load P_2 is



(a) 16 N
(b) 64 N
(c) 15 N
(d) 35 N

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) :



Area of SFD = 50 × 0.2 + 0.4 × P_1
16 = 50 × 0.2 + P_1 × 0.4

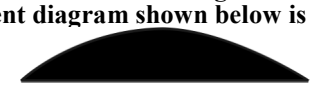
$$P_1 = \frac{6}{0.4}$$

$$\boxed{P_1 = 15}$$

$P_1 + P_2 = 50$
$15 + P_2 = 50$
$P_2 = 50 - 15$

$$\boxed{P_2 = 35\,N}$$

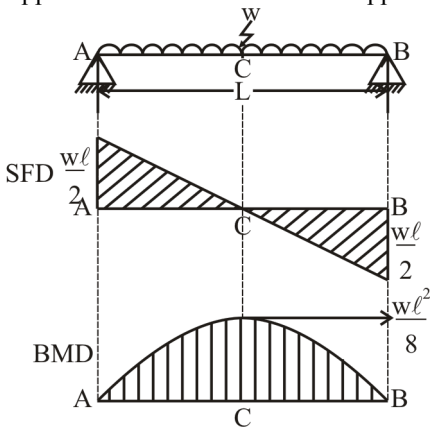
559. The beam that would generate the bending moment diagram shown below is



(a) Simply supported beam with a central point load
(b) Cantilever with uniformly distributed load
(c) Simply supported beam with uniformly decreasing load from the midspan towards the supports
(d) Simply supported beam with uniformly distributed load

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : In case of simply supported beam UDL produce parabola in BMD and straight line in SFD. Simple supported beam has zero BM at support.



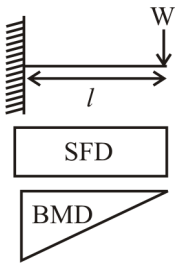
560. A cantilever of span *l* is subjected to a point load W at the free end. The bending moment at the free end will be

(a) W*l* (b) zero
(c) W/*l* (d) W

TSPSC Manager (Engg.) HMWSSB 12.11.2020

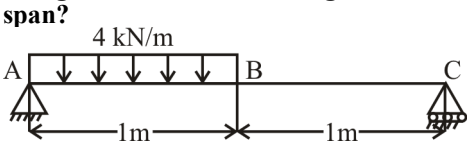
Search on Telegram @apna_pdf

Ans. (b) :



Bending moment (M) at free end = 0
Bending moment at fixed end = W×l

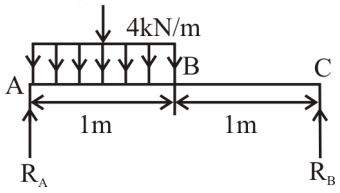
561. A mass less beam has a loading pattern shown in figure. Find the bending moment at mid span?



(a) 1 kN-m (b) 3 kN-m
(c) 2 kN-m (d) 0.0 kN-m

ISRO Scientist/Engineer 12.01.2020

Ans. (a) :



$$R_A = \frac{4\times1.5}{2} = 3\,kN$$

$(B.M)_B = R_A \times 1 - w \times 0.5 = 3 \times 1 - 4 \times 0.5 = 1$ kN-m

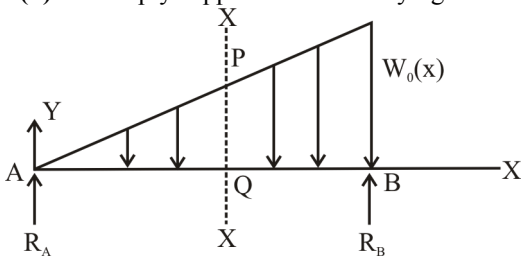
562. A simply supported beam of length l, carries a load $w(x) = w_0(x)$ over the entire span. Maximum bending moment in the beam at x will be

(a) $\frac{l}{3}$ (b) $\frac{l}{\sqrt{3}}$

(c) $\frac{l\sqrt{3}}{2}$ (d) $\frac{l}{\sqrt{2}}$

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : A simply supported beam carrying load



Reaction at A, $R_A = \frac{\frac{Wl}{2}\times\frac{l}{3}}{l} = \frac{Wl}{6}$

Reaction at B, $R_B = \frac{\frac{Wl}{2}\times\frac{2l}{3}}{l} = \frac{Wl}{3}$

$V_x = +R_A - \text{Area of APQ}$

$$V_x = \frac{Wl}{6} - \frac{1}{2}x.\frac{Wx}{l}$$

$$V_x = \frac{Wl}{6} - \frac{Wx^2}{2l}$$

Max. Bending moment occurs at,

$$V_x = 0$$

$$\frac{Wl}{6} - \frac{Wx^2}{2l} = 0$$

$$\frac{Wx^2}{2l} = \frac{Wl}{6}$$

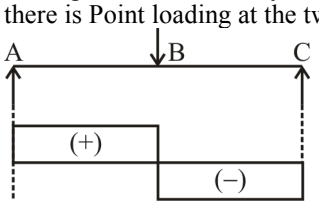
$$\boxed{x = \frac{l}{\sqrt{3}}}$$

563. When there is a sudden increase or decrease in shear force diagram between any two points, it indicates that there is

(a) No loadings between the two points
(b) Point loading at the two points
(c) Uniformly varying load between the two points
(d) Uniformly distributed load between the two points

UPPSC AE 13.12.2020, Paper-I
RPSC IOF, 2020
VIZAG Steel MT 24.01.2021

Ans. (b) : When there is a sudden increase or decrease in shear force diagram between any two points, it indicates that there is Point loading at the two points.



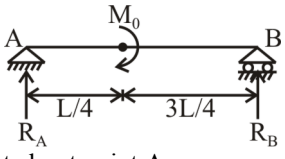
564. A simply supported beam of span L is subjected to a moment M_0 at a distance of $\frac{L}{4}$ from the left end. Magnitude of the maximum bending moment in the beam is

(a) M_0 (b) $\frac{M_0}{2}$

(c) $\frac{M_0}{4}$ (d) $\frac{3M_0}{4}$

UPPSC AE 13.12.2020, Paper-I

Ans. (d) :



Taking moment about point A

$$R_B \times L - M_0 = 0$$

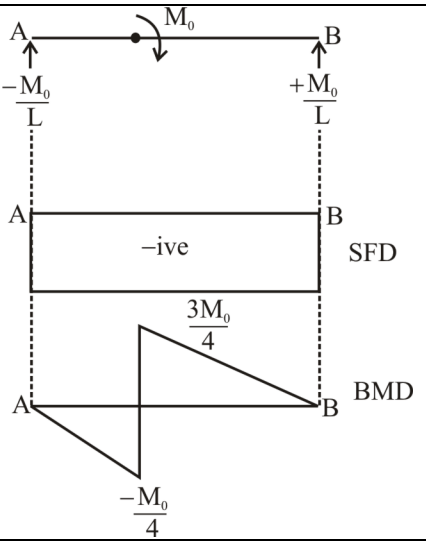
$$R_B = \frac{M_0}{L}$$

$$R_A + R_B = 0$$

$$R_A = -R_B$$

$$R_A = -\frac{M_0}{L}$$

Search on Telegram @apna_pdf



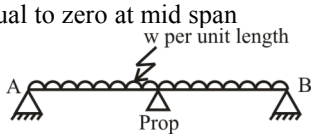
Maximum bending moment at $(x = L/4) = \frac{3M_0}{4}$

565. A simply supported beam carrying a uniformly distributed load over its whole span, is propped at the centre of the span so that the beam is held to the level of the end supports. The reaction of the prop will be

(a) half the distributed load
(b) $3/8^{th}$ the distributed load
(c) $5/8^{th}$ the distributed load
(d) 0 distributed load

RPSC IOF, 2020

Ans. (c) : The beam held to the level of end means deflection equal to zero at mid span



Deflection from distributed load $= \frac{5wl^4}{384EI}$ .....(i)

Deflection from prop load $= \frac{Pl^3}{48EI}$ .....(ii)

From equation (i) and (ii)

$$\frac{5wl^4}{384EI} = \frac{Pl^3}{48EI}$$

$$P = \frac{5}{8}wl$$

$wl \Rightarrow$ distributed load

So, The reaction (P) of the prop $= \left(\frac{5}{8}\right)^{th}$ the distributed load.

566. A simply supported beam, 6.0 m long, carries a single concentrated load of P at 1.0 m from one end. The cross-section of beam is square with the side of 100 mm. What will be the maximum value of P so that stress in material should not exceed 8 MN/m^2?

(a) 1 kN (b) 1.2 kN
(c) 1.4 kN (d) 1.6 kN

APPSC Poly Lect. 13.03.2020

Ans. (d) : Given data,
For simply supported beam length (L) = 6 m
Square cross - section side (b = d) = 100 mm = 0.1 m
Bending stress (σ_b) = 8 MN/m^2 = 8×10^6 N/m^2
Let,
P = load acting at point C from A distance = 1 m
R_A & R_B is reaction at A and B
$R_A + R_B = P$ ..... (1)
Taking moment about A, then –

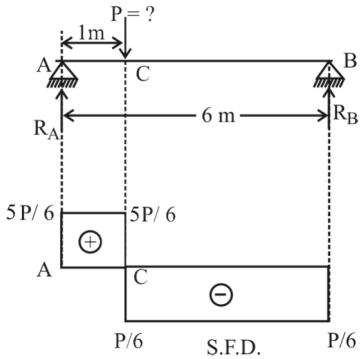
$$R_B \times 6 = P \times 1 \Rightarrow \boxed{R_B = \frac{P}{6}}$$

$$\therefore \boxed{R_A = \frac{5P}{6}}$$

Bending moment –
For section AC –
$M_x = R_A.x$ ..... (1)
For section BC –

$$M_x = R_A x - P\,(x-1) = \frac{5P.x}{6} - Px + P$$

$$M_x = -\frac{Px}{6} + P \quad .....(2)$$



From the S.F.D; shear force is zero at point C
i.e., at that point C (x=1) bending moment is maximum.

$$\therefore M_{x=1} = \frac{-P \times 1}{6} + P = \frac{5P}{6}\,N-m$$

$\because$ For square X-sectional (b=d)

$$\because I = \frac{bd^3}{12} = \frac{(0.1)\times(0.1)^3}{12}$$

$$y = \frac{d}{2} = \frac{0.1}{2}$$

Now, from bending equation –

$$\frac{M}{I} = \frac{\sigma_b}{y}$$

$$M = \frac{\sigma_b \times I}{y} = \frac{\sigma_b \times \frac{bd^3}{12}}{d/2} = \frac{\sigma_b \times d^4}{12 \times \frac{d}{2}} = \frac{8\times10^6 \times (0.1)^3}{6}$$

$$M = \frac{8\times10^6 \times 10^{-3}}{6} = \frac{8\times10^3}{6}$$

$$\Rightarrow \frac{5P}{6} = \frac{8\times10^3}{6}$$

$P = 1.6 \times 10^3$ N $\Rightarrow \boxed{P = 1.6\ kN}$

Search on Telegram @apna_pdf

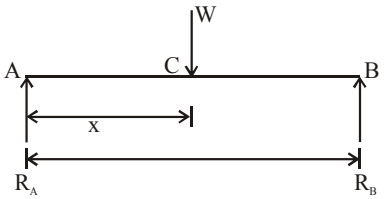
567. A simply supported beam of length *L* carrying a concentrated load W at a section which is at a distance of 'x' from one end. What will be the value of bending moment at this section?

(a) $W(x - x^2)$ (b) $W(x^2 - xL)$

(c) $W\left(x - \frac{x^2}{L}\right)$ (d) Wx

SJVN ET 2019

Ans. (c) :



$R_A + R_B = W$ .....(i)

Taking moment about A,

$R_B \times L = Wx$

$$R_B = \frac{Wx}{L}$$

$$R_A = W - R_B = W - \frac{Wx}{L}$$

Taking moment about C,

$$M_C = R_A \times x = W\left(x - \frac{x^2}{L}\right)$$

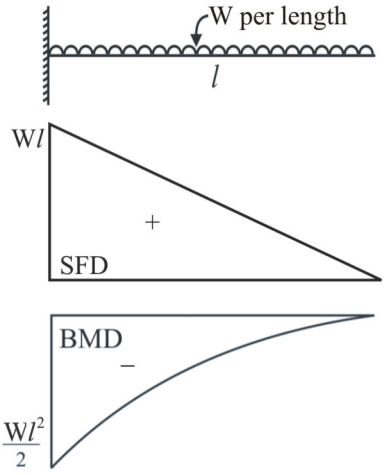
568. A cantilever beam of length *l* carry a UDL of *W* per length across the whole span. What will be the value of maximum shear stress and maximum bending moment on the beam respectively?

(a) $\frac{Wl}{2}, Wl^2$ (b) Wl, Wl^2

(c) $\frac{Wl}{2}, \frac{Wl^2}{2}$ (d) $Wl, \frac{Wl^2}{2}$

SJVN ET 2019
HPPSC AE 2018
Punjab PSC SDE 12.02.2017
GMB AAE 25.06.2017
WBPSC AE, 2017

Ans. (d) : In question they asked max shear stress that should be max shear force.

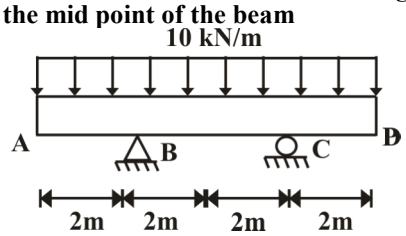


Max shear force at fixed = $W \times l$

Max value of bending moment $= \left(\frac{1}{2} W \times l\right) \times l$

$$= \frac{Wl^2}{2}$$

569. Calculate the shear force and bending moment at the mid point of the beam

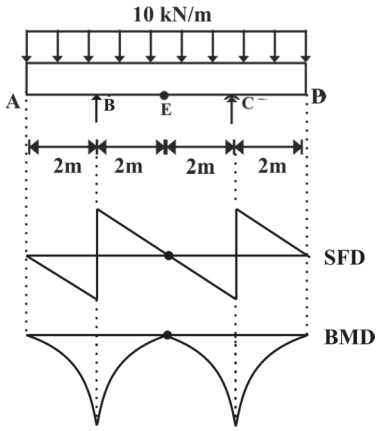


(a) 0 kN, 0 kN-m (b) -20 kN, -20 kN-m

(c) 20 kN, -20 kN-m (d) 20 kN, 0 kN-m

APPSC AEE SCREENING 17.02.2019

Ans. (a) :



Due to symmetry, R_B (or) R_C

$$= \frac{\text{Total load}}{2} = \frac{10 \times 8}{2} = 40\,\text{kN}$$

At mid span

$(SF)_E = 10 \times 4 - 40 = 0$

$(BM)_E = 40\,(2) - 10 \times 4 \times 2 = 0$

SF and BM both will be zero at mid point.

570. Consider the following:

1. **Bending moment is a moment about the longitudinal axis of a beam.**
2. **A structural component cannot have axial force and shear force together.**

(a) Only 1 is correct

(b) Only 2 is correct

(c) Both 1 and 2 are correct

(d) Both 1 and 2 are incorrect

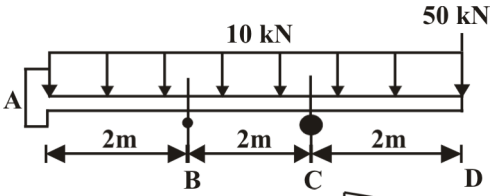
APPSC AEE SCREENING 17.02.2019

Ans. (d) : • Bending moment is the moment about neutral axis, but not about longitudinal axis.

• Structural components can have axial forces, shear forces together when inclined loads are acting, on a beam.

571. Out of the options given below, which one is the correct shear force diagram? B is an internal hinge

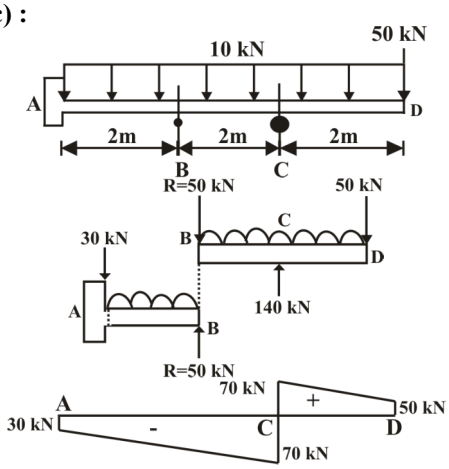
Search on Telegram @apna_pdf



(a) 
(b) 
(c) 
(d) None of the above

APPSC AEE SCREENING 17.02.2019

Ans. (c) :



SFD

572. Find out the Static indeterminacy of the beam in the figure below

(a) 0 (b) 2
(c) 3 (d) 6

APPSC AEE SCREENING 17.02.2019

Ans. (b) : Degree of static indeterminacy of beam

$D_S = 3m - 3j + R_e - R_r$

m = Number of member

j = Number of joints

R_e = external reaction of support

R_r = Number of internal hinge

In the given beam,

$m = 2, j = 3, R_e = 6, R_r = 1$

$D_S = 3 \times 2 - 3 \times 3 + 6 - 1$

$= 6 - 9 + 5$

$\boxed{D_s = 2}$

573. Consider the following:

1. **In addition to equilibrium equations, compatibility equations are also required for solving indeterminate structure.**
2. **A fixed beam (two ends are fixed) is a kinematically determinate structure.**

(a) Both 1 and 2 are correct
(b) Both 1 and 2 are wrong
(c) Only 1 is correct
(d) Only 2 is correct

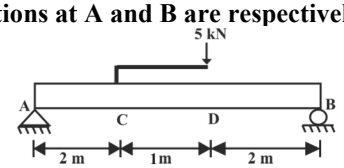
APPSC AEE SCREENING 17.02.2019

Ans. (a) : For analysing statically indeterminate structures both equilibrium and compatibility equations are required.

Fixed beam has no degree of freedom.

∴ It is kinematically determinate beam.

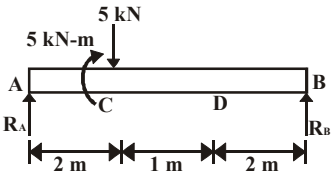
574. For the beam shown below, the vertical reactions at A and B are respectively



(a) 2 kN, 3 kN (b) 3 kN, 2 kN
(c) -1 kN, 1 kN (d) 1 kN, 1 kN

APPSC AEE SCREENING 17.02.2019

Ans. (a) :



$\sum F_y = 0$

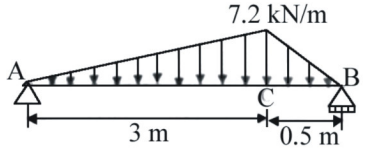
$R_A + R_B = 5$ kN

$\sum M_A = 0$

$R_B (5) = 5 \times 2 + 5 = 15/5$

∴ $R_B = 3$ kN and $R_A = 2$ kN

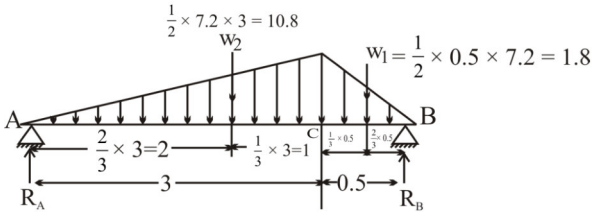
575. A simply supported beam of length 3.5 m carries a triangular load as shown in the figure below. Maximum load intensity is 7.2 N/m. The location of zero shear stress from point A is :



(a) 3 m (b) 1.5 m
(c) 2 m (d) 2.5 m

BHEL ET 2019

Ans. (c) : From section 'A C'-



$R_A + R_B = 10.8 + 1.8 = 12.6$

$\Sigma M_B = 0$

$R_A \times 3.5 - 10.8 \times 1.5 - 1.8 \times \frac{2}{3} \times 0.5 = 0$

$R_A \times 3.5 - 16.2 - 0.6 = 0$

$R_A = \frac{16.8}{3.5}$

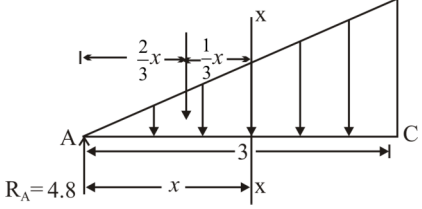
Search on Telegram @apna_pdf

$R_A = 4.8$ kW

$R_B = 12.6 - 4.8$

$= 7.8$ kW

from section (A C) –



We know that

$L \rightarrow W$

$1 \rightarrow \frac{W}{L}$

$x \rightarrow \frac{W}{L}x$

Load at section (x - x)

$$W = \frac{1}{2} \times x \times \frac{W}{L}x$$

$$= \frac{W}{2L}x^2$$

$(SF)_A = 4.8$

$$(SF)_C = 4.8 - \frac{Wx^2}{2L}$$

zero shear force mean 'maximum bending moment'

$$4.8 - \frac{7.2x^2}{2 \times 3} = 0$$

$\boxed{x = 2m}$

576. Which of the following statements is/are correct?

1. In uniformly distributed load, the nature of shear force is linear and bending moment is parabolic.
2. In uniformly varying load, the nature of shear force is linear and bending moment is parabolic.
3. Under no loading condition, the nature of shear force is linear and bending moment is constant.

Select the correct answer using the code given below.

(a) 1 and 2 (b) 1 and 3
(c) 2 only (d) 1 only

ESE 2019

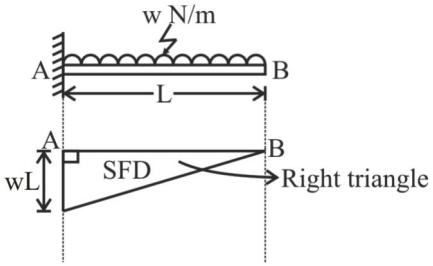
Ans. (d) : (i) In UDL, shear force is linear and bending moment is parabolic. Hence statement first is correct.
(ii) In UVL, shear force is parabolic and bending moment is cubic. Hence statement second is incorrect.
(iii) In no loading, shear force is constant and bending moment is linear. Hence statement third is also incorrect.

577. The shear force diagram of a cantilever beam of length ℓ and carrying uniformly distributed load of w per unit length will be

(a) a right angled triangle
(b) an issoscles triangle
(c) an equilateral triangle
(d) a rectangle

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (a) :



w = Load per unit length

At B, SF = 0

At A, $SF = w \times L = wL$

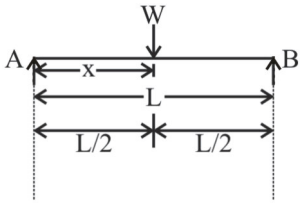
578. The maximum bending moment of a simply supported beam of span L and carrying a point load W at the centre of beam is,

(a) $\frac{WL}{4}$ (b) $\frac{WL}{2}$

(c) WL (d) $\frac{WL^2}{2}$

Nagaland PSC (CTSE) 2018, Paper-I, ESE 1996

Ans. (a) :



So from figure, $R_A = \frac{W}{2} = R_B$ $\quad \therefore R_A + R_B = W$

So for BM, at centre,

$$BM_{max} = \frac{W}{2} \times \frac{L}{2}$$

$$M_{max} = \frac{WL}{4}$$

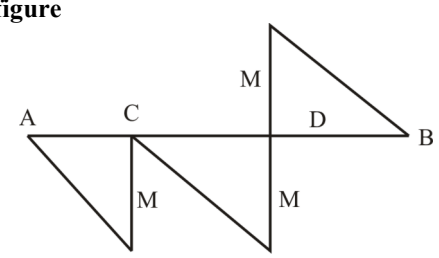
579. For a simply supported beam on two end supports the Bending Moment is maximum

(a) On the supports
(b) At mid span
(c) Where the deflection is maximum
(d) Where there is no shear force

GPSC Executive Engineer 23.12.2018

Ans. (d) : Where there is no shear force.

580. A simply supported beam AB has the bending moment diagram as shown in the following figure



The beam is possibly under the action of following loads.

(a) Couples of M at C and 2M at D
(b) Couples of 2M at C and M at D

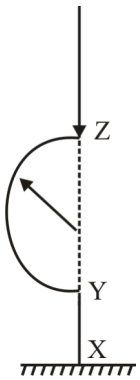
Search on Telegram @apna_pdf

(c) Concentrated loads of M/L at C and 2M/L at D
(d) Concentrated loads of M/L at C and couple of 2M at D

GPSC ARTO Pre 30.12.2018

Ans. (a) : The beam is possibly under the action of couples of M at C and 2M at D.

581. A curved member with a straight vertical leg is carrying a vertical load at Z as shown in the figure. The stress resultants in the XY segment are:



(a) bending moment, shear force and axial force
(b) bending moment and axial force only
(c) bending moment and shear force only
(d) axial force only

GPSC ARTO Pre 30.12.2018

Ans. (d) : The stress resultants in X-Y segment is only axial force as load passes through axis of segment.
For bending moment in the section, there is some eccentricity required with the load.

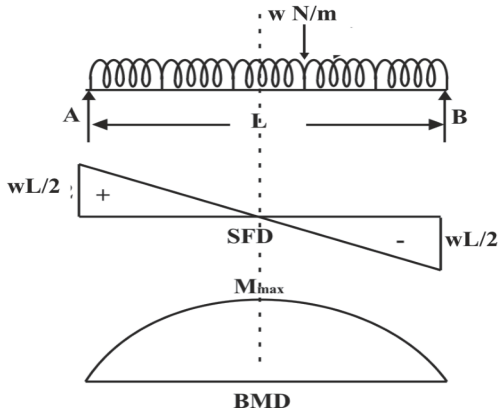
582. The shear force diagram for a simply supported beam carrying uniformly distributed load of w per unit length, consists of

(a) One right angled triangle
(b) One equilateral triangle
(c) Two right angled triangle
(d) Two rectangles

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (c) : $R_A + R_B = wL$

$$R_A = R_B = \frac{wL}{2}$$



$BM_{max} = \frac{wL^2}{8}$ at mid point [L/2]

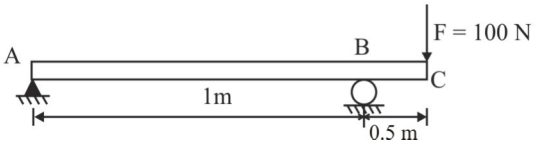
583. The reaction at the support of a beam with fixed end is referred as

(a) fixed end moment
(b) fixed end couple
(c) floating end moment
(d) floating end couple

TNPSC AE 2018

Ans. (a) : The reaction at the support of a beam with fixed end is referred as fixed end moment.

584. The beam ABC is supported at A (hinge support) and B (roller support). If a force of 100 N is applied at C as given in figure, then the reaction at the supports will be given by :

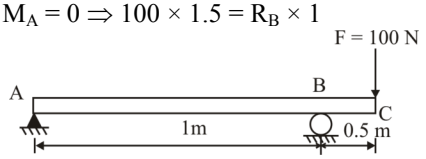


(a) $R_A = 50N(\downarrow); R_B = 150N(\uparrow)$
(b) $R_A = 50N(\uparrow); R_B = 100N(\downarrow)$
(c) $R_A = 150N(\uparrow); R_B = 50N(\downarrow)$
(d) $R_A = 150N(\downarrow); R_B = 50N(\uparrow)$
(e) $R_A = 50N(\downarrow); R_B = 150N(\downarrow)$

CGPSC AE 25.02.2018

Ans. (a) : $R_A + R_B = 100$

$M_A = 0 \Rightarrow 100 \times 1.5 = R_B \times 1$



$R_B = 150N(\uparrow)$

$R_A = -50N$

$R_A = 50N(\downarrow)$

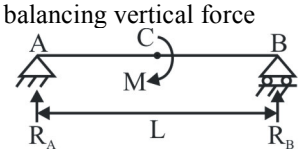
585. Which one of the following is the correct bending moment diagram for a beam which is hinged at the ends and is subjected to a clockwise couple acting at the mid-span?

(a)

(b) 
(c) 
(d) 
ESE 2018

Search on Telegram @apna_pdf

Ans. (c) : On balancing vertical force



$R_A + R_B = 0$ .....(i)

By taking moment about point A,

$R_B \times L = M$

$R_B = \frac{M}{L}$ .....(ii)

From equation (i) and (ii)

$R_A = -\frac{M}{L}$

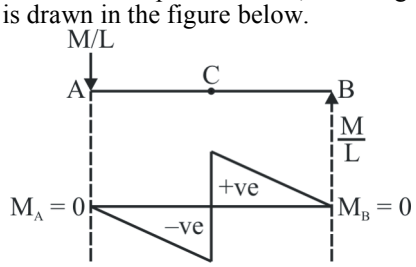
Bending moment

$M_A = M_B = 0$

$(M_c)_{Right} = R_B \times \frac{L}{2} = \frac{M}{2}$ (Sagging)

$(M_c)_{Left} = R_B \times \frac{L}{2} - M = -\frac{M}{2}$ (Hogging)

From the above computed values, bending moment diagram is drawn in the figure below.

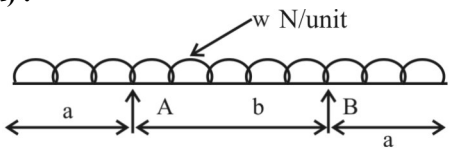


586. A beam carrying a uniformly distributed load rests on two supports 'b' apart with equal overhang 'a' at each end. The ratio b/a for zero bending moment at the mid span is

(a) 1/2 (b) 1
(c) 3/2 (d) 2

RPSC Vice Principal ITI 2018

Ans. (d) :



$R_A = R_B = \frac{(2a+b)w}{2}$

B.M. at middle of AB

$BM_{middle} = -(2a+b)\frac{w}{2} \times \frac{b}{2} + w\left(a + \frac{b}{2}\right)\left(a + \frac{b}{2}\right) \times \frac{1}{2}$

For zero B.M. at middle

$0 = -(2a+b)\frac{w}{2} \times \frac{b}{2} + \frac{w}{2}\left(a + \frac{b}{2}\right)^2$

$= -\frac{2ab - b^2}{2} + a^2 + \frac{b^2}{4} + \frac{2ab}{2}$

$= -ab - \frac{b^2}{2} + a^2 + \frac{b^2}{4} + ab$

$\boxed{\frac{b}{a} = 2}$

587. For a simply supported beam on two end supports the bending moment is maximum

(a) usually on the supports
(b) always a mid span
(c) where there is no shear force
(d) where the deflection is maximum

Karnataka PSC Lect., 27.05.2017

Ans (c) : Bending moment will be maximum if $\frac{dM}{dx} = 0$ i.e. V = 0

Bending moment will be maximum at the point at which shear force is zero (SFD changes its nature)

If M = Bending moment at the section of beam.

$\frac{dM}{dx}$ = Slope of bending moment diagram

$\frac{dM}{dx}$ = V (V = shear force at section of beam)

588. A point of contraflexure occurs in

(a) A simply supported beam
(b) A fixed beam
(c) A cantilever
(d) Fixed beam and cantilever

Karnataka PSC Lect., 27.05.2017

Ans (b) : In a beam if the bending moment changes its sign at a point, the point itself having zero bending moment, the beam changes curvature at this point of zero bending moment and this points is called point of contraflexure or point of inflection.

A point of contraflexure always occurs in a over hanging beam.

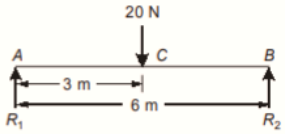
589. Calculate the bending moment at the mid-point of a 6 m long simply supported beam carrying a 20 N point load at the mid-point.

(a) 20 Nm (b) 30 Nm
(c) 45 Nm (d) 60 Nm

BPSC AE Mains 2017 Paper - VI

Ans : (b) : By symmetry,

$R_1 = R_2 = 10$ N



$(BM)_C = R_1 \times 3 = 10 \times 3$

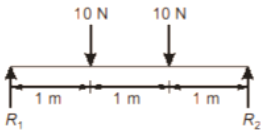
$(BM)_C = 30$ Nm

590. A 3 m long beam, simply supported at both ends, carries two equal loads of 10 N each at a distance of 1 m and 2 m from one end. The shear force at the mid-point would be

(a) 0 N (b) 5 N
(c) 10 N (d) 20 N

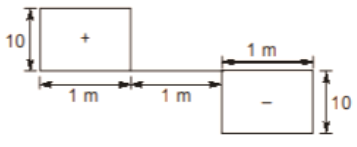
BPSC AE Mains 2017 Paper - VI

Ans : (a) :



By symmetry,

$R_1 = R_2 = 10$ N



Hence shear force at midpoint is zero.

Search on Telegram @apna_pdf

591. A simply supported beam of span carries over its full span a load varying linearly from zero at each end to W N/m at mid span. The maximum bending moment is

(a) $\frac{WL^2}{12}$ (b) $\frac{WL^2}{8}$

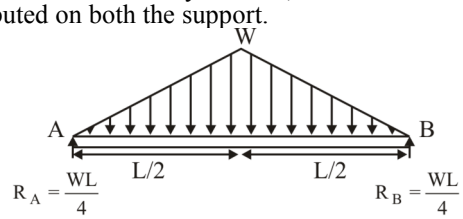
(c) $\frac{WL^2}{4}$ (d) $\frac{WL^2}{2}$

JWM 2017

Ans. (a) : Consider equilibrium of beam AB total load on beam is $2\times\left(\frac{1}{2}\times\frac{L}{2}\times W\right)$

Total load = $\frac{WL}{2}$

As the beam symmetric, the total load equally distributed on both the support.



$R_A = R_B = \frac{WL}{4}$

Bending moment (M_x)

In the region $0 < x < \frac{L}{2}$

$M_x = \frac{WL}{4}.x - \left(\frac{1}{2}\times x \times \frac{2Wx}{L}\right)\times\left(\frac{x}{3}\right)$

$= \frac{WL}{4}x - \frac{Wx^3}{3L}$

For maximum bending moment

$\frac{d(M_x)}{dx} = 0$

$\frac{WL}{4} - \frac{Wx^2}{L} = 0$

$\therefore x = \frac{L}{2}$

At. $x = \frac{L}{2}$ $\boxed{M_{max} = \frac{WL^2}{12}}$

592. The bending moment diagram for a simply supported beam is a rectangle over a larger portion of the span except near the supports. What type of load does the beam supports. What type of load does the beam carry?

(a) A uniformly distributed symmetrical load over a larger portion of the span except near the supports

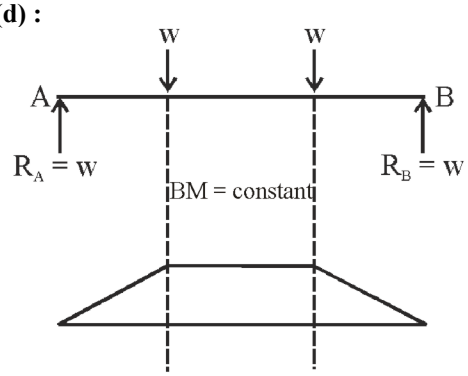
(b) A concentrated load at mid span

(c) Two identical concentrated loads equidistant from the supports and close to mid-point of the beam.

(d) Two identical concentrated loads equidistant from the mid span and close to supports

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2007

Ans. (d) :



Two identical concentrated loads equidistant from the mid span and close to supports.

593. For a cantilever $\frac{dM}{dx}$ = constant for its whole length. What is the shape of the SF diagram for the beam?

(a) Rectangle (b) Triangle

(c) A parabola (d) A hyperbola

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2008

Ans. (a) : $\frac{dM_x}{dx} = V_x$

For $\frac{dM_x}{dx} = \text{constant}$

Shear force,

V_x = constant

$\therefore$ Shape of SFD is rectangular.

594. SF diagram for a simply supported beam is a rectangle with its longer side equal to beam length. What type of load is acting on the beam?

(a) Concentrated load at it mid span

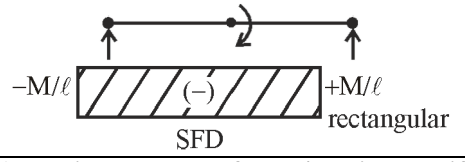
(b) UDL over its whole span

(c) Concentrated load along with a couple at a point on beam length

(d) Couple at a point on the beam length

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2008

Ans. (d) :



595. A cantilever beam of span/carries a uniformly varying load of zero intensity at the free end and w per metre length at the fixed end. What does the integration of the ordinate of the load diagram between at the limits of free and fixed ends of the beam give?

(a) Bending moment at the fixed end

(b) Shear force at the fixed end

(c) Bending moment at the free end

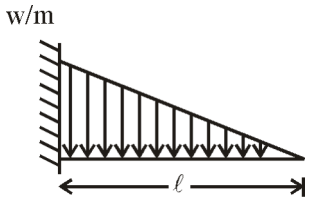
(d) Shear force at the free end

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) :

$\frac{dV_x}{dx}$ = w (Rate of loading)

Search on Telegram @apna_pdf



Shear force between any two points on the loaded beam is equal to total area of the leading diagram between these two points.

$$(SF)_{\text{fixed end}} = \frac{1}{2} \times \ell \times w$$

596. The diagram showing the variation of axial load along the span is called

(a) shear force diagram
(b) bending moment diagram
(c) thrust diagram
(d) influence line diagram

TSPSC AEE 28.08.2017 (Civil/Mechanical)

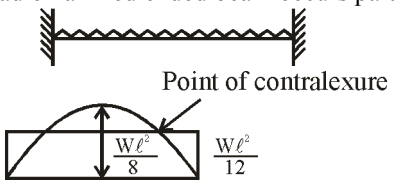
Ans. (c) : Diagram showing the variation of axial load along the span is called thrust diagram.

597. The variation of the bending moment due to the moving load on a fixed ended beam occurs

(a) linear (b) parabolic
(c) cubic (d) constant

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : The variation of the Bending moment due to a moving load on a fixed ended beam occurs parabolic.

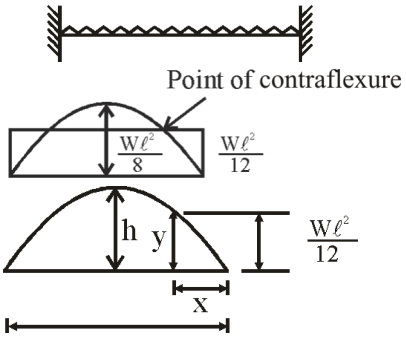


598. A prismatic beam of length L is fixed at both ends carries a uniformly distributed load. The distance of points of contra flexure from either end is

(a) 0.207 L (b) 0.211 L
(c) 0.277 L (d) 0.25 L

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) :



$$y = \frac{W\ell^2}{12}$$

$$y = \frac{4h}{\ell^2} x(\ell - x)$$

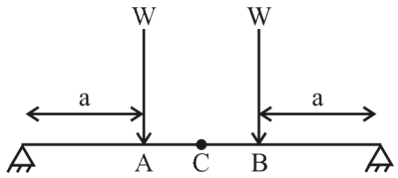
$$\frac{W\ell^2}{12} = \frac{4}{\ell^2}\left(\frac{W\ell^2}{8}\right) x(\ell - x)$$

$$\frac{\ell^2}{6} = x(\ell - x)$$

$$x^2 - \ell x + \frac{\ell^2}{6} = 0$$

$$x = 0.2111\ell$$

Directions : Q. No. 599-600 are based of the following figures:

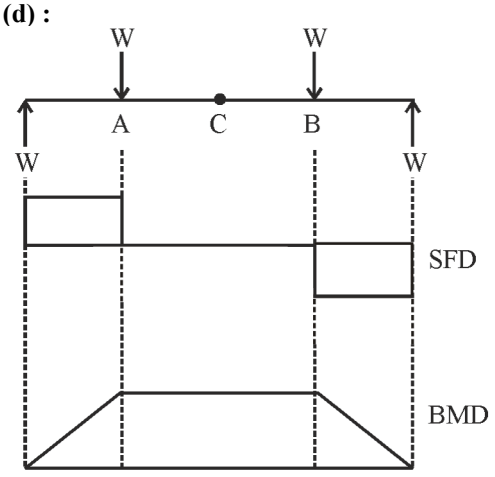


599. A beam is simply supported at the ends and loaded as shown in figure. The shearing force at the mid-point C will be:

(a) $\frac{W}{2}$ (b) W
(c) 2W (d) Zero

PTCUL AE 25.06.2017

Ans. (d) :

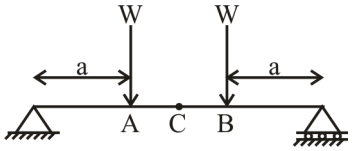


600. The bending moment between the point A and B is:

(a) Increasingly linearly
(b) Decreasingly linearly
(c) Varying parabolically
(d) Constant

PTCUL AE 25.06.2017

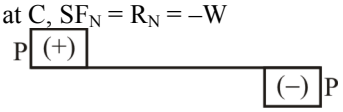
Ans. (d) :



By symmetric–
Reaction at supports is $R_M = W$, $R_N = W$
For SFD: (From left side)
Shear force at C, $SF_M = R_M = W$
Shear force at A (just left of A), $SF_A = W$
Shear force at A (just right of A), $SF_A = W - W = 0$
Shear force at B (just left of B), $SF_B = 0$
Shear force at B (just right of B), $SF_B = -W$

Search on Telegram @apna_pdf

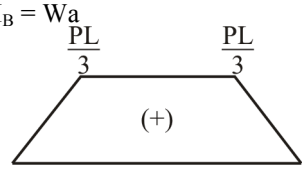
Shear force at C, $SF_N = R_N = -W$



For BMD: (From left side)

BM at A, $BM_A = Wa$

BM at B, $BM_B = Wa$



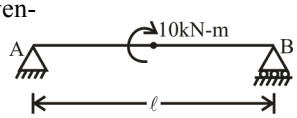
From SFD and BMD it is clear that there will be no shear force between A and B, but there will be a uniform bending moment between A and B.

601. A beam of length 2 m is pinned at both ends and is subjected to a concentrated moment 10 kNm at its center. The maximum bending moment in the beam is

(a) 10 kNm (b) 5 kNm
(c) 20 kNm (d) 15 kNm

GPSC EE Pre, 28.01.2017

Ans. (b) : Given-



Length (l) = 2 m

Concentrated moment = 10 kN-m

Maximum bending moment = $\frac{M}{l} \times \frac{l}{2}$

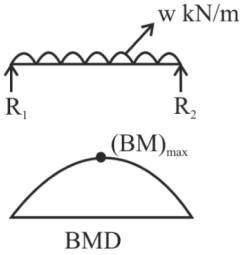
$$(BM)_{max} = \frac{10}{2} = 5\,kN-m$$

602. The number of points of contraflexure in a simple supported beam carrying uniformly distributed load, is

(a) One (b) Two
(c) Zero (d) None of these

GPSC EE Pre, 28.01.2017

Ans. (c) : Zero



In a bending moment diagram, the point of contra flexure is the point on beam where bending moment changes sign.

603. Match the following :

P.	Point of contraflexure	i.	Bending moment changes sign
Q.	Load intensity	ii.	Shear force changes sign
		iii.	Rate of change of bending moment
		iv.	Rate of change of shear force

(a) P-i, Q-iv (b) P-ii, Q-iv
(c) P-i, Q-iii (d) P-ii, Q-iii

APGENCO AE, 2017

Ans. (a) : At point of contraflexure bending moment changes its sign from positive to negative and vice-versa and at this point value of B.M. becomes zero.

Shear force $(S) = \frac{dM}{dx}$ = rate of change of bending moment.

Intensity of loading $(w) = \frac{dS}{dx}$ = rate of change of shear force.

604. The rate of change of shear force at any section represents

(a) Point of contraflexure
(b) Shear force at that section
(c) Bending moment at that section
(d) Rate of loading at that section

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (d) : Consider a simply supported beam subjected to UDL for the entire span consider a free body diagram at small portion elemental length example.

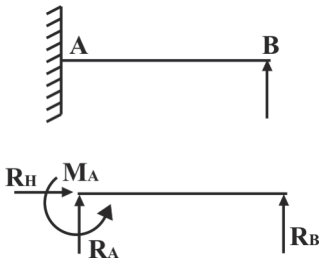
This rate of change of shear force at any section is equal to the intensity of loading.

605. A beam is fixed at one end and is vertically supported at the other end. What is the degree of statical indeterminacy?

(a) 1 (b) 2
(c) 3 (d) 4

ISRO Scientist/Engineer 07.05.2017

Ans. (a) :



- A beam is to be statically indeterminate, if the number of reaction is greater than static equilibrium condition equation.
- A beam is said to be statically determinate, if the number of reaction is equal to static equilibrium condition equation.

For propped cantilever beam—

Four reaction R_H, R_A, R_B and M_A.

And three equation of static i.e. $\sum H = 0$, $\sum V = 0$ and $\sum M = 0$

So, hence beam is statically indeterminate to one degree.

So, total No. of Reaction = 4

No. of independent equilibrium equation = 3

So, degree of static indeterminacy will be = 4 - 3 = 1.

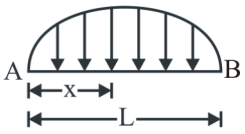
606. A simply supported beam of length L is subjected to a varying distributed load sin(πx/L) N/m, where distance x is measured from the left support. The magnitude of the vertical reaction in N at the left support is

(a) 3L/π (b) 2L/π
(c) L/2π (d) L/π

ISRO Scientist/Engineer 07.05.2017

Search on Telegram @apna_pdf

Ans. (d) :



$R_A = ?$

$$\text{Load} = \sin\left(\frac{\pi x}{L}\right) N/m$$

$$\text{Total load} = \int_0^L \sin\left(\frac{\pi x}{L}\right) dx$$

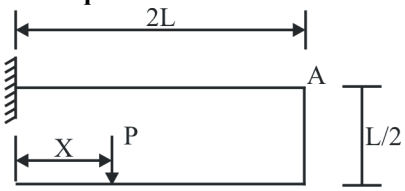
$$= -\frac{L}{\pi}\left[\cos\left(\frac{\pi x}{L}\right)\right]_0^L$$

$$\text{Total load} = -\frac{L}{\pi}[-1-1]$$

$$= \frac{2L}{\pi}$$

$$R_A = R_B = \frac{2L}{\pi} \times \frac{1}{2} = \frac{L}{\pi}$$

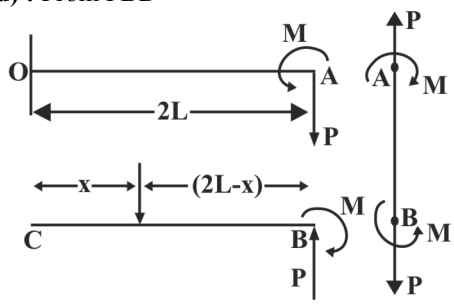
607. A force P is applied at a distance 'X' from the end of the beam as shown in the figure. What would be value of 'X' so that the displacement at 'A' is equal to zero?



(a) 0.5 L (b) 0.25 L
(c) 0.33 L (d) 0.66 L

ISRO Scientist/Engineer 07.05.2017

Ans. (d) : From FBD—



where,

$M = P(2L - x)$

Deflection at point (A) due to moment M.

$$\delta_M = \frac{M(2L)^2}{2EI} = \frac{4ML^2}{2EI}(\uparrow)$$

$$= \frac{4P(2L-x).L^2}{2EI}$$

Deflection at point (A) due to point load P

$$\delta_P = \frac{P(2L)^3}{3EI} = \frac{8PL^3}{3EI}(\downarrow)$$

So,

$\delta_M + \delta_P = 0$ (given)

$$\frac{4P(2L-x).L^2}{2EI} - \frac{8PL^3}{3EI} = 0$$

$$\frac{4P(2L-x).L^2}{2EI} = +\frac{8PL^3}{3EI}$$

$$2L - x = \frac{4}{3}L$$

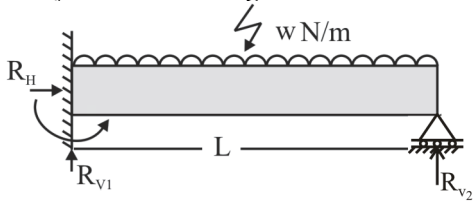
$$x = \frac{2}{3}L = 0.66L$$

608. A propped cantilever is indeterminate externally to

(a) The second degree (b) The third degree
(c) The fourth degree (d) The fifth degree

TNPSC AE 2017

Ans. (a) : A propped cantilever is indeterminate externally to the second degree.



For general loading, the total reaction components (R) are equal to (3 + 2) = 5, while the total number of conditions (r) are equal to 3. The beam is statically indeterminate externally to second degree.

Note- For vertical loading, the beam is statically determinate to single degree (In figure).

609. The difference between member of a truss and of a beam is:

(a) The members of a truss take their loads along their length whereas a beam takes loads at right angles to its length
(b) The member of the truss takes load lateral to its length whereas the beam along the length
(c) The member of the truss can be made of C.I where as the beam is of structural steel only
(d) The member of the truss can have a circular cross-section whereas the beam can have any cross-section

JWM 2017

Ans. (a) : Beams support their loads in shear and bending where as truss support loads in tension and compression.

The members of a truss take their loads along their length where as a beam takes loads at right angle to its length.

610. Shear force at any point of the beam is the algebraic sum of

(a) All vertical forces
(b) All horizontal forces
(c) Forces on either side of the point
(d) Moment of forces on either side of the point

Vizag Steel (MT) 2017

Ans. (c) :

- Shear force at any point of the beam is the algebraic sum of forces on either side of the point.
- Bending moment at any point of the beam is the algebraic sum of moment of forces on either side of the point.

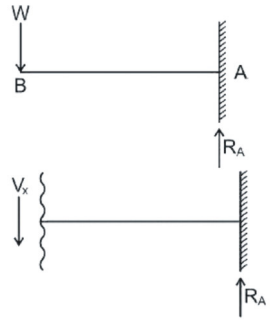
Search on Telegram @apna_pdf

611. A cantilever carries a concentrated load (W) at its free end. Its shear force diagram will be:

(a) 
(b)

(c) 
(d) 
CIL MT 26.03.2017

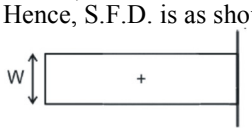
Ans. (d) : $R_A = w$



$V_x = R_A = w$

$V_A = w$, $V_B = w$

Hence, S.F.D. is as shown in figure below

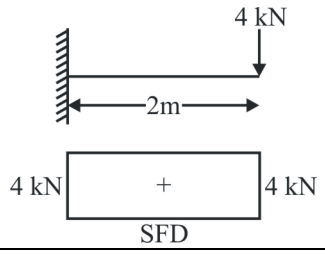


612. A cantilever beam of span 2 m with a point load of 4 kN at its free end will have a constant shear force of _____ throughout the span.

(a) 2 kN (b) 4 kN
(c) 6 kN (d) 8 kN
(e) 10 kN

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : It have constant shear force of 4 kN.



613. Basic equation of deflection (y) of the beam is represented by $EI\frac{d^2y}{dx^2} = M$, where EI flexural rigidity and M Bending moment, then $EI\frac{d^3y}{dx^3}$

(a) Shear force at the section
(b) Rate of loading
(c) Zero always
(d) Bending moment at section

UPRVUNL AE 07.10.2016
APPSC Poly. Lect. 2013

Ans. (a) :

$$EI\frac{d^2y}{dx^2} = M$$

We know that

$$\frac{dM}{dx} = \text{shear force}$$

then

$$EI\frac{d^3y}{dx^3} = \frac{dM}{dx} = \text{shear force at section}$$

614. Shear force at a section of a horizontal beam is the

(a) algebraic sum of the vertical forces to any one side of the section
(b) algebraic sum of the vertical forces on both sides of the section
(c) algebraic sum of the moments of all forces on any one side of the section
(d) algebraic sum of the moments of all forces on both sides of the section

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : Shear force at a section of horizontal beam is the algebraic sum of the vertical forces to any one side of the section.

615. Bending moment is maximum at a section of a beam where

(a) Shear force changes from –ve to +ve
(b) Shear force is zero
(c) Shear force changes from +ve to –ve
(d) All the given answers

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : Bending moment at any section x

$\frac{dM_x}{dx} = V_x$ (shear force)

The bending moment is maximum at a section of a beam where shear force changes its sign or the value of shear force is zero.

616. Which of the following is giving correct relation between load(w), shear force (F) and bending moment (M)

(a) $M = \frac{dF}{dx}$ (b) $F = \frac{dM}{dx}$
(c) $w = \frac{dM}{dx}$ (d) $M = \frac{dw}{dx}$

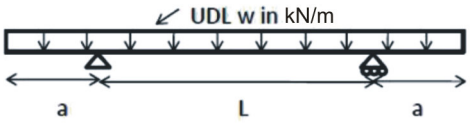
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know, The Rate of change of Bending moment with respect to 'x' is equal to the shearing force or the slope of the moment diagram at a given point is the shear at that point.

So shear force, $F = \frac{dM}{dx}$

617. A beam with equal overhangs is carrying UDL as shown in the following figure. The bending moment at the centre of the beam will be zero for the condition

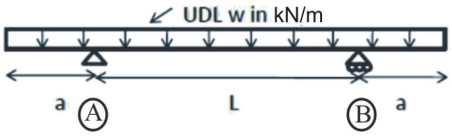
Search on Telegram @apna_pdf



(a) a = L/3 (b) a = L/2
(c) a = 3L/2 (d) a = L

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : We know,



$$R_A = W\left(a + \frac{L}{2}\right)$$

$$M_x = R_A x - \frac{W}{2}(a+x)^2$$

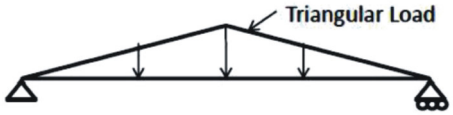
$$= W\left(a + \frac{L}{2}\right)x - \frac{W}{2}(a+x)^2$$

We know,

At $x = \frac{L}{2}$, $M = 0$,

So, We get $\frac{a}{L} = \frac{1}{2} \Rightarrow \boxed{a = \frac{L}{2}}$

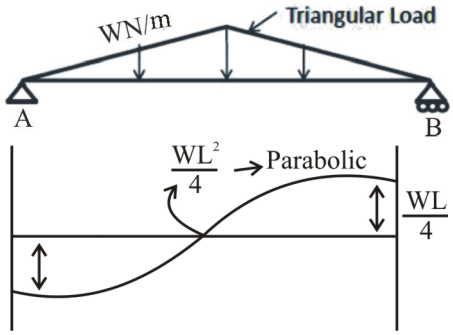
618. A simple supported beam is carrying a linearly varying load from zero at either ends to the maximum value at the mid span. Then the shape of shear force diagram (SFD) is



(a) Rectangle
(b) Triangular
(c) Second Degree Parabola
(d) cubic

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : Total load = $\frac{1}{2} \times L \times W = \frac{WL}{2}$



$$w_x = \frac{Wx}{L/2} = \frac{2Wx}{L}$$

Shear force at section x,

$$V_x = \frac{WL}{4} - \frac{1}{2} x w_x$$

$$= \frac{WL}{4} - \frac{1}{2} x \left(\frac{2Wx}{L}\right)$$

$$\boxed{V_x = \frac{WL}{4} - \frac{Wx^2}{L}} \text{ (Parabolic)}$$

$$\boxed{M_x = \frac{WL}{4} x - \frac{Wx^3}{3L}} \text{ (Cubic Parabolic)}$$

619. A simply supported beam of span L and constant width b carries a point load W at mid span. The depth of the beam required at the mid span for maximum extreme fibre stress P.

(a) $d = \frac{3WL}{2bp}$ (b) $d = \sqrt{\frac{3WL}{2bp}}$
(c) $d^3 = \frac{3WL}{2bp}$ (d) $d = \frac{3WL}{2bp^2}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : Bending moment, $M_{max} = \frac{WL}{4}$

Maximum extreme stress (Bending stress) = P

Bending stress, $\sigma_b = P = \frac{My}{I} = \frac{M\frac{d}{2}}{\left(\frac{bd^3}{12}\right)}$

$$P = \frac{\left(\frac{WL}{4}\right)\left(\frac{d}{2}\right)}{\frac{bd^3}{12}} = \frac{12}{8}\frac{WL}{bd^2}$$

$$P = \frac{3}{2}\frac{WL}{bd^2}$$

$$\boxed{d = \sqrt{\frac{3WL}{2bP}}}$$

620. The number of contra flexure points that occur in a cantilever beam subjected uniformly distributed load is

(a) 3 (b) 2
(c) 1 (d) 0

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : Point of contraflexure in a beam is a point at which bending moment changes it sign from positive to negative and vice versa. But in cantilever there is no change in sign of bending moment. So, point of contraflexure is zero.

621. A simply supported beam of span L carries a point load P at center, the slope at left end is

(a) $PL^3/(16EI)$ (b) $PL^2/(48EI)$
(c) $PL^2/(16EI)$ (d) $PL^3/(48EI)$

APPSC AEE Mains 2016 (Civil Mechanical)

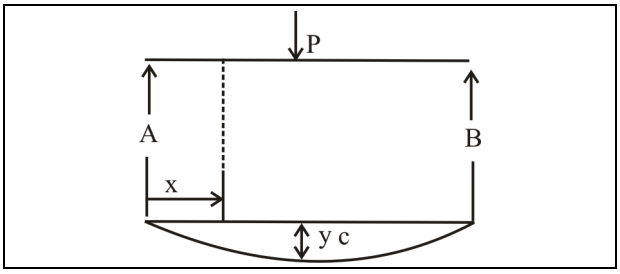
Ans. (c) : For a simply supported beam, L, The general equation for this is

$$EI\frac{dy}{dx} = \frac{Px^2}{4} - \frac{PL^2}{16}$$

So, the slope of left end.

$$\boxed{\frac{dy}{dx} = \frac{PL^2}{16 \times EI}}$$

Search on Telegram @apna_pdf



622. When equations of statics are not sufficient to determine all the reactive forces at the supports, such beams are called

(a) statically indeterminate
(b) statically determinate
(c) Imperfect
(d) Defective

APPSC AEE Mains 2016 (Civil Mechanical)

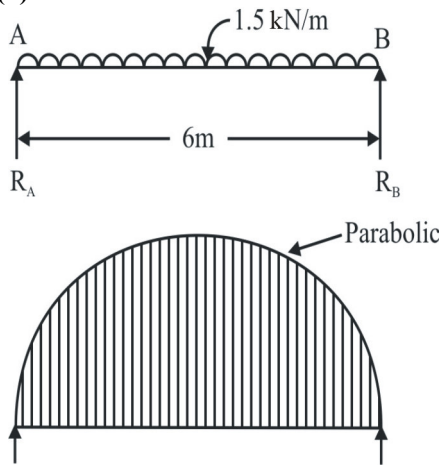
Ans. (a) : In statics and structural mechanics a structure is statically indeterminate when the static equilibrium equations - force & moment equilibrium conditions are insufficient for determining the internal forces & reactions on that structure.

623. A simply supported beam of span length 6 m carries a uniformly distributed load of 1.5 kN/m. What is the maximum value of bending moment?

(a) 13.5 kN-m (b) 6.75 kN-m
(c) 27 kN-m (d) 9.25 kN-m

UPRVUNL AE 21.08.2016

Ans. : (b)



$$(BM)_{max} = \frac{wl^2}{8}$$

$$(BM)_{max} = \frac{1.5 \times 6^2}{8}$$

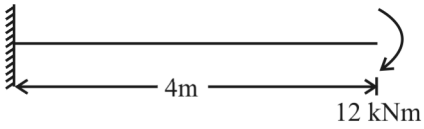
$$(BM)_{max} = 6.75\,kN\text{–}m$$

624. A cantilever of length 4m is subjected to clockwise couple of 12kN-m at free end. What is the shear force at fixed end?

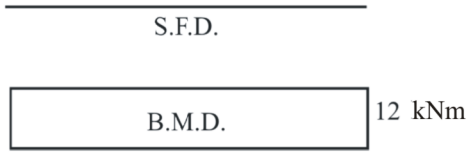
(a) zero (b) 12 kN
(c) 3 kN (d) 4 kN

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



As S.F. is due to load only and here there is no load on the beam so there will not be any S.F. in beam.

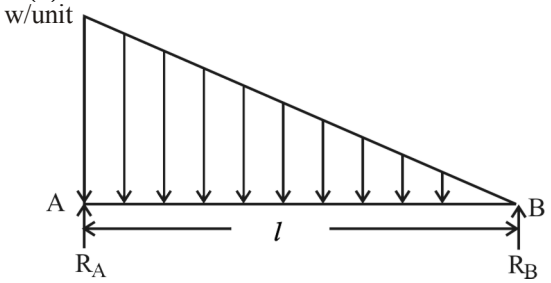


625. A simply supported beam with a gradually varying load from zero at 'B' and 'w' per unit length at 'A'. The shear force at 'B' is equal to

(a) $\frac{wl}{6}$ (b) $\frac{3wl}{2}$
(c) wl (d) $\frac{2wl}{3}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Total load = Area of loading diagram

$$= \frac{1}{2} \times w \times l = \frac{wl}{2}$$

This load will act at the C.G. of loading diagram

i.e $\frac{l}{3}$ from support A,

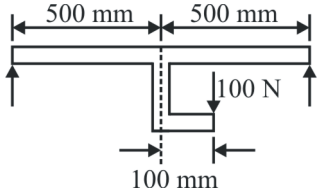
Reaction at A, $R_A = \frac{\frac{wl}{2} \times \frac{2l}{3}}{l}$

$$R_A = \frac{wl}{3}$$

Reaction at B, $R_B = \frac{\frac{wl}{2} \times \frac{l}{3}}{l}$

$$R_B = \frac{wl}{6}$$

626. In a simply supported beam loaded as shown in figure, the maximum bending moment in Nm is

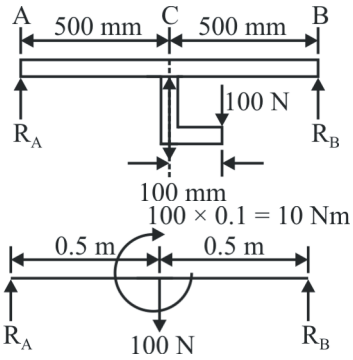


Search on Telegram @apna_pdf

(a) 25 (b) 30
(c) 35 (d) 60

ISRO Scientist/Engineer 03.07.2016
GATE 2007

Ans. (b) :



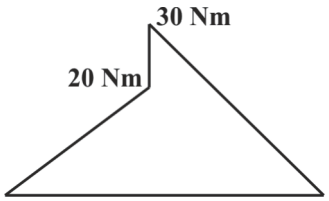
$R_A + R_B = 100$

Taking moment about point A

$R_B \times 1 = 100 \times 0.1 + 100 \times 0.5$

$R_B = 60N$

$R_A = 40N$



Moment at point (B)

$M_B = 0$

Moment at point (A) $M_A = 0$

Moment at point C = 40 × 0.5 = 20

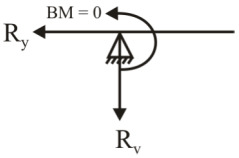
Concentrated moment (10 N-m) also act in the same direction so

Max. Bending moment at C = 20 + 10 = 30 N-m.

627. At a hinge in a beam
(a) Shear force is zero
(b) Bending moment is maximum
(c) Bending moment is zero
(d) Bending moment changes sign

APPSC AEE Screening Test 2016

Ans. (c)

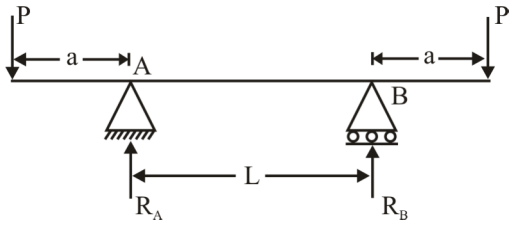


Bending moment (BM) = 0

628. The bending moment for a beam with equal overhangs and carrying equal point loads each of P at the free ends, the shear force for the beam portion between the supports is
(a) Zero
(b) equal to P
(c) Linearly varying from–P to +P
(d) Linearly varying from 0 to P

APPSC AEE Screening Test 2016

Ans. (a)



$R_A + R_B = 2P$

$R_A = P, \ R_B = P$

Hence, the shear force for the beam portion between the supports is zero.

629. The reaction at a roller support of beam will be
(a) Tangential to support
(b) Normal to support
(c) Unknown in direction
(d) Inclined to support

APPSC AEE Screening Test 2016
KPSC ADF 2015

Ans. (b)

Only normal/perpendicular support = R_v

$R_H = 0$

$\Sigma M = 0$

630. For a beam subjected to point loads, the shear force between point loads
(a) is constant
(b) varies linearly
(c) has parabolic variation
(d) always remain zero

APPSC AEE Screening Test 2016

Ans. (a) : For a beam subjected to point loads, the shear force between point loads is constant.

631. Which of the following statements is true for shear force (SF) and bending moment (BM) diagram (where, w = weight per unit length)
(a) Change in BM over a small length (dM) = Area of SF diagram under that length (Vdx)
(b) Change in BM over a small length (dM) = Rate of change of SF under that length (dV/dx)
(c) Rate of change of Change in BM over a small length (dM/dx) = Rate of change of SF under that length (dV/dx)
(d) Change in SF over a small length (dV) is greater than area of loading diagram over that length (wdx)

RPSC LECTURER 16.01.2016

Search on Telegram @apna_pdf

Ans. (a) : We know that

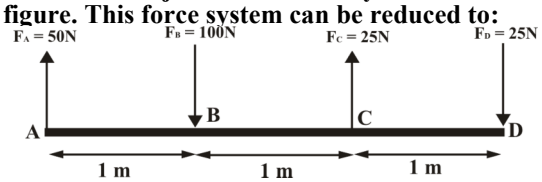
$$\frac{dM}{dx} = \text{shear force (SF)}$$

$dM = (SF) \times dx$

So,

change in BM over a small length (dM) = Area of SF diagram under that length

632. A beam is subjected to a force system shown in figure. This force system can be reduced to:



(a) A single force of 50 N (downward) at 2.5 m from A

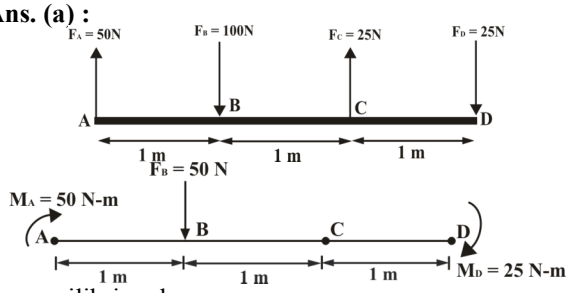
(b) A single force of 50 N (downward) at 2.5 m from D

(c) A single force of 50 N (upward) at 2.5 m from D

(d) A single force of 50 N (upward) at 2.5 m from A

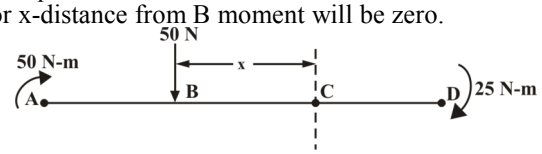
UPRVUNL AE 07.10.2016

Ans. (a) :



For equilibrium beam

For x-distance from B moment will be zero.



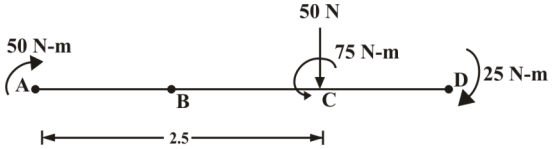
For equilibrium

$$\sum M_{CW} = \sum M_{ACW}$$

$50 + 25 = 50x$

$x = 1.5$ or

From A at a distance of 2.5



Then this force system can be reduced to single force of 50 N (downward) at 2.5 m from A.

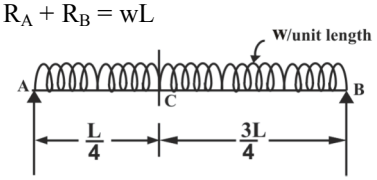
633. Bending moment at distance L/4 from one end of a simply supported beam of length (L) with uniformly distributed load of strength w per unit length is given by

(a) $\frac{7}{32}wL^2$ (b) $\frac{5}{32}wL^2$

(c) $\frac{3}{32}wL^2$ (d) $\frac{1}{32}wL^2$

UPRVUNL AE 07.10.2016

Ans. (c) : $R_A + R_B = wL$



taking moment at point A

$$R_B \times L = wL \times \frac{L}{2}$$

$$\boxed{R_B = R_A = \frac{wL}{2}}$$

taking moment at point C

$$M_c = R_A \times \frac{L}{4} - w \times \frac{L}{4} \times \frac{L}{8}$$

$$M_c = \frac{wL}{2} \times \frac{L}{4} - w\frac{L}{4} \times \frac{L}{8} = \frac{3}{32}wL^2$$

634. If the shear force diagram for a beam is triangle with length of the beam as its base, the beam is

(a) A cantilever with a point load at its free end.

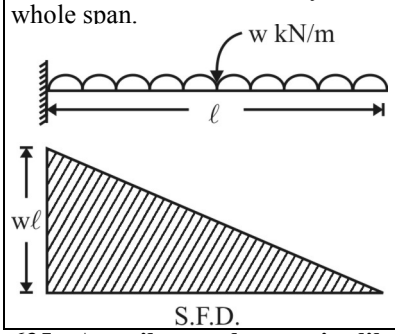
(b) A cantilever with uniformly distributed load over its whole span.

(c) A simply supported beam with a point load at its mid-point.

(d) A simply supported beam with uniformly distributed load over its whole span.

UPPSC AE 12.04.2016 Paper-I

Ans : (b) If the shear force diagram for a beam is triangle with length of the beam as its base, the beam is a cantilever with uniformly distributed load over its whole span.



635. A railway sleeper is like a beam having uniformly distributed load acting upwards (as reaction) and supports at rails with loads acting downwards due to the passing rail, such that:

(a) Greatest bending moment is at the centre of sleeper

(b) Greatest bending moment is at the end of sleeper

(c) Greatest bending moment is at the contact of rails

(d) Greatest bending moment is as small as possible

GPSC Asstt. Prof. 28.08.2016

Ans. (d) :

636. Two similar beams of same length and same load acting at the centre. First one is fixed at ends and second one is simply supported. The maximum bending moment of first with respect to second is

Search on Telegram @apna_pdf

(a) Double (b) Same
(c) Half (d) One fourth

GPSC Asstt. Prof. 28.08.2016

Ans. (c) : II[nd] maximum BM for simply supported beam at centre $= \frac{PL}{4}$

I[st] maximum BM for fixed end beam at centre $= \frac{PL}{8}$

$$\text{Ratio} = \frac{(BM)_I}{(BM)_{II}} = \frac{\frac{PL}{8}}{\frac{PL}{4}} = \frac{1}{2}$$

So, I[st] to II[nd] is

$$\text{Maximum } (BM)_{ss} = \frac{1}{2} \text{Maximum } (BM)_{\text{fixed}}$$

637. …….. has the unit 'N-m'.

(a) Kinetic Energy (b) Potential Energy
(c) Shear Force (d) Bending Moment

HPPSC Lect. (Auto) 23.04.2016

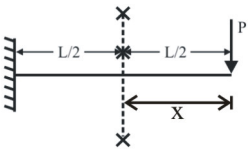
Ans. (d) : Bending moment has the unit 'N-m'
- Kinetic energy – Joule (J)
- Potential energy – Joule (J)
- Shear force – Newton (N)

638. For a cantilever beam of length 'L' having a point load 'P' at its free end, the bending moment at the mid-span of the beam is given by :

(a) PL (b) (P/2) L
(c) P/L (d) L/P

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) :



$M_{xx} = P \times x$

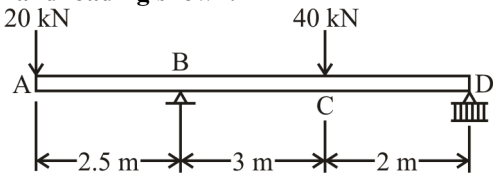
At x = L (Fixed point)

Bending moment ($M_{\text{at fixed end}} = PL$)

At, $x = \frac{L}{2}$ (Mid point)

$$M_{\text{mid span}} = P.\frac{L}{2}$$

639. Draw the SFD and BMD diagram for the beam and loading shown.



(a) 
(b) 
(c) 
(d) 
(e) None of these

CGPSC AE 16.10.2016

Ans. (b) :

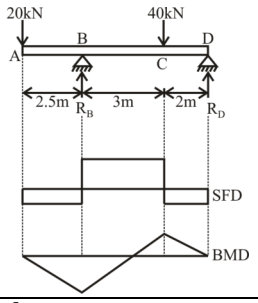
$\sum M_D = 0$

$R_B \times 5 = 40 \times 2 + 20 \times 7.5$

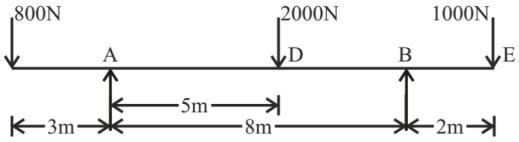
$R_B = 46$ kN

$R_D = 60 - 46$

$R_D = 14$ kN



640. A beam is loaded as shown :

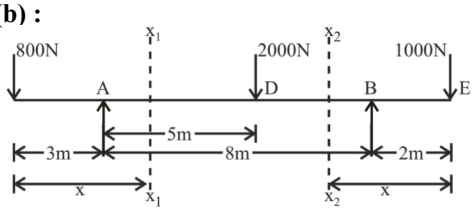


The points of contraflexure within the span AB will be

(a) 3m from A and 3 m from B
(b) 3m from A and 1.67 m from B
(c) 1.67m from A and 3 m from B
(d) 1.67m from A and 1.67 m from B
(e) None of the above

CGPSC AE 16.10.2016

Ans. (b) :



$R_A + R_B = 3800$ N

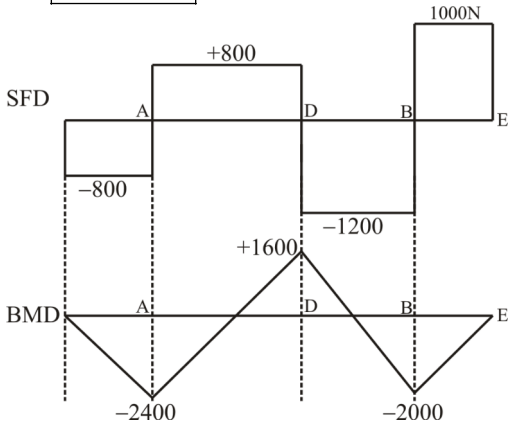
$\sum M_A = 0$

$800 \times 3 + R_B \times 8 = 2000 \times 5 + 1000 \times 10$

$\boxed{R_B = 2200\,\text{N}}$

$R_A = 3800 - 2200$

$\boxed{R_A = 1600\,\text{N}}$



Search on Telegram @apna_pdf

Moment in section AD (x_1-x_1)

$M = 0$

$800 \times x - 1600 \times (x - 3) = 0$

$x = 6$ m

Distance from A = 6 – 3 = 3 m

Moment in section DB (x_2-x_2)

$M = 0$

$1000x = 2200 \times (x - 2)$

$x = 3.666$

Distance from B = 3.666 – 2

= 1.667 m

641. Slope of tangent to shear force diagram gives

(a) Bending moment
(b) Couple moment
(c) Support reactions
(d) Rate of loading
(e) Rate of bending moment

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : According to relation $\frac{dF}{dx} = -W$ (constant)

So, slope of tangent to shear force diagram gives rate of loading.

642. For a simply supported beam of length L, the bending moment M is described as M = a ($x - x^3/L^2$), $0 \le x \le L$; Where a is constant. The shear force will be zero at:

(a) The supports (b) $x = \sqrt{\frac{L}{3}}$

(c) X = L (d) $X = \frac{L}{2}$

TSPSC Managers, 2015

Ans. (*) : Given – Bending moment (M)

$$M = a\left(x - \frac{x^3}{L^2}\right), \quad 0 \le x \le L$$

We know that,

$$\text{shear force } (F) = \frac{dM}{dx}$$

So, $\frac{dM}{dx} = a - \frac{3x^2}{L^2} \times a$

According to question says that shear force is zero.

$$F = 0 = \frac{dM}{dx}$$

$$a - \frac{3x^2}{L^2} \times a = 0$$

or $\frac{3x^2}{L^2} = 1$

$3x^2 = L^2$

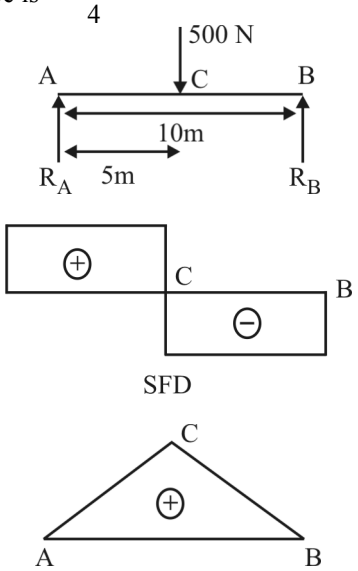
$$\boxed{x = \frac{L}{\sqrt{3}}}$$

643. A simply supported beam of span 10 m carrying a load of 500 N at the midspan will have a maximum bending moment of :

(a) 500 Nm (b) 1250 Nm
(c) 2500 Nm (d) 5000 Nm

Kerala PSC AE 06.08.2015

Ans. (b) : Formula for max bending moment for simply supported be is $= \frac{WL}{4}$



$\Sigma F_V = 0$

$R_A + R_B = 500$

take moment about 'B'

$R_A \times 10 = 500 \times 5$

$R_A = 250$ N ...(i)

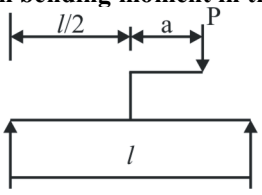
$R_B = 250$ N ...(ii)

moment about 'C' (will be max.)

$M_A = R_A \times 5 = 250 \times 5$

= 1250 Nm

644. A simply supported beam carries a load 'P' through a bracket as shown in the figure. The maximum bending moment in the beam is

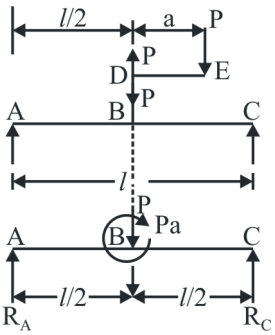


(a) $\frac{Pl}{2}$ (b) $\frac{Pl}{2} + \frac{ap}{2}$

(c) $\frac{Pl}{2} + aP$ (d) $\frac{Pl}{2} - aP$

ISRO Scientist/Engineer 11.10.2015
UPPSC AE 12.04.2016 Paper-I

Ans. (*) :



$R_A + R_C = P$ .....(i)

Take a moment about 'C'

Search on Telegram @apna_pdf

$$R_A \times \ell + Pa = P \times \frac{\ell}{2}$$

$$R_A \times \ell + Pa = \frac{P\ell}{2}$$

$$R_A = \frac{\frac{P\ell}{2} - Pa}{\ell} = \frac{P}{2} - \frac{Pa}{\ell}$$

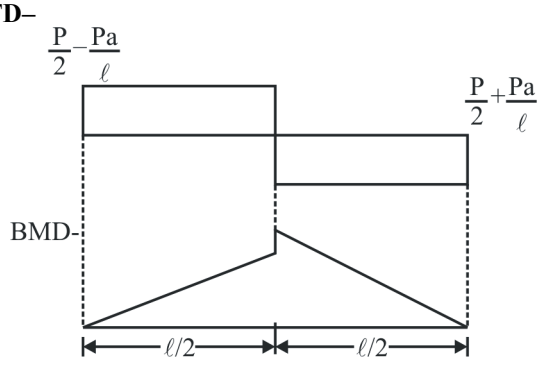
From equation (i)– $R_A + R_C = P$

$$R_A + R_C = P$$

$$R_C = P - R_A = P - \frac{P}{2} + \frac{Pa}{\ell}$$

$$R_C = \frac{P}{2} + \frac{Pa}{\ell}$$

SFD–



Maximum Bending Moment

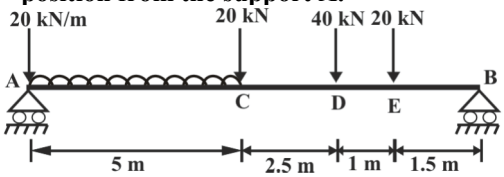
$$BM\ (M_{max}) = \left(\frac{P}{2} - \frac{Pa}{\ell}\right)\frac{\ell}{2} + Pa$$

$$= \frac{P\ell}{4} - \frac{Pa}{2} + Pa$$

$$= \frac{P\ell}{4} + \frac{Pa}{2} = \frac{1}{2}\left[\frac{P\ell}{2} + Pa\right]$$

Note-ISRO given answer (c).

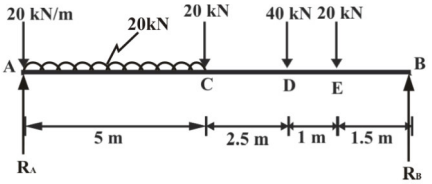
645. Find the maximum bending moment and the position from the support A.



(a) 240 Nm and 4.9 m
(b) 240.1 Nm and 4.9 m
(c) 240 Nm and 5 m
(d) 185 Nm and 7.5 m
(e) 260 Nm and 4.9 m

CGPSC AE 26.04.2015 Shift-I

Ans. (b) :



$R_A + R_B = (20 \times 5) + 20 + 40 + 20$

$R_A + R_B = 180$ ...(1)

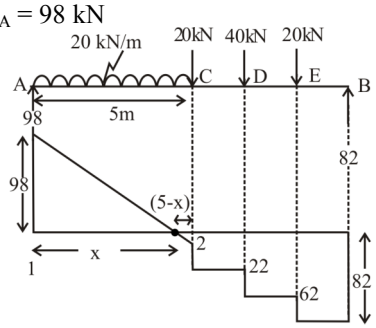
taking moment about point A

$R_B \times 10 = (20 \times 8.5) + (40 \times 7.5) + (20 \times 5) + \left(20 \times 5 \times \frac{5}{2}\right)$

$10R_B = 820$

$R_B = 82$ kN

$R_A = 98$ kN



Bending moment is maximum or minimum where shear force changes sign

$$\frac{98}{x} = \frac{2}{5-x}$$

x = 4.9 m

$$BM\big|_{x=4.9} = 98 \times 4.9 - 20 \times 4.9 \times \frac{4.9}{2}$$

= 480.2 - 240.1

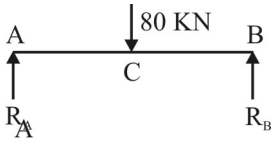
= 240.1 N-m

646. The maximum bending moment of a simply supported beam of span 2m and carrying a point load 80 kN at the centre of the beam is

(a) 160 kN-m (b) 80 kN-m
(c) 320 kN-m (d) 40 kN-m

TSPSC AEE 2015

Ans : (d)



Maximum Bending moment = $\frac{wl}{4}$

$$(BM)_{max} = \frac{80 \times 2}{4}$$

$(BM)_{max} = 40$ KN-m

647. The bending moment for a certain portion of a beam is constant. For that section, shear force would be :

(a) zero (b) increasing
(c) decreasing (d) constant

Assam PSC CCE Pre 2015

Ans. (a) : The bending moment for a certain portion of a beam is constant. For that section shear force would be zero.

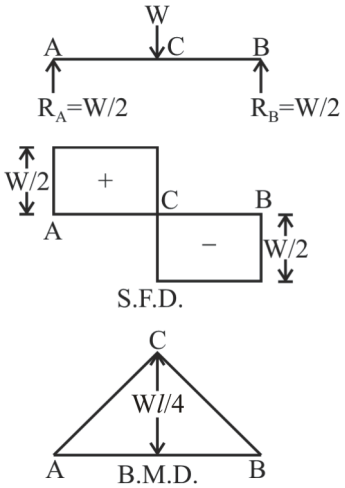
648. The maximum bending moment of a simply supported beam of span *l* and carrying a point load *W* at the centre of the beam is

(a) $Wl/4$ (b) $Wl/2$
(c) Wl (d) $Wl^2/4$

Assam PSC CCE Pre 2015

Search on Telegram @apna_pdf

Ans. (a) For given load condition and beam.
Maximum bending moment (M_{max}) = $Wl/4$



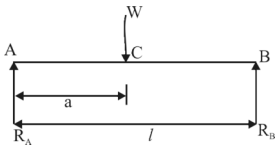
Simply supported beam carrying a point load W at the centre of the beam.

649. A simply supported beam of span 'ℓ' is subjected to a transverse point load 'W' acting at a distance of 'a' from the left support A. The reaction on the left support will be equal to

(a) W.a / ℓ (b) W. (ℓ -a)/ ℓ
(c) W/2 (d) w. ℓ /a

VIZAG MT 2015

Ans. (b) :



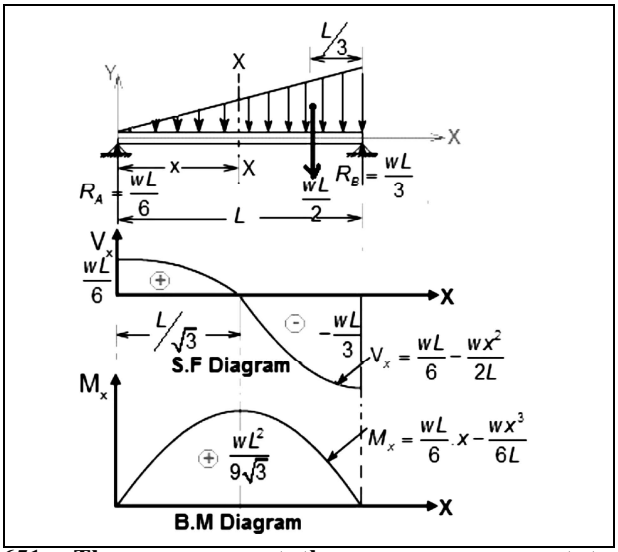
$$R_A = \frac{W \times BC}{AB}$$
$$= \frac{W \times (\ell - a)}{\ell}$$
$$R_B = \frac{W \times AC}{AB}$$
$$= \frac{W \times a}{\ell}$$

650. When the shear force diagram is a parabolic curve between two points, it indicates that there is

(a) a point load at two points
(b) no loading between the two points
(c) a uniformly distributed load between the two points
(d) a uniformly varying load between the two points

Assam PSC CCE Pre 2015

Ans. (d) : Simply supported beam with a gradually varying load, from zero, at one end to w per metre at the other end then the shear force diagram is a parabolic curve between two points.



651. The area-moment theorem …….. respect to bending of beams states that the area of the M/EI diagram between two sections of a beam gives :

(a) the difference in slopes between those two sections
(b) the difference in the maximum bending strains between those two sections
(c) the difference in deflections between those two sections
(d) the difference in strain energies between those two sections

BPSC Asstt. Prof. 29.11.2015

Ans. (a) : Moment Area method (Mohr's method)– This method is suitable for cantilevers and simply supported beams carrying symmetrical loadings and beams fixed at both ends i.e. those beams for which the area and CG area of BMD can be found easily. This means this method is not suitable for triangular loading and irregular loading. This can also be used for non-prismatic bars.
This method is suitable for :
(i) Centilevers (because slope at the fixed end is zero)
(ii) simply supported beams carrying.
(iii) Beams fixed at both ends (slope at each end is zero.

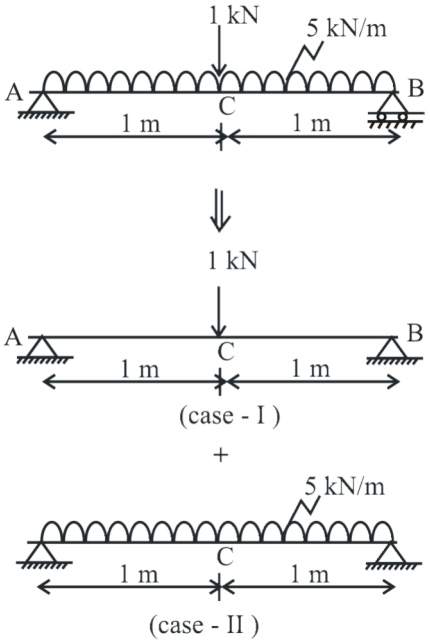
652. A simply supported beam of 2 m length is applied with uniformly distributed load of 5 kN/m through out. It is also applied with a point load of 1 kN at its centre. The maximum bending moment in the beam will be–

(a) 2 kN-m
(b) 3 kN-m
(c) 4 kN-m
(d) 5 kN-m

TSGENCO AE 14.11.2015

Search on Telegram @apna_pdf

Ans. (b) : Given –
Length (l) = 2m, W = 5 kN-m



Maximum bending moment (case - I) due to point load to centre of SSB

$$(BM)_I = \frac{WL}{4} = \frac{1\times 2}{4} = 0.5 \text{ kN-m}$$

Maximum bending moment (case - II) due to uniformly load.

$$(BM)_{II} = \frac{WL^2}{8} = = \frac{5\times 2\times 2}{8} = 2.5 \text{ kN-m}$$

So, Total (case -I + case - II)
$BM_{(max)} = 2.5 + 0.5 = 3$ kN-m

653. Choose the wrong statement

(a) The shear force at any section of a beam is equal to the total sum of the forces acting on any one side of the section.
(b) The magnitude of the bending moment at any section of a beam is equal to the vector sum of the moments (about the section) due to the forces acting on the beam on any one side of the section.
(c) A diagram which shows the values of shear forces at various sections of structured member is called a shear force diagram.
(d) A simply supported beam is one which is supported on more than two supports.

MPPSC AE 08.11.2015

Ans. (d) : A simply supported beam is one which is not supported on more than two supports. fig (a) and fig (b)

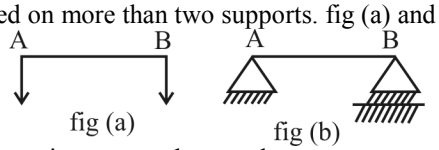


fig (a) fig (b)

If the beam is supported more than two supports called continuous beam.

654. In fixed beam of length (L) with a concentrated central load two points of contraflexure will occur, each from supports at a distance of :

(a) 1/3 (b) $1/\sqrt{3}$
(c) 1/6 (d) $1/4$

(HPPSC AE 2014)

Ans : (d)

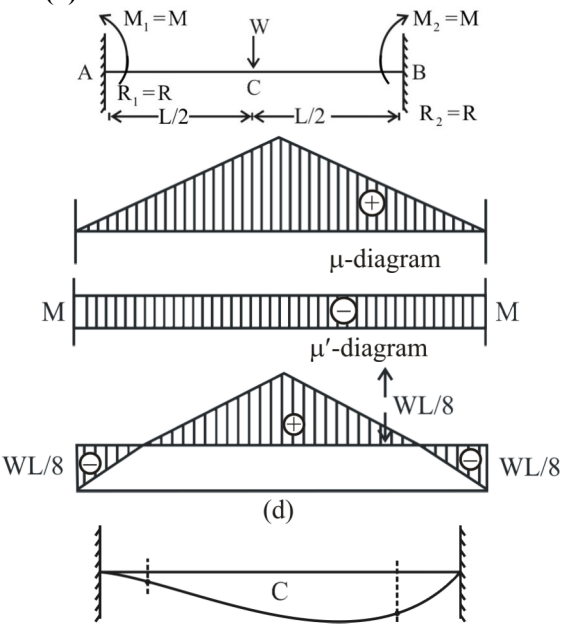

fig (d) shows the B.M diagram obtained by super-imposing and μ'diagram. At any point distance x from A

$$M_x = \mu_x + \mu'_x = \frac{Wx}{2} - \frac{WL}{8}$$

$$\text{At } x = \frac{L}{2}, M_c = \frac{W}{2}.\frac{L}{2} - \frac{WL}{8} = \frac{WL}{8}$$

Thus, the central B.M. is half of the B.M. for a freely supported beam. For point of Contraflexure

$$M_x = \frac{Wx}{2} - \frac{WL}{8} = 0$$

This gives $x = \frac{L}{4}$

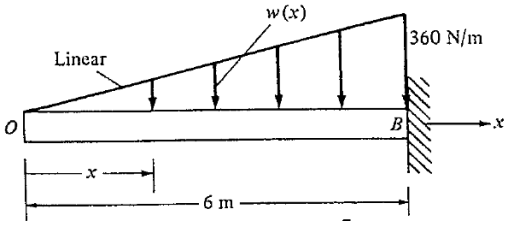
655. The three-moment for continuous beams was forwarded by :

(a) Bernoulli (b) Clapeyron
(c) Castigliano (d) Maxwell

(HPPSC AE 2014)

Ans : (b) The three moment theorem for continuous beam was forwarded by Clapeyron.

656. A cantilever beam 6 meter long as shown in figure is subjected to a linearly varying loading which has a maximum ordinate of 360 N/m at the fixed end on the right. The moment as a function of x is

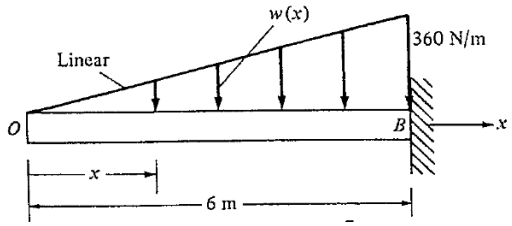


Search on Telegram @apna_pdf

(a) $M = -3x^3$ (b) $M = -6x^3$
(c) $M = -10x^3$ (d) $M = -20x^3$

ISRO Scientist/Engineer 24.05.2014

Ans. (c) :



$$W_{x-x} = \frac{-wx}{L} \quad ...(1)$$

$$(SF)_{xx} = \frac{-wx}{L} \times \frac{x}{2} \quad ...(2)$$

$$= \frac{-wx^2}{2L}$$

$$(BM)_{xx} = \frac{-wx^2}{2L} \times \frac{x}{3}$$

$$= \frac{-wx^3}{6L} \quad ...(3)$$

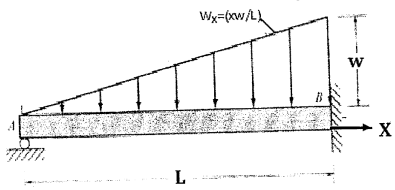
So, here, $w = 360$ N/m

$L = 6$ m

$$M = \frac{-360}{6 \times 6} \times x^3$$

$M = -10x^3$

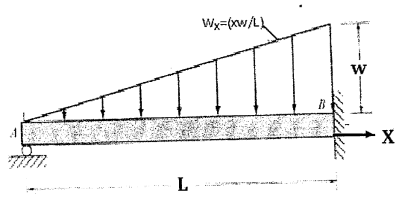
657. Consider the beam shown in figure. The beam is simply supported at its left end A and fixed at its right end B. It carries a load that varies in intensity from zero at support A to 'w' at support B according to the relation $w_x = (x/L)w$. The reaction component at A is



(a) wL/10 (b) 2wL/5
(c) 5wL/2 (d) wL/5

ISRO Scientist/Engineer 24.05.2014

Ans. (a) : Moment at distance x from A is given as



$$M(x) = R_A x - \frac{1}{2} x \times \frac{wx}{L} \times \frac{x}{3} = R_A x - \frac{wx^3}{6L}$$

By double integration method

$$EIy'' = R_A x - \frac{wx^3}{6L}$$

Integrating once and twice we get

$$EIy' = \frac{R_A x^2}{2} - \frac{wx^4}{24L} + C_1$$

$$EIy = \frac{R_A x^3}{6} - \frac{wx^5}{120L} + C_1 x + C_2 \quad .....(1)$$

Using conditions (a) at x = 0, y = 0, thus $C_2 = 0$; and (b) at x = L, y′ = 0, we get

$$C_1 = \frac{wL^3}{24} - \frac{R_A L^2}{2}; C_2 = 0$$

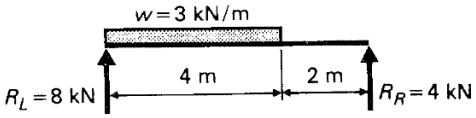
Putting above value in Eq. (1) for x = L, y = 0 we get

$$EIy = \frac{R_A x^3}{6} - \frac{wx^5}{120L} + \frac{wL^3}{24} - \frac{R_A L^2}{2}$$

$$\Rightarrow \quad 0 = \frac{-R_A L^3}{3} + \frac{wL^4}{30}$$

$$\Rightarrow \quad R_A = \frac{wL}{10}$$

658. A simply supported beam is shown in the figure below. The location is the point of maximum moment in the beam from reaction R_L is



(a) $\frac{3}{8}$ meter

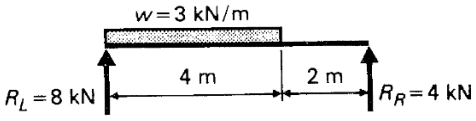
(b) $\frac{8}{3}$ meter

(c) $\frac{18}{5}$ meter

(d) $\frac{21}{5}$ meter

ISRO Scientist/Engineer 24.05.2014

Ans. (b) :



Taking section x-x from R_L at a distance x

So at a location of max. bending moment, shear force will be zero so

$$S_{xx} = 8 - wx = 8 - 3x = 0$$

$$\boxed{x = \frac{8}{3} m}$$

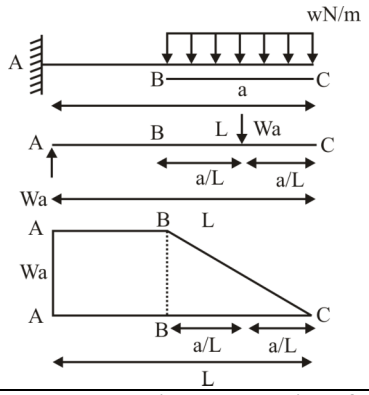
659. A cantilever of length *l* carries a uniformly distributed load for a distance a (a<L) from the free end. The shear force diagram will be

(a) A rectangle
(b) A triangle
(c) A trapezium
(d) A parabola

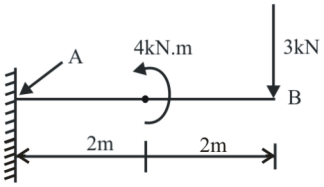
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Search on Telegram @apna_pdf

Ans. (c)



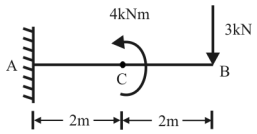
660. With the usual sign convection for bending moment, i.e. a positive bending moment causes compression in top fibre, what is sign, magnitude and location of numerically largest bending moment in the beam shown in the figure?



(a) (+) 10 kN.m at C (b) (–) 8 kN.m at A
(c) (–) 16 kN.m at A (d) (+) 4 kN.m at A

RPSC AEN Pre-2013

Ans. (b) :



Bending moment at A

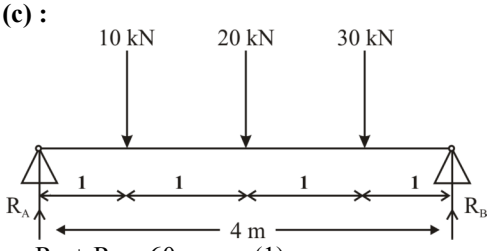
$(B.M)_A = -3 \times 4 + 4 = -8$ kN.m

661. A simply supported beam of span 4 m with hinged support at both the ends. It is carrying the point loads of 10, 20 & 30 kN at 1, 2 and 3 m from left support. The R_A & R_B are

(a) 27.5 kN, 32.5 kN (b) 15 kN, 45 kN
(c) 25 kN, 35 kN (d) 32.5 kN, 27.5 kN

TNPSC AE 2013

Ans. (c) :



$R_A + R_B = 60$ ....(1)

Taking moment about point A

$R_B \times 4 = 30 \times 3 + 20 \times 2 + 10 \times 1$

$R_B = 35$ kN

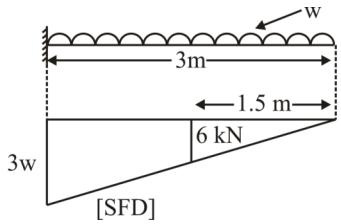
$R_A = 25$ kN

662. Uniformly distributed load 'w' act over per unit length of a cantilever beam of 3m length. If the shear force at the midpoint of beam is 6kN, what is the value of 'w':-

(a) 2 kN/m (b) 3 kN/m
(c) 4 kN/m (d) 5 kN/m

UKPSC AE-2013, Paper-I

Ans. (c) :



From shear force diagram

$$\frac{3w}{3} = \frac{6}{1.5}$$

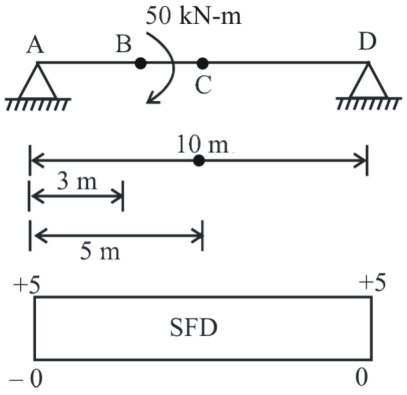
$w = 4$ kN/m

663. A beam 10 m long hinged at both the ends is subjected to a clockwise moment of 50 kNm, at a distance of 3 m from one end. What is shear force at the centre of the beam :

(a) 0 kN (b) 3 kN
(c) 5 kN (d) None of these

PSPCL AE, 2012

Ans. (c) : Shear force to constant throughout a length with value of 5 kN.

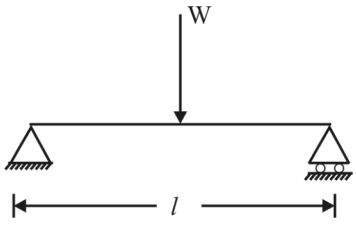


664. A beam A carries a point load at mid-span. Another identical beam B carries the same load but as uniformly distributed load over the entire span. The ratio of maximum bending moment in beam A to that in beam B will be :

(a) $\frac{3}{2}$ (b) $\frac{1}{2}$
(c) 3 (d) 2

APGENCO AE 2012

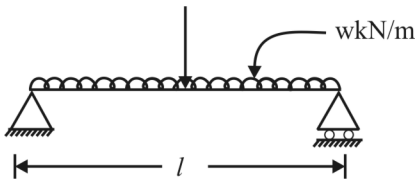
Ans. (d) : C – 1



Search on Telegram @apna_pdf

Maximum Bending moment $(BM)_{max} = \frac{Wl}{4}$

C – 2



Maximum Bending moment $(BM)_{max} = \frac{wl^2}{8}$

$(\because\ W = wL)$

$$(BM)_{max} = \frac{WL}{8}$$

$$\frac{(BM)_A}{(BM)_B} = \frac{(BM)_1}{(BM)_2} = \frac{WL}{4} \times \frac{8}{WL}$$

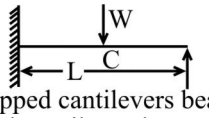
$$= 2$$

665. In a propped cantilever beam, the number of points of contra-flexure is

(a) 1 (b) 2
(c) 3 (d) 4

APPSC AEE 2012

Ans : (a)



Propped cantilevers beam

In a propped cantilever beam, the number of point of contra-flexure is one.

666. If a fixed beam is subject to a point load at mid span, total number of points of contra-flexure are

(a) 1 (b) 2
(c) 3 (d) zero

APPSC AEE 2012

Ans : (b) In a fixed beam is subjected to a point load at mid span total number of points of contra-flexure are two.

$$R_A = R_B = \frac{W}{2}$$

$$M_x = \frac{P}{8}(4x - L)$$

$$\left[x < \frac{L}{2}\right]$$

$$M_{x=0} = M_B = M_A = -\frac{PL}{8}$$

$$M_{x=L/2} = M_C = \frac{P}{8}\left[4 \times \frac{L}{2} - L\right] = \frac{PL}{8}$$

In this bending moment diagram bending moment change it's sign at two points.

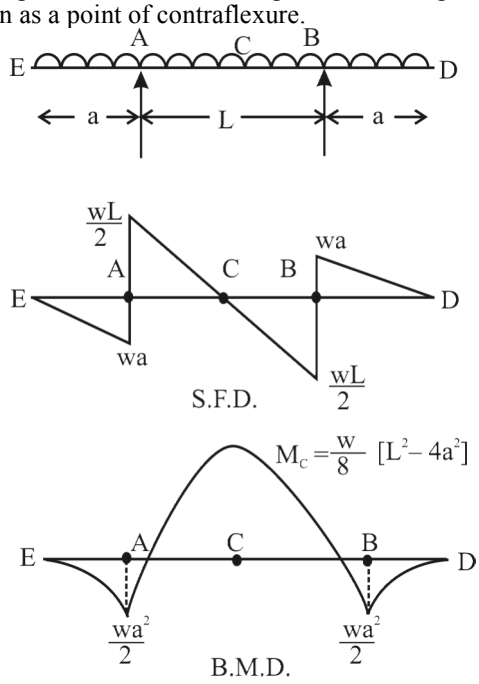
667. In a double overhanging beam carrying udl throughout its length, the number of points of contra flexure are

(a) 1 (b) 2
(c) zero (d) 3

APPSC AEE 2012

Ans : (b) In a double overhanging beam carrying UDL throughout its length, the number of points of contraflexure are two.

Points of contraflexure:– Where the bending moment will change sign from negative to positive or vice versa. Such a point, where the bending moment change sign, is known as a point of contraflexure.

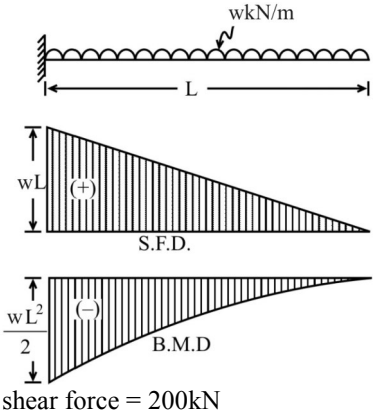


668. A cantilever is subjected to udl throughout the length. If the maximum shear force is 200kN and maximum bending moment is 400kN, the span "L" of the beam in meters is

(a) 3 (b) 2
(c) 4 (d) 8

APPSC AEE 2012

Ans : (c)



Maximum shear force = 200kN

$wL = 200kN$ ……..(i)

Maximum Bending moment

$\frac{wL^2}{2} = 400kN$ ……..(ii)

for equation (i) and (ii)

$$\frac{\frac{wL^2}{2}}{wL} = 2 \quad \boxed{L = 4m}$$

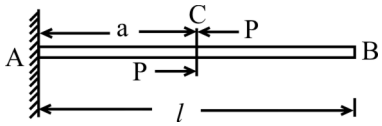
669. A cantilever beam AB of length *l* is subjected to an anticlockwise couple of 'M' at a section C, distance 'a' from support. Then the maximum shear force is equal to

(a) M (b) $\frac{M}{2}$

(c) Zero (d) Ma

APPSC AEE 2012

Ans : (c)



A cantilever beam AB of length *l* is subjected to an anticlockwise couple of M at a section C, distance 'a' from support, then the maximum shear force is equal to zero. Because No transverse load acting on the beam.

670. At section of a beam sudden change in BM indicates the action of

(a) point load (b) couple

(c) point load or couple (d) ud*l*

APPSC AEE 2012

Ans : (b) At section of a beam sudden change in BM indicates the action of couple.

671. For uniform shear force throughout the span of a simply supported beam, it should carry

(a) a concentrated load at the mid-span

(b) a couple anywhere in the sections

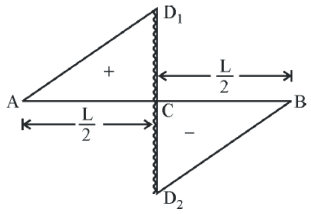
(c) ud*l* over its entire span

(d) two concentrated loads equally spaced

APPSC AEE 2012

Ans : (b) For uniform shear force throughout the span of a simply supported beam, it should carry a couple anywhere in the section.

672. The bending moment diagram for a simply supported beam AB of length 'L' is shown below :



$CD_1 = CD_2 = \frac{M}{2}$

Sagging moment : positive

Hogging moment : negative

What is the load acting on beam AB ?

(a) An upward concentrated load $\frac{M}{2}$ at C.

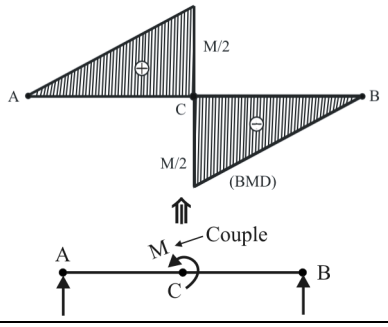
(b) A downward concentrated load $\frac{M}{2}$ at C.

(c) An anticlockwise moment 'M' at C

(d) A clockwise moment 'M' at C.

UKPSC AE 2012 Paper-I

Ans. (c) : An anticlockwise moment 'M' at C



673. Two cantilever steel beams of identical length and of rectangular section are subjected to same point load at their free end. In one beam, the longer side of section is vertical, while in the other, it is horizontal. Beams defect at free end:

(a) equally irrespective of their disposition.

(b) more in case of longer side vertical.

(c) less in case of longer side horizontal.

(d) less in case of longer side vertical.

UKPSC AE 2012 Paper-I

Ans. (d) : less in case of longer side vertical.

674. The bending moment diagram for a simply supported beam loaded in its centre is

(a) a right angled triangle

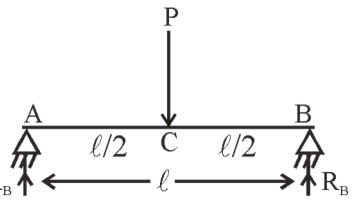
(b) an isosceles triangle

(c) an equilateral triangle

(d) a rectangle

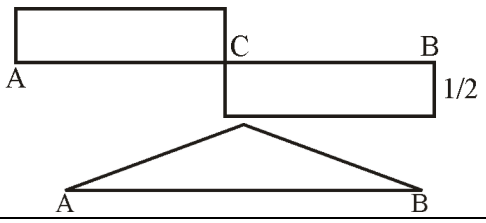
TNPSC ACF 2012

Ans. (b) :



$R_A = \frac{P \times \ell/2}{\ell}$

$R_A = P/2, \quad R_B = P/2$



675. In a beam where shear force is maximum, the bending moment will be

(a) zero

(b) minimum

(c) maximum

(d) none of these

TNPSC ACF 2012

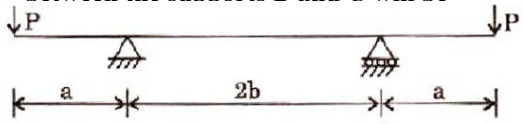
Search on Telegram @apna_pdf

Ans. (d) : When shear force is zero, bending moment maximum.

$$F = \frac{dM}{dx}$$

In a beam, where shear force is maximum the bending moment depends upon the type of loading and type of beam.

676. For the beam shown in the fig, the elastic curve between the supports B and C will be



(a) circular (b) parabolic
(c) elliptic (d) a straight line

APPSC AEE 2012, ESE 1998

Ans. (a) : Form simple bending theory equation

$$\frac{\sigma}{y} = \frac{M}{I} = \frac{E}{R}$$

$$\frac{1}{R} = \frac{M}{EI} = \text{constant}$$

Therefore, the elastic curve is the deflection curve which is circular between the support B and C.

677. Bending moment at any point is equal to the algebraic sum of :

(a) Moments of all vertical forces
(b) Moments of all horizontal forces
(c) Moment of forces on either side of the point
(d) All the above.

RPSC AE GWD, 2011

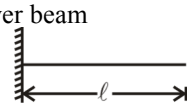
Ans. (c) : Bending moment at any point is equal to the algebraic sum of moments of forces on either side of the point.

678. What is the beam fixed at one end and free at the other end called as?

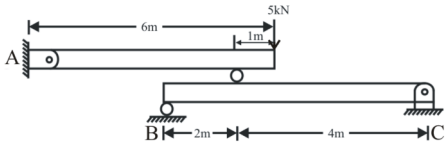
(a) Simply supported beam
(b) Fixed beam
(c) Overhanging beam
(d) Cantilever beam

VIZAG STEEL MT 2011

Ans. (d) : Cantilever beam



679.

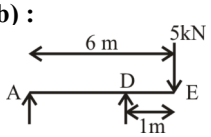


The magnitude of reaction at support B is :

(a) 2 kN (b) 4 kN
(c) 5 kN (d) 6 kN

UPSC JWM Advt. No.-52/2010

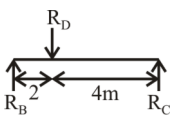
Ans. (b) :



Moment about A

$R_D \times 5 = 5 \times 6$

$R_D = 6\,kN$



Moment about C

$R_B \times 6 = 6 \times 4$

$\boxed{R_B = 4\,kN}$

680. Consider the following statements :
Shear force in beams is caused by

1. Lateral forces acting on the beam
2. Variation of bending moment along beam length
3. A couple acting on the beam

Which of the above statements is/are correct ?

(a) 1 only (b) 1 and 2
(c) 2 and 3 (d) 1 and 3

UPSC JWM Advt. No.-50/2010

Ans. (b) : As we know, shear force in beams is caused by the lateral forces acting on the beam and variation of bending moment along beam length.

681. Consider the following statements :
If a beam is to bend without being twisted,

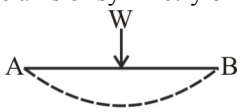
1. Plane of a load must contain one of the axes of symmetry of the beam
2. The beam cross-section must have at least an axis of symmetry

Which of the above statements is/are correct ?

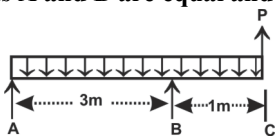
(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor 2

UPSC JWM Advt. No.-50/2010

Ans. (a) : It is the concept of shear centre that of a beam is to bend without twisting then plane of the load must contain one of the axis of symmetry of beam.



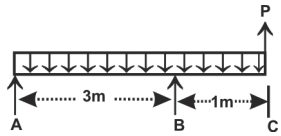
682. An overhang beam ABC of length 4m is supported at A and B 3m apart. It is loaded with UDL of 5kN/m along its entire length. Find the value of load 'P' at C such that the reactions A and B are equal and opposite.



(a) P = 10 kN (b) P = 30 kN
(c) P = 20 kN (d) P = 25 kN

ISRO Scientist/Engineer 2009

Ans. (c) : Overhang Beam ABC
length L = 4m



As mentioned reactions at A and B are equal and opposite. So, upward force P will be equal to total uniformly distributed load.

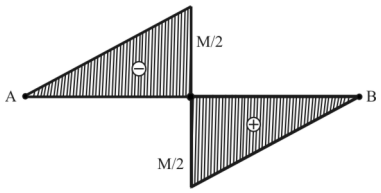
$$R_A + R_B = P \Rightarrow 5 \times 4 = 20$$

But $R_A = -R_B$

$P = 20\ kN$

Search on Telegram @apna_pdf

683.



The bending moment diagram for a beam AB is shown in the above figure. What is the nature of the beam?

(a) Simply supported with a concentrated load at its mid length

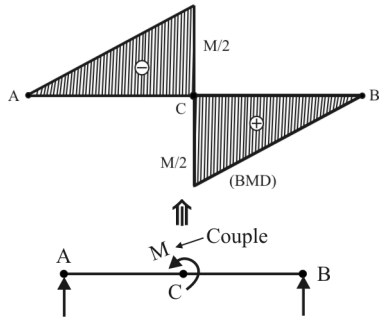
(b) Simply supported and is subjected to a couple M at its mid point

(c) Simply supported and carries a uniformly varying load from zero at the support to a maximum at its mid length

(d) A cantilever subjected to end moment M

UPSC JWM Adv. No-16/2009

Ans. (b) : The nature of the beam is simply supported and is subjected to a couple M at its mid point.



684. A beam of length '*l*' overhangs equally from its two supports. It carries three identical concentrated loads at its ends and at mid length. If the bending moment at midpoint of the beam is zero, what is the overhang length?

(a) $\frac{l}{8}$ (b) $\frac{l}{6}$

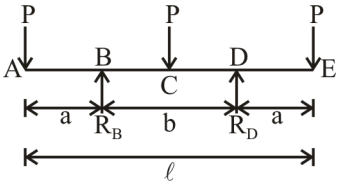
(c) $\frac{l}{4}$ (d) $\frac{L}{3}$

UPSC JWM Adv. No-16/2009

Ans. (b) : Let, a = Over hanging length

b = length of BD

l = Total length of beam



$\sum R_v = 0$

$R_B + R_D = 3P$

$\boxed{R_B = R_D = \frac{3P}{2}}$ (figure is symmetric)

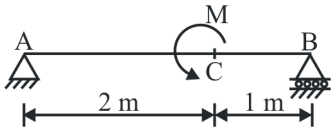
$\sum M_C = 0$

$P \times \frac{\ell}{2} - R_B \times \left(\frac{\ell}{2} - a\right) = 0$

$P \times \frac{\ell}{2} = \frac{3P}{2} \times \left(\frac{\ell}{2} - a\right)$

$\frac{\ell}{3} = \frac{\ell}{2} - a \Rightarrow \boxed{a = \frac{\ell}{6}}$

685. Couple *M* is applied at *C* on a simply supported beam *AB*. The maximum shear on *AC* will be



(a) Zero (b) M

(c) $\frac{2M}{3}$ (d) $\frac{M}{3}$

ISRO Scientist/Engineer 2008

Ans. (d) :

$R_1 + R_2 = 0$

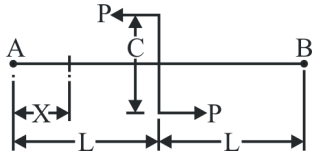
$\sum M_A = 0$

$R_2 \times 3 = -M$

$R_2 = -\frac{M}{3}$

$R_1 = \frac{M}{3}$

686. A beam AB is hinge-supported at its ends and is loaded by couple P.c. as shown in the figure. The magnitude of shearing force at a section x of the beam is



(a) 0

(b) P

(c) P/2L

(d) P.c/2L

ISRO Scientist/Engineer 2008

Search on Telegram @apna_pdf

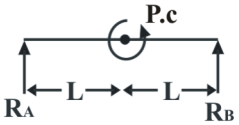
Ans. (d) : Shear force at section

$R_A + R_B = 0$

$\sum M_B = 0$

$R_A \times 2L = Pc$

$R_A = \frac{Pc}{2L}$



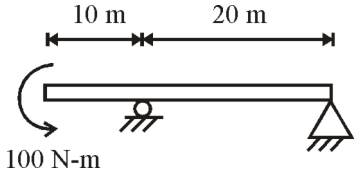
687. A discontinuity or jump in the shear force diagram occurs whenever a beam is loaded by

(a) a distributed moment
(b) a distributed force
(c) a concentrated moment
(d) a concentrated force

DRDO Scientists 2008

Ans. (d) : A discontinuity or jump in the shear force diagram occurs whenever a beam is loaded by a concentrated force.

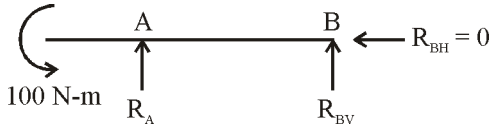
688. For the beam loaded as shown in figure the magnitude of bending moment at the roller support is



(a) 100 Nm
(b) 1000 Nm
(c) 0
(d) 2000 Nm

DRDO Scientists 2008

Ans. (a) :



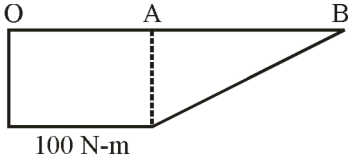
$R_A + R_{BV} = 0$

$\Sigma M_B = 0$

$-100 + R_A \times 20 = 0$

$R_A = 5$ N

$R_{BV} = -5$ N



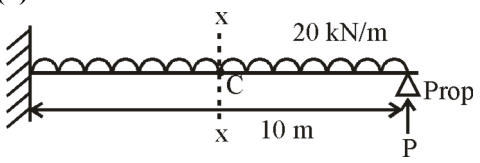
Bending moment at roller support,
= 100 N-m

689. A cantilever 10 m long carries a uniformly distributed load of 20 KN/m run throughout its length. It is propped by a force P at its free end so that the centre of the cantilever becomes the point of inflexion, then the magnitude of P is

(a) 200 KN
(b) 150 KN
(c) 100 KN
(d) none of the above

WBPSC AE, 2007

Ans. (d) :



For centre of cantilever becomes the point of inflexion,

$(BM)_{\text{at centre}} = 0$

$\Sigma M_C = 0$

$P \times 5 = 20 \times 5 \left(\frac{5}{2}\right)$

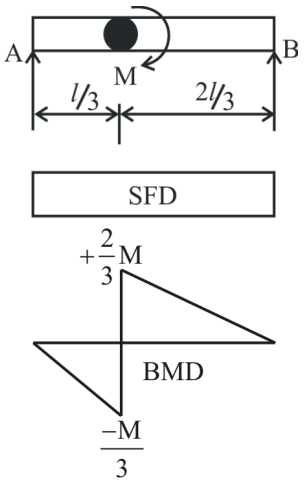
$P = 50$ kN

690. A simply supported beam of length 'L' acted upon by a couple of magnitude 'M' at a length of $\frac{2}{3}$L from one of the ends. The magnitude of maximum Bending moment in the beam is

(a) $\frac{1}{3}$M
(b) $\frac{2}{3}$M
(c) M
(d) $\frac{3}{2}$M

OPSC Civil Services Pre 2006

Ans. (b) :



$R_A + R_B = 0$

$R_B \times l + M = 0$

$R_B = \frac{M}{l}$

$R_A = -\frac{M}{l}$

from fig. magnitude of Maximum bending moment is $\frac{2}{3}$M.

Search on Telegram @apna_pdf

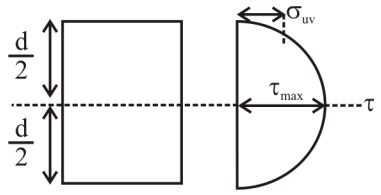
4. Bending Stresses and Shear Stresses in Beams

691. The shear stress distribution over a rectangular cross section of a beam is

(a) linear (b) cubic
(c) parabolic (d) none of these

OPSC AEE 2019 Paper-I
GPSC Executive Engineer 23.12.2018
TSPSC AEE 28.08.2017 (Civil/Mechanical)
APPSC AEE Mains 2016 (Civil Mechanical)
GPSC Lect. 23.10.2016, APPSC AEE 2012
UKPSC AE 2012 Paper-I, ESE 2004

Ans. (c) : For rectangular section beam, the shear stress distribution is parabolic and maximum shear stress is at neutral axis of the section.



692. Which one of the following statements in correct? A beam is said to be uniform strength, if :

(a) The bending moment is the same throughout the beam
(b) The shear stress is the same throughout the beam
(c) The deflection is the same throughout the beam
(d) The bending stress is the same at every section along its longitudinal axis

Assam PSC AE (IWT) 14.03.2021
RPSC IOF, 2020
OPSC AEE 2019 Paper-I
GPSC Asstt. Director of Transport 05.03.2017
TSPSC Managers, 2015
OPSC AEE 2015 Paper-I
TNPSC AE 2014, ESE 2006
J & K PSC Screening, 2006

Ans : (d) : A beam is said to be uniform strength if, the bending stress is the same at every section along its longitudinal axis.

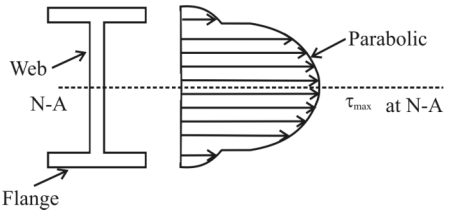
693. In an I-section of a beam subjected to transverse shear force, the maximum shear stress is developed at

(a) The bottom edges of the top flange.
(b) The top edges of the top flange.
(c) The centre of the web
(d) The upper edges of the bottom flange.

TSPSC Manager (Engg.) HMWSSB 12.11.2020
TSPSC AEE 28.08.2017 (Civil/Mechanical)
APPSC AE Subordinate Service Civil/Mech. 2016
UPPSC AE 12.04.2016 Paper-I
TNPSC AE 2014
ISRO Scientist/Engineer 2007
ESE 2008

Ans. : (c) In an I-section of a beam subjected to transverse shear force, the maximum shear stress is developed at the centre of the web.

Shear stress distribution for I-section

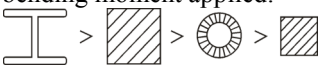


694. Which one of the following is the preferable cross-section of a beam for bending loads?

(a) Circular (b) Annular circular
(c) Rectangular (d) I-section

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
TSPSC AEE 28.08.2017 (Civil/Mechanical)
TANGEDCO AE 2015, TNPSC ACF 2012
CSE Pre-2006

Ans. (d) : For a given cross-sectional area material and bending moment applied.



'Z' value decrease $\rightarrow M_R$ decreases $\rightarrow$
Bending stress $(\sigma_b)_{max}$ increases
I section is preferred for bending applications.

695. The section modulus is expressed as–

(a) I/Y (b) E/I
(c) M/1 (d) EI

OPSC AEE 2019 Paper-I
Nagaland PSC CTSE 2017, Paper-I
CGPSC AE 26.04.2015 Shift-I
APPSC AEE 2012, TNPSC ACF 2012

Ans. (a) : Section modulus is the ratio of moment of Inertia about N.A. upon the for test point of section from Neutral Axis (N.A.).

$$Z = \frac{I}{Y}$$

696. Which is the correct relation in a beam?

(a) $\frac{M}{\sigma} = \frac{I}{y} = \frac{R}{E}$ (b) $\frac{M}{I} = \frac{y}{\sigma} = \frac{E}{R}$
(c) $\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$ (d) $\frac{M}{y} = \frac{E}{R} = \frac{\sigma}{I}$

OPSC AEE 2019 Paper-I
Nagaland PSC (CTSE) 2018, Paper-I
TNPSC ACF 2012, UKPSC AE 2007 Paper -I
ISRO Scientist/Engineer 2006

Ans : (c) : Bending Formula –

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

Where M = Bending moment
I = Second moment of inertia of cross section about neutral axis.
σ = Bending stress on any layer
Y = Distance of any layer from neutral layer.
E = Young's Modulus
R = Radius of curvature of the neutral

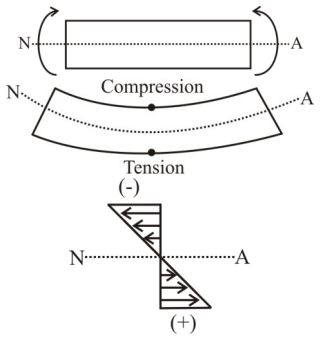
Search on Telegram @apna_pdf

697. The neutral axis of the cross-section a beam is that axis at which the bending stress is

(a) zero (b) minimum
(c) maximum (d) infinity

UPRVUNL AE 05.07.2021
APPSC AE Subordinate Service Civil/Mech. 2016
KPCL AE 2016
Haryana PSC Civil Services Pre, 2014
APPSC AEE 2012

Ans. (a) :



N–A shows neutral axis- at neutral axis there is no bending stress.

$\sigma_{bending} = \frac{M}{I} \times y$ at neutral axis (y = 0)

$\boxed{\sigma_{bending} = 0}$

Note-Inner fibre always subjected to maximum stress.

698. Two beams of equal cross section area are subjected to equal bending moment. If one beam has square cross section and the other has circular section, then:

(a) Both the beams will be equally strong
(b) Square cross section beam will be stronger
(c) Circular section beam will be stronger
(d) Depends on the loading condition

RPSC AE (GWD) 06.05.2016
NPCIL ET, 2015, TSPSC AEE 2015
ISRO Scientist/Engineer 2011
ESE 1999

Ans. (b) : Since, cross-section area of square and circular cross-section are equal.

Let d = diameter of the cross-section are equal
a = side of square

[Given, Equal cross-section]

$$\frac{\pi}{4}d^2 = a^2$$

Now, σ_b for circular cross-section

$$\sigma_b = \frac{M.y_{max}}{I_{NA}} = \frac{M.\frac{d}{2}}{\frac{\pi d^4}{64}} = \frac{32M}{\pi d^3}$$

σ_b for square cross-section

$$\sigma_b = \frac{M.\frac{a}{2}}{\frac{a^4}{12}} = \frac{6M}{a^3}$$

$$\frac{\sigma_b \text{ for circular cross-section}}{\sigma_b \text{ for square cross-section}} = \frac{\frac{32M}{\pi d^3}}{\frac{6M}{a^3}}$$

$$= \frac{32}{\pi}\left(\frac{a^3}{d^3}\right)$$

$$= \frac{32}{\pi}\left(\sqrt{\frac{\pi}{4}}\right)^3 \cdot \left(\frac{a^3}{d^3}\right) \qquad \left[\because \frac{\pi}{4}d^2 = a^2\right]$$

$\therefore$ σ_b for circular-section > σ_b for square-section

Stress in circular beam is more so it will be less strong as compare to square beam.

699. The maximum transverse shear stress in a circular beam is (V-shear force, A-cross section area)

(a) $\frac{3V}{4A}$ (b) $\frac{4V}{3A}$
(c) $\frac{1V}{3A}$ (d) $\frac{4V}{\pi A}$

Haryana PSC AE (PHED) 05.09.2020, Paper-II
Oil India Senior Officer 23.12.2020
TSPSC AEE 28.08.2017 (Civil/Mechanical)
ESE 2006

Ans. (b) : $\tau_{max} = \frac{4}{3}\tau_{avg} = \frac{4V}{3A}$

700. The ratio of average shear stress to the maximum shear stress in a beam with a square cross section is :

(a) 2 (b) 1.5
(c) 2/3 (d) 1

OPSC AEE 2019 Paper-I
TSPSC AEE 28.08.2017 (Civil/Mechanical)
J&K PSC Civil Services Pre, 2010
GATE 1998

Ans. (c) : For square cross-section –

Maximum shear stress (τ_{max}) =

$$\frac{3}{2} \times \text{average shear stress}\left(\tau_{avg}\right)$$

$$\frac{\tau_{max}}{\tau_{avg}} = \frac{3}{2}$$

or $\frac{\tau_{avg}}{\tau_{max}} = \frac{2}{3}$

701. The rectangular beam A has a length λ and width b but depth d is double that of A. The elastic strength of beam B will be ____ as compared to beam A.

(a) same (b) double
(c) one-fourth (d) four times

ISRO Scientist/Engineer (RAC) 12.01.2020
Nagaland PSC (CTSE) 2018, Paper-I
TSPSC AEE 2015, JPSC AE 2013, Paper-V

Ans : (d) : We know that section modulus for beam A,

$$Z_A = \frac{I_A}{y_A} = \frac{bd^3/12}{d/2}$$

Search on Telegram @apna_pdf

$= \frac{bd^2}{6}$

And section modulus for beam B

$$Z_B = \frac{I_B}{y_B} = \frac{b(2d)^3/12}{2d/2} = \frac{2bd^2}{3}$$

(Depth is double that of A)

Since elastic strength of beam is directly proportional to their respective section modulus, therefore,

$$\frac{Z_B}{Z_A} = \frac{2bd^2}{3} \times \frac{6}{bd^2} \text{ or } Z_B = 4Z_A$$

$\boxed{Z_B = 4Z_A}$

702. If the depth is kept constant for a beam of uniform strength, then its width will vary in proportional to (where M = Bending moment)

(a) M (b) $\sqrt{M}$

(c) M^2 (d) M^3

Nagaland PSC (CTSE) 2018, Paper-I
Nagaland PSC CTSE 2016 Paper-I
TSPSC AEE 2015, ESE 1995

Ans. (a) : We know that

$$\frac{M}{I} = \frac{\sigma}{y}$$

$$I = \frac{bd^3}{12}$$

So $M \propto b$

If depth is constant then M is directly proportional to its width [b].

For a beam of uniform strength bending stress σ will be also constant

703. The ratio of maximum shear stress to average shear stress in a beam of rectangular section is

(a) 5/1 (b) 2/3

(c) 3/2 (d) 1.0

ISRO Scientist/Engineer 12.01.2020
ESE 2016, APPSC AEE 2012, GATE 1994

Ans. (c) :

Cross section	$\frac{\tau_{max}}{\tau_{avg}}$	$\frac{\tau_{NA}}{\tau_{avg}}$	$\frac{\tau_{max}}{\tau_{NA}}$
Rectangle/square	3/2	3/2	1
Circle	4/3	4/3	1
Triangle	3/2	4/3	9/8
Diamond	9/8	1	9/8

704. A wooden rectangular beam, subject to uniformly distributed load, has an average shear stress (τ_{avg}) across the section. The maximum shear stress (τ_{max}) at natural axis is:

(a) $\tau_{max} = 0.5\ \tau_{avg}$ (b) $\tau_{max} = 1.0\ \tau_{avg}$

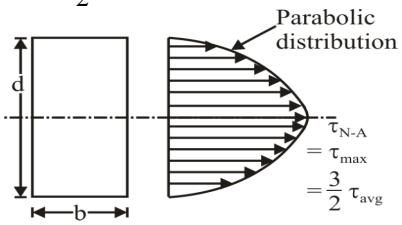
(c) $\tau_{max} = 1.5\ \tau_{avg}$ (d) $\tau_{max} = 2.0\ \tau_{avg}$

(e) $\tau_{max} = 2.5\ \tau_{avg}$

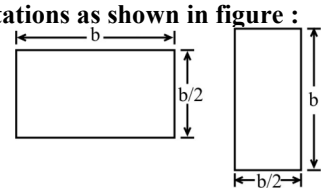
(CGPCS Polytechnic Lecturer 2017)
APPSC AEE Screening Test 2016
APPSC AEE 2012, ESE 2009

Ans. (c) Shear stress distribution across the rectangular section.

$$\tau_{max.} = \frac{3}{2}\tau_{avg} = 1.5\ \tau_{avg}$$



705. A beam cross-section is used in two different orientations as shown in figure :



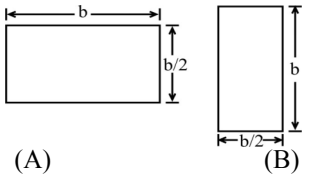
Bending moments applied in both causes are same. The maximum bending stresses induced in cases (A) and (B) are related as

(a) $\sigma_A = \sigma_B$ (b) $\sigma_A = 2\sigma_B$

(c) $\sigma_A = \frac{\sigma_B}{2}$ (d) $\sigma_A = \frac{\sigma_B}{4}$

TSPSC Manager (Engg.) HMWSSB 12.11.2020
APPSC AEE 2012, ESE 1997

Ans : (b)



(A) (B)

For first case:–

$$I_A = \frac{1}{12} \times b\left(\frac{b}{2}\right)^3 = \frac{b^4}{96}$$

$$\frac{M}{I_A} = \frac{\sigma_A}{y} \Rightarrow \frac{M \times 12 \times 8}{b^4} = \frac{\sigma_A}{b/4}$$

$$\boxed{\sigma_A = \frac{24M}{b^3}} \quad \text{..... (i)}$$

For second case

$$I_B = \left(\frac{b}{2}\right) \times (b)^3 \times \frac{1}{12}$$

$$I_B = \frac{b^4}{24}$$

$$\frac{M}{I_B} = \frac{\sigma_B}{y}$$

$$\frac{M}{\frac{b^4}{12 \times 2}} = \frac{\sigma_B}{\frac{b}{2}}$$

$$\boxed{\sigma_B = \frac{12M}{b^3}} \quad \text{..... (ii)}$$

For equation first and second $\boxed{\sigma_A = 2\sigma_B}$

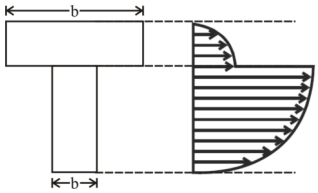
Search on Telegram @apna_pdf

706. Which one of the following represents the shearing stress distribution over a cross section of a T-beam ?

(a)
(b)
(c)
(d)

UPSC JWM Advt. No.-50/2010
CSE Pre-2000
ESE 2000

Ans. (d) :



As we know that,

$$\tau_s = \frac{F_s A \bar{Y}}{I_{NA} b}$$

$$\tau_s \propto \frac{1}{b}$$

707. Circular beam of uniform strength can be made by varying the diameter in such way that:

(a) M/Z is constant (b) σ/Y is constant
(c) M/R is constant (d) E/R is constant

VIZAG MT 2015
UKPSC AE 2007 Paper -I

Ans. (a) : According to bending equation–

$$\frac{M}{I} = \frac{E}{R} = \frac{\sigma_b}{y_{max}}$$

$$\text{Uniform strength } (\sigma_b) = \frac{M}{Z}$$

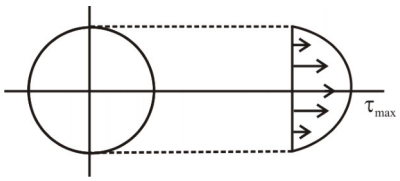
$\frac{M}{Z}$ is constant

708. In case of beam of circular cross-section subject to transverse loading, the maximum shear stress developed in the beam is greater than the average shear stress by

(a) 10% (b) 25%
(c) 50% (d) 33%

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
APGCL AM, 2021

Ans. (d) :

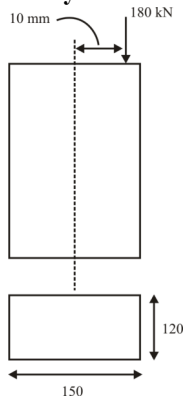


As we know,
In case of beams with circular section, the ratio of maximum shear stress to average shear stress

$$= \frac{4}{3}\tau_{avg} = 1.33\ \tau_{avg}$$

The maximum shear stress developed in the beam is 33% greater than the average shear stress.

709. A rectangular strut is 150 mm wide and 120 mm thick. It carries a load of 180 kN at an eccentricity of 10mm in a plane bisecting the thickness as shown in the figure. The maximum and minimum intensities of stress in the section will be respectively.



(a) 10 MPa and 4 MPa (b) 14 MPa and 4 MPa
(c) 10 MPa and 6 MPa (d) 14 MPa and 6 MPa

CGPSC AE 15.01.2021, 16.10.2016

Ans. (d) : Given,

P = 180 kN

Bending moment, $M = 180 \times 10^3 \times 10$

Bending stress $\Rightarrow \sigma_b = \frac{My}{I}$

$$= \frac{180 \times 10^4 \times \left(\frac{150}{2}\right) \times 12}{120 \times (150)^3}$$

$$\boxed{\sigma_b = 4\,\text{MPa}}$$

Direct stress,

$$\sigma_d = \frac{P}{A} = \frac{180 \times 10^3}{120 \times 150} = 10\text{MPa (compressive)}$$

Maximum intensity of stress $= -\sigma_b + \sigma_d$
$= -4 - 10$
$= |-14|$ MPa = 14 MPa

Minimum intensity of stress $= +\sigma_b + \sigma_d$
$= +4 - 10$
$= |-6$ MPa $| = 6$ MPa

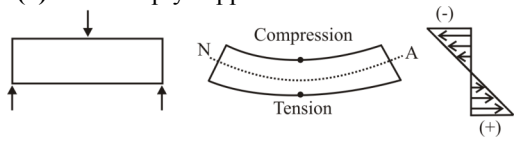
710. When a rectangular beam is loaded transversely, the maximum compressive stress is developed on the

(a) top layer (b) bottom layer
(c) neutral axis (d) every cross-section

Sikkim PSC (Under Secretary), 2017
Haryana PSC Civil Services Pre, 2014

Search on Telegram @apna_pdf

Ans. (a) : For simply supported beam–

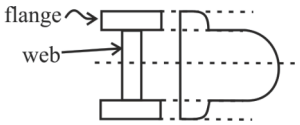


Right answer – (a)
Haryana PSC gives (b)
Note-In case of cantilever beam compressive stress is obtained at bottom layer.

711. In the case of an I-section beam maximum shear stress is at
(a) The junction of Top flange and web
(b) Middle of the web
(c) Both (A) and (B)
(d) The junction of bottom flange and web

APGCL AM, 2021, ESE 2008

Ans. (b**) :**



The maximum shear stress in I section of beam is at middle of the web.

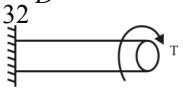
712. If a circular shaft is subjected to a torque T and a bending moment M, the ratio of the maximum shear stress to maximum bending stress is :
(a) 2 M/T (b) T/2M
(c) 2T/M (d) M/2T

ISRO Scientist/Engineer (RAC), 10.03.2019
ISRO Scientist/Engineer 12.05.2013

Ans. (b) : $\tau_{max} = \dfrac{16T}{\pi d^3}$

$$\frac{T}{J} = \frac{G\theta}{l} = \frac{\tau}{R}$$

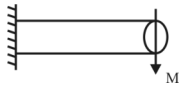
$$\tau = \frac{TR}{J} = \frac{T \times D/2}{\frac{\pi}{32} D^4}$$



$$\boxed{\tau_{max} = \frac{16T}{\pi D^3}}$$

$$\sigma_{max} = \frac{32M}{\pi d^3}$$

$$\frac{\sigma}{y} = \frac{M}{I} = \frac{E}{R}$$



$$\sigma = \frac{M}{I} \times y$$

$$\sigma = \frac{M}{\frac{\pi}{64} D^4} \times D/2$$

$$\boxed{\sigma_{max} = \frac{32M}{\pi D^4}}$$

$$\boxed{\frac{\tau_{max}}{\sigma_{max}} = \frac{\frac{16T}{\pi D^3}}{\frac{32M}{\pi D^3}} = \frac{T}{2M}}$$

713. Which one of the following conditions will qualify for a constant strength beam?
(a) Bending moment along the whole length of beam is constant
(b) Shear force at every section of the beam is constant
(c) The beam should be of uniform section
(d) Ratio of bending moment to its section modulus at every section must be constant.

UKPSC AE 2012 Paper-I
UPSC JWM Advt. No.-52/2010

Ans. (d) : Ratio of bending moment to its section modulus at every section must be constant for a constant strength beam

$$\text{Strength of beam} = = \frac{M}{Z}$$

Since, the strength of a beam depends upon its section modulus (Z).

714. A shaft was initially subjected to bending moment and then it was subjected to torsion. If the magnitude of bending moment is found to be the same as that of the torque, then the ratio of maximum bending stress to shear stress will be.
(a) 0.25 (b) 0.50
(c) 2 (d) 4

APPSC IOF, 2009, WBPSC AE 2003

Ans. (c) : $\left[\dfrac{M}{I} = \dfrac{\sigma}{y} = \dfrac{E}{R}\right]$

from $\dfrac{M}{I} = \dfrac{\sigma}{y} \Rightarrow M = \dfrac{\sigma I}{y}$

$$M = \frac{\sigma}{y} \times \frac{\pi d^4}{64} \qquad [y = d/2]$$

$$M = \frac{\sigma \times 2 \times \pi \times d^4}{d \times 64} = \frac{\pi \sigma d^3}{32} \qquad ...(i)$$

$\because$ $\dfrac{T}{J} = \dfrac{\tau}{R} = \dfrac{G\theta}{L}$

from $T = \dfrac{\tau . J}{R}$ $\because$ $R = d/2$ & $J = \dfrac{\pi}{32} d^4$

$$T = \frac{\tau \times 2 \times \pi d^4}{d \times 32} = \frac{\pi d^3 \times \tau}{16} \qquad ....(ii)$$

bending moment = torque

$$M = T$$

$$\frac{\pi d^3 \sigma}{32} = \frac{\pi d^3 . \tau}{16}$$

$$\frac{\sigma}{\tau} = 2$$

Search on Telegram @apna_pdf

715. The variation of bending stress in a curved beam is ..... in nature.

(a) Linear (b) Cubic
(c) Parabolic (d) Hyperbolic

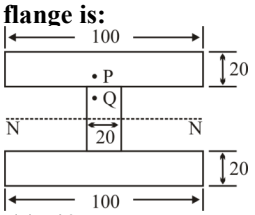
HPPSC AE 2018
ISRO Scientist/Engineer 24.05.2014

Ans. (d) : The variation of bending stress in curved beam is given as

$$\sigma_b = \frac{M\,y}{A.e.[R_n - y]}$$

Where,
M = Bending moment acting at the given section about the centroidal axis.
A = Area of cross-section
e = Distance from the centroidal axis to the neutral axis $R - R_n$
R = Radius of curvature of the centroidal axis
R_n = Radius of curvature of the neutral axis
y = Distance between the neutral axis to the considered fibre which bending stress needed to be calculated.
This equation shows that the stress distribution is Hyperbolic in nature.

716. An I-section of a beam is shown in the figure below. If the shear stress at point P which is very close to bottom of the flange is 12 MPa, the shear stress at the point Q close to the flange is:



(a) 40 MPa (b) 12 MPa
(c) Indeterminate (d) 60 MPa

BHEL ET 2019, ESE 2001

Ans. (d) : Given - shear stress of flange

$$(\tau_{flange}) = 12MPa$$

shear stress of web (τ_{web}) =?
width of flange (b_t) = 100 mm
width of web (b_w) = 20 mm

from - $\dfrac{(\tau_{flange})}{(\tau_{web})} = \dfrac{(b_{web})}{(b_{flange})}$

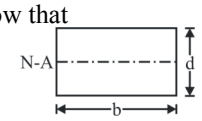
$$\frac{12}{(\tau_{web})} = \frac{20}{100} = \frac{1}{5} \qquad \boxed{(\tau_{web}) = 60MPa}$$

717. Section of the modulus (Z) for a rectangular section with width (b) and depth (d) is given by:

(a) $Z = \dfrac{bd^3}{12}$ (b) $Z = \dfrac{bd^2}{12}$
(c) $Z = \dfrac{bd^3}{6}$ (d) $Z = \dfrac{bd^2}{6}$
(e) $Z = \dfrac{bd^2}{8}$

CGPCS Polytechnic Lecturer 2017
TNPSC AE 2013

Ans. (d) : We know that



$$Z = \frac{I_{N-A}}{Y_{max.}}$$

$$Y_{max} = \frac{d}{2}$$

$$I_{N\text{-}A} = \frac{bd^3}{12}$$

$$Z = \frac{bd^3 \times 2}{12 \times d}$$

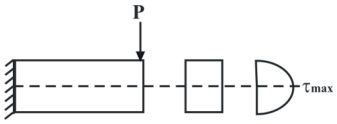
$$\boxed{Z = \frac{bd^2}{6}}$$

718. When a beam is subjected to a transverse shearing force, the shear stress in the upper fibers will be

(a) Maximum (b) Minimum
(c) Zero (d) Depends on other data

Nagaland PSC CTSE 2017, Paper-I
ISRO Scientist/Engineer 2008

Ans. (c) :



Shear stress varies parabolically. At top & bottom fibres it's value is zero & at neutral axis it's value is maximum.

719. In the case of a curved beam subjected to pure bending, which of the following is true?

(a) Neutral axis coincides with the centroidal axis
(b) Neutral axis lies between the centroidal axis and the center of curvature.
(c) Location of neutral axis depends upon the magnitude of bending moment
(d) There is no neutral axis

DRDO Scientists 2008

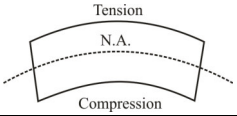
Ans. (b) : In case of curved beam subjected to pure bending, neutral axis lies between the centroidal axis and the center of curvature.
In case of normal beam, subjected to pure bending, neutral axis coincides with the centroidal axis.

720. Neutral plane of the beam

(a) Is in the middle
(b) Is one whose length remains unchanged during deformation
(c) Passes through centers of gravity
(d) Lies at the top most fiber

ISRO Scientist/Engineer (RAC) 07.05.2017 GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : At neutral plane there are no bending stress (σ_b = zero) so whose length unchanged during deformation.



Search on Telegram @apna_pdf

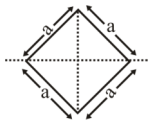
721. A beam of square section, side of square 'a' is used with its diagonal horizontal the modulus of section of beam is given by

(a) $\frac{a^4}{6\sqrt{2}}$ (b) $\frac{a^4}{12\sqrt{2}}$

(c) $\frac{a^3}{6\sqrt{2}}$ (d) $\frac{a^3}{12\sqrt{2}}$

APPSC AEE SCREENING 17.02.2019
MPSC Lect. (Prod.) 2018

Ans. (c)



$$I = \frac{a^4}{12}$$

$$Y_{max} = \frac{a}{\sqrt{2}}$$

$$\text{Section modulus } (Z) = \frac{I}{Y_{max}} = \frac{\frac{a^4}{12}}{\frac{a}{\sqrt{2}}} = \frac{a^3}{6\sqrt{2}}$$

722. If E= elasticity modulus, I = moment of inertia about the neutral axis and M = bending moment in pure bending under the symmetric loading of a beam, the radius of curvature of the beam :

(i) Increases with E (ii) Increases with M
(iii) Decreases with I (iv) Decreases with M
Which of these are correct?

(a) (i) and (ii) (b) (ii) and (iii)
(c) (iii) and (iv) (d) (i) and (iv)

OPSC AEE 2019 Paper-I, ESE 2013

Ans : (d) : In pure bending

$$\frac{\sigma}{y} = \frac{M}{I} = \frac{E}{R}$$

$$R = \frac{E.I}{M}$$

R increase with E
R decrease with M
Statement (i) and (iv) are correct.

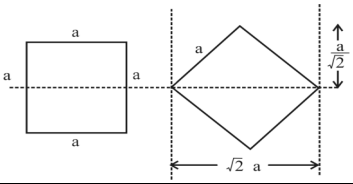
723. The ratio of flexural strength of a square section with its two sides horizontal to its diagonal horizontal is

(a) $\sqrt{2}$ (b) 2

(c) $2\sqrt{2}$ (d) $\frac{\sqrt{2}}{5}$

APPSC AEE 2012, ESE 2012

Ans : (a)



$$I_{SH} = \frac{a^4}{12}$$

$$y = \frac{a}{2}$$

$$Z_{SH} = \frac{a^3}{6}$$

$$\boxed{Z_{SH} = \frac{a^3}{6}}$$

$$I_{SD} = \frac{a^4}{12}$$

$$y = \frac{a}{\sqrt{2}}$$

$$Z_{SD} = \frac{a^4 \times \sqrt{2}}{12 \times a} = \frac{a^3}{6\sqrt{2}}$$

we know that

$$M \propto Z$$

$$\frac{M_{SH}}{M_{SD}} = \frac{Z_{SH}}{Z_{SD}} = \frac{a^3}{6} \times \frac{6\sqrt{2}}{a^3} = \sqrt{2}$$

724. For a circular section the ratio of Maximum shear stress to the average shear stress is :

(a) 1.13 (b) 1.23
(c) 1.33 (d) 1.43

GMB AAE 25.06.2017
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (c) : The ratio of maximum shear stress to average shear stress of a circular section.

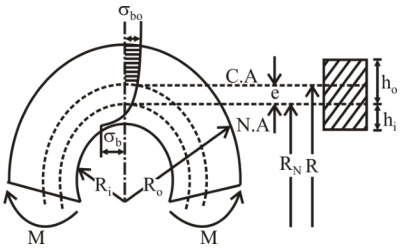
$$\boxed{\tau_{max} = \frac{4}{3}\tau_{avg}}$$

725. The maximum bending stress in a curved beam having symmetrical section always occurs at which one of the following?

(a) Inside fibre (b) Outside fibre
(c) Neutral axis (d) Centroidal axis

CGPSC AE 15.01.2021
UPSC JWM Adv. No-16/2009

Ans. (a) :



The bending stress in a straight beam is linear whereas that in a curved beam is hyperbolically varying over the cross-section.

- If the section is symmetrical, the maximum bending stress always occurs at radius r_i of the inside fiber.
- If the section is unsymmetrical, the stress may be maximum either at R_i or R_o.
- The neutral axis where the bending stress is zero is located between the centroidal axis at radius R and the neutral axis at radius R_i or R_o.

Search on Telegram @apna_pdf

- The distance h_o is to be considered positive for distances towards the center of curvature and negative for distances away from the center of curvature.

726. Consider the following statements :
Two beams of identical cross-section but of different materials are subjected to equal bending moments at a certain section along their length:
1. **Maximum bending stress at the section of two beams is same**
2. **Maximum shearing stress at the sections of two beam is same.**
3. **Maximum bending stress at the section of two beams will depend on the elastic modulus of the beam materials**
4. **Curvature of the beam having greater value of E will be larger.**

Which of the above statements is/are correct?
(a) 1 and 2 (b) 1 and 3
(c) 2 and 3 (d) 4 only

UPSC JWM Adv. No-16/2009, CSE Pre 2007

Ans. (a) : According to bending equation –

$$\boxed{\frac{M}{I}=\frac{\sigma_b}{y}=\frac{E}{R}} \quad \ldots(i)$$

$$\Rightarrow \quad \boxed{\sigma_b=\frac{M.y}{I} \quad or \quad \frac{M}{Z}} \quad \ldots(ii)$$

Bending stress = σ_b

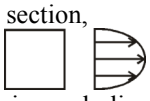
If two beams of identical cross-section but of different materials, when subjected to the equal bending moment at a certain section along their length then according to bending equation, the bending stress not depend on the elastic properties of the material i.e., Maximum bending stress of the material i.e. Maximum bending stress at the section of two beams is same.

And also Maximum shearing stress at the section of two beams is same.

727. A square section with side 'X' of a beam is subjected to a shear force 'S'. The magnitude of shear stress at the top edge of the square is
(a) $\frac{1.5S}{X^2}$ (b) $\frac{S}{X^2}$
(c) $\frac{0.5S}{X^2}$ (d) Zero

APPSC AEE 2012, WBPSC AE, 2007

Ans. (d) : For square section,



Shear stress variation is parabolic shear stress at the top edge of the square is zero.

728. A cantilever beam of rectangular cross-section is 1 m deep and 0.6 m thick. If the beam were to be 0.6 m deep and 1 m thick, then the beam would
(a) be weakend 0.5 times
(b) be weakend 0.6 times
(c) be strengthed 0.6 times
(d) have the same strength on the original beam because the cross-sectional area remains the same

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-1999

Ans. (b) : Flexural strength of beam depends upon it's section modulus.

$$Z_I=\frac{\frac{1}{12}\times 0.6\times 1^3}{0.6/2}=0.1\,m^3$$

$$Z_{II}=\frac{\frac{1}{12}\times 1\times 0.6^3}{0.6/2}=\frac{(0.6)^2}{6}=0.6\times 0.1$$

$= 0.06\ m^3$

$$Z_{11}<Z_1=\frac{0.06}{0.1}=0.6$$

Beam would be weakened by 0.6 times.

729. Three beams of 100 mm × 1200 mm section are made from RCC, aluminium and timber respectively. These three beams are loaded identically with similar supports, Maximum bending stress will occur in which beam?
(a) Timber beam
(b) Aluminium beam
(c) RCC beam
(d) The three beams will have same maximum bending stress

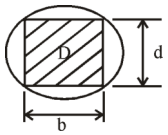
TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-2008

Ans. (d) : Bending stress does not depend upon material.

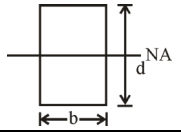
730. A beam of rectangular cross-section is to be cut from a circular beam of diameter D. What is the ratio of the depth of the beam to its width for maximum moment of resistance?
(a) $\sqrt{3}$ (b) $\sqrt{2}$
(c) $\sqrt{\frac{3}{2}}$ (d) $\frac{3}{\sqrt{2}}$

TSPSC AEE 28.08.2017 (Civil/Mechanical)
APGENCO AE 2012

Ans. (b)



$b^2 + d^2 = D^2$
$d^2 = D^2 - b^2$
for the strongest beam in bending its 'z' should be minimum.



Search on Telegram @apna_pdf

$$\frac{dz}{db}=0$$

$$z=\frac{bd^2}{6}$$

$$z=\frac{b\left(D^2-b^2\right)}{6}$$

$$\frac{D^2-3b^2}{6}=0\Rightarrow b=\frac{D}{\sqrt{3}}$$

$$b^2+d^2=D^2$$

$$d^2=D^2-\frac{D^2}{3}\Rightarrow d=\sqrt{\frac{2}{3}D^2}$$

$$d=b.\sqrt{2}$$

$$\frac{\text{depth}}{\text{width}}=\sqrt{2}$$

731. If a shaft is simultaneously subjected to a torque T and bending moment M, the maximum shear stress is

(a) $\frac{16}{\pi D^3}(M+T)$

(b) $\frac{16}{\pi D^3}(M+\sqrt{M^2+T^2})$

(c) $\frac{16}{\pi D^3}(M-\sqrt{M^2+T^2}$

(d) $\frac{16}{\pi D^3}\sqrt{M^2+T^2}$

Nagaland PSC CTSE 2017, Paper-I
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : We know,

$$\sigma_b=\frac{M_b}{Z}\quad\&\quad Z=\frac{I}{Y}$$

$$\sigma_b=\frac{M}{\left(\frac{\pi d^4}{64}\right)}\times\frac{d}{2}=\frac{32M}{\pi d^3}$$

$$\tau=\frac{16T}{\pi d^3}\Rightarrow\ \therefore\ T_{equivalent}=\sqrt{M^2+T^2}$$

$$\tau_{max}=\frac{16\times T_{eq}}{\pi d^3}=\frac{16}{\pi D^3}\times\sqrt{M^2+T^2}$$

732. Section modulus (Z) of a beam depends on :

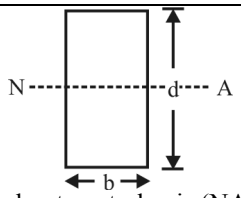
(a) The geometry of the cross-section
(b) Weight of the beam
(c) Only on length of the beam
(d) Density of the beam

HPPSC Lect. (Auto) 23.04.2016
HPPSC LECT. 2016

Ans. (a) : Section modulus is a geometrical phenomenon.

$$\text{Bending stress }(\sigma_{bending})=\frac{My_{max}}{I_{NA}}$$

$$\text{Section modulus }(Z_{N.A})=\frac{I_{NA}}{y_{max}}$$



Section modulus about neutral axis (NA)

$$Z_{NA}=\frac{\frac{bd^3}{12}}{\frac{d}{2}}=\frac{bd^2}{6}$$

$$\boxed{Z_{N.A}=\frac{bd^2}{6}}$$

733. When a shaft with diameter (d) is subjected to pure bending moment (M_b), the bending stress (σ_b) induced in the shaft is given by:

(a) $\sigma_b=\left(\frac{32M_b}{\pi d^3}\right)$ (b) $\sigma_b=\left(\frac{64M_b}{\pi d^3}\right)$

(c) $\sigma_b=\left(\frac{64M_b}{\pi d^2}\right)$ (d) $\sigma_b=\left(\frac{32M_b}{\pi d^2}\right)$

APPSC Poly Lect. 13.03.2020
CIL (MT) 2017 IInd Shift

Ans. (a) : In case of pure bending, the bending stress induced in the shaft $\sigma_b=\left(\frac{32M_b}{\pi d^3}\right)$.

734. The bending stress in a beam is _____ section modulus.

(a) inversely proportional to two times
(b) directly proportional to
(c) inversely proportional to
(d) None of the above

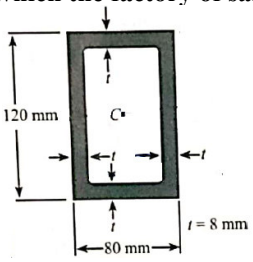
Assam PSC AE (IWT) 14.03.2021

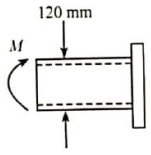
Ans. (c) : The bending moment equation

$$\frac{M}{I}=\frac{\sigma}{y_{max}}=\frac{E}{R}\qquad\sigma=\frac{M}{I/y_{max}}=\frac{M}{Z}$$

From the equation we said that bending stress inversely proportional to the section modulus
Section modulus $Z=I/y_{max}$

735. The rectangular tube shown is extruded from an aluminum alloy for which σ_y = 150 MPa, σ_U = 300 MPa and E = 70 GPa. Neglecting the effect of fillets, the bending moment M for which the factory of safety will be 3.00 is :





(a) M = 9.20 kN-m (b) M = 3.0 kN-m
(c) M = 6.1 kN-m (d) M = 15 kN-m

CGPSC AE 15.01.2021

Search on Telegram @apna_pdf

Ans. (a) : $\frac{M}{I}=\frac{\sigma}{y}\rightarrow M=\frac{\sigma}{y}\cdot I$

$$I=\frac{80\times120^3}{12}-\frac{(80-2\times8)(120-2\times8)^3}{12}$$

$$I=5.52\times10^{-6}\ m^4$$

$$\sigma_{allowable}=\frac{\sigma_U}{FOS}=\frac{300}{3}=100\,MPa$$

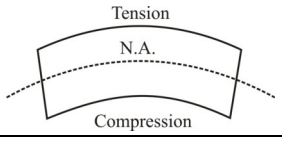
$$M=100\times10^6\times\frac{5.52\times10^{-6}}{60\times10^{-3}}=9.2\ kN\text{-}m$$

736. At the neutral axis of the beam, the layers ___.

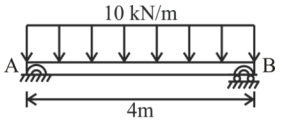
(a) do not undergo any strain
(b) are subjected to tension
(c) are subjected to compression
(d) are subjected to maximum bending stress

VIZAG Steel MT 24.01.2021

Ans. (a) : At the neutral axis of the beam, the layers do not undergo any strain and any stress. Therefore, bending stress at neutral axis is zero and no load acting at neutral axis.



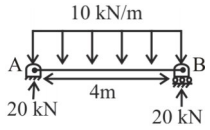
737. A simply supported beam of width 100 mm, height 200 mm and length 4 m is carrying a uniformly distributed load of intensity 10 kN/m. The maximum bending stress (in MPa) in the beam is _____ (correct to one decimal place).



(a) 30 (b) 120
(c) 90 (d) 60

Assam Engg. College AP/Lect. 18.01.2021

Ans. (a) :



Given,
b = 100 mm
D = 200 mm
$R_A + R_B = 40$
$R_A \times 4 = 10 \times 4 \times 2$
$R_A = 20$ kN
$R_B = 20$ kN

$$I=\frac{bd^3}{12}=\frac{100\times(200)^3}{12}$$

$$\frac{\sigma}{y}=\frac{M}{I}=\frac{E}{R}$$

$$\sigma=\frac{M}{I}\times y\ \left(y=\frac{D}{2}=\frac{200}{2}\right)$$

$M_{max} = 20 \times 2 - 10 \times 2 \times 1$
$= 20$ kN-m
$= 20 \times 10^6$ Nmm

$$=\frac{20\times10^6}{\frac{100\times(200)^3}{12}}\times\left(\frac{200}{2}\right)$$

$\sigma_b = 30$ MPa

738. For a cast iron simply supported beam with low strength in tension and high strength in compression, due to the transversely applied load, with beam bent concave upwards, following section will be better.

(a) Square
(b) Rectangular
(c) Circular
(d) Trapezoidal

JPSC AE 10.04.2021, Paper-II

Ans. (d) : If simply supported beam bend concave upwards then compressive stress developed at top fibre and tensile stress developed at bottom fibre.

Cast iron is low strength in tension and high strength in compression so bottom fibre has to be more area (more material) and top fibre is strong in compression so no need to add more material on top fibre so better section will be trapezoidal section.

739. Variation of bending stresses at any section on a beam is related to the bending moment by _____.

(a) St Venant's formula (b) flexural formula
(c) torsional formula (d) bending formula

HPPSC Workshop Suptd. 08.07.02021

Ans. (b) : flexural formula

740. A wooden beam AB supporting two concentrated loads P has a rectangular cross-section of width = 100 mm and height = 150 mm. The distance from each end of the beam to the nearest load is 0.5 m. If the allowable stress in bending is 11 MPa and the beam weight is negligible, the maximum permissible load will be nearly

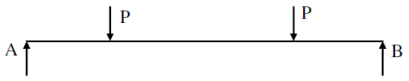
Search on Telegram @apna_pdf

(a) 5.8 kN (b) 6.6 kN
(c) 7.4 kN (d) 8.2 kN

ESE 2020

Ans. (d) : $M_{max} = P \times 0.5 = P \times 500$ Nmm

$$\sigma_{max} = \frac{6M_{max}}{bd^2} = \frac{M_{max}}{bd^2/6}$$



$$11 = \frac{6 \times P \times 500}{100 \times 150^2}$$

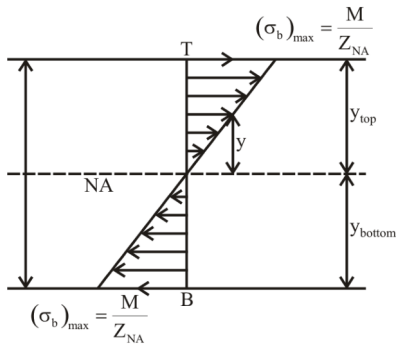
$P = 8250$ N $= 8.25$ kN

741. When a beam is subjected to bending moment alone, the bending stress at any point from the neutral axis

(a) equal
(b) varies directly proportional with respect to distance from neutral axis
(c) varies inversely proportional with respect to distance from neutral axis
(d) stress is independent of the distance

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (b) : For pure bending condition,



Bending stress distribution

$$(\sigma_b)_{max} = \frac{M_y}{I_{NA}}$$

$$\boxed{(\sigma_b) \propto y}$$

• The bending stress at any point from the neutral axis varies directly proportional with respect to distance from neutral axis.

742. A square beam and a circular beam of same material have the same length, same allowable stress and the same bending moment. The ratio of weights of the square beam to that of circular beam is

(a) 1/2 (b) 1
(c) 1/1.12 (d) 1/3

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) : Bending stress, $\sigma = \frac{M}{Z}$

For same stress and moment,

$Z_{square} = Z_{circular}$

$$\frac{b^3}{6} = \frac{\pi}{32}d^3$$

$$b^3 = \frac{3}{16}\pi d^3$$

$$b = \left(\frac{3\pi}{16}\right)^{1/3} \cdot d$$

$$\frac{W_{square}}{W_{circular}} = \frac{A_s \times \ell}{A_{circular} \times \ell} = \frac{b^2}{\frac{\pi}{4}d^2} = \frac{4}{\pi}\left(\frac{b}{d}\right)^2 = \frac{4}{\pi}\left(\frac{3\pi}{16}\right)^{2/3}$$

$$\frac{W_{square}}{W_{circular}} = \frac{1}{1.12}$$

743. The average shear stress in a circular cross section of a beam is equal to:

(a) 0.85 times the maximum shear stress
(b) 0.55 times the maximum shear stress
(c) 0.75 times the maximum shear stress
(d) 0.25 times the maximum shear stress

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : Maximum shear stress occurs at neutral axis and $y = 0$

Max shear stress $= \frac{4}{3}$ average shear stress

For circular section

Avg shear stress $= \frac{3}{4}$ Maximum shear stress

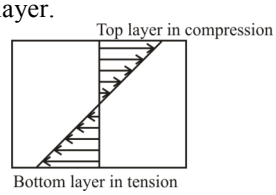
$= 0.75$ times the maximum shear stress.

744. When a rectangular beam is loaded transversely, the maximum tensile stress is developed on the

(a) top layer (b) bottom layer
(c) neutral axis (d) every cross-section

RPSC IOF, 2020

Ans. (b) : When a rectangular beam is loaded transversely, the maximum tensile stress is developed on the bottom layer.



Compressive stress developed on the top layer.
Stress is zero at the neutral axis.

745. In a triangular section, the maximum shear stress occurs at

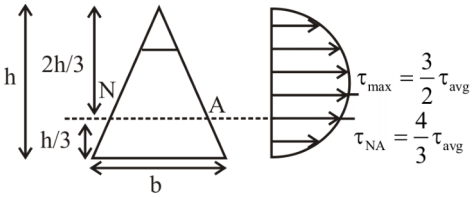
(a) Apex of the triangle (b) Mid of the height
(c) 1/3 of the height (d) base of the triangle

RPSC IOF, 2020

Ans. (b) : In a triangular section, the maximum shear stress occurs at mid of the height.

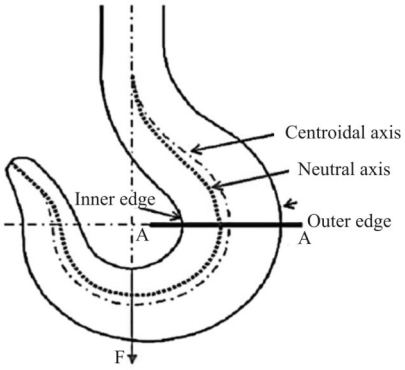
→ For rectangular section $F_{max} = h/2$

→ For triangular section, the shear stress has a parabolic variation.



Search on Telegram @apna_pdf

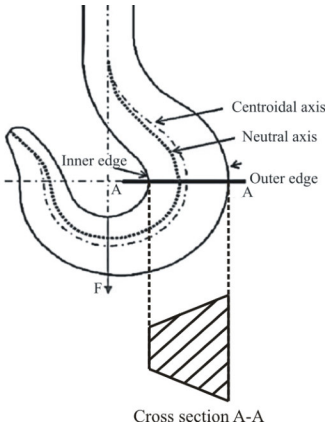
746. For a standard crane hook (as shown in figure) subjected to a constant load F, the tensile stress at a given section A-A will be maximum at___



(a) innermost edge (b) neutral axis
(c) outermost edge (d) centroidal axis

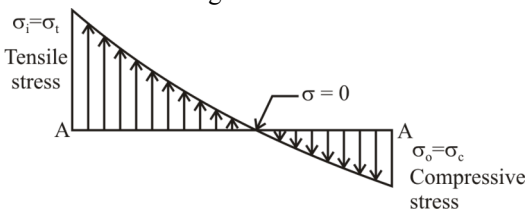
APPSC Poly Lect. 13.03.2020

Ans. (a) : For a standard crane hook (as shown in figure) subjected to a constant load F, the tensile stress at a given section A-A will be maximum at innermost edge.



Cross section A-A

Stress distribution in a given section-



Where, $\sigma_i = \sigma_t = \frac{F}{A} + \frac{MY}{A_e R}$

$\sigma_o = \sigma_c = \frac{F}{A} - \frac{MY}{A_e R}$

747. A non uniform bending refers to flexure of a beam

(a) in presence of uniformly distributed loaded in the beam
(b) in presence of uniform bending moment
(c) in presence of shear forces
(d) in absence of shear forces

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (c) : Bending Equation–Every element of the beam is bend with the some radius of curvature

$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$ or $R = \frac{EI}{M}$

A non-uniform bending is deformation is the presence of shear force and BM change along the axis of beam.

748. The normal stresses in a cross section of a beam under lateral loading

(a) varies linearly with distance from the neutral axis
(b) varies quadratically with distance from the neutral axis
(c) does not vary with distance from the neutral axis
(d) varies inversely with distance from the neutral axis

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Lateral load produce bending. Bending stress developed in cross section is normal to cross section so called normal stress. Bending stress linearly varies with distance from the neutral stress.

749. The shear in a cross section for a rectangular beam under lateral loading

(a) does not vary with distance from the neutral axis
(b) varies linearly with distance from the neutral axis
(c) varies quadratically with distance from the neutral axis
(d) varies inversely with distance from the neutral axis

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (c) : Shear stress in the cross section for any section beam under lateral loading varies quadratically (parabolically) with distance from neutral axis.

750. Product of allowable bending stress and sectional modulus is

(a) Moment of rigidity
(b) Radius of gyration
(c) Moment of resistance
(d) Moment of inertia

CIL MT 27.02.2020

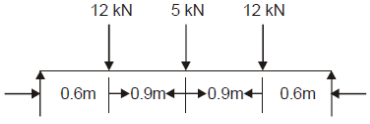
Ans. (c) : The maximum bending moment which can be carried by given section for a given maximum value of stress is known as moment of resistance (M_r)

Section modulus $(Z) = \frac{I}{y}$

$M_r = \sigma \frac{I}{y}$, $M_r = \sigma Z$

Moment of resistance=Bending stress×Section modulus

751. A beam of span 3 m and width 90 mm is loaded as shown in the figure. If the allowable bending stress is 12 MPa, the minimum depth required for the beam will be



Search on Telegram @apna_pdf

(a) 218 mm (b) 246 mm
(c) 318 mm (d) 346 mm

ESE 2020

Ans. (b) :

$R_A + R_B = 29$

$R_A \times 3 = 12 \times 2.4 + 5 \times 1.5 + 12 \times 0.6$

$R_A = 14.5$

$R_B = 14.5$

$M_{max} = 14.5 \times 1.5 - 12 \times 0.9$

$= 10.95$ kNm

$= 10.95 \times 10^6$ N mm

Bending stress $\sigma_b = \frac{MY}{I} = \frac{6\,M_{max}}{bd^2}$

$12 = \frac{6 \times 10.95 \times 10^6}{90 \times d^2}$

$d = 246.64$ mm

752. A vertical hollow aluminium tube 2.5 m high fixed at the lower end, must support a lateral load of 12 kN at its upper end. If the wall thickness is $\frac{1}{8}^{th}$ of the outer diameter and the allowable bending stress is 50 MPa, the inner diameter will be nearly

(a) 186 mm (b) 176 mm
(c) 166 mm (d) 156 mm

ESE 2020

Ans. (d) :

$t = \frac{1}{8} d_0$

$d_i = d_0 - 2t$

$= d_0 - 2 \times \frac{1}{8} d_0 = \frac{3}{4} d_0$

$\frac{d_i}{d_0} = \frac{3}{4}$

$\sigma_b = \frac{32 M_{max}}{\pi d_0^3 (1 - K^4)}$

$50 = \frac{32 \times 12 \times 10^3 \times 2500}{\pi d_0^3 \left[1 - \left(\frac{3}{4}\right)^4\right]}$

$d_0 = 207.54$

$d_i = \frac{3}{4} \times 207.54 = 155.66$ mm

753. Which of the following is NOT an example of curved beam?

(a) Chain links with tensile load
(b) Crane hooks subjected to downward load
(c) Rings with uniform tensile load
(d) Cantilever beam with point load

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Curved beams : Beam whose axis is not straight and is curved in the elevation is said to be a curved beam is the applied loads are along the y-direction and the span of the beam is along the x-direction. The axis of the beam should have a curvature in xy plane.

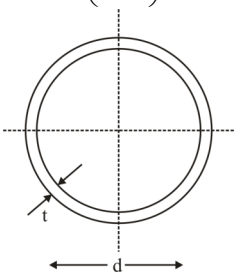
ex. : Chain links with tensile load, crane hooks subjected to downward load, ring with uniform tensile load.

754. Section modulus of hollow circle with average diameter 'd' and with thickness 't' is equal to

(a) $\frac{4}{5} td^2$ (b) $\frac{4}{5} t^2 d^2$
(c) $\frac{4}{5} t^2 d$ (d) $\frac{5}{4} td^2$

TNPSC AE 2019

Ans. (a) : $I_{x-x} = I_{y-y} = \left(\frac{\pi d^3}{8}\right) \times t$



$Ro = \frac{d}{2} + t \simeq \frac{d}{2}$

$Z_{x-x} = Z_{y-y} \left[\frac{\pi d^2}{4} \times t\right]$

$\approx \frac{4}{5} td^2$

755. Pure bending means :

(a) The bending beam shall be accompanied by twisting
(b) Shear force is zero
(c) There is no twisting
(d) None of these

OPSC AEE 2019 Paper-I

Ans : (b) : Pure bending- Pure bending is a condition of stress where a bending moment is applied to a beam without the simultaneous application of axial shear or torsional forces. Beam that is subjected to pure bending means the shear force in the particular beam is zero and no torsional or axial loads are presented. Pure bending is also the flexure (bending) of a beam that under a constant bending moment therefore pure bending only occurs therefore pure bending only occurs when the shear force in equal to zero.

756. The point within the cross-sectional plane of beam through which the resultant of the external loading on the beam has to pass through to ensure pure bending without twisting of the cross-section of the beam is called :

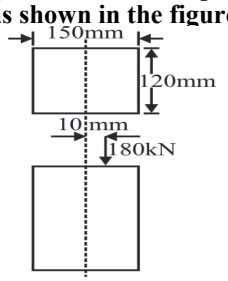
(a) Moment centre (b) Centroid
(c) Shear center (d) Elastic center

OPSC AEE 2019 Paper-I

Ans : (c) : Shear center is the point within the cross sectional plane of a beam through which the resultant of the external loading on the beam has to pass through to ensure pure bending without twisting of cross section of the beam.

Search on Telegram @apna_pdf

757. A rectangular strut is 150 mm wide and 120 mm thick. It carries a load of 180 kN at an eccentricity of 10 mm in a plane bisecting the thickness as shown in the figure



The maximum intensity of stress in the section will be

(a) 14 MPa (b) 12 MPa
(c) 10 MPa (d) 8 MPa

ESE 2019

Ans. (a) : Given,

P = 180 kN
b = 150 mm
d = 120 mm
e = 10 mm

Resultant normal stress is maximum at the right side fiber of the cross section, because the line of action of eccentric axial compressive load is nearer to this fiber.

Maximum intensity of stress

$$= \sigma_c + \sigma_b$$

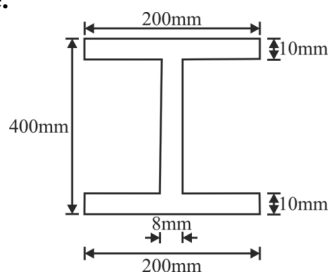
$$\sigma_{max} = \frac{-P}{A} - \frac{M}{Z}$$

$$= \frac{-P}{A} - \frac{P \times e}{\left(\frac{db^2}{6}\right)} = \frac{-P}{bd} - \frac{6P \times e}{db^2}$$

$$= \frac{-P}{bd}\left[1 + \frac{6 \times e}{b}\right] = -\frac{180 \times 10^3}{120 \times 150}\left[1 + \frac{6 \times 10}{150}\right]$$

$$= -14 \text{ MPa} = 14 \text{ MPa (compressive)}$$

758. The cross-section of the beam is as shown in the figure.



If the permissible stress is 150 N/mm^2, the bending moment M will be nearly

(a) 1.21×10^8 N mm (b) 1.42×10^8 N mm
(c) 1.64×10^8 N mm (d) 1.88×10^8 N mm

ESE 2019

Ans. (b) : Moment of inertia of I-section

$$I = I_{web} - 2\,(I_{flange})$$

$$I = \left[\frac{200 \times 400^3}{12} - 2 \times \frac{96 \times 380^3}{12}\right]$$

$$= 1.887 \times 10^8 \text{ mm}^4$$

$$\text{Section modulus } (Z) = \frac{I}{y_{max}}$$

$$= \frac{1.887 \times 10^8}{200}$$

$$= 943573.33 \text{ mm}^3$$

Permissible stress

$$\sigma_{max} = \frac{M}{Z}$$

Bending moment $M = \sigma_{max} \times Z$

$$= 150 \times 943573.33$$

$$= 1.415 \times 10^8 \text{ N-mm}$$

759. A hollow circular bar used as a beam has its outer diameter thrice the inside diameter. It is subjected to a maximum bending moment of 60 MN m. If the permissible bending stress is limited to 120 MPa, the inside diameter of the beam will be.

(a) 49.2 mm (b) 53.4 mm
(c) 57.6 mm (d) 61.8 mm

ESE 2019

Ans. (c) : Given,

$d_o = 3\,d_i$, M = 60 MN-mm = 60×10^6 N-mm

$$y_{max} = \frac{d_o}{2}$$

$$\sigma_{max} \le \sigma$$

$$\frac{M}{I} \times y_{max} \le \sigma$$

$$\frac{60 \times 10^6}{\frac{\pi}{64}\left(d_o^4 - d_i^4\right)} \cdot \frac{d_o}{2} \le 120$$

$$\frac{60 \times 10^6 \times 64}{\pi d_o^4\left[1 - \left(\frac{d_i}{d_o}\right)^4\right]} \times \frac{d_o}{2} = 120$$

$$\frac{384 \times 10^7}{2 \times 120 \times \pi\left[1 - \left(\frac{1}{3}\right)^4\right]} = d_o^3$$

d_o = 172.79 mm

$d_i = d_o/3$

d_i = 57.6 mm

Note : Bending moment value should be in MN-mm but in question it is given in MN-m.

760. In a beam of I-section, which of the following parts will take the maximum shear stress when subjected to traverse loading?

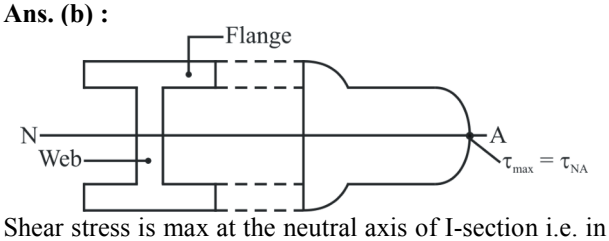
1. Flange 2. Web

Select the correct answer using code given below.

(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 or 2

ESE 2019

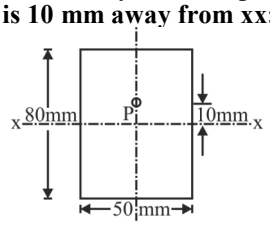
Ans. (b) :



Shear stress is max at the neutral axis of I-section i.e. in the web portion.

Search on Telegram @apna_pdf

761. A pull of 100 kN acts on a bar as shown in the figure in such a way that it is parallel to the bar axis and is 10 mm away from xx:

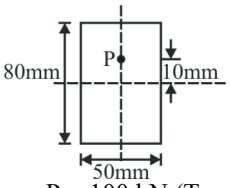


The maximum bending stress produced in the bar at xx is nearly.

(a) 20.5 N/mm^2 (b) 18.8 N/mm^2
(c) 16.3 N/mm^2 (d) 14.5 N/mm^2

ESE 2019

Ans. (b) :



P = 100 kN (Tensile)

Bending moment (M) = $100 \times 10^3 \times 10$
$= 10^6$ N-mm

$$y_{max} = \frac{80}{2} = 40 \text{ mm}$$

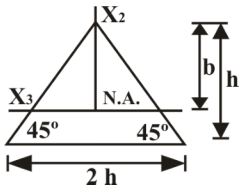
$$I = \frac{bd^3}{12} = \frac{50 \times 80^3}{12}$$

Maximum bending stress

$$\sigma_{max} = \frac{M}{I} \cdot y_{max} = \frac{10^6}{\left(\frac{50 \times 80^3}{12}\right)} \times 40$$

σ_{max} = 18.8 N/mm^2

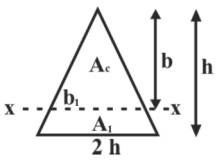
762. The beam of triangular cross-section as shown in the figure below, is subjected to pure bending. If a plastic hinge develops at a section, determine the location of neutral axis (distance b from top) at that section. The beam material is elastic-perfectly plastic (i.e., yield stress is constant)



(a) $\frac{h}{\sqrt{3}}$ (b) $\frac{h}{2}$
(c) $\frac{h}{\sqrt{2}}$ (d) $\frac{h}{3}$

APPSC AEE SCREENING 17.02.2019

Ans. (c) :



$A_c = A_t$

$$\frac{1}{2} \times b \times b_1 = \frac{1}{2}\left[\frac{1}{2} \times 2h \times h\right]$$

$$b_1 = \frac{h^2}{b}$$

from similar triangles

$b \to b_1$

$h \to 2h$

$b \times 2h = b_1 h$

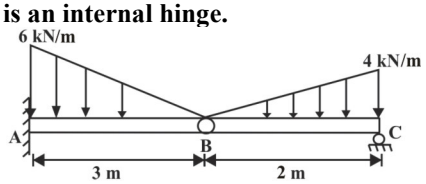
$$b = \frac{b_1}{2}$$

$$b = \frac{h^2}{b \times 2}$$

$$b^2 = \frac{h^2}{2}$$

$$b = \frac{h}{\sqrt{2}}$$

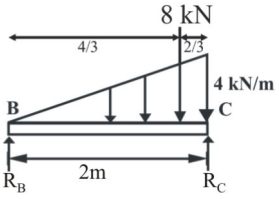
763. Calculate the shear force and bending moment at point B for the beam AB subjected to linearly varying load as shown in the figure. The value of the linearly varying load at the point is 6 kN/m and 4 kN/m, respectively. Point B is an internal hinge.



(a) 2.67 kN and 0 kN-m (b) 4 kN and 0 kN-m
(c) 4 kN and 1.33 kN-m (d) 1.33 kN and 0 kN-m

APPSC AEE SCREENING 17.02.2019

Ans. (d) :



Consider BC part

$$SF_B = R_B = \frac{\frac{1}{2} \times 4 \times 2 \times \frac{2}{3}}{2} = \frac{4}{3} = 1.33kN$$

$\boxed{R_B = 1.33 \text{ kN}}$

$BM_B = 0$ (at hinge moment is zero)

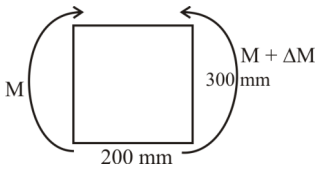
764. A beam of rectangular section 200mm × 300mm carries certain loads such that bending moment at a section A is M and at another section B it is (M + ΔM). The distance between section A and B is 1 m and there are no external loads acting between A and B. If ΔM is 20 kNm, maximum shear stress in the beam section is

(a) 0.5 MPa (b) 1.0 MPa
(c) 1.5 MPa (d) 2.0 MPa

APPSC AEE SCREENING 17.02.2019

Search on Telegram @apna_pdf

Ans. (a) :



$$\frac{dM}{dx} = F$$

$$\frac{20kN - m}{1m} = F$$

F = 20 kN

For rectangular cross-section

$$\tau_{max} = \frac{3}{2}\left[\tau_{avg}\right]$$

$$\tau_{max} = \frac{3}{2}\left[\frac{F}{bd}\right] = \frac{3}{2}\left[\frac{20\times10^3}{200\times300}\right] = 0.5 \text{ MPa}$$

765. A mild steel flat of width 100 mm and thickness 12 mm is bent into an arc of a circle of radius 10 m by applying a pure moment M. If Young's modulus E = 200 GPa, then the magnitude of M is

(a) 72 Nm (b) 144 Nm
(c) 216 Nm (d) 288 Nm

APPSC AEE SCREENING 17.02.2019

Ans. (d) : Given, Radius of curvature (R) = 10,000 mm
Modulus of elasticity (E) = 200×10^3 MPa
Thickness (t) = 12 mm
From bending equation

$$\frac{M}{I} = \frac{E}{R} = \frac{\sigma}{Y}$$

$$\frac{M}{\left[\frac{100\times12^3}{12}\right]} = \frac{200\times10^3}{10,000}$$

M = 288000 N-mm
= 288 N-m

766. A rectangular beam section with depth 400 mm and width 300 mm is subjected to a bending moment of 60 kN-m. The maximum bending stress in the section is

(a) 7.50 MPa (b) 2.50 MPa
(c) 1.56 MPa (d) 0.42 MPa

APPSC AEE SCREENING 17.02.2019

Ans. (a) : Maximum bending stress in the beam

$$f_{max} = \frac{M}{Z} = \frac{M}{\left[\frac{bd^2}{6}\right]} = \frac{60\times10^6}{\left[\frac{300\times400^2}{6}\right]} = 7.5 \text{ MPa}$$

767. In case of pure bending, the beam will bend into an arc of a/an

(a) parabola (b) hyperbola
(c) circle (d) ellipse

APPSC AEE SCREENING 17.02.2019

Ans. (c) : If a beam is subjected to pure bending the elastic curve is a circular arc with constant radius.

768. Two beams have the same length, same allowable stresses and the same bending moment. The cross sections of the beams are a square and a rectangle with depth twice that of width. The ratio of weight of square beam to the weight of rectangular beam is:

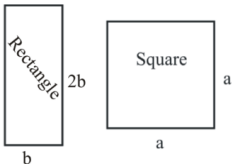
(a) 0.85 (b) 0.75
(c) 0.95 (d) 1.25

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (d) : $l_1 = l_2$

$\delta_1 = \delta_2$

$M_1 = M_2$



From bending equation

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

$$\sigma = \frac{M}{I}\times y$$

$\sigma_1 = \sigma_2$

$$\frac{M_1}{I_1}\times y_1 = \frac{M_2}{I_2}\times y_2 \qquad (M_1 = M_2)$$

$$\left(\frac{y_1}{I_1}\right)_{rec.} = \left(\frac{y_2}{I_2}\right)_{sq.}$$

$$\frac{2b/2}{b\times\frac{(2b)^3}{12}} = \frac{a/2}{\frac{a^4}{12}}$$

$$\frac{2b}{8b^4} = \frac{a}{a^4}$$

$$\frac{1}{4b^3} = \frac{1}{a^3}$$

$$a^3 = 4b^3$$

$$\boxed{a = 1.587b}$$

$$\frac{\text{weight of square Beam}}{\text{weight of rectangular Beam}} = \frac{m_2 g}{m_1 g} = \frac{\rho_2 V_2 g}{\rho_1 V_1 g} = \frac{V_2}{V_1}$$

$$= \frac{a^2\times l}{2b^2\times l}$$

$$= \frac{(1.587b)^2\times l_1}{2b^2\times l_2} \qquad (l_1 = l_2)$$

= 1.25

769. A beam with rectangular cross section (10mm × 20mm) is subjected to maximum shear force of 5kN. The maximum shear stress induced is :

(a) 54.5 MPa (b) 25 MPa
(c) 37.5 MPa (d) 50 MPa

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

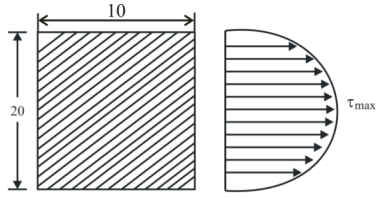
Search on Telegram @apna_pdf

Ans. (c) : Given,

Area of rectangular cross section

$A = 10\ mm \times 20mm$

Shear force $(F_s) = 5\ kN$



$$\tau_{max} = \frac{3}{2}\tau_{avg}$$

$$= \frac{3}{2} \times \frac{F_s}{A}$$

$$= \frac{3}{2} \times \frac{5 \times 10^3}{10 \times 20}$$

$$\tau_{max} = 37.5MPa$$

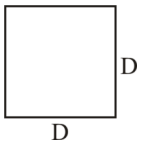
770. The ratio of moment carrying capacity of a square cross section beam of dimension D to the moment carrying capacity of a circular cross section of diameter D is :

(a) $\frac{16}{3\pi}$ (b) $\frac{16}{\pi}$

(c) $\frac{16}{5\pi}$ (d) $\frac{8}{3\pi}$

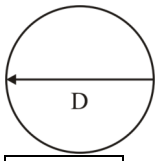
BHEL ET 2019

Ans. (a) :



Section modulus of square cross - section $Z_s = \frac{D^3}{6}$

Section modulus of circular cross - section $Z_c = \frac{\pi D^3}{32}$



$$\boxed{\sigma_b = \frac{M}{Z_{NA}}}$$

For square cross section–

$$(\sigma_b)_s = \frac{M_s}{\frac{D^3}{6}} = \frac{6M_s}{D^3}$$

For circular cross section–

$$(\sigma_b)_c = \frac{M_c}{\frac{\pi D^3}{32}} = \frac{32M_c}{\pi D^3}$$

Note- Bending stress of both beam will be same

$$(\sigma_b)_s = (\sigma_b)_c$$

$$\frac{6M_s}{D^3} = \frac{32M_c}{\pi D^3}$$

$$\boxed{\frac{M_s}{M_c} = \frac{16}{3\pi}}$$

771. If the Bending moment is increased three times, then to keep the stress in the beam same, sectional modulus shall be

(a) decreased 3 times (b) increased 3 times

(c) unchanged (d) increased 6 times

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (b) : Bending stress

$$\sigma = \frac{M}{Z}$$

For $\sigma = \frac{M}{Z} = \text{constant}$

If $M \uparrow \rightarrow 3M$

then Z also increase 3 times to keep the stress in the beam same.

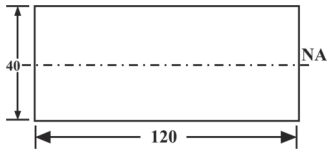
772. A beam with rectangular section of 120 mm × 40 mm is placed horizontally by mistake, (with width as 120 mm and depth as 40 mm) whereas it was designed to be placed vertically, (with width as 40 mm and depth as 120 mm). The ratio of section modulus will be

(a) 1/3 (b) 1/2

(c) 1/6 (d) 1/8

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (a) : Case-I



$$Z = \frac{I_{NA}}{Y_{max}}$$

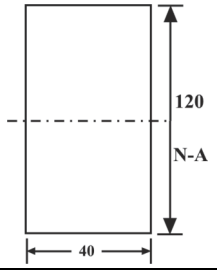
$$I_{NA} = \frac{120 \times (40)^3}{12}$$

$$Y = \frac{40}{2}$$

$$Z_1 = \frac{120 \times 40 \times 40 \times 40 \times 2}{12 \times 40}$$

$$Z_1 = 32000\ mm^3$$

Case-II



Search on Telegram @apna_pdf

$$I_{N-A} = \frac{40 \times (120)^3}{12}$$

$$y_{max} = \left(\frac{120}{2}\right)$$

$$Z_2 = \frac{40 \times 120 \times 120 \times 120 \times 2}{120 \times 12}$$

$$Z_2 = 96000 \text{ mm}^3$$

$$\frac{Z_1}{Z_2} = \frac{32000}{96000} = \frac{1}{3}$$

773. Neutral axis of a beam is;

(a) Layer subjected to tensile stress
(b) Layer subjected to compressive stress
(c) Layer subjected to torsion stress
(d) Layer subjected to zero stress

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (d) : Neutral axis of a beam is layer subjected to zero stress.

$$\sigma_b = \frac{M}{I} \times y \qquad \text{(at neutral axis, y = 0)}$$

$$\boxed{\sigma_b = 0}$$

774. The beams, one having square cross section and another circular cross section, are subjected to same amount of bending moment. If the cross section area and the material of both the beams are the same then

(a) Both beams will experience same deformation
(b) Maximum bending stress developed in both the beams is the same
(c) The circular beam experiences more bending stress than the square one.
(d) The square beam experiences more bending stress than the circular one

GPSC Executive Engineer 23.12.2018, GATE 2003

Ans. (c) : Area of square and circle is same,

$$\frac{\pi}{4} \times d^2 = a^2$$

Let,

a = Side of square
d = diameter of circle

$$d = \frac{2a}{\sqrt{\pi}} \text{ ……..(i)}$$

Bending stress is given as,

$$\sigma = \frac{M}{Z} \text{ ……..……(ii)}$$

Where, M = Maximum bending moment
Z = Section modulus

Section modulus

$$Z = \frac{I}{Y}$$

Greater value of section modulus stronger be the section and as per equation (ii) lower will be bending stress.

$$Z_{Square} = \left(\frac{I}{Y}\right)_{Square}$$

$$Z_{square} = \frac{9 \times a^3}{\frac{12}{9}} = \frac{a^3}{6}$$

$$\frac{9}{2}$$

$$= 0.167 \, a^3 \text{ ……..(iii)}$$

$$Z_{circle} = \left(\frac{I}{Y}\right)_{Circle} = \frac{\pi R^4}{\frac{4}{R}}$$

$$Z_{circle} = \frac{\pi}{4} R^3 = \frac{\pi}{4} \times \frac{d^3}{8}$$

$$\because R = \frac{d}{2}$$

From equation (i), we get,

$$Z_{circle} = \frac{\pi}{32} \times \left(\frac{29}{\sqrt{\pi}}\right)^3$$

$$= 0.141 \, a^3 \text{ ……..(iv)}$$

From equation (iii) and (iv),

$(Z)_{circle} < (Z)_{square}$

Hence from equation (i), we get

$\sigma_{circle} > \sigma_{square}$

775. The relationship between the radius of curvature R, bending moment M and flexural rigidity EI is given by

(a) $R = \frac{M}{EI}$ (b) $M = \frac{EI}{R}$

(c) $EI = \frac{R}{M}$ (d) $E = \frac{MI}{R}$

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : $\frac{M}{I} = \frac{E}{R}$

$\Rightarrow M = \frac{EI}{R}$

776. Due to some point load anywhere on a fixed beam, the maximum free bending moment is M. The sum of fixed end moment is

(a) M (b) 1.5 M
(c) 2.0 M (d) 3.0 M

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : Due to some point load any where on a fixed beam, the maximum free bending moment is M. The sum of fixed end moment is M.

777. A pipe of external diameter 3 cm and internal diameter 2 cm and length 4m supported at its ends. If carries a point load of 65 N at its center-section, modulus of pipe will be

(a) $\frac{65\pi}{64} \text{cm}^3$ (b) $\frac{65\pi}{32} \text{cm}^3$

(c) $\frac{65\pi}{96} \text{cm}^3$ (d) $\frac{65\pi}{124} \text{cm}^3$

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2002

Ans. (c) : External diameter $D_0 = 3$ cm
Internal diameter $D_i = 2$ cm

Search on Telegram @apna_pdf

Section modulus,

$$Z = \frac{I}{y_{max}}$$

$$I = \frac{\pi}{64}\left(D_0^4 - D_i^4\right)$$

$y_{max} = D_0/2$

(distance of extreme fiber from neutral axis)

$$Z = \frac{\frac{\pi}{64}\left[3^4 - 2^4\right]}{3/2}$$

$$Z = \frac{65\pi}{96}\,cm^3$$

778. In a loaded beam under bending

(a) both the maximum normal and maximum shear stresses occur at the skin fibers.

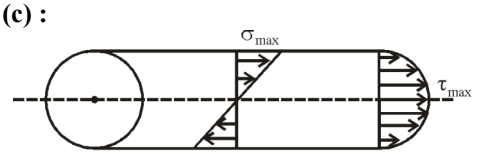
(b) both the maximum normal and maximum shear stresses occur at the neutral axis

(c) the maximum normal stress occurs at the skin fibres and the maximum shear stress occurs at the neutral axis

(d) the maximum normal stress occurs at the neutral axis while the maximum shear stress occurs at the stress fibers

TSPSC AEE 28.08.2017 (Civil/Mechanical), CSE Pre 2003

Ans. (c) :



Bending stress distribution | Shear stress distribution

Normal stress occurs maximum at extreme fiber while maximum shear stress occurs at neutral axis.

779. A beam has rectangular section 100 mm × 200 mm. If it is subjected to a maximum BM of 4 × 10^7 Nmm, then the maximum bending stress developed would be

(a) 30 N/mm^2 (b) 60 N/mm^2

(c) 90 N/mm^2 (d) 120 N/mm^2

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : Rectangular section = 100 mm × 200 mm

$$I = \frac{1}{12}\times 100\times 200^3$$

$$y_{max} = \frac{200}{2} = 100$$

$$Z = \frac{I}{y_{max}} = \frac{\frac{1}{12}\times 100\times 200^3}{100} = \frac{2}{3}\times 10^6\,mm^3$$

$M_R = \sigma_{max} \times Z$

$$\sigma_{max} = \frac{M_R}{z} = \frac{4\times 10^7}{\frac{2}{3}\times 10^6}\,N\text{–}mm$$

$\sigma_{max} = 60$ N/mm^2

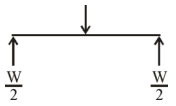
780. A timber beam is simply supported at the ends and carries a concentrated load at mid span. The maximum longitudinal stress 'f' is 12 N/mm^2 and the maximum shear stress 'q' is 1.2 N/mm^2. The ratio of span to depth would be

(a) 10 (b) 6

(c) 5 (d) 4

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c)



Maximum shearing stress $q = \frac{3}{2}q_{avg}$

(for rectangular such)

$$q = \frac{3}{2}\left(\frac{W}{2}\right)\times\frac{1}{bd}$$

$$q = \frac{3W}{4bd} \qquad \text{———(1)}$$

Maximum bending stress $f = \frac{M}{Z}$

$$f = \frac{\frac{W}{4}\ell}{bd^2/6} = \frac{3W\ell}{2bd^2} \qquad \text{———(2)}$$

$$\frac{f}{q} = \frac{2\ell}{d} = \frac{\ell}{d} = \frac{1}{2}\times\frac{12}{1.2} = 5$$

781. The moment of inertia of a given rectangular area is minimum about

(a) its longer centroidal axis

(b) its polar axis

(c) its axis along the diagonal

(d) its shorter centroidal axis

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : $I_{xx} = \frac{1}{12}bd^3$

$$I_{yy} = \frac{1}{12}db^3$$

since $b < d$

$\therefore I_{xx} > I_{yy}$

Hence MOI of a given rectangular section is minimum about longer centroidal axis.

782. A beam of uniform strength refers which the following?

(a) A beam in which extreme fibre stresses are same at all cross-section along the length of the beam

(b) A beam in which the moment of inertia about the axis of bending is a constant at all cross-section of the beam

(c) A beam in which the distribution of bending stress across the depth of cross-sections of the beam

(d) A beam in which the bending stress is uniform at the maximum bending moment cross-section

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Search on Telegram @apna_pdf

Ans. (a) : Beams of uniform strength are those beams whose cross-section varies along length of beam, such that maximum bending stress at each cross-section reaches permissible stress and is constant through out the length of beam.

783. A mild steel plate is subjected to a moment M each at its ends such that it bends into an arc of a circle of radium 10 m. The plate has width 60 mm and thickness 10 mm. $E = 2 \times 10^5$ N/mm^2. What is the maximum bending stress produced in the plate?

(a) 100 MPa (b) 200 MPa
(c) 300 MPa (d) 400 MPa

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : Thickness of plate = 10 mm
Radius of curvature = 10 m
$E = 2 \times 10^5$ N/mm^2

Flexure formula $\frac{E}{R} = \frac{\sigma}{y}$

$$\sigma = \frac{E \times y}{R}$$

$$\sigma = \frac{2 \times 10^5 \times \frac{10}{2}}{10 \times 1000} \text{ N/mm}^2$$

$\sigma = 100$ N/mm^2 = 100 MPa

784. In the design of beams for a given strength, consider that the conditions of economy of used of the material would avail as follows:

1. Rectangular cross-section is more economical than square section of the same cross-sectional area of the beam.
2. Circular section is more economical than square section.
3. I-section is more economical than a rectangular section of the same depth.

Which of the above are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

ESE 2017

Ans. (d) : For same material and same volume
$Z_I > Z_{rect} > Z_{sq} > Z_{cir}$
Square section is more economical than circular section therefore statement second is wrong.

785. Consider a simply supported beam of length, 50h, with a rectangular cross-section of depth, h, and width, 2h. The beam carries a vertical point load, P, at its mid point. The ratio of the maximum shear stress to the maximum bending stress in the beam is

(a) 0.02 (b) 0.10
(c) 0.05 (d) 0.01

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) :

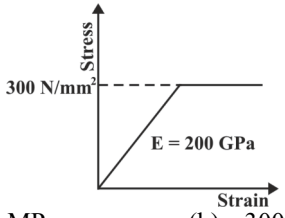
$$\sigma_{max} = \frac{M_{max}}{z} = \frac{(PL/4)}{(h^3/3)} = \frac{P \times 50h/4}{h^3/3} = 37.5\frac{P}{h^2}$$

$$\tau_{max} = \frac{3}{2}\frac{P_{max}}{A} = \frac{3P_{max}}{4h^2} = 0.75\frac{P_{max}}{h^2}$$

$$\tau_{max} = \frac{0.75P}{h^2 \times 2} \quad \therefore \quad P_{max} = \frac{P}{2}$$

$$\frac{\tau_{max}}{\sigma_{max}} = \frac{0.375}{37.5} = 0.01$$

786. The stress produced in a wire of diameter 6 mm, when it is bend around a large cylinder of diameter 2 m can be obtained as (Young's modulus of both wire and cylinder = 200 GPa, the stress strain curve of the material is given below)



(a) 600 MPa (b) 300 MPa
(c) 100 MPa (d) 200 MPa

ISRO Scientist/Engineer 17.12.2017

Ans. (b) : Given,

$\sigma = 300$ N/mm^2
$E = 200 \times 10^3$ N/mm^2

$$R = \frac{D}{2} = \frac{2}{2} = 1 \text{ m} = 1000 \text{ mm}$$

$$y_{max} = \frac{6}{2} = 3 \text{ mm}$$

From bending equation

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

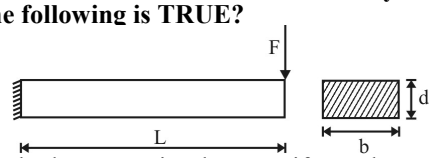
$$\sigma = y_{max}\frac{E}{R}$$

$$= 3 \times \frac{200 \times 10^3}{1000}$$

$= 600$ MPa

But $\sigma_{critical} = 300$ MPa
$\therefore$ $\sigma = 300$ MPa

787. A cantilever beam of rectangular cross section (depth 'd', width 'b' & length 'L') is subjected to a shear force 'F' at its free end as shown in figure. The beam is made of material which follown maximum shear stress theory. Which of the following is TRUE?



(a) The beam section has a uniform shear stress, $\frac{F}{bd}$
(b) Maximum shear stress in section and maximum bending stress in beam is equal when L = d/2
(c) For L > d/2, bending stress decides the failure stress
(d) Bending stress developed in the beam is independent of 'b'

ISRO Scientist/Engineer 17.12.2017

Search on Telegram @apna_pdf

Ans. (c) (a) Shear stress varies parabolically in a rectangular cross-section.

(b) Maximum shear stress = $\frac{1.5F}{bd} \neq$ maximum bending stress.

(d) Bending stress depends on b.

788. A solid rod of 12 mm diameter was tested for tensile strength with the gauge length of 50 mm. Final length = 80 mm; Final diameter = 4 mm; Yield load = 1130 N. What is the nearest yield stress and % reduction in area respectively?

(a) 10 MPa and 10% (b) 90 MPa and 90%
(c) 10 MPa and 90% (d) 90 MPa and 10%

ISRO Scientist/Engineer 07.05.2017

Ans. (c) : Given, $d_i = 12$ mm, $L_i = 50$ mm, $L_f = 80$ mm
$d_f = 4$ mm, $P = 1130$ N, $\sigma_y =$

$$\sigma_{\text{yield stress}} = \frac{P}{A}$$

$$= \frac{1130}{\frac{\pi}{4}\times 12\times 12} = \frac{1130}{\pi\times 3\times 12} = 10 \text{ MPa}$$

Percentage reduction–

$$\% \text{ reduction area} = \frac{A_i - A_f}{A_i}\times 100$$

$$= \frac{\frac{\pi}{4}d_i^2 - \frac{\pi}{4}d_f^2}{\frac{\pi}{4}d_i^2}$$

$$= \frac{144-16}{144}\times 100 = \frac{128}{144}\times 100 = 88.88 \approx 90\%$$

789. A beam of uniform strength has constant :

(a) Shear force (b) Bending moment
(c) Cross-sectional area (d) Deflection

TRB Polytechnic Lecturer 2017

Ans. (b) : A beam of uniform strength is subjected to constant bending stress.

$$\sigma = \frac{M}{I}\times Y$$

For particular beam I & Y remains same so,

$\sigma = M =$ Constant

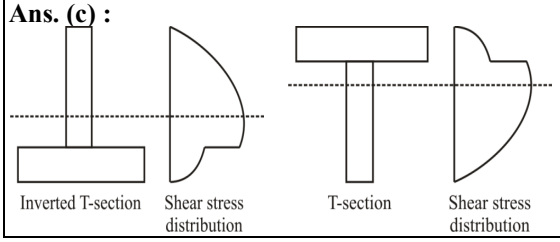
Hence, bending moment also will be constant.

790. An inverted T-section is subjected to a shear force F. The maximum shear stress will occur at:

(a) Top of the section
(b) Junction of web and flange
(c) Neutral axis of the section
(d) Bottom of the section

TRB Polytechnic Lecturer 2017

Ans. (c) :



The maximum shear stress will occur at neutral axis of the section in inverted T-section when subjected to a shear force.

791. A steel wire of 10 mm diameter is bent into a circular shape of 5 m radius. What will be the maximum stress induced in the wire, when E = 200 GPa?

(a) 50 MPa (b) 100 MPa
(c) 150 MPa (d) 200 MPa
(e) 250 MPa

(CGPCS Polytechnic Lecturer 2017)

Ans. (d) : Data given,
$d = 10$ mm
$R = 5$ m $= 5 \times 10^3$ mm
$E = 200$ GPa $= 200 \times 10^3$ N/mm^2
$\sigma = ?$

We know that pure bending equation

$$\frac{M}{I} = \frac{\sigma}{Y} = \frac{E}{R}$$

So $\sigma = \frac{E}{R}\times y_{max.}$ $\quad y_{max.} = \frac{d}{2} = \frac{10}{2} = 5$ mm

$$\sigma = \frac{200\times 10^3}{5\times 10^3}\times 5$$

$\sigma = 200$ N/mm^2

$\boxed{\sigma = 200 \text{ MPa}}$

792. A rectangular beam 100 mm wide is subjected to a maximum shear force of 50 kN. If the maximum shear stress is 3 MPa, the depth of the beam will be _____.

(a) 100 mm (b) 150 mm
(c) 200 mm (d) 250 mm
(e) 275 mm

CGPCS Polytechnic Lecturer 2017

Ans. (d) : We know that

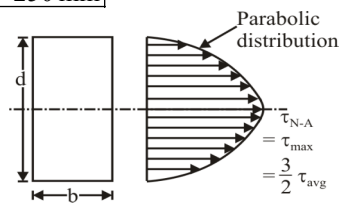
$$\tau_{max.} = \frac{3}{2}\tau_{avg.} \quad \text{[For rectangular beam]}$$

$$\tau_{avg} = \frac{\text{Shear Force}}{\text{Cross-Sectional Area}} = \frac{50\times 10^3}{100\times d}$$

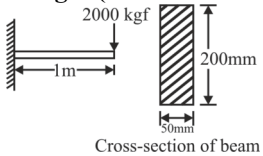
$$3 = \frac{3}{2}\times\frac{50\times 10^3}{100\times d}$$

$$d = \frac{3\times 50\times 10^3}{2\times 3\times 100}$$

$\boxed{d = 250 \text{ mm}}$



793. The maximum shearing stress induced in the beam section at any layer at any position along the beam length (shown in the figure) is equal to



Search on Telegram @apna_pdf

(a) 30 kgf/cm^2 (b) 40 kgf/cm^2
(c) 50 kgf/cm^2 (d) 60 kgf/cm^2

ESE 2017

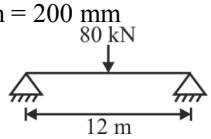
Ans. (a) : For rectangular cross section

$$\tau_{max} = \frac{3}{2}\tau_{avg}$$
$$= \frac{3}{2} \times \frac{2000}{50 \times 200} \text{kgf/mm}^2$$
$$= 30 \text{ kgf/cm}^2$$

794. A beam of rectangular section (12 cm wide × 20 cm deep) is simply supported over a span of 12 m. It is acted upon by a concentrated load of 80kN at the mid span. The maximum bending stress induced is.
(a) 400 MPa (b) 300 MPa
(c) 200 MPa (d) 100 MPa

ESE 2017

Ans. (b) : Given,
b = 12 cm = 120 mm
d = 20 cm = 200 mm



L = 12 m = 12000 mm
W = 80 kN = 80 × 10^3 N

$$M_{max} = \frac{WL}{4} = \frac{80 \times 10^3 \times 12000}{4}$$
$$= 240 \times 10^6 \text{ N–mm}$$
$$I = \frac{bd^3}{12} = \frac{120 \times 200^3}{12}$$
$$= 80 \times 10^6 \text{ mm}^4$$
$$y = \frac{d}{2} = \frac{200}{2} = 100 \text{ mm}$$

$$\text{Maximum bending stress } (\sigma) = \frac{MY}{I}$$
$$= \frac{240 \times 10^6 \times 100}{80 \times 10^6}$$
$$= 300 \text{ MPa}$$

795. In theory of simple bending an assumption is made that plane sections before bending remain plane even after bending. This assumption implies that
(a) Strain is uniform across the section
(b) Stress is uniform across the section
(c) Stress in any layer is proportional to its distance from the neutral axis
(d) Strain in any layer is directly proportional to its distance from the neutral axis

JWM 2017

Ans. (d) : The assumption made in theory of simple bending that plane sections before bending remain plane even after bending means the strain in any layer is directly proportional to its distance from the neutral axis.

796. Section modulus is defined as
(a) Moment of inertia about the neutral axis/square of the distance of neutral axis from farthest point
(b) Moment of inertia about the neutral axis/distance of the most distant point from neutral axis
(c) Bending moment/Moment of inertia
(d) None of the above

ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (b) : Section Modulus—It is defined as the ratio of moment of inertia about the neutral axis to distance of the most distant point from neutral axis.
It is denoted by Z.

$$Z = \frac{I_{N-A}}{y_{max}}$$

797. Weldments in fabricated steel beams are designed for
(a) Bending stress at the flange
(b) Shear stresses in transverse plane
(c) Combination of bending and shear
(d) Bending and tensile stress

TSPSC AEE 2017

Ans. (c) : Weldments in fabricated steel beams are designed for combination of bending and shear for optimum design.

798. A beam with a rectangular section of 120 mm × 60 mm, designed to be placed vertically is placed horizontally by mistake. If the maximum stress is to be limited, the reduction in load carrying capacity would be
(a) 1/4 (b) 1/3
(c) 1/2 (d) 1/6

GPSC EE Pre, 28.01.2017

Ans. (c) : Given, depth (h) = 120 mm
width (b) = 60 mm
According to bending equation

$$\frac{M}{I} = \frac{E}{R} = \frac{\sigma_b}{y_{max}}$$
$$\sigma_b = \frac{M \times y_{max}}{I}$$

$$\text{I}^{st} \text{ case } \sigma_{b_1} = \frac{(M_{max})_1 \times \frac{h}{2}}{\frac{1}{12}bh^3}$$
$$\sigma_{b_1} = \frac{6(M_{max})_1}{bh^2}$$

$$\text{II}^{nd} \text{ case } \sigma_{b_2} = \frac{(M_{max})_2 \times \frac{b}{2}}{\frac{1}{12}hb^3}$$
$$= \frac{6(M_{max})_2}{hb^2}$$

At given- $\sigma_1 = \sigma_2$

$$\Rightarrow \quad \frac{6(M_{max})_1}{bh^2} = \frac{6(M_{max})_2}{b^2h}$$
$$\frac{(M_{max})_1}{(M_{max})_2} = \frac{bh^2}{b^2h}$$

Search on Telegram @apna_pdf

$$\frac{(M_{max})_1}{(M_{max})_2} = \frac{h}{b}$$

$$\frac{(M_{max})_2}{(M_{max})_1} = \frac{h}{b} = \frac{60}{120} = \frac{1}{2}$$

Note- Answer given by commission (a) but actual answer is (c).

799. For high speed engines, a rocker arm of..... should be used.

(a) rectangular section (b) I-section
(c) T-section (d) circular

GPSC EE Pre, 28.01.2017

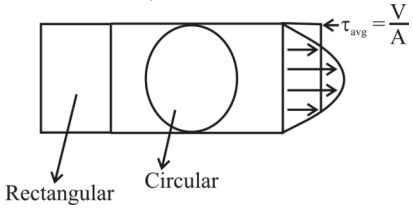
Ans. (b) : A rocker arm is an oscillating lever that conveys radial movement from the cam lobe into linear momentum at the poppet valve to open it. It may be made of cast iron, cast steel as malleable iron. In a order to reduce inertia of the rocker arm I-section is used for the high speed engines and it may be rectangular section for low speed engines.

800. If the average shear stress in a rectangular section beam is 5 N/sq. mm, then maximum shear stress for the circular section of the equal area is

(a) 7.50 N/sq.mm (b) 6.65 N/sq.mm
(c) 10 N/sq.mm (d) 2.50 N/sq.mm

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : For Circular,



For Circular,

$$\tau_{max} = \frac{4}{3} \times \frac{V}{A} = \frac{4}{3} \times \tau_{avg}$$

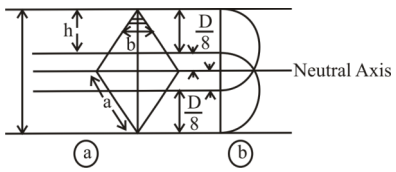
$$\tau_{max} = \frac{4}{3} \times 5 = 6.65 \text{ N/mm}^2$$

801. A horizontal beam of square section is placed with one diagonal (d) placed horizontally. The average shear stress occurs at

(a) d/8 from neutral axis
(b) d/4 from neutral axis
(c) neutral axis
(d) 3d/8 from neutral axis

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) :



$$h = \frac{D}{2} - y \Rightarrow \text{Base} \Rightarrow b = 2\left(\frac{D}{2} - y\right)$$

The Average shear stress occur at $\frac{D}{8}$ from Neutral Axis

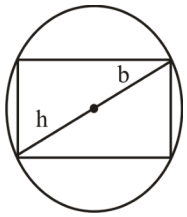
802. A long of wood is of 3 m diameter circular section. Then the width of the stronger rectangular section is bending that can be cut out from this log of wood is

(a) $\sqrt{6}$m (b) $\sqrt{3}$m
(c) $1/\sqrt{3}$m (d) $\sqrt{2}/3$m

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know,
for strongest rectangle

$$b/h = \frac{1}{\sqrt{2}}$$



$$b = \frac{d}{\sqrt{3}} = \frac{3}{\sqrt{3}} = \sqrt{3} \text{ m}$$

803. The bending force required for V-bending. U-bending and Edge-bending will be in the ratio of

(a) 1 : 2 : 0.5 (b) 1 : 1 : 1
(c) 2 : 1 : 0.5 (d) 1 : 2 : 1

UPRVUNL AE 21.08.2016

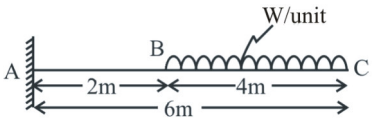
Ans. : (a) The bending force required for V-bending. U-bending and Edge-bending will be in the ratio of 1:2: 0.5

804. A cantilever of length 6 m is carrying a uniformly distributed load of W per unit run for a distance 4m from the free end. The value of maximum bending moment is

(a) 16W (b) 22W
(c) 18.5W (d) 21W

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :

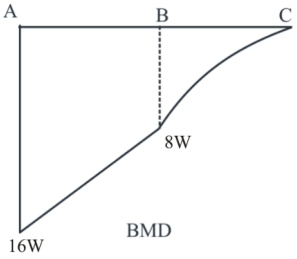


Total load = 4W and act at distance 2 m from free end for bending moment calculation.

$M_C = O$

$M_B = 4W \times 2 = 8\ W$

$M_A = 4W \times 4 = \boxed{16\ W = M_{max}}$



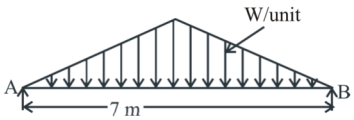
Search on Telegram @apna_pdf

805. A simply supported beam of length 7m is carrying a load whose intensity varies uniformly from zero at each end to W per unit run at the mid span. The value of maximum shear force is

(a) 1.75 W (b) 2.38 W
(c) 2.96 W (d) 3.42 W

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Total load = Area of loading diagram

$$= \frac{1}{2} \times 7 \times W = 3.5W$$

Reactions at A & B will be equal due to symmetry of load, so this total load (3.5 W) is divided equal on both the supported.

$$R_A = R_B = \frac{3.5W}{2} = 1.75W$$

for uniformly varying loading, the maximum shear force (S.F.) will be at supports.

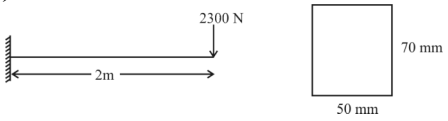
So, $\boxed{\text{Max. S.F.} = 1.75W}$

806. A cantilever of length of 2 m fails, when a load of 2300 N is applied at free end. What is the stress at failure, if the section of cantilever is 50 mm × 70 mm.

(a) 112.65 MPa (b) 121.38 MPa
(c) 132.93 MPa (d) 141.64 MPa

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



From bending equation,

Bending stress at failure = $\sigma_f = \frac{M_{max}}{Z}$

$M_{max} = 2300 \times 2 \times 10^3$

$Z = \frac{bd^2}{6} = \frac{50 \times 70^2}{6}$

$\sigma_f = \frac{2300 \times 2 \times 10^3 \times 6}{50 \times 70^2}$

$= 112.65\,N/mm^2$

$= 112.65$ MPa

807. A beam of symmetrical section is subjected to bending moment which produces a maximum stress of 110 N/mm^2. If the beam is 260 mm deep find radius to which the longitudinal axis of beam will be bent. Take E= 2 × 10^5 MPa

(a) 236.36 m (b) 21.46 m
(c) 192.71 m (d) 28.9 m

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Given,

$\sigma_{max} = 110 N/mm^2$

d = 260 mm

$E = 2 \times 10^5$ MPa

From bending equation

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

$$R = \frac{E.y}{\sigma} = \frac{2 \times 10^5 \times 130}{110} = 236363.63 \text{ mm}$$

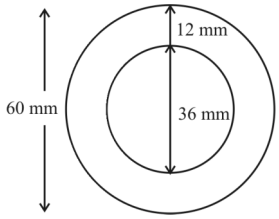
$\boxed{R = 236.36m}$

808. A hollow cast iron pipe is of external diameter 60 mm and 12 mm thick. The section modulus is

(a) 18448.13 mm^3 (b) 17017 mm^3
(c) 19362.24 mm^3 (d) 16496.75 mm^3

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



External dia of pipe (D) = 60 mm

Thickness of pipe (t) = 12 mm

Internal dia. of pipe (d) = D – 2t = 60 – 2 × 12 = 36 mm

Section modulus of hollow circular section,

$$Z = \frac{I}{y}$$

$$I = \frac{\pi}{64}\left(D^4 - d^4\right)$$

$$y = \frac{D}{2}$$

$$z = \frac{\pi}{32D}\left[D^4 - d^4\right]$$

$$Z = \frac{\pi}{32 \times 60}\left[60^4 - 36^4\right] = 18448.13 \text{ mm}^3$$

taking $\pi = 3.14$

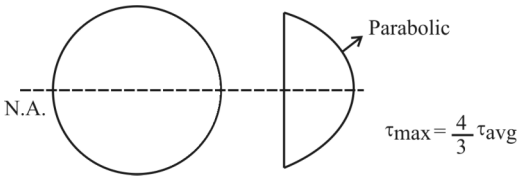
$Z = 18448.13$ mm^3

809. For a solid circular section, the shear stress distribution is according to a

(a) parabolic law (b) constant
(c) cubic law (d) linear law

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Shear stress distribution for solid circular section.



Search on Telegram @apna_pdf

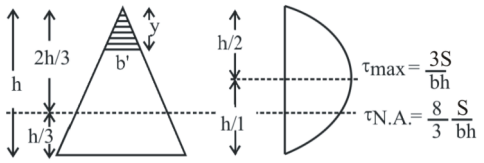
810. A beam is triangular in section and is of base 'b' and height 'h'. If it is placed with its base horizontal, what is maximum shear stress if the shear force is S.

(a) $\frac{8S}{3bh}$ (b) $\frac{3S}{4bh^3}$

(c) $\frac{4S}{5b^2h}$ (d) $\frac{8S}{5bh}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



MOI about N.A. = $I = \frac{bh^3}{36}$

Let the shear stress intensity be at a depth 'y' from the top.

Width of beam at depth 'y' from the top = $b' = \frac{b}{h}y$

$$\tau = \frac{Sa\bar{y}}{Ib} = \frac{S\left(\frac{y}{2}\frac{by}{h}\right)\left(\frac{2}{3}h - \frac{2}{3}y\right)}{\left(\frac{bh^3}{36}\right)\left(\frac{by}{h}\right)}$$

$$\tau = \left(\frac{12S}{bh^3}\right)y(h-y)$$

For τ to be max, $\frac{d\tau}{dy} = \left(\frac{12S}{bh^3}\right)(h-2y) = 0 \quad \therefore y = \frac{h}{2}$

$$\tau_{max} = \left(\frac{12S}{bh^3}\right)\frac{2}{3}h \times \frac{h}{3}$$

$$\boxed{\tau_{max} = \frac{8}{3}\frac{S}{bh}}$$

To find the shear stress at N.A, put $y = \frac{2}{3}h$

$$\tau_{N.A.} = \frac{12S}{bh^3} \times \frac{2}{3}h \times \frac{h}{3}$$

$$\boxed{\tau_{N.A.} = \frac{8S}{3bh}}$$

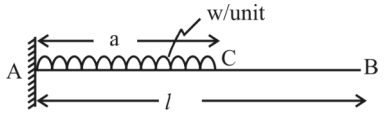
811. A cantilever of length ℓ is carrying a uniformly distributed load of w per unit run of a distance's from fixed end. The slope at the free end is (where EI is the flexural rigidity)

(a) $\frac{wa^3}{6EI}$ (b) $\frac{wa^4}{8EI}$

(c) $\frac{wa^4}{6EI}$ (d) $\frac{wa^3}{8EI}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Slope at C = slope at B

$$\boxed{\theta_C = \theta_B = \frac{wa^3}{6EI}}$$

Deflection at C,

$$y_C = \frac{wa^4}{8EI}$$

Deflection at B,

$$y_B = y_C + (\ell - a)\theta_C$$

$$y_B = \frac{wa^4}{8EI} + \frac{wa^3}{6EI} \times (l - a)$$

812. A hinged support can transmit

(a) two reactive forces

(b) one reactive forces

(c) three reactive forces

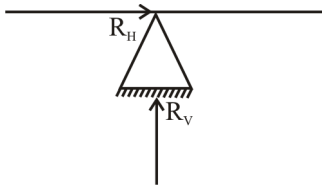
(d) four reactive forces

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : A hinged support can transmit two reactive forces.

A roller support can transmit one reactive force.

A fixed support can transmit three, reactive force.



813. The curvature of a beam at a section is given by

(a) $\frac{M}{EI}$ (b) $\frac{\sigma}{y}$

(c) $\frac{\varepsilon}{y}$ (d) $\frac{MI}{E}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Bending equation

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

$$\frac{1}{R} = \text{curvature} = \frac{M}{EI}$$

814. A rectangular bar of width b and height d is being used as a cantilever. The loading is in a plane parallel to the side b. The section modulus is

(a) $\frac{b^2d}{6}$ (b) $\frac{bd^3}{12}$

(c) $\frac{bd^2}{6}$ (d) $\frac{bd^2}{8}$

APPSC AE Subordinate Service Civil/Mech. 2016
APPSC AEE Screening Test 2016

Search on Telegram @apna_pdf

Ans. (a) : Given,
Width = b
Height = d

$$\text{Section modulus} = \frac{I}{y}$$

$$I = \frac{b^3 d}{12}, \quad y = \frac{b}{2}$$

$$Z = \frac{b^3 d}{12} \times \frac{2}{b}$$

$$Z = \frac{b^2 d}{6}$$

815. Assumption made in the theory of bending is
(a) Radius of curvature is small
(b) Radius of curvature is large
(c) Transverse sections of the beam do not remain plane after bending
(d) Doesn't follow Hooke's law in bending

APPSC AEE Screening Test 2016

Ans. (b) Assumption made in the theory of bending
(i) The materials of the beam is homogeneous and isotropic.
(ii) The value of Young's Modulus of elasticity is same in tension and compression.
(iii) The transverse sections which were plane before bending remain plane after bending also.
(iv) The beam is initially straight and all longitudinal filaments bonds into circular arcs with a common centre of curvature.
(v) The radius of curvature is large compared to the dimensions of the cross-section.
(vi) Each layer of the beam is free to expend or contract, independently of the layer above or below it.

816. A beam strongest in flexural is one which has
(a) maximum bending stress
(b) maximum area of cross section
(c) maximum section modulus
(d) maximum moment of inertia

APPSC AEE MAINS 2016, PAPER-III

Ans. (c) : A beam strongest in flexural is one which has maximum section modulus. Section modulus is also known as strength of beam.

$$Z = \frac{I_{N-A}}{y_{max.}}$$

817. A component has a cross section area of 100 mm^2 and section modulus of 5×10^3 mm^3. It is subjected to an eccentric axial tensile load of 10 kN with an eccentricity of 10 mm. What will be the maximum and minimum stresses developed in the member?
(a) 120 MPa (tensile) and 80 MPa (tensile)
(b) 120 MPa (tensile) and 80 MPa (compressive)
(c) 80 MPa (tensile) and 80 MPa (compressive)
(d) None of these

RPSC AE (GWD) 06.05.2016

Ans. (a) : Given-
$A = 100\ mm^2$
Section modulus $(Z) = 5 \times 10^3\ mm^3$
P = 10 kN
e = 10 mm

$$\sigma_{1,2} = \frac{P}{A} \pm \frac{M}{Z}$$

$$\sigma_{max} = \frac{P}{A} + \frac{M}{Z}$$

$$= \frac{10 \times 10^3}{100} + \frac{10 \times 10 \times 10^3}{5 \times 10^3}$$

= 100 + 20
= 120 MPa (Tensile)

$$\sigma_{min} = \frac{P}{A} - \frac{M}{Z}$$

= 100 – 20
= 80 MPa (Tensile)

818. Bending equation is derived by considering:
(a) Maximum bending moment on the beam
(b) The beam is simply supported
(c) The beam is a cantilever
(d) Constant pure bending moment on the beam

GPSC Asstt. Prof. 28.08.2016

Ans. (d) : Assumptions of Bending Equation–
(1) The beam should be isotropic and homogeneous.
(2) The constant pure bending moment on the beam.
(3) The section remains plane before and after bending.

819. Section modulus of a square section of side 'b' is equal to
(a) $b^3/6$ (b) $b^2/6$
(c) $b/6$ (d) $b^3/3$

TSPSC AEE 2015

Ans : (a) Square section moment of inertia $(I) = \frac{b^4}{12}$
Section modulus = I/y

$$Z_{sq} = \frac{b^4 \times 2}{12 \times b}$$

$$Z_{sq} = \frac{b^3}{6}$$

820. The maximum bending moment of a square beam of section modulus $\frac{200^3}{6}$ mm^3 is 20×10^6 N-mm. The maximum bending stress induced in the beam is
(a) 30 N/mm^2 (b) 7.5 N/mm^2
(c) 45 N/mm^2 (d) 15 N/mm^2

TSPSC AEE 2015

Ans : (d) bending moment $(M) = 20 \times 10^6$ N-mm
section modulus $(Z) = \frac{200^3}{6}\ mm^3$

$$\frac{M}{I} = \frac{\sigma_{max}}{y} = \frac{E}{R} (bending\ equation)$$

Search on Telegram @apna_pdf

$$\frac{M}{\sigma_{max}} = \frac{I}{y}$$

$$\sigma_{max} = \frac{M}{Z}$$

$$\sigma_{max} = \frac{20 \times 10^6}{200^3 / 6}$$

$$\sigma_{max} = 15 N / mm^2$$

821. Area moment of inertia of the cross-section of the beam resist

(a) the applied normal force
(b) both the torque and bending moment
(c) the applied torque
(d) the applied bending moment of the beam

TANGEDCO AE 2015

Ans. (d) : $\frac{M}{I} = \frac{\sigma}{y}$

The beam having cross sectional area and area moment of inertia resist the applied bending moment of the beam.

822. The radius of gyration 'k' of plane figure is determined by the relation

(a) $k = (A/I)^{1/2}$ (b) $k = (I/m)^{1/2}$
(c) $C.k = (m/I)^{1/2}$ (d) $k = (I/A)^{1/2}$

VIZAG MT 2015

Ans. (d) : $I = Ak^2$

$$k = \left(\frac{I}{A}\right)^{1/2}$$

823. The stress distribution in a curved beam, when subjected to pure bending couple is :

(a) linear
(b) non-linear and hyperbolic
(c) non-linear and parabolic
(d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (b) : The stress distribution in a curved beam, when subjected to pure bending couple, is non-linear and hyperbolic.

824. A beam of rectangular cross-section of breadth 10 cm and depth 20 cm is subjected to a bending moment of 20 kNm. Stress developed at a distance of 10 cm from the top face of the beam is :

(a) Zero (b) 10 kPa
(c) 20 kPa (d) 30 kPa

TSGENCO AE 14.11.2015

Ans. (a) : $\frac{\sigma}{y} = \frac{M}{I}$ (Bending equation)

$$\sigma = \left(\frac{M}{I}\right) \cdot y$$

At 10 cm from top face,

$y = 0$

$\sigma = 0$

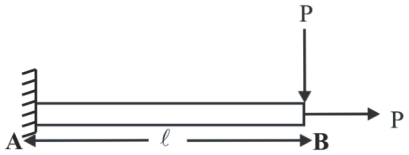
y = measured from neutral axis

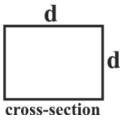
825. Two loads P act at right angles to one another at the free end of a cantilever beam having square cross-section d × d and length *l* on the vertical and horizontal faces. Maximum bending stress in the beam will be equal to-

(a) $6Pl/d^3$ (b) $24Pl/d^3$
(c) $12\ Pl/d^3$ (d) $18Pl/d^3$

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) According to this figure bending stress due to only vertical force not due to horizontal force so



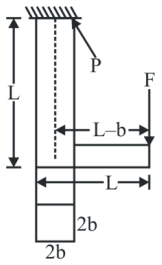


$$\frac{M}{I} = \frac{\sigma}{y_{max}}$$

$$\frac{M}{\left[\frac{d^4}{12}\right]} = \frac{\sigma}{\left[\frac{d}{2}\right]}$$

$$\boxed{\sigma = \frac{6P\ell}{d^3}}$$

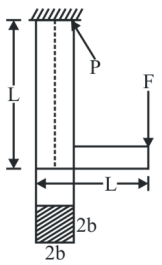
826. For the component loaded with a force F as shown in the figure, the axial stress at the corner point P is



(a) $\frac{F(3L-b)}{4b^3}$ (b) $\frac{F(3L+b)}{4b^3}$
(c) $\frac{F(3L+4b)}{4b^3}$ (d) $\frac{F(3L-2b)}{4b^3}$

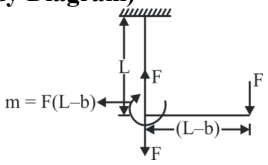
ISRO Scientist/Engineer 11.10.2015, GATE 2008

Ans. (d) :



Search on Telegram @apna_pdf

FBD (Free Body Diagram)–



$\sigma = \sigma_a + \sigma_b$

σ_a = Axial stress

$$\sigma_a = \frac{F}{2b \times 2b}$$

σ_b = (Bending Stress)

$$\sigma_b = \frac{M}{Z} = \frac{F \times (L-b)}{Z}$$

Where $$Z = \frac{I}{Y} = \frac{\frac{1}{12}(2b)(2b)^3}{\left(\frac{2b}{2}\right)}$$

$$Z = \frac{8b^3}{6} = \frac{4}{3}b^3$$

So, $\sigma = \sigma_a + \sigma_b$

$$= \frac{F}{4b^2} + \frac{F(L-b)}{\frac{4}{3}b^3}$$

$$= \frac{F}{4b^2} + \frac{3F(L-b)}{4b^3}$$

$$= \frac{Fb + 3FL - 3Fb}{4b^3} = \frac{3FL - 2Fb}{4b^3}$$

$$= \frac{F(3L-2b)}{4b^3}$$

827. A circular log of timber has diameter D. Find the dimension of the strongest rectangular section which can be cut from it.

(a) $D/\sqrt{3}$ wide and $(\sqrt{2/3})$ D deep

(b) $D^2/\sqrt{3}$ wide and $(\sqrt{2/3})$ D deep

(c) $D/\sqrt{2}$ wide and $(\sqrt{2/3})$ D deep

(d) $D/\sqrt{3}$ wide and $(\sqrt{1/3})$ D deep

(e) $\pi D/\sqrt{3}$ wide and $(\sqrt{2/3})$ D deep

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : For strongest beam

$$\text{width of beam} = \frac{D}{\sqrt{3}}$$

$$\text{depth of beam} = \sqrt{\left(\frac{2}{3}\right)}D$$

828. A rectangular beam 300 mm deep, is simply supported over a span of 4 m. Determine the uniformly load per meter, which the beam can carry, if the bending stress does not exceed 120 N/mm^2. Take moment of inertia of the beam = 8×10^6 mm^4.

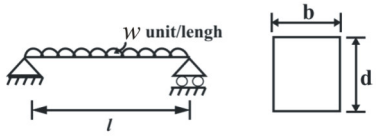
(a) 3.2 N/mm (b) 1.2 N/mm

(c) 4.2 N/mm (d) 4.5 N/mm

(e) 2.2 N/mm

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : Maximum bending stress—Maximum bending stress will occur at mid-span of beam on either top or bottom fiber of beam



$$M_{max} = \frac{wl^2}{8}$$

$$\sigma_{max} = \frac{M_{max}}{I} y$$

$$\sigma_{max} = \frac{wl^2}{8I} \times \frac{d}{2}$$

$$120 = \frac{w \times (4 \times 10^3)^2}{8 \times 8 \times 10^6} \times \left(\frac{300}{2}\right)$$

w = 3.2 N/mm

829. Bending stress in a beam cross section at a distance of 15 cm from neutral axis is 50 MPa. Determine the magnitude of bending of a distance of 10 cm from neutral axis.

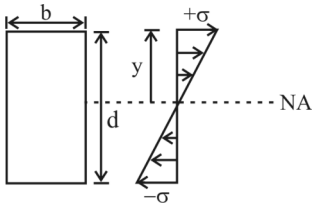
(a) 50 MPa (b) 30.43 MPa

(c) 33.33 MPa (d) 75 MPa

(e) 45.53 MPa

CGPSC AE 26.04.2015 Shift-I

Ans. (c) :



Bending stress $(\sigma) = \frac{M}{I} y$

$\sigma \propto y$

$$\frac{\sigma_2}{\sigma_1} = \frac{y_2}{y_1}$$

$$\frac{\sigma_2}{50} = \frac{10}{15}$$

σ_2 = 33.33 MPa

830. Which of the following statements is correct, in case of a curved beam?

(a) Neutral axis is nearer to centre of curvature compared to centroidal axis.

(b) Neutral axis is farther to centre of curvature compared to centroidal axis.

(c) Neutral axis matches with centroidal axis.

(d) Neutral axis shifts above or below centroidal axis depending on loading conditions.

ISRO Scientist/Engineer 24.05.2014

Ans. (a) : In case of a curved beam neutral axis is nearer to centre of curvature compared to centroidal axis.

Search on Telegram @apna_pdf

831. A flat spiral mode of strip of breadth 5 mm, thickness 1 mm and length 1.5 m has been subjected to a winding couple which induces a maximum stress of 150 N/mm^2. The magnitude of winding couple is nearest to

(a) 20.8 Nmm (b) 41.6 Nmm
(c) 62.5 Nmm (d) 83.3 Nmm

TNPSC AE 2014

Ans. (c) : Data given

b = 5 mm t = 1 mm
L = 1.5 m
$\sigma_b = 150$ N/mm^2
M = ?
We know that

$$\sigma_b = \frac{12M}{bt^2}$$

$$150 = \frac{12 \times M}{5 \times (1)^2}$$

$$\boxed{M = 62.5 \text{ N} - \text{mm}}$$

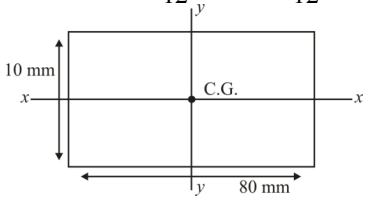
832. Moment of Inertia of the rectangle of base 80 mm and height 10 mm about its centroidal (Ixx) axis

(a) 6666.66 mm^4 = Ixx (b) 5827.21 mm^4 = Ixx
(c) 7777.22 mm^4 = Ixx (d) 6826.11 mm^4 = Ixx

TNPSC AE 2014

Ans. (a) : We know that

$$[I_{x-x}]_{CG} = \frac{80 \times [10]^3}{12} = \frac{80 \times 1000}{12}$$



$$[I_{x-x}]_{CG} = 6666.66 \text{ mm}^4$$

833. In circular plates with edges clamped and with a uniformly distributed load, the maximum radial stress occurs at :

(a) clamp edge (b) the centre
(c) the mean radius (d) none of these

(HPPSC AE 2014)

Ans : (b) In circular plates with edges clamped and with a uniformly distributed load, the maximum radial stress occurs at the centre.

834. Equivalent moment of inertia of the cross-section in terms of timber of a flitched beam made up of steel and timber is ($m = E_s/E_t$) :

(a) $(I_t + m/I_s)$ (b) $(I_t + I_s/m)$
(c) $(I_t + mI_s)$ (d) $(I_t + 2mI_t)$

(HPPSC AE 2014)

Ans : (c) Equivalent moment of inertia of the cross-section in terms of timber of a flitched beam made up-of steel and timber
is $I_t + mI_s$
$m = E_s/E_t$
E_s = Modulus of elasticity of steel.
E_t = Modulus of elasticity of timber.

835. Which one of the following statements is true?

(a) A flexure formula is used for pure bending only
(b) A flexure formula is used for bending with shear only.
(c) A flexure formula is used for bending as well as for bending with shear
(d) None of the above statements are true

HPPSC Asstt. Prof. 2014

Ans. (c) : Flexure formula or bending formula,

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

is used for bending as well as for bending with shear.

836. Which of the following assumptions is not made in curved beam?

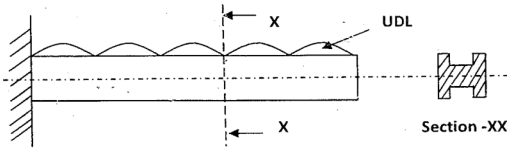
(a) Limit of proportionality is not exceeded
(b) Radial strain is not negligible
(c) Plane to transverse sections remain plane after bending
(d) Material considered isotropic and obeys Hooke's law

HPPSC Asstt. Prof. 2014

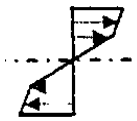
Ans. (b) : Assumptions in curved beam:

(1) Material is homogeneous and isotropic.
(2) Modulus of elasticity in tension and compression are equal.
(3) Plane sections remain plane after bending
(4) Obey Hooke's law ($\sigma_{\alpha\varepsilon}$) means limit of proportionality is not exceeded.
(5) Radial strain is negligible.

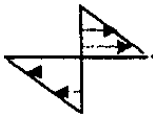
837. A cantilever beam is subjected to a UDL. The cross section of the beam is a H-Section placed as shown in Fig. The bending stress distribution across the cross section will be



(a)

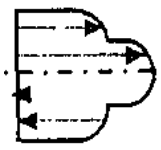


(b)



(c)

(d)



ISRO Scientist/Engineer 12.05.2013

Search on Telegram @apna_pdf

Ans. (c) : We know that bending stress,

$$\sigma_b = \frac{M}{I_{N-A}} \cdot y$$

Where M & I_{N-A} remain constant throughout the beam.

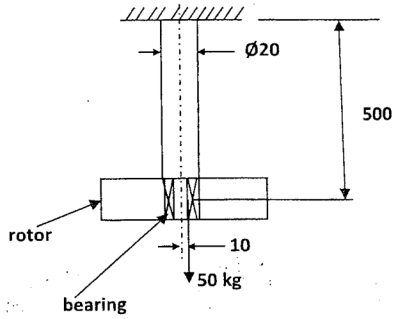
$$\sigma_b \propto y \Rightarrow \sigma_b = c \cdot y \qquad c = \frac{M}{I_{N-A}}$$

At neutral axis y = 0

$$\sigma_b = 0$$

So option (b) and (d) ruled out and varies linearly throughout the section so option (a) also ruled out (because change its shape).

838. A rod of 20 dia is fixed to the ceiling of a roof on one end. A rotor of 50 kg mass is attached to the free end with bearings. The CG of the rotor is 10 mm away from the shaft axis. The rotor is rotating at 600 rpm. The max tensile stress (in N/Sq. mm) in the rod is nearly equal to



(a) $\pi/2$ (b) 200π

(c) 300π (d) 400π

ISRO Scientist/Engineer 12.05.2013

Ans. (d) :

Given d = 20mm, e = 10mm, m = 50 kg

N = 600 rpm

$$\omega = \frac{2\pi N}{60} = \frac{2 \times 3.14 \times 600}{60}$$

$= 20\pi$

$F = m\omega^2 e$

$= 50 \times (20\pi)^2 \times 10 \times 10^{-3}$

$= 200\pi^2$ N

Let Section modulus (Z) $= \frac{\pi d^3}{32}$

$= 250\pi$ mm^3

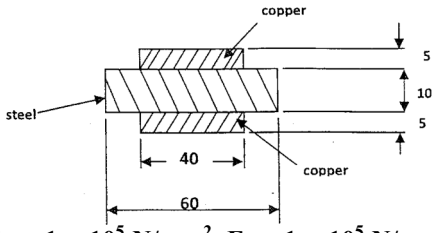
Maximum bending moment in rod = M_{max}.

$= F.L = 200\pi^2 \times 500 = 100000\ \pi^2$ N-mm.

$$\therefore \quad \sigma_{max} = \frac{M_{max}}{Z} = \frac{100000}{250\pi}\pi^2$$

$= 400\ \pi$N/mm^2

839. The cross section of a compound bar 1m long is as shown in figure. If the temperature is raised by 80°C determine the stresses (in N/mm^2) in each metal



$E_{ss} = 1 \times 10^5$ N/mm^2, $E_c = 1 \times 10^5$ N/mm2, A_{ss} = 600 mm^2, A_c = 200 mm^2

(a) $\sigma_c = 20$ (Compressive), $\sigma_{ss} = 30$ (Tensile)

(b) $\sigma_c = 30$ (Compressive), $\sigma_{ss} = 20$ (Tensile)

(c) $\sigma_c = 30$ (Tensile), $\sigma_{ss} = 20$ (Compressive)

(d) $\sigma_c = 30$ (Tensile), $\sigma_{ss} = 20$ (Tensile)

ISRO Scientist/Engineer 12.05.2013

Ans. (b) : 1. Forces on both metals are equal i.e.

$$\sigma_1 A_1 = \sigma_2 A_2$$

2. Final expansion of metal 1 is equal to final expansion of metal 2 i.e.

$$\alpha_2 t\ell_2 - \frac{\sigma_2}{E_2}\ell_2 = \alpha_1 t\ell_1 - \frac{\sigma_1}{E_1}\ell_1$$

We know that,

$\sigma_c \times 2A_c = \sigma_{ss} \times A_{ss}$

$\sigma_c \times 400 = \sigma_{ss} \times 600$

$\sigma_c : \sigma_{ss} = 3 : 2$

or $\sigma_c : \sigma_{ss} = 30 : 20$

In such question there are two equation, and nature of forces on both material will be opposite hence option (d) is ruled out so option (b) is right option.

840. Beams with four unknown reaction is

(a) In-Determinate Beams

(b) Determinate Beams

(c) Propped Beams

(d) In- Propped Beams

TNPSC AE 2013

Ans. (a) : A structure is statically indeterminate when the static equilibrium equation [Force and moment equilibrium equation condition] are insufficient for determining the internal forces and reaction on that structure.

For in-determinate beam No. of equilibrium equation < No. of Reactions.

For determinate beam No. of equilibrium equation = No. of reactions.

841. The section modulus of hollow circular section is

(a) $\frac{\pi}{16D}(D^4 - d^4)$ (b) $\frac{\pi}{32D}(D^4 - d^4)$

(c) $\frac{\pi}{32D}(D^3 - d^3)$ (d) $\frac{\pi}{16D}(D^3 - d^3)$

TNPSC AE 2013

Ans. (b) : $Z = \frac{I}{Y_{max}} = \frac{\pi}{64}\frac{\left[D^4 - d^4\right]}{\left[\frac{D}{2}\right]}$

$$Z = \frac{\pi\left(D^4 - d^4\right)}{32D}$$

Search on Telegram @apna_pdf

842. A 50 mm diameter shaft is made from carbon steel having ultimate tensile strength of 630 MPa. It is subjected to a torque which fluctuates between 2000 N- m to –800 N-m. The mean shear stress will be

(a) 24.4 N/mm^2 (b) 48.8 N/mm^2
(c) 12.2 N/mm^2 (d) 6.1 N/mm^2

APPSC Poly. Lect. 2013

Ans. (a) : d = 50mm, τ_u = 630 MPa, T_{max} = 2000 N-m, T_{min} = –800 N-m

The mean or average Torque

$$T_m = (T_{max} + T_{min})/2$$

$$= \frac{2000 + (-800)}{2}$$

$$= \frac{(2000 - 800)}{2}$$

$$= 600 \text{ N-m} = 600 \times 10^3 \text{ N-mm}$$

→ Mean or average shear stress

$$\tau_m = \frac{16.T_m}{\pi d^3}$$

$$\tau_m = \frac{\left(16 \times 600 \times 10^3\right)}{\pi \times (50)^3} = 24.4 \text{ N/mm}^2$$

843. The bending moment at a section tends to bend or deflect the beam and the internal stresses resist bending. The resistance offered by the internal stresses to the bending is called

(a) compressive stress (b) shear stress
(c) bending stress (d) elastic stress

JPSC AE 2013, Paper-V

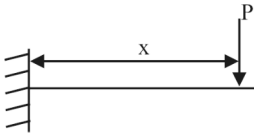
Ans : (c) : The bending moment at a section tends to bend or deflect the beam and the internal stresses resist bending. The resistance offered by the internal stresses to the bending is called bending stress.

844. For a beam of uniform strength having constant width, the depth of the beam at a distance of x from the support varies with

(a) $\sqrt{x}$ (b) x
(c) $x^{1/4}$ (d) $x^{3/4}$

APPSC Poly. Lect. 2013

Ans. (a) : Assume the beam as cantilever beam



Point load is acting at a distance x

Bending moment(BM)= Px

$$\sigma_b = \frac{My}{I}$$

$$\sigma_b = \frac{P.x.\left(\frac{d}{2}\right)}{\frac{b \times d^3}{12}}$$

$$\sigma_b = \frac{6Px}{bd^2}$$

$$d^2 \propto x$$

$$\boxed{d \propto \sqrt{x}}$$

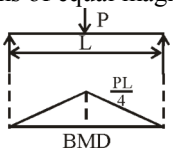
As all other things remain constant, depth of the beam varies as square root of distance x.

845. Two simply supported beams of equal lengths, cross sectional areas, and section moduli, are subjected to the same concentrated load at its mid-length. One beam is made of steel and other is made of Aluminium. The maximum bending stress induced will be in

(a) Steel beam
(b) Aluminium beam
(c) Both beams of equal magnitude
(d) The beams according to their Elastic Moduli magnitude.

UKPSC AE 2012 Paper-I

Ans. (c) : Both beams of equal magnitude



$$M_{max} = \frac{PL}{4}$$

$$\sigma_b = \frac{MY}{I}$$

• Since σ_b is depend only on geometrical shape of the beam so both beam has equal magnitude.

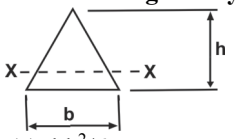
846. The flexural rigidity is the product of

(a) modulus of elasticity and mass moment of inertia
(b) modulus of rigidity and area moment of inertial
(c) modulus of rigidity and mass moment of inertia
(d) modulus of elasticity and area moment of inertia

BPSC AE 2012 Paper - VI

Ans : (d) : The flexural rigidity is the product of modulus of elasticity and area moment of inertia.

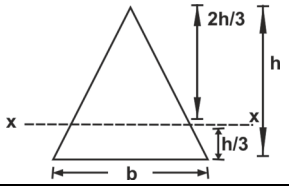
847. A beam is having a triangular cross section with its neutral axis XX. The section modulus about XX is given by



(a) $bh^2/6$ (b) $bh^2/36$
(c) $bh^2/24$ (d) $hb^2/36$

ISRO Scientist/Engineer 2012

Ans. (c) :



Search on Telegram @apna_pdf

$$I_{xx} = \frac{bh^3}{36}$$

$$Z_{xx} = \frac{I_{xx}}{y_{max}} = \frac{I_{xx}}{\frac{2h}{3}}$$

$$Z_{xx} = \frac{\frac{bh^3}{36}}{\frac{2h}{3}}$$

$$= \frac{bh^3}{36} \times \frac{3}{2h} = \frac{bh^2}{24}$$

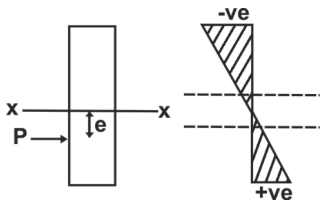
848. A rectangular column is subjected to an eccentric load P at distance 'e' from centroidal Axis. The stress diagram at cross-section will be

(a) 
(b)

(c) 
(d)

ISRO Scientist/Engineer 2012

Ans. (d) :



From the figure stress at any section will be

$$= \frac{-P}{A} \pm \frac{Pe}{I} \cdot y$$

Hence compressive load is taken as negative

849. Shear stress distribution for a rectangular beam subjected to transverse loading is

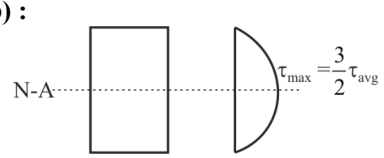
(a)

(b) 
(c)

(d)

ISRO Scientist/Engineer 2012

Ans. (b) :



Shear stress is acting in the parallel to the plane and Parabolically varies

At Neutral Axis, y = 0

$$\tau_{max} = \frac{3}{2}\tau_{avg} \qquad \left[\because \tau_{avg} = \frac{P}{A}\right]$$

850. A steel plate 50mm wide and 100mm thick is to be bent into a circular arc of radius 10m. If $E = 2 \times 10^5 N/mm^2$, then the maximum bending stress induced will be

(a) 200 N/mm^2 (b) 100 N/mm^2

(c) 10,000 N/mm^2 (d) 1000 N/mm^2

APPSC AEE 2012

Ans : (d) Given, b=50mm, d= 100mm, R = 10m

E= 2×10^5 N/mm^2

Bending equation :-

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

y = 50mm

$$\frac{\sigma}{y} = \frac{E}{R}$$

$$\sigma = \frac{E}{R} \times y$$

$$\sigma = \frac{2\times10^5}{10\times10^3} \times 50$$

$$\boxed{\sigma = 1000 N/mm^2}$$

851. Radius of curvature of the beam is equal to

(a) $\frac{ME}{I}$ (b) $\frac{M}{EI}$

(c) $\frac{EI}{M}$ (d) $\frac{MI}{E}$

APPSC AEE 2012

Ans : (c) Bending equation

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R.}$$

$$\frac{M}{I} = \frac{E}{R.}$$

Radius of curvature of the $(R) = \frac{EI}{M}$

852. A beam of Z-section is called a

(a) doubly symmetric section beam

(b) singly symmetric section beam

(c) a-symmetric section beam

(d) none of the above

UKPSC AE 2012 Paper-I

Ans. (c) : a-symmetric section beam

853. A uniform metal bar of weight 'W', length '*l*', cross-sectional area 'A' is hung vertically with its top end rigidly fixed. Which section of the bar will experience maximum shear stress ?

Search on Telegram @apna_pdf

(a) Top-section (b) Mid-section
(c) Bottom-section (d) $l/3$ from top

UKPSC AE 2012 Paper-I

Ans. (a) : Top-section

854. In theory of simple bending of beams, which one of the following assumptions is incorrect ?
(a) Elastic modulus in tension and compression are same for the beam materials.
(b) Plane sections remain plane before and after bending.
(c) Beam is initially straight.
(d) Beam material should not be brittle.

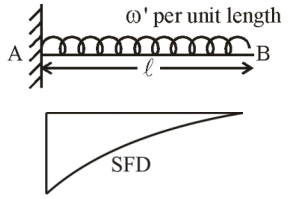
UKPSC AE 2012 Paper-I

Ans. (d) : Beam material should not be brittle.

855. The shear force of a cantilever beam of length 'ℓ' carrying a uniformly distributed load of 'ω' per unit length is …… at the free end
(a) zero (b) $\omega\ell/3$
(c) $\omega\ell/2$ (d) $\omega\ell$

TNPSC ACF 2012

Ans. (a) :



At end B the shear force is zero
$R_A = \omega\ell\, R_B = 0$

856. The strength of the beam mainly depends on
(a) bending moment (b) C.G. of the section
(c) Section modulus (d) its weight

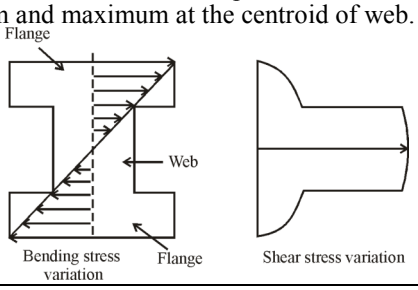
APPSC AEE 2012

Ans. (c) : Strength of the beam mainly depends upon section modulus.
$\Rightarrow$ Strength $\propto$ Z
Section modulus Z = I/y Where Z = Section modulus
I = Area M.O.I.
y = beam width

857. In a beam of I section, the maximum shear force is carried by
(a) the upper flange (b) the web
(c) the lower flange (d) Any of these

APPSC AEE 2012

Ans. (b) : Shear force at top and bottom surface is minimum and maximum at the centroid of web.



858. The maximum shear stress induced in a shaft subjected to a shear S_a and bending stress S_b will be:
(a) $\sqrt{S_a^2 + S_b^2}$ (b) $S_a + \frac{1}{2}\sqrt{S_a^2 + S_b^2}$
(c) $\sqrt{4S_a^2 + S_b^2}$ (d) None of these

RPSC AE GWD, 2011

Ans. (d) : Maximum shear stress $\tau = \sqrt{\left(\frac{\sigma_1 - \sigma_2}{2}\right)^2 + \tau_s^2}$

$= \sqrt{\left(\frac{s_b - 0}{2}\right)^2 + s_a^2} = \sqrt{\left(\frac{s_b}{2}\right)^2 + s_a^2}$

$\boxed{\tau = \frac{1}{2}\sqrt{s_b^2 + 4s_a^2}}$

859. Which one of the following assumptions is *not* valid for the derivation of flexure formula?

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

(a) The beam material is linearly elastic
(b) Sections which are plane before bending remain plane after the bending
(c) The beam has large initial curvature
(d) Elastic modulus of the beam material are same in tension and compression.

UPSC JWM Advt. No.-52/2010

Ans. (c) : Explanation : The beam has large initial curvature is not a valid assumption for the derivation of flexure formula.

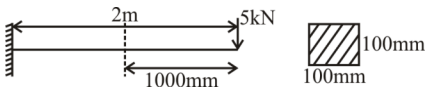
$$\boxed{\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}}$$

Assumptions made in the theory of pure Bending-
(1) The material of the beam is homogenous and isotropic.
(2) The value of Young's modulus of elasticity is same in tension and compression.
(3) The Transverse sections which were plane before bending, remain plane after bending also.
(4) The beam is initially straight and all longitudinal filaments bend into circular arcs with a common centre of curvature.
(5) The radius of curvature is large as compared to the dimensions of the cross-section.
(6) Each layer of the beam is free to expand or contract independently of the layer, above or below it.

860. A cantilever beam of square cross-section (100mm × 100mm) and length 2 m carries a concentrated load of 5 kN at its free end. What is the maximum normal bending stress at its mid-length cross-section ?
(a) 10 N/mm^2 (b) 20 N/mm^2
(c) 30 N/mm^2 (d) 40 N/mm^2

UPSC JWM Advt. No.-50/2010

Ans. (c)



$$\frac{M}{I} = \frac{\sigma_b}{y}$$

Search on Telegram @apna_pdf

$$\frac{5\times10^3\times1000\times12\times50}{100\times100^3}=\sigma_b$$

$\sigma_b = 30\ N/mm^2$

861. A horizontal beam with square cross-section is simply supported with sides of the square horizontal and vertical and carries a distributed loading that produces maximum bending stress σ in the beam. When the beam is placed with one of the diagonals horizontal the maximum bending stress will be :

(a) $(1/\sqrt{2})\sigma$ (b) σ

(c) $\sqrt{2}\sigma$ (d) 2σ

APPSC IOF, 2009

Ans. (c) : $\frac{M}{Z}$ = Bending stress

For rectangular beam with sides horizontal & vertical,

$$Z_1=\frac{a^3}{6}$$

For same section with diagonal, $Z_2=\frac{a^3}{6\sqrt{2}}$

Ratio of stresses $=\sqrt{2}$

862. Which one of the following conditions will cause bending of the beam without being twisted?

(a) The applied load is vertical

(b) The beam cross-section is doubly symmetric

(c) The plane of applied load contains the axis of symmetry of the beam section

(d) The beam cross-section is singly symmetric

UPSC JWM Adv. No-16/2009

Ans. (a) : The conditions which causes bending of the beams without being twisted when the applied load is vertical.

863. Match List-I with List-II and select the correct answer using the code given below the lists :

	List-I (Stress Induced)	**List-II (Component)**
(A)	Membrane stress	1. Neutral axis of beam
(B)	Torsional and direct	2. Close coiled helical shear stress spring under axial load
(C)	Double shear stress	3. Thin cylindrical shell subjected to internal fluid pressure
(D)	Maximum shear	4. Rivets in butt joint stress having two cover plates

Code :

	A	**B**	**C**	**D**
(a)	3	4	2	1
(b)	1	2	4	3
(c)	3	2	4	1
(d)	1	4	2	3

UPSC JWM Adv. No-16/2009

Ans. (c)

(A) Membrane Stress → Thin cylindrical shell subjected to internal fluid pressure.

(B) Torsional and direct shear stress → Closed coiled helical spring under axial load.

(C) Double shear stress → Rivets in butt joining having two cover plates.

(D) Maximum shear stress → Neutral axis of beam.

864. At a particular cross-section of a straight bar of rectangular cross-section, the bending moment is 10000 N-mm and the axial force acting through the centroid of the cross-section is 1000 N. If the area of cross-section is 100 mm^2 and the area moment of inertia about the centroidal axis is 1000 mm^4, the distance between the centroidal axis and the neutral axis is

(a) 0.1 mm (b) 1 mm

(c) 2 mm (d) 4 mm

DRDO Scientists 2009

Ans. (b) : $\sigma=\frac{P}{A}\pm\frac{My}{I}$

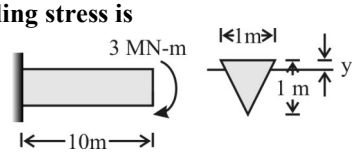
At the neutral axis, $\sigma = 0$,

$$\frac{My}{I}=\frac{P}{A}$$

or $$y=\frac{PI}{MA}=\frac{1000\times1000}{10000\times100}$$

$= 1$ mm

865. A cantilever beam has the cross-section of an isosceles triangle and is loaded as shown in figure. If the moment of inertia of the cross-section $I_{zz}=\frac{1}{36}m^4$, then the maximum tensile bending stress is

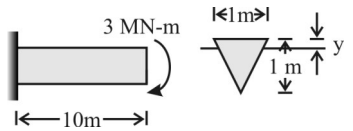


(a) 1/16 MPa (b) 72 MPa

(c) 36 MPa (d) 1/36 MPa

DRDO Scientists 2008

Ans. (c) :



$$\sigma_b=\frac{My}{I}$$

$$y=\frac{1}{3}m$$

$$I=\frac{bd^3}{36}=\frac{1\times1^3}{36}=\frac{1}{36}m^4$$

$M = 3 \times 10^6$ Nm

$$\sigma_b=\frac{3\times10^6\times1}{3\times\frac{1}{36}}=36MPa$$

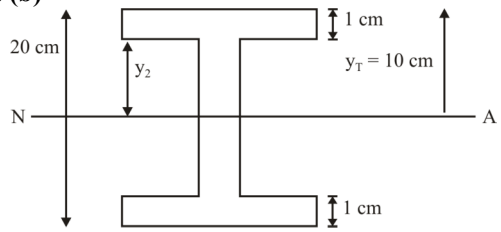
Search on Telegram @apna_pdf

866. A beam of I section of depth 20 cm is subjected to a bending moment M. The flange thickness is 1 cm. If the minimum stress developed in the 1 section be 100 N/mm^2, the stress developed at the inner edge of the flange is

(a) 95 N/mm^2 (b) 90 N/mm^2
(c) 47.5 N/mm^2 (d) 60 N/mm^2

WBPSC AE, 2007

Ans. (b)



We know that under sagging top fibre is in compression and bottom fibre is in tension

Hence

$(\sigma_b)_{min} = -100$ N/mm^2 at top fibre

$(\sigma_b)_{max} = +100$ N/mm^2 at bottom fibre

Bending stress is given by

$$\sigma_b = \frac{m \times y}{I}$$

where y = distance from neutral axis

$\Rightarrow \sigma_b \alpha y$

Let $(\sigma_1)_2$ = Bending stress of inner fibre of top flange.

$$\Rightarrow \frac{(\sigma_b)_{Top}}{(\sigma_b)_2} = \frac{Y_T}{y_2}$$

$$\frac{100}{(\sigma_b)_2} = \frac{10 \times 10}{9 \times 10}$$

$$(\sigma_b)_2 = \frac{900}{10} = 90$$

$$\boxed{(\sigma_b)_2 = 90\,N/mm^2}$$

867. A beam of rectangular section of breadth b and depth d is tested under bending and M_{ult} is the ultimate bending moment recorded. The modulus of rupture is given by

(a) $\frac{6M_{ult}}{bd^3}$ (b) $\frac{6M_{ult}}{bd^2}$
(c) $\frac{12M_{ult}}{bd^2}$ (d) $\frac{12M_{ult}}{bd^3}$

WBPSC AE, 2007

Ans. (b) : Modulus of Rupture is given by

$$M_R = \sigma_{per} \times z$$

$$M_{ult} = \sigma_{per} \times \frac{bd^2}{6}$$

$$\boxed{\sigma_{per} = \frac{6 \times M_{ult}}{bd^2}}$$

868. Flexural rigidity (EI) is expressed in units of

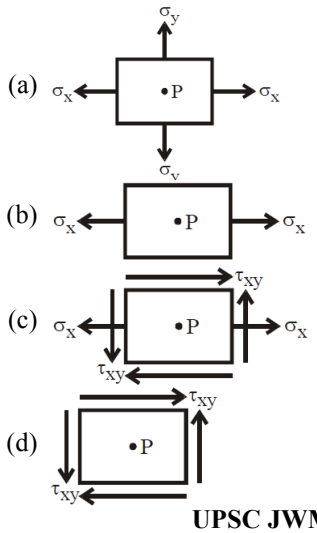
(a) kNm^2 (b) MNm
(c) kNm^{-2} (d) MNm^4

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Flexural rigidity = EI

Unit of flexural rigidity = $\frac{kN}{m^2} \times m^4 = kNm^2$

869. A cantilever beam of rectangular cross-section is subjected to a concentrated load at its free end. The state of stress at a point P on the centroidal longitudinal axis of beam is given by



UPSC JWM Advt. No.-50/2010

Ans. (d) : From question the longitudinal axis is where,

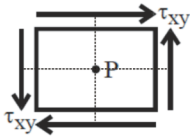
$y = 0$

So, $\frac{M}{I} = \frac{\sigma_b}{y}$

For $y = 0$

$\sigma_b = 0$

So only shear stresses are there



5. Torsion of Shafts

870. Compare the strength of solid and hollow shafts both having outside diameter D and hollow shaft having inside diameter of D/2 in torsion. The ratio of strength of solid to hollow shafts in torsion will be

(a) 0.5 (b) 0.75
(c) 15/16 (d) 1/16

Ans. (c) : For solid shaft polar moment of inertia

$$J = \frac{\pi D^4}{32}$$

$$T_s = \tau \frac{\pi D^4}{32} \times \frac{2}{D} = \frac{\pi}{16} \times \tau D^3$$

For hollow shaft

$$J = \frac{\pi}{32}\left(D^4 - d^4\right) \quad \therefore\ d = \frac{D}{2}$$

$$T_H = \frac{\pi}{16}.\tau\left(\frac{D^4 - d^4}{D}\right)$$

According to question d = D/2

$$T_H = \frac{\pi}{16} \cdot \tau\left[\frac{D^4 - \frac{D^4}{16}}{D}\right]$$

$$T_H = \frac{\pi}{16} \cdot \tau\left[\frac{15}{16} D^3\right]$$

$$\frac{T_S}{T_H} = \frac{\frac{\pi}{16}\tau D^3}{\frac{\pi}{16} \cdot \tau \cdot \frac{15}{16} D^3}$$

$$\frac{T_S}{T_H} = \frac{16}{15}$$

$$\frac{T_H}{T_S} = \frac{15}{16}$$

871. Two shafts A and B are made of the same material. The diameter of shaft B is twice that of shaft A. The ratio of power which can be transmitted by shaft A to that of shaft B is

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$

(c) $\frac{1}{8}$ (d) $\frac{1}{16}$

$$\text{Equivalent torque} = \sqrt{M^2+T^2} = \sqrt{(3)^2+(4)^2}$$

$$T_e=\sqrt{25}=5\,\text{kNm}$$

877. A shaft can safely transmit 90 kW while rotating at a given speed. If the diameter of the shaft is doubled and speed is halved the previous shaft, the power that can be transmitted by new shaft is

(a) 360 kW (b) 90 kW
(c) 720 kW (d) 180 kW

Karnataka PSC AE (WRD) 31.07.2021
BPSC Poly. Lect. 2016
CGPSC Poly. Lect. 22.05.2016
VIZAG MT 2015
TRB Asstt. Prof., 2012, ESE 2002

Ans : (a) We know that

$$P=\frac{2\pi NT}{60}=\frac{2\pi N}{60}\times\frac{\pi d^3\tau}{16}$$

$P \propto N, d^3$

$P = kNd^3$

If diameter of the shaft is double and halved the speed.

$d_2 = 2d_1$, $N_2 = \frac{N_1}{2}$

$$\therefore \frac{P_1}{P_2}=\left(\frac{N_1}{N_2}\right)\left(\frac{d_1}{d_2}\right)^3=2\left(\frac{1}{2}\right)^3=\frac{1}{4}$$

$P_2 = 4P_1 = 4 \times 90 = 360$ kW

878. When a circular shaft is subject to torque only, the torsional shear stress is :

(a) Maximum at the axis of rotation and zero at outer surface.

(b) Maximum at outer surface and zero at axis of rotation.

(c) Uniform from axis of rotation to outer surface

(d) None of the above

JPSC AE 10.04.2021, Paper-II
OPSC AEE 2019 Paper-I
RPSC Vice Principal ITI 2018, ESE 2012

Search on Telegram @apna_pdf

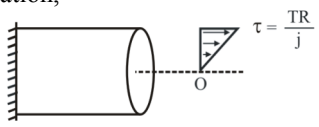
Ans. (b) : According to torsion equation,

$$\frac{T}{J}=\frac{G\theta}{\ell}=\frac{\tau}{R}$$

$$\tau=\frac{TR}{J}$$

$$\tau=\frac{Tr}{J}$$

At axis of rotation,



$r = 0$

$\boxed{\tau = 0}$

At outer surface

$r = R$

$$\boxed{\tau=\frac{TR}{J}}$$

879. The diameter of shaft is increased from 50 mm to 100 mm all other conditions remaining unchanged. How many times the torque carrying capacity increases?

(a) 2 times (b) 4 times

(c) 8 times (d) 16 times

GPSC ARTO 01.05.2016, ESE 2016
KPSC AE. 2015
Kerala PSC AE 06.08.2015
TANGEDCO AE 2015

Ans. (c) : Given, $d_1 = 50\text{ mm} = \frac{1}{20}\text{mm}$

$$d_2 = 100\text{ mm} = \frac{1}{10}\text{mm}$$

$\because$ equation for the shaft

$$\frac{T}{J}=\frac{\tau}{R}=\frac{G\theta}{l} \quad ...(i)$$

moment of inertia $I=\frac{\pi}{64}d^4$

$\Rightarrow$ Polar moment of inertia $[J = I_1 + I_2]$

$$J=\frac{\pi}{32}d^4$$

Now from $\frac{T}{J}=\frac{\tau}{R}$

$$T=\frac{\tau\times 2\times\pi d^4}{d\times 32}=\frac{\tau\times\pi d^3}{16}$$

$$\boxed{T\propto d^3}$$

$$T_1=\left(\frac{1}{20}\right)^3$$

$$T_2=\left(\frac{1}{10}\right)^3$$

$$\frac{T_1}{T_2}=\frac{1}{8}$$

$$\boxed{T_2 = 8T_1}$$

Thus after increasing the diameter of shaft and all other parameter remains unchanged, the torque will be 8 times of previous torque.

880. Bending moment 'M' and torque 'T' is applied on a solid circular shaft. If maximum bending stress equals to maximum shear stress developed, then M is equal to

(a) T (b) T/2

(c) 2T (d) 4T

UKPSC AE-2013, Paper-I

Ans : (c) :

$$\frac{T}{J} = \frac{\tau}{R} = \frac{G\theta}{\ell}$$

$$\tau = \frac{T \times R}{J}$$

$$\tau_0 = \frac{T \times 0}{J} = 0$$

Hence, shear stress at centre will be zero for round shaft subjected to pure torsion.

884. The value of J in equation $T/J = \tau/r = G.\theta/L$ for a circular shaft of diameter D will be

(a) $\pi D^4/32$ (b) $\pi D^4/64$

(c) $\pi D^3/32$ (d) $\pi D^3/16$

NSPSC AE 2018, RPSC AE 2018
Punjab PSC SDE 12.02.2017
WBPSC AE, 2017

Ans. (a) : General torsion equation,

$$\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{L}$$

T = Torque or twisting moment
J = Polar moment of inertia
τ = Shear stress at outer fibre
r = Radius of shaft
G = Modulus of rigidity
θ = Angle of twist
L = Length of shaft
D = Diameter of shaft
For solid shaft,

$$J = \frac{\pi D^4}{32}$$

885. Two shafts of same length & materials are joined in series. If the ratio of their diameter is 2, then the ratio of their angle of twist will be :

(a) 2 (b) 4

(c) 8 (d) 16

ISRO Scientist/Engg. 22.04.2018
J&K PSC Civil Services Pre, 2010
WBPSC AE 2003, CSE Pre-2003, 1995

Ans. (d) : Ratio of diameter $= \frac{d_1}{d_2} = 2$

Angle of twist $\theta = \frac{TL}{GJ}$

Let two shaft have diameter d_1 and d_2, its length L_1 and L_2.

Given, $L_1 = L_2$, $\frac{d_1}{d_2} = 2$

$$\frac{\theta_1}{\theta_2} = \frac{\frac{T_1L_1}{G_1J_1}}{\frac{T_2L_2}{G_2J_2}}$$

For same material,
$G_1 = G_2$
And for series joined shaft if torque applied $T_1 = T_2$ for both in shaft

So, $\frac{\theta_1}{\theta_2} = \frac{J_2}{J_1}$

$$\frac{\theta_1}{\theta_2} = \frac{\frac{\pi}{32}d_2^4}{\frac{\pi}{32}d_1^4} = \left(\frac{d_2}{d_1}\right)^4 = \left(\frac{1}{2}\right)^4$$

$$\frac{\theta_1}{\theta_2} = \frac{1}{16}$$

$$\frac{\theta_2}{\theta_1} = 16$$

886. If the diameter of the shaft is increased two times, the torque transmitted will be

(a) Two times (b) Four times

(c) Eight times (d) Sixteen times

APGCL AM, 2021, JPSC AE Paper-II 10.04.2021
RPSC IOF, 2020

Search on Telegram @apna_pdf

Ans. (c)

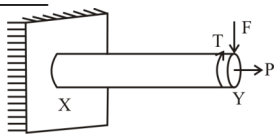
$$\frac{T}{J}=\frac{\tau}{R}$$

$$T \propto Z_p$$

$$\frac{T_1}{T_2}=\frac{\frac{\pi d_1}{16}}{\frac{\pi d_2}{16}}=\left(\frac{d_1}{d_2}\right)^3=\left(\frac{d_1}{2d_1}\right)^3=\frac{1}{8}$$

$$\boxed{T_2=8T_1}$$

887. A machine element XY, fixed at end X, is subjected to an axial load P, transverse load F, and a twisting moment T at its free end Y. The most critical point from the strength point of view is_____



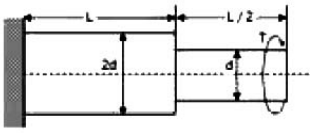
(a) a point on the circumference at location X
(b) a point at the center at location Y
(c) a point on the circumference at location Y
(d) a point at the center at location X

Assam Engg. College AP/Lect. 18.01.2021
PPSC Asstt. Municipal Engineer 15.06.2021
GATE 2016

Ans. (a) : Most critical loading point will be a point on circumference at location X

Torque (τ) and axial load (P) will be same for element XY but vertical force (F) will produce maximum stress at a point on circumference at X.

888. A torque T is applied at the free end of a stepped rod of circular cross-sections as shown in the figure. The shear modulus of the material of the rod is G. The expression for d to produce an angular twist θ at the free end is

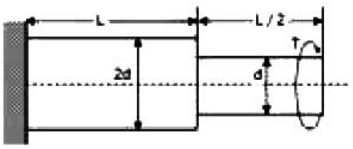


(a) $\sqrt[1/4]{\frac{32TL}{\pi\theta G}}$ (b) $\sqrt[1/4]{\frac{18TL}{\pi\theta G}}$

(c) $\sqrt[1/4]{\frac{16TL}{\pi\theta G}}$ (d) $\sqrt[1/4]{\frac{2TL}{\pi\theta G}}$

Vadodara Muncipal Corp. DEE, 2018
NPCIL ET, 2015, GATE 2011

Ans. (b) :



Given- $T_1 = T_2 = T$

$\theta = \theta_1 + \theta_2$

$$\theta=\frac{T_1L_1}{GJ_1}+\frac{T_2L_2}{GJ_2}$$

$$=\frac{T}{G}\left[\frac{L_1}{J_1}+\frac{L_2}{J_2}\right]$$

$$\theta=\frac{T}{G}\left[\frac{L_1}{\frac{\pi d_1^4}{32}}+\frac{L_2}{\frac{\pi d_2^4}{32}}\right]$$

$$\theta=\left[\frac{L}{\frac{\pi(2d)^4}{32}}+\frac{L/2}{\frac{\pi(d)^4}{32}}\right]\frac{T}{G}$$

$$=\frac{T}{G}\left[\frac{32L}{\pi\times 16d^4}+\frac{32L/2}{\pi\times d^4}\right]$$

$$=\frac{T}{G}\left[\frac{2L}{\pi d^4}+\frac{16L}{\pi d^4}\right]$$

$$\theta=\frac{T}{G}\left[\frac{18L}{\pi d^4}\right]$$

$$\theta=\frac{18TL}{G\pi d^4}\Rightarrow d^4=\frac{18TL}{\pi G\theta}$$

$$d=\sqrt[1/4]{\frac{18TL}{\pi G\theta}}$$

889. A solid circular shaft needs to be designed to transmit a torque of 50 Nm. If the allowable shear stress of the material is 140 MPa, assuming a factor of safety 2, the minimum allowable design diameter in mm is:

(a) 8 (b) 16
(c) 24 (d) 32

Assam Engg. College AP/Lect. 18.01.2021
NPCIL ET, 2015, GATE 2012

Ans. (b) : Given,

T = 50 N-m

$\tau_{allowable}$ = 140 MPa

Factor of safety (FOS) = 2

$$\tau_{safe}=\frac{\tau_{allowable}}{FOS}=\frac{140}{2}=70\,MPa$$

We know that,

$$\tau_{safe}=\frac{T}{z_p}\qquad (z_p = \text{Polar section modulus})$$

$$z_p=\frac{\pi d^3}{16}$$

$$\tau_{safe}=\frac{16T}{\pi d^3}$$

$$d^3=\frac{16T}{\pi\times\tau_{safe}}$$

$$d=\sqrt[3]{\frac{16\times 50\times 10^3}{\pi\times 70}}$$

= 15.8 mm

$d \approx 16$ mm

Search on Telegram @apna_pdf

890. A twisting moment 'T' and Bending moment 'M' are acting on a circular shaft. What is the ratio of maximum shear stress to maximum bending stress?

(a) 2 M/T (b) 2T/M
(c) T/M (d) T/2M

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
Gujarat PSC AE 2019
UPPSC AE 12.04.2016 Paper-I

Ans. (d) : As we know, $\frac{\sigma_b}{y} = \frac{M}{I}$

$$\sigma_b = \frac{M}{I} \times y$$

$$= \frac{M}{\frac{\pi d^4}{64}} \times \frac{d}{2} = \frac{32M}{\pi d^3}$$

$$\tau_{max} = \frac{16T}{\pi d^3},$$

$$\text{So } \frac{\tau_{max}}{\sigma_b} = \frac{T}{2M}$$

891. A circular shaft subjected to torsion undergoes a twist of 1° in a length of 120 cm. If the maximum shear stress induced is limited to 1000 kg/cm^2 and if the modulus of rigidity, G = 0.8 × 10^6 kg/cm^2, then the radius of shaft in cm should be

(a) $\frac{\pi}{18}$ (b) $\frac{\pi}{27}$
(c) $\frac{18}{\pi}$ (d) $\frac{27}{\pi}$

ISRO Scientist/Engineer (RAC) 12.01.2020
TRB Poly. Lect. 2012
ISRO Scientist/Engg. 2007

Ans. (d) : From torsion equation,

$$\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{\ell}$$

$$\frac{\tau}{r} = \frac{G\theta}{\ell} \qquad r = \frac{\tau}{\theta} \times \frac{L}{G}$$

$$\theta = 1° = \frac{\pi}{180}, L = 120cm, \tau = 1000\,kg/cm^2$$

$$G = 0.8 \times 10^6\ kg/cm^2$$

$$r = \frac{1000\,kg/cm^2}{\pi/180} \times \frac{120\,cm}{0.6\times10^6} kg/cm^2$$

$$r = \frac{27}{\pi} cm$$

892. A shaft was initially subjected to bending moment and then was subjected to torsion. If the magnitude of bending moment is found to be the same as that of the torque, then the ratio of maximum bending stress to shear stress would be

(a) 0.25 (b) 0.50
(c) 1.0 (d) 2.0

Punjab PSC (Lect.) 06.08.2017
APPSC AEE 2012, APPSC IOF 2009

Ans. (d) : Bending moment (M) = Torque (T)

Bending stress $(\sigma_b) = \frac{32M}{\pi d^3}$

Shear stress $(\tau) = \frac{16T}{\pi d^3}$ $\frac{\sigma_b}{\tau} = \frac{32M/\pi d^3}{16T/\pi d^3} = \frac{32}{16} = 2$

$(\because M = T)$

$$\boxed{\sigma_b = 2\tau}$$

893. A circular shaft can transmit a torque of 5 kN-m. If the torque is reduced to 4kN-m, then the maximum value of bending moment that can be applied to the shaft is :

(a) 1 kN-m (b) 2 kN-m
(c) 3 kN-m (d) 4 kN-m

RPSC ACF & FRO, 26.02.2021
KPSC AE 2015, APPSC IOF, 2009

Ans. (c) : Given,

T_{eq} = 5 kN-m
T = 4 kN-m
M = ?

$$T_{eq} = \sqrt{M^2 + T^2}$$

$$5 = \sqrt{M^2 + 4^2}$$

$$\boxed{M = 3 \text{ kN-m}}$$

894. A solid shaft steel of 100 mm diameter and 1.0 m long is subjected to a twisting moment T. This shaft is to be replaced by a hollow shaft having outer and inner diameters as 100 mm and 50 mm respectively. If the maximum shear stress induced in both the shafts is same, the twisting moment T transmitted by hollow shaft must be reduced by

(a) T / 4 (b) T / 8
(c) T / 16 (d) T /12

BPSC Poly. Lect. 2016, ESE 2012, ESE 1998

Ans : (c) Solid Shaft | hollow shaft
d = 100mm | d_o = 100 mm
ℓ = 1.0 m | d_i = 50 mm.
ℓ = 1.0 m.

T_s = Twisting moment for solid shaft T_h = twisting moment transmitted by hollow shaft
same material then $\tau = \tau_s = \tau_h$

for solid shaft:-

$$T_s = \frac{\pi d^3 \tau}{16}$$

for hollow shaft:-

$$T_h = \frac{\pi d_0^3 \left(1 - C^4\right)\tau}{16}$$

$$C = \frac{d_i}{d_0} = 0.5$$

$$T_h = \frac{\pi d_o^3}{16T_h} \times \frac{15}{16}$$

$$\frac{T_h}{T_s} = \frac{15}{16}$$

Search on Telegram @apna_pdf

$$T_h = \frac{15}{16} T_s$$

Reduce twisting moment = $T_s - T_h$

$$= T - \frac{15}{16} T$$

Reduce twisting moment = $\frac{T}{16}$

895. The polar section modulus of a solid circular shaft of diameter 'd' about an axis through its centre of gravity is

(a) $\frac{\pi}{4} d^3$ (b) $\frac{\pi}{12} d^3$

(c) $\frac{\pi}{16} d^3$ (d) $\frac{\pi}{32} d^3$

Nagaland PSC (CTSE) 2018, Paper-I
GPSC Lect. (Auto) 16.10.2016
WBPSC AE 2008

Ans. (c) : Polar section modulus $Z_P = \frac{J}{R}$

$$Z_P = \frac{\pi \times d^4}{32 \times d} \times 2$$

$$Z_P = \frac{\pi}{16} d^3$$

896. In case of a circular shaft subjected to torque the value of shear stress

(a) Is uniform through out
(b) Has maximum value at axis
(c) Has maximum value at the surface
(d) Is zero at the axis and linearly increases to a maximum value at the surface of the shaft

Nagaland PSC CTSE 2017, Paper-I
GPSC Asstt. Director of Transport 05.03.2017
Nagaland PSC CTSE 2016 Paper-I

Ans. (d) : In case of a circular shaft subjected to torsion the value of shear stress is zero at the centre and linearly increase to a maximum value at the surface of the shaft.

897. For a circular shaft of diameter D subjected to torque T, the maximum value of the shear stress is

(a) $(64T/\pi D^3)$ (b) $(32T/\pi D^3)$
(c) $(16T/\pi D^3)$ (d) $(128T/\pi D^3)$
(e) $(8T/\pi D^3)$

RPSC 2016, CGPSC AE 26.04.2015 Shift-I
GATE 2006

Ans. (c) : From torsion equation we have

$$\frac{T}{J} = \frac{\tau}{r}$$

where T = torque
J = polar moment of inertia
τ = shear stress
r = radius

The maximum value of shear stress is given by

$$\frac{T}{\left(\frac{\pi D^4}{32}\right)} = \frac{\tau}{\left(\frac{D}{2}\right)}, \quad \tau = \frac{16T}{\pi D^3}$$

898. Angle of twist of a solid shaft of torsional rigidity GJ, length L and applied torque T will be given by:

(a) $\frac{T}{GJL}$ (b) $\frac{L}{GJT}$

(c) $\frac{TL}{GJ}$ (d) $\frac{GJ}{TL}$

SJVN ET 2019, UKPSC AE 2007 Paper -I

Ans. (c) : $\frac{\tau}{r} = \frac{T}{J} = \frac{G\theta}{\ell}$

$$\frac{G\theta}{\ell} = \frac{T}{J}$$

$$\theta = \frac{TL}{GJ}$$

899. A shaft of diameter (d) is subjected to torque (T) and bending moment (M). The value of maximum principle stress and maximum shear stress is given respectively by:

(a) $\frac{16}{\pi d^3}\left[M + \sqrt{M^2 + T^2}\right]; \frac{16}{\pi d^3}\left[\sqrt{M^2 + T^2}\right]$

(b) $\frac{16}{\pi d^4}\left[M + \sqrt{M^2 + T^2}\right]; \frac{16}{\pi d^4}\left[\sqrt{M^2 + T^2}\right]$

(c) $\frac{16}{\pi d^3}\left[\sqrt{M^2 + T^2}\right]; \frac{16}{\pi d^3}\left[M + \sqrt{M^2 + T^2}\right]$

(d) $\frac{16}{\pi d^4}\left[\sqrt{M^2 + T^2}\right]; \frac{16}{\pi d^4}\left[M + \sqrt{M^2 + T^2}\right]$

(e) $\frac{32}{\pi d^4}\left[\sqrt{M^2 + T^2}\right]; \frac{32}{\pi d^4}\left[M + \sqrt{M^2 + T^2}\right]$

CGPSC AE 25.02.2018
Nagaland PSC CTSE 2016 Paper-I

Ans. (a) : Maximum principle stress σ_{max}.

$$\sigma_{max} = \frac{16}{\pi d^3}\left[M + \sqrt{M^2 + T^2}\right]$$

maximum shear stress

$$\tau_{max} = \frac{16}{\pi d^3}\left[\sqrt{M^2 + T^2}\right]$$

900. The diameter of shaft is increased from 30 mm to 60 mm, all other conditions remaining unchanged. How many times its torque carrying capacity increases?

(a) 2 (b) 4
(c) 8 (d) 16

OPSC AEE 2019 Paper-I
MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (c) : From torsion equation.

$$\frac{T}{J} = \frac{G\theta}{\ell} = \frac{\tau}{R}$$

$$T = \frac{\tau \times J}{R}$$

$$T = \frac{\tau \times \frac{\pi}{32} d^4}{d/2}$$

Search on Telegram @apna_pdf

$$T = \frac{\tau d^3 \pi}{16}$$

$$T \propto d^3$$

$$\frac{T_2}{T_1} = \left(\frac{d_2}{d_1}\right)^3$$

$$\frac{T_2}{T_1} = \left(\frac{60}{30}\right)^3 = 2^3 = 8$$

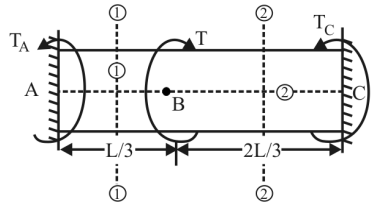
901. A hollow shaft of length *L* is fixed at its both ends. It is subjected to a torque *T* at a distance of *L*/3 from its one end. What is the reaction torque at the other end of the shaft?

(a) 2T/3 (b) T/2

(c) T/3 (d) T/4

TSPSC AEE 28.08.2017 (Civil/Mechanical)
UPSC JWM Advt. No.-52/2010

Ans. (c) : Let; *T* is the torque acting at B from the end A at a distance L/3



(Hollow shaft)

Let; T_A and T_C reaction torque on both side of fixed end of the hollow shaft due to applying torque *T*.

(1) For section – (1) (1) & section (2)- (2)

Torque ; $T_1 = T_A$; $T_2 = T_A - T$ or T_C …(i)

(2) Net torque; $T_A + T_C = T$ …(ii)

(3) $\theta_1 + \theta_2 = 0$ …(iii)

(for both end fixed)

$$\frac{T_1 L_1}{G_1 J_1} + \frac{T_2 L_2}{G_2 J_2} = 0 \qquad \begin{cases} \because GJ = \text{constant} \\ \text{i.e. } G_1 J_1 = G_2 J_2 = GJ \end{cases}$$

$$\Rightarrow T_1 L_1 + T_2 L_2 = 0$$

$$\Rightarrow T_A \times \frac{L}{3} + (T_A - T) \times \frac{2L}{3} = 0$$

$$\Rightarrow T_A + 2T_A - 2T = 0$$

$$\Rightarrow 3T_A = 2T$$

$$\boxed{T_A = \frac{2T}{3}}$$

From eqn (ii) ; $T_A + T_C = T$

$$\Rightarrow \frac{2T}{3} + T_C = T$$

$$\Rightarrow \boxed{T_C = \frac{T}{3}}$$

$T_C = T/3$;

is the torque at the other end of the shaft.

902. A uniform solid shaft of diameter D is subjected to equal magnitude of bending moment and twisting moment M. What is the maximum shear stress induced in the shaft?

(a) $\frac{32M}{\pi D^3}$ (b) $16\sqrt{2}.\frac{M}{\pi D^3}$

(c) $\frac{16M}{\pi D^3}$ (d) $\frac{16}{\sqrt{2}}.\frac{M}{\pi D^3}$

UPSC JWM Advt. No.-52/2010
UKPSC AE 2007 Paper -I

Ans. (b) : Solution : Given :

Combined effect of Bending moment and Twisting moment. Both have equal magnitude M.

$$\therefore \text{ Shear stress } (\tau) = \frac{16}{\pi D^3}\left(\sqrt{M^2 + T^2}\right)$$

$$\therefore \quad \tau_{max} = \frac{16}{\pi D^3} \times \sqrt{2M^2} \qquad (\because M = T)$$

$$\tau_{max} = 16.\sqrt{2}.\frac{M}{\pi D^3}$$

903. Torque in a solid shaft of diameter 'd' and shear stress 'τ' is given by

(a) $\frac{\pi}{8}\tau d^3$ (b) $\frac{\pi}{16}\tau d^3$

(c) $\frac{\pi}{12}\tau d^3$ (d) $\frac{\pi}{32}\tau d^3$

UPPSC AE 12.04.2016 Paper-I
WBPSC AE 2008

Ans. (b) : From Torsion equation

$$\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{L}$$

$$\frac{T}{J} = \frac{\tau}{r}$$

$$\tau = \frac{Tr}{J} = \frac{T \times d \times 32}{2 \times \pi \times d^4}$$

$$\boxed{\tau = \frac{16T}{\pi d^3}}$$

$$\boxed{T = \frac{\pi d^3}{16}\tau}$$

Where symbols have their usual meaning.

904. In case of a solid shaft the strain energy in torsion, per unit volume, is equal to

(a) $\frac{\tau^2}{2C}$ (b) $\frac{\tau^2}{4C}$

(c) $\frac{\tau^2}{6C}$ (d) $\frac{\tau^2}{8C}$

ESE 2013, WBPSC AE 2008

Ans. (b) For prismatic bar under torsion.

$$U = \frac{\tau^2}{4C} \cdot V$$

$$\frac{U}{V} = \frac{\tau^2}{4C}$$

Search on Telegram @apna_pdf

905. Two shafts A and B of solid circular cross-section are identical expect for their diameter d_A and d_B. The ratio of power transmitted by the shaft A to that of shaft B is

(a) $\frac{d_A}{d_B}$ (b) $\frac{(d_A)^2}{(d_B)^2}$

(c) $\frac{(d_A)^3}{(d_B)^3}$ (d) $\frac{(d_A)^4}{(d_B)^4}$

Karnataka PSC Lect., 27.05.2017
KPSC ADF 2015

Ans. (c) :

$\because$ Power (P) = T.ω $\quad \boxed{\because \text{Torque}(T) = \frac{\pi}{16}d^3\tau}$

$$P = \frac{\pi}{16}d^3.\tau.\omega$$

For shaft A; $P_A = \frac{\pi}{16}d_A^3.\tau.\omega \quad \left\{\tau_A = \tau_B = \tau,\ \omega_A = \omega_B = \omega\right\}$

For shaft B; $P_B = \frac{\pi}{16}d_B^3.\tau.\omega$

$\therefore \quad \boxed{\frac{P_A}{P_B} = \frac{(d_A)^3}{(d_B)^3}}$

906. A solid shaft transmits a torque of T. The allowable shear stress is τ. What is the diameter of the shaft ?

(a) $\sqrt[3]{\frac{16T}{\pi\tau}}$ (b) $\sqrt[3]{\frac{32T}{\pi\tau}}$

(c) $\sqrt[3]{\frac{16T}{\tau}}$ (d) $\sqrt[3]{\frac{T}{\pi}}$

OPSC AEE 2015 Paper-I
RPSC AE GWD, 2011, ESE 2008

Ans : (a) Torsion equation

$$\frac{T}{J} = \frac{G\theta}{\ell} = \frac{\tau}{r}$$

$$\frac{32T}{\pi d^4} = \frac{2\tau}{d} = \frac{16T}{\pi d^3} = \tau$$

$$\boxed{d = \sqrt[3]{\frac{16T}{\pi\tau}}}$$

907. The section modulus of a circular section of diameter (*d*) is

(a) π/32 d^2 (b) π/32 d^3

(c) π/64 d^3 (d) π/64 d^4

Nagaland PSC (CTSE) 2018 Paper-I
GMB AAE 25.06.2017

Ans. (b) : Section Modulus – Section modulus is the ratio of moment of inertia about N.A. upon the for test point of section from Neutral axis (N.A)

$$\boxed{Z = \frac{I}{Y}}$$

for circular section

$$Z_{XX} = \frac{I_{XX}}{Y}$$

$$= \frac{\pi}{64} \times d^4 \times \frac{1}{d/2}$$

$\therefore \quad \boxed{Z_{XX} = \frac{\pi}{32}d^3 mm^3}$

908. A hollow shaft of the same cross-section area and material as that of a solid shaft, transmits:

(a) Same torque (b) Lesser torque

(c) More torque (d) None

UJVNL AE 2016, RO Scientist/Engineer 2007
ESE 2005

Ans : (c) A hollow shaft of the same cross- sectional area and materials transmits more torque than solid shaft.

given $A_s = A_h$

$$\frac{\pi}{4}d^2 = \frac{\pi}{4}\left[d_o^2 - d_i^2\right]$$

$$d^2 = d_o^2 - d_i^2 \quad \ldots\ldots\ldots\ldots \text{(i)}$$

from equation (i) we can say that

$$d_o > d$$

$$\frac{T_h}{T_s} = \frac{\frac{\pi d_o^3 \times \tau\left[1 - k^4\right]}{16}}{\left(\frac{\pi d^3}{16}\right) \times \tau}$$

$$\frac{T_h}{T_s} = \frac{d_o^3\left[1 - k^4\right]}{d^3}$$

If we assume that [hit and trail method]

$d_i = 3$ unit

$d_o = 5$ unit

$d = 4$ unit

$$\frac{T_h}{T_s} = \frac{125\left[1 - \left(\frac{3}{5}\right)^4\right]}{64} = 1.7$$

$T_h = 1.7\ T_s$

So we can say that $T_h > T_s$.

909. Angle of twist of a shaft of diameter 'd' is inversely proportional to :

(a) d (b) d^2

(c) d^3 (d) d^4

OPSC AEE 2019 Paper-I
ISRO Scientist/Engg. (RAC) 22.04.2018

Ans : (d) : By using torsion formula,

$$\theta = \frac{T\ell}{GJ} = \frac{T\ell}{G \times \frac{\pi}{32} \times d^4} \Rightarrow \theta \propto \frac{1}{d^4}$$

910. A solid circular shaft is subjected to pure torsion. The ratio of maximum shear to maximum normal stress at any point would be-

(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) 2 : 3

RPSC AE 2018, APPSC AEE 2012, ESE 1996

Search on Telegram @apna_pdf

Ans. (a) : A solid circular shaft is subjected to pure torsion, then

$$\tau_{max} = \frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$$

$$\sigma_x = \sigma_y = 0$$

$$\tau_{max} = \tau_{xy}$$

$$\sigma_{max} = \frac{\sigma_x + \sigma_y}{2} + \frac{1}{2}\sqrt{(\sigma_x - \sigma_y)^2 + 4\tau_{xy}^2}$$

$$\sigma_{max} = \tau_{xy}$$

then,

$$\frac{\tau_{max}}{\sigma_{max}} = 1:1$$

911. Two shafts, one solid and the other hollow, made of the same material, will have the same strength and stiffness, if both are of the same

(a) length as well as weight
(b) length as well as polar modulus
(c) weight as well as polar modulus
(d) length, weight as well as polar modulus

ESE 2017, Nagaland PSC CTSE 2016 Paper-I

Ans. (b) : Solid shaft and hollow shaft are same material, so G is same.

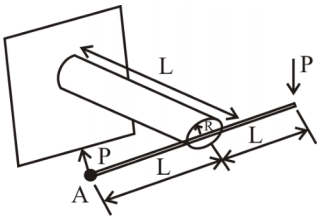
$$\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{\ell}$$

$$k_t = \frac{T}{\theta} = \frac{GJ}{\ell}$$

$$\tau_{max} = \frac{T}{J} \times r_{max}$$

$\therefore$ For strength and stiffness to be same, both must have same polar moment of inertia (J) and same length (ℓ).

912. A rigid horizontal rod of length 2L is fixed to a circular cylinder of radius R as shown in the figure. Vertical forces of magnitude P are applied at the two ends as shown in the figure.



The shear modulus for the cylinder is G and the Young's modulus is E.

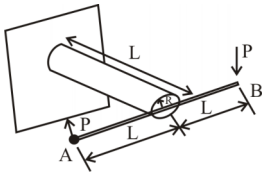
The vertical deflection at point A is

(a) $\frac{PL^3}{\pi R^4 G}$ (b) $\frac{PL^3}{\pi R^4 E}$

(c) $\frac{4PL^3}{\pi R^4 G}$ (d) $\frac{2PL^3}{\pi R^4 E}$

Assam Engg. College AP/Lect. 18.01.2021
GATE 2016

Ans. (c) : $\frac{4PL^3}{\pi R^4 G}$



Vertical deflection at point 'A'

$(X) = \theta \times L$

$X = \theta \times L$ .....(i)

$\frac{T}{J} = \frac{G\theta}{L} = \frac{\tau}{R}$ $\qquad T = P \times 2L$

$\theta = \frac{TL}{GJ}$

$x = \theta \times L$

$= \frac{TL^2}{GJ}$

$= \frac{P \times 2L \times L^2}{G \times \frac{\pi}{32}(D^4)}$

$= \frac{2PL^3}{G\frac{\pi}{32}(2R)^4}$

$x = \frac{4PL^3}{G\pi R^4}$

Vertical deflection at point 'A'

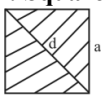
913. The polar moment of inertia of a hollow shaft of outer diameter (D) and inner diameter (d) is

(a) $\frac{\pi}{16}(D^3 - d^3)$ (b) $\frac{\pi}{16}(D^4 - d^4)$

(c) $\frac{\pi}{32}(D^4 - d^4)$ (d) $\frac{\pi}{64}(D^4 - d^4)$

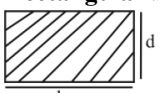
MECON MT 2019
Sikkim PSC (Under Secretary), 2017

Ans. (c) : Square section **Polar Moment of Inertia**



$J = \frac{a^4}{6} = 0.1667a^4$

Rectangular Section



$J = \frac{bd(b^2 + d^2)}{12}$

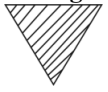
Circular section

$J = \frac{\pi D^4}{32} = 0.098D^4$

Tube section

$J = \frac{\pi}{32}(D^4 - d^4)$

Triangular section



$J = \frac{\sqrt{3}}{48}S^4 = 0.036S^4$

Search on Telegram @apna_pdf

914. When a shaft is subjected to twisting moment, every cross-section of the shaft will be under

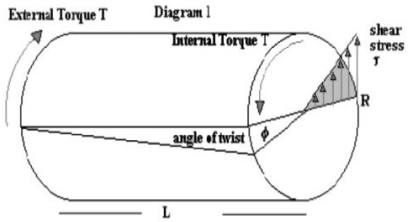
(a) tensile stress (b) compressive stress
(c) shear stress (d) bending stress

Vizag Steel (MT) 2017, Assam PSC CCE Pre 2015

Ans. (c)

Torsion equation – $\frac{T}{J}=\frac{G\theta}{\ell}=\frac{\tau}{r}$

$$T=\frac{\pi}{16}\tau d^3$$



Shear stress in shaft, $\boxed{\tau=\frac{16T}{\pi d^3}}$

When a shaft is subjected to twisting moment, every cross-section of the shaft will be under shear stress.

915. Torsional Stiffness is _____ .

(a) quotient of shear modulus and polar moment of inertia
(b) product of shear modulus and polar moment of inertia
(c) torque produced per unit moment of inertia
(d) torque produced per unit angle of twist

VIZAG MT, 14.12.2020
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (d) : Torsional equation,

$$\frac{T}{J}=\frac{G\theta}{\ell}=\frac{\tau}{R}$$

$$T=\frac{GJ}{\ell}\theta$$

$$T=K_T\theta$$

$\boxed{K_T=\frac{GJ}{\ell}}$ ← Torsional stiffness

$\boxed{K_T=\frac{T}{\theta}}$ ← Torsional stiffness

Torsional stiffness is torque produced per unit angle of twist.

916. If 'P' is the Ratio of inside to outside diameter of a shaft, the ratio of torque carrying capacity of solid shaft to that of hollow shaft is given by:

(a) $(1-P^4)^{-1}$ (b) $1-P^4$
(c) P^4 (d) $\frac{1}{P^4}$

Kerala PSC Poly. Lect., 2017, ESE 2008

Ans. (a) : Maximum shear stress for hollow shaft,

$$\tau_{max}=\frac{16T_H}{\pi D^3(1-P^4)} \qquad \because\ P=\frac{D_i}{D_0}$$

Torque carrying capacity,

$$T_H=\frac{\pi D^3(1-P^4)}{16}\tau_{max} \qquad .....(1)$$

Maximum shear stress for solid shaft,

$$\tau_{max}=\frac{16T}{\pi D^3}$$

Torque carrying capacity,

$$T_S=\frac{\pi D^3}{16}\tau_{max} \qquad .....(2)$$

Equation (2) ÷ equation (1)

$$\boxed{\frac{T_S}{T_H}=\frac{1}{(1-P^4)}}$$

917. The greatest twisting moment which a shaft section can resist is equal to

(a) polar modulus × τ (b) polar modulus/τ
(c) τ/polar modulus (d) None of the above

RPSC VPITI 14.02.2016
APPSC Poly. Lect. 2013

Ans. (a) : The maximum twisting moment which a shaft can resist is product of the permissible shear stress and polar modulus.

$$\frac{T}{J}=\frac{\tau}{R}=\frac{G\theta}{\ell}$$

Where, T = Maximum Torque,
J = Polar Moment of Inertia
τ = Shear stress, R = Radius,
G = Modulus of rigidity, θ = Angle of twist

918. For the same material, length and given torque, a hollow shaft weighs _____ a solid shaft :

(a) less than (b) more than
(c) equal to (d) None of the above

APPSC AE 04.12.2012, APPSC AEE 2012

Ans. (a) : For the same material, length and given torque, a hollow shaft weighs less than a solid shaft.

919. Power transmitted by a shaft (kW) subjected to an average torque T (kNm), rotating at N rpm is equal to

(a) $\frac{2\pi NT}{3600}$ (b) $\frac{2\pi NT}{4500}$
(c) $\frac{2\pi NT}{60}$ (d) $\frac{\pi NT}{3060}$

APPSC AEE Mains 2016 (Civil Mechanical)
HPPSC Lect. 2016

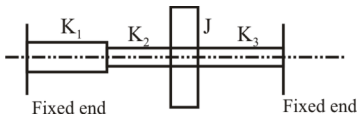
Ans. (c) : As we know,
Work done per minute = force × distance
= Average torque × Angular displacement

$$=T\times\frac{2\pi N}{60}$$

$$P=\frac{2\pi NT}{60}\text{kW}$$

920. Consider the arrangement shown in the figure below where J is the combined polar mass moment of inertia of the disc and the shafts. K_1, K_2 and K_3 are the torsional stiffness of the respective shafts. The natural frequency of the torsional oscillation of the disc is given by

Search on Telegram @apna_pdf



(a) $\sqrt{\left(\frac{K_1+K_2+K_3}{J}\right)}$

(b) $\sqrt{\left(\frac{K_1K_2+K_2K_3+K_3K_1}{J(K_1+K_2)}\right)}$

(c) $\sqrt{\left(\frac{K_1K_2K_3}{J(K_1K_2+K_2K_3+K_3K_1)}\right)}$

(d) $\sqrt{\left(\frac{K_1K_2+K_2K_3+K_3K_1}{J(K_2+K_3)}\right)}$

Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2003

Ans. (b) : K_1 and K_2 are in series and K_3 in parallel with equivalent resistance between 1 and 2.

Equivalent stiffness between 1 and 2 (series)

$$\frac{1}{K_{12}}=\frac{1}{K_1}+\frac{1}{K_2}$$

$$K_{12}=\frac{K_1\cdot K_2}{K_1+K_2}$$

Equivalent stiffness between K_{12} and K_3 is (parallel)

$$K_{eq}=K_{12}+K_3$$

$$K_{eq}=\frac{K_1K_2}{K_1+K_2}+K_3$$

$$K_{eq}=\frac{K_1K_2+K_2K_3+K_3K_1}{(K_1+K_2)}$$

The natural frequency for torsional oscillation is given by–

$$\omega=\sqrt{\frac{K_{eq}}{J}}$$

$$\omega=\sqrt{\frac{K_1K_2+K_2K_3+K_3K_1}{J(K_1+K_2)}}$$

921. The shear stress at a point in a shaft subjected to a torque

(a) directly proportional to the polar moment of inertia and to the distance of the point from the axis

(b) directly proportional to the applied torque and inversely proportional to the polar moment of inertia

(c) directly proportional to the applied torque and the polar moment of inertia

(d) inversely proportional to the applied torque and the polar moment of inertia

GPSC Executive Engineer 23.12.2018
JPSC AE 2013, Paper-V, CSE Pre-1995

Ans. (b) : The shear stress produced by torque vary from zero at centre of cross section to maximum at surface in circumferential directions. Shear stresses in direction normal to the cross-section plane are always complimentary in nature and have equal magnitude.

By torsional formula:-

$$\frac{T}{J}=\frac{G\theta}{l}=\frac{\tau}{r}$$

Where, J = Polar moment of inertia

l = Length of shaft

r = Radius of shaft

maximum shear stresses will occur when

$$r=r_{max}=R$$

$$\tau_{max}=\frac{T}{J}\times r_{max}$$

$$\tau_{max}=\frac{T}{J}\times R\,(\text{at surface of shaft})$$

922. Maximum shear stress in a solid shaft of diameter D and length L twisted through an angle θ is τ. A hollow shaft of the same material and length having outside and inside diameters of D and $\frac{D}{2}$ respectively is also twisted through the same angle of twist θ. The value of maximum shear stress in the hollow shaft will be

(a) $\frac{16}{15}\tau$ (b) $\frac{8}{7}\tau$

(c) $\frac{4}{3}\tau$ (d) τ

UPPSC AE 13.12.2020, Paper-I, ESE 1997

Ans. (d) : $\frac{\tau_{max}}{r_{max}}=\frac{G\theta}{\ell}$

$$\tau_{max}\propto r_{max}$$

$$\frac{(\tau_{max})_H}{(\tau_{max})_S}=\frac{(r_{max})_H}{(r_{max})_S}=\frac{(D/2)}{(D/2)}$$

$$(\tau_{max})_H=(\tau_{max})_S=\tau$$

923. A line shaft rotating at 200 rpm is to transmit 20 kW. The allowable shear stress of shaft material is 42 MPa. Neglecting the bending moment, the diameter of the shaft needs to be :

(a) 35 mm (b) 50 mm

(c) 65 mm (d) 75 mm

RPSC ACF & FRO, 26.02.2021
APPSC Poly. Lect. 2013

Ans. (b) : Given, N = 200 rpm

P = 20 kW

τ = 42 MPa

d = ?

$$P=\frac{2\pi NT}{60}$$

$$20\times10^3=\frac{2\pi\times200}{60}\times T$$

$$\boxed{T=954.92\ \text{Nm}}$$

$$T=954.92\times10^3\ \text{Nmm}$$

$$\tau=\frac{16T}{\pi d^3}$$

$$d^3=\frac{16T}{\pi\tau}$$

Search on Telegram @apna_pdf

$$d^3 = \frac{16 \times 954.92 \times 10^3}{\pi \times 42}$$

$$d = \sqrt[3]{\frac{16 \times 954.92 \times 10^3}{\pi \times 42}}$$

$\boxed{d = 48.74}$ mm ≈ 50 mm

924. For a hollow shaft of inner diameter 'd' and outer diameter 'D' the modulus of rupture is :

(a) $8TD/\pi(D^4 - d^4)$ (b) $16TD/\pi(D^4 - d^4)$

(c) $32TD/\pi(D^4 - d^4)$ (d) $64TD/\pi(D^4 - d^4)$

SJVN ET 2019, RPSC VPITI 14.02.2016

Ans. (b) : The maximum shear stress calculated by using the torsion formula is called modulus of rupture

$$\tau_{max} = \frac{T \times D/2}{J}$$

$$\tau_{max} = \frac{T \times D/2}{\frac{\pi}{32}\left(D^4 - d^4\right)}$$

$$\tau_{max} = \frac{16TD}{\pi\left(D^4 - d^4\right)}$$

925. Two shaft A and B under pure tension are of identical length and identical weight and are made of the same material. The shaft A is solid and the shaft B is hollow. We can say that.

(a) Shaft B is better than shaft A

(b) Shaft A is better than shaft B

(c) Both the shafts are equally good

(d) Both the shafts are not good

RPSC ACF & FRO, 26.02.2021

Ans. (a) : Case- I – External diameter same

In this case solid shaft will have more strength.

Case- II – Weight is same.

In this case hollow shaft will have more strength

Case- III – Cross-sectional area same.

In this case solid shaft transmit more torque.

In question it is given that weight is identical or same so Hollow shaft (B) will have more strength, so shaft B is better than A.

926. A solid circular shaft of diameter 100 mm is subjected to an axial stress to 50 MPa. It is further subjected to a torque of 10 kNm. The maximum principal stress experienced on the shaft is closest to

(a) 41 MPa (b) 82 MPa

(c) 164 MPa (d) 204 MPa

VIZAG STEEL MT 18.08.2013

Vizag Steel MT Mechanical, 2013 Re-Exam

VIZAG STEEL MT 10.06.2012

Ans. (b) : Shear stress $(\tau) = \frac{16T}{\pi d^3}$

$$\tau = \frac{16 \times 10000}{\pi \times (0.1)^3} = 50.93 \text{ MPa}$$

Maximum principal stress-

$$\sigma_{max} = \frac{\sigma_b}{2} + \sqrt{\left(\frac{\sigma_b}{2}\right)^2 + \tau^2}$$

$$= \frac{50}{2} + \sqrt{\left(\frac{50}{2}\right)^2 + (50.93)^2}$$

$$= 25 + \sqrt{25^2 + (50.93)^2}$$

$\boxed{\sigma_{max} = 82 \text{ MPa}}$

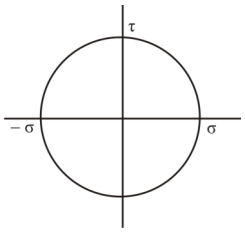
927. A circular shaft subjected to twisting moment results in maximum shear stress of 90 MPa. Then the maximum compressive stress in the material is

(a) 130 MPa (b) 100 MPa

(c) 80 MPa (d) 90 MPa

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : Mohr circle for pure shear, So, the compressive stress would be equal to applied shear stress.



$\sigma_1 = \sigma$ (Tensile)

$\sigma_2 = \sigma$ (Compressive)

$\tau = \sigma = 90$ MPa

928. A solid circular shaft, under pure torsion, develops maximum shear stress of 10 MPa on the surface. If the shaft diameter is halved, what will be the maximum shear stress developed corresponding to the same torque?

(a) 05 MPa (b) 40 MPa

(c) 20 MPa (d) 80 MPa

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : As we know,

Maximum shear stress $= \frac{16T}{\pi d^3}$

$$10 = \frac{16T}{\pi d^3} = \tau_1$$

Max. shear stress, when diameter is halved.

$$\tau_2 = \frac{16T}{\pi\left(\frac{d}{2}\right)^3}$$

$$\tau_2 = 8\left(\frac{16T}{\pi d^3}\right)$$

$$\tau_2 = 8 \times \tau_1$$

$$\tau_2 = 80 \text{ MPa}$$

929. While transmitting the same power by a shaft, if its speed is reduced by half, what should be its new diameter if the maximum shear stress induced in the shaft remains same?

Search on Telegram @apna_pdf

(a) $(2)^{1/2}$ of the original diameter
(b) $(1/2)^{1/2}$ of the original diameter
(c) twice of the original diameter
(d) $(2)^{1/3}$ of the original diameter

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : Given-
Power = Torque (T) × Angular speed (ω)
If P is const.

$$T \propto \frac{1}{\omega}$$

$$\text{If } \frac{T'}{T} = \frac{\omega}{\omega'} = \frac{\omega}{\left(\frac{\omega}{2}\right)} = 2$$

$$\text{Shear Stress, } \tau = \frac{16T}{\pi d^3}$$

$$T \propto d^3$$

$$\frac{T'}{T} = \left(\frac{d'}{d}\right)^3$$

$$2 = \left(\frac{d'}{d}\right)^3$$

$$\frac{d'}{d} = (2)^{1/3}$$

930. The ratio of Shear stresses of solid shaft (diameter'd') to hollow shaft (internal diameter $\frac{'d'}{3}$, external diameter 'd') When subjected to same twisting moment

(a) $\frac{81}{80}$ (b) $\frac{80}{81}$
(c) $\frac{26}{27}$ (d) $\frac{27}{26}$

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (b) : d = solid shaft dia $d_o = d$ = hollow shaft external dia

$$d_i = \frac{d}{3} = \text{internal dia.}$$

$$\tau_s = \frac{16T}{\pi d^3} \text{-------(i)}$$

$$\tau_H = \frac{16Td}{\pi\left[d^4 - \left(\frac{d}{3}\right)^4\right]} \text{--------(ii)}$$

By comparing both eq.

$$\frac{\tau_s}{\tau_H} = \frac{80}{81}$$

931. Maximum shear stress developed on the surface of a solid circular shaft under pure torsion is 320 MPa. If the shaft diameter is doubled, then what is the maximum shear stress developed corresponding to the same torque?

(a) 60 MPa (b) 120 MPa
(c) 40 MPa (d) 20 MPa

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (c) : Given-
We know,

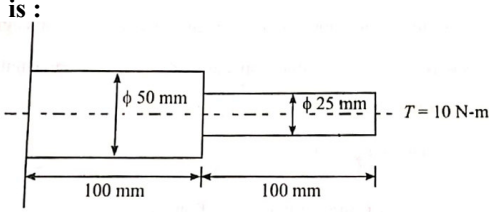
$$\text{Maximum shear stress } = \frac{16T}{\pi d^3} = 320\text{MPa}$$

So, Max. shear stress developed when diameter is doubled.

$$\tau_{new} = \frac{16T}{\pi(2d)^3} = \frac{1}{8} \times 320$$

$$\tau_{new} = 320/8 = 40\text{MPa}$$

932. A stepped steel shaft shown below is subjected to 10 N-m torque. If the modulus of rigidity is 80 GPa, the strain energy in the shaft in N-mm is :

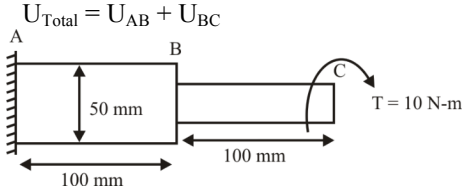


(a) 4.12 (b) 3.46
(c) 1.73 (d) 0.86

CGPSC AE 15.01.2021

Ans. (c) : Strain Energy in the shaft

$$U_{Total} = U_{AB} + U_{BC}$$



$$= \frac{T_{AB}^2 L}{2GJ} + \frac{T_{BC}^2 L}{2GJ}$$

$$= \frac{(10\times10^3)^2 \times 100}{2\times80\times10^3 \times \left[\frac{\pi}{32}(50)^4\right]} + \frac{(10\times10^3)^2 \times 100}{2\times80\times10^3 \times \left[\frac{\pi}{32}(25)^4\right]}$$

= 1.73 N-mm

933. A solid circular shaft is subjected to bending moment of 3000N and a torsion of 10,000N-m. The equivalent bending moment would be _____.

(a) 6600 N-m (b) 5920 N-m
(c) 10440 N-m (d) 6720 N-m

VIZAG Steel MT 24.01.2021

Ans. (d) : Bending moment (M) = 3000 N
Torsional moment (T) = 10,000 N
Equivalent bending moment,

$$(M_e) = \frac{1}{2}\left[M + \sqrt{M^2 + T^2}\right]$$

$$= \frac{1}{2}\left[3000 + \sqrt{(3000)^2 + (10,000)^2}\right]$$

$$= \frac{1}{2}\left[3000 + \sqrt{9000000 + 100000000}\right]$$

$$= \frac{1}{2}[3000 + 10440.3065]$$

= 6720.153 N-m

Search on Telegram @apna_pdf

934. The torsional rigidity of a shaft is the torque required to _____.

(a) produce maximum shear stress
(b) produce unit twist at unit length
(c) produce maximum twist
(d) produce zero twist

VIZAG Steel MT 24.01.2021

Ans. (b) : According to torsional equation–

$$\frac{T}{J}=\frac{G\theta}{\ell}=\frac{\tau}{R}$$

$$\frac{G\theta}{\ell}=\frac{T}{J}$$

For, $\theta = 1$ radian, length $(\ell) = 1$

$$G=\frac{T}{J}$$

$$\boxed{G \propto T}$$

935. For a hollow circular shaft under torsion T only the shear stress, τ will be expressed by :

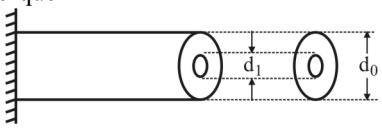
(a) $\frac{16T}{\pi(d_o^3+d_i^3)}$ (b) $\frac{32T}{\pi(d_o^3+d_i^3)}$

(c) $\frac{16\sqrt{M^2+T^2}}{\pi d_o^3}$ (d) $\frac{16Td_0}{\pi(d_o^4-d_i^4)}$

Where d_o, d_i are outer and inner diameters.

JPSC AE 10.04.2021, Paper-II

Ans. (d) : Consider,
Outside dia = d_o
Inside dia = d_i
Torque = T



then shear stress (τ) on hollow shaft.

$$\frac{T}{J}=\frac{G\theta}{\ell}=\frac{\tau}{r}$$

$$\tau=\frac{Tr}{J}$$

$$=\frac{T(d_0/2)}{\frac{\pi}{32}(d_0^4-d_i^4)}$$

$$\boxed{\tau=\frac{16Td_0}{\pi(d_0^4-d_i^4)}}$$

936. A circular shaft when subjected to equal opposite end couples whose axes coincide with axis of the shaft is said to be in

(a) pure torsion
(b) pure bending
(c) combined bending and torsion
(d) none of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : A circular shaft when subjected to equal opposite end couples whose axes coincide with axis of the shaft is said to be in pure torsion.

937. The efficiency in resisting torsional moments by hollow shaft when compared to solid shaft is

(a) less (b) more
(c) equal (d) cannot be determined

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : The efficiency in resisting torsional moments by hollow shaft when compared to solid shaft is more.

938. Two shafts will have equal strength, if

(a) diameter of both the shafts is same
(b) angle of twist of both the shafts is same
(c) material of both the shafts is same
(d) twisting moment of both the shafts is same

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : Two shafts will have equal strength, if twisting moment of both the shafts is same.

939. In case of a bar under torsion if the force is applied at the outer surface of the bar and longitudinally, the shear stress is maximum at

(a) the centre of the bar.
(b) just before the outer surface.
(c) the outer surface.
(d) the mid-point of radius of the bar.

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (c) : The shear stress varries linearly zero at the centre and maximum at outer surface.

940. A solid circular shaft is subjected to a bending moment of 6000 Nm and a torque of 8000 Nm. The equivalent bending moment of the shaft is _____.

(a) 14000 Nm (b) 10000 Nm
(c) 6000 Nm (d) 8000 Nm

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : Given,
Bending moment, M = 6000 N-m
Torque, T = 8000 N-m
∴ Equivalent bending moment,

$$M_e=\frac{1}{2}\left[M+\sqrt{M^2+T^2}\right]$$

$$=\frac{1}{2}\left[6000+\sqrt{(6000)^2+(8000)^2}\right]$$

$$M_e=\frac{1}{2}[6000+10000]$$

$$=\frac{16000}{2}=8000\ \text{N}-\text{m}$$

941. The polar moment of inertia of a solid circular shaft of diameter d is _____.

(a) $\frac{\pi d^3}{32}$ (b) $\frac{\pi d^4}{32}$

(c) $\frac{\pi d^4}{64}$ (d) $\frac{\pi d^3}{64}$

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (b) : For solid circular shaft–
diameter = d

$$I_{xx}=\frac{\pi d^4}{64}$$

Search on Telegram @apna_pdf

$I_{yy} = \dfrac{\pi d^4}{64}$

polar moment of Inertia, $I_{zz} = I_{xx} + I_{yy}$

$= \dfrac{\pi d^4}{64} + \dfrac{\pi d^4}{64}$

$\boxed{I_{zz} = \dfrac{\pi d^4}{32}}$

942. Units of section modulus is

(a) mm (b) mm^4

(c) mm^3 (d) mm^2

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : mm^3

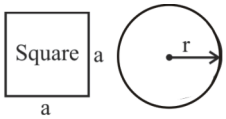
943. The cross-sections of two solid bars made of the same material are shown in the figure. The square cross-section has flexural (bending) rigidity I_1, while the circular cross section has flexural rigidity I_2, Both sections have the same cross-sectional area. The ratio $\dfrac{I_1}{I_2}$ is

(a) $\dfrac{1}{\pi}$ (b) $\dfrac{2}{\pi}$

(c) $\dfrac{\pi}{3}$ (d) $\dfrac{\pi}{6}$

Assam Engg. College AP/Lect. 18.01.2021

Ans. (c) : $\dfrac{\pi}{3}$



Area of cross section is same.

$A_1 = A_2$

$a^2 = \pi r^2$

$a = r\sqrt{\pi}$

Flexural rigidity of square $I_1 = E_1 I_{m_1}$

Flexural rigidity of circle $I_2 = E_2 I_{m_2}$

Where, $E_1 = E_2 = E$ = Young's modulus (same material)

I_{m_1} & I_{m_2} are moment of inertia of respective figures.

$$\frac{I_1}{I_2} = \frac{EI_{m_1}}{EI_{m_2}}$$

$$\frac{I_1}{I_2} = \frac{\frac{a^4}{12}}{\frac{\pi d^4}{64}} = \frac{a^4}{12} \times \frac{64}{\pi d^4} \qquad (d = 2r)$$

$$\frac{I_1}{I_2} = \frac{a^4}{12} \times \frac{64}{\pi (2r)^4}$$

$$= \frac{a^4}{12} \times \frac{64}{\pi \times 16r^4}$$

put $\left(a = r\sqrt{\pi}\right)$

$$= \frac{\left(r\sqrt{\pi}\right)^4 \times 64}{12\pi \times 16r^4}$$

$$= \frac{\pi^2 \times r^4 \times 64}{12 \times \pi \times 16r^4}$$

$$\frac{I_1}{I_2} = \frac{\pi}{3}$$

944. Two shafts of equal length and similar material in which one is hollow and other is solid are transmitting same level of torque. If the inside diameter is $\dfrac{2}{3}$ of the outside diameter of the hollow shaft, the ratio of weight of hollow shaft to weight of solid shaft is

(a) 0.642 (b) 0.358

(c) 0.732 (d) 1.444

UPPSC AE 13.12.2020, Paper-I

Ans. (a) : $T_H = T_S$

$$(\tau_{allowable} \times Z_P)_H = (\tau_{allowable} \times Z_P)_S$$

$$\frac{\pi}{16} d_o^3 (1 - k^4) = \frac{\pi}{16} d^3$$

$$\left(\frac{d_o}{d}\right)^3 = \frac{1}{1 - k^4} = \frac{1}{1 - \left(\frac{2}{3}\right)^4}$$

$$\frac{d_o}{d} = 1.076$$

Weight = ρg (Volume)

$= \rho g (A \times \ell)$

$$\frac{W_H}{W_S} = \frac{A_H}{A_S} = \frac{\frac{\pi}{4} d_o^2 (1 - k^2)}{\frac{\pi}{4} d^2}$$

$$= \left(\frac{d_o}{d}\right)^2 (1 - k^2)$$

$$= (1.076)^2 \left[1 - \left(\frac{2}{3}\right)^2\right]$$

$= 0.643$

945. What is the maximum torque transmitted by a hollow shaft of external radius 'R', internal radius 'r' and maximum allowable shear stress τ?

(a) $\dfrac{\pi}{16}(R^3 - r^3)\tau$ (b) $\dfrac{\pi}{2R}(R^4 - r^4)\tau$

(c) $\dfrac{\pi}{8R}(R^4 - r^4)\tau$ (d) $\dfrac{\pi}{32}(R^4 - r^4)\tau$

UPPSC AE 13.12.2020, Paper-I
ESE 2006

Search on Telegram @apna_pdf

Ans. (b) : Torque $(T) = \tau \times \frac{\pi}{16}\left[\frac{(2R)^4 - (2r)^4}{2R}\right]$

$$T = \tau \times \frac{\pi}{16} \times 16\left[\frac{R^4 - r^4}{2R}\right]$$

$$T = \tau \frac{\pi}{2R}[R^4 - r^4]$$

946. A shaft is subjected to a bending moment M = 0.75 kNm and a twisting moment T = 1 kNm. The magnitude of equivalent bending moment in shaft is

(a) 1.25 kNm (b) 1.125 kNm
(c) 1.0 kNm (d) 0.75 kNm

UPPSC AE 13.12.2020, Paper-I

Ans. (c) : Given, M = 0.75 kNm
T = 1 kNm

Equivalent bending moment $= \frac{1}{2}\left[M + \sqrt{M^2 + T^2}\right]$

$$= \frac{1}{2}\left[0.75 + \sqrt{(0.75)^2 + 1^2}\right]$$

$$= 1 \text{ kNm}$$

947. A solid shaft of diameter 'D' carries a twisting moment that develop maximum shear stress τ. If this shaft is replaced by a hollow one of outside diameter D and inside diameter D/2, then the maximum shear stress will be

(a) 1.067 τ (b) 1.145 τ
(c) 1.335 τ (d) 2 τ

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : $k = \frac{D_i}{D_o} = \frac{1}{2}$

For solid shaft, $\tau_s = \frac{16T}{\pi D^3}$

For hollow shaft, $\tau_H = \frac{16T}{\pi D^3[1 - k^4]}$

$$\tau_H = \frac{16T}{\pi D^3\left[1 - \left(\frac{1}{2}\right)^4\right]}$$

$$\tau_H = \frac{16T}{\pi D^3} \times \frac{16}{15}$$

$$\tau_H = 1.066\ \tau$$

948. Two solid shafts 'A' and 'B' are made of the same material. The shaft 'A' is 50 mm diameter and shaft 'B' is 100 mm diameter. The ratio of strength of shaft 'B' compared to shaft 'A' is

(a) 1/2 (b) 2
(c) 4 (d) 8

ISRO Scientist/Engineer (RAC) 12.01.2020, ESE 2016

Ans. (d) : $d_A = 50$ mm
$d_B = 100$ mm

Strength of shaft is proportional to the polar section modulus.

$$\frac{Z_{P_B}}{Z_{P_A}} = \left(\frac{d_B}{d_A}\right)^3 = 8$$

949. A pump is used to transport the water. The maximum power required through the shaft is 62.8 W, when it rotates at 100 rpm. What will be the diameter of shaft (in cm) if the maximum permissible shearing stress is 100 MN/m^2? [π = 3.14]

(a) $\left(\frac{96}{314}\right)^{1/3}$ (b) $\left(\frac{196}{314}\right)^{1/3}$
(c) $\left(\frac{296}{314}\right)^{1/3}$ (d) $\left(\frac{396}{314}\right)^{1/3}$

APPSC Poly Lect. 13.03.2020

Ans. (a) : Given data : Power (P) = 62.8 Watt
Rotational speed (N) = 100 rpm
shear stress $(\tau)_{max}$ = 100 MN/m^2
π = 3.14
Let,
d = dia of the shaft

$\because P = T\omega = \frac{2\pi NT}{60}$

$\Rightarrow T = \frac{60P}{2\pi N}$

$\tau_{max} = \frac{16T}{\pi d^3} \Rightarrow T = \frac{\pi d^3}{16} \times \tau_{max}$

$\because \frac{\pi}{16} d^3 \tau = \frac{60P}{2\pi N}$

$\Rightarrow d^3 = \frac{60P \times 16}{\pi\tau \times 2\pi N} = \frac{60 \times 62.8 \times 16}{3.14 \times 100 \times 10^6 \times 2 \times 3.14 \times 100}$

$\Rightarrow d^3 = \frac{96 \times 2}{2 \times 100 \times 3.14 \times 10^6}$

$\Rightarrow d^3 = \frac{96}{314} \times 10^{-6}$ m

$\Rightarrow d^3 = \left(\frac{96}{314}\right)^{1/3} \times 10^{-2}$ m

$\Rightarrow d = \left(\frac{96}{314}\right)^{1/3}$ cm

950. Torsional-sectional-modulus of a shaft is also called as:

(a) Sectional modulus (b) Polar modulus
(c) Torsion modulus (d) Torsional rigidity

CIL MT 27.02.2020

Ans. (b) : Polar modulus is defined as the ratio of the polar moment of inertia to the radius of shaft. It is also called as torsional section modulus (Z_P).

$$I_P = \frac{\pi}{32} D^4$$

$$Z_P = \frac{\pi}{16} D^3$$

951. A solid circular shaft needs to be designed to transmit a torque of 55 N m. If the allowable shear stress of the material is 280 N/mm^2, find the diameter (in mm) of the shaft required to transmit torque. (Assume, π = 22/7)

Search on Telegram @apna_pdf

(a) 5.62 (b) 10
(c) 31.62 (d) 25.0

ISRO Scientist/Engineer 12.01.2020

Ans. (b) : For circular solid shaft,

$$\tau = \frac{16T}{\pi D^3}$$

$$D^3 = \frac{16T}{\pi\tau_{per}} = \frac{16\times 55\times 10^3}{\frac{22}{7}\times 280}$$

$D^3 = 1000$, $D = 10$ mm

952. A solid bar of circular cross-section having a diameter of 40 mm and length of 1.3 m is subjected to torque of 340 Nm. If the shear modulus of elasticity is 80 GPa, the angle of twist between the ends will be

(a) 1.26° (b) 1.32°
(c) 1.38° (d) 1.44°

ESE 2020

Ans. (a) : Angle of twist

$$\theta = \frac{T\ell}{GJ}$$

$$= \frac{340\times 10^3\times 1300}{80\times 10^3\times\frac{\pi}{32}\times 40^4}$$

$= 0.02198$ rad, $\theta = 1.26°$

953. Two shafts, one hollow and the other solid, are of same material, weight and length. If the inside diameter of the hollow shaft is half of its outer diameter, the strength of the hollow shaft to that of solid shaft will be about

(a) 1.067 (b) 1.33
(c) 1.44 (d) 1.67

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : When the hollow and solid shafts are of equal weights. In this case torsional strength is compared.

$$\frac{T_{hollow}}{T_{solid}} = \frac{1+n^2}{\sqrt{1-n^2}}$$

Given as $D_i = \frac{D_o}{2}$

$$n = \frac{D_i}{D_o}$$

$$= \frac{1}{2} = 0.5$$

$$\frac{T_{hollow}}{T_{solid}} = \frac{1+0.5^2}{\sqrt{1-0.5^2}} = 1.44$$

954. An universal coupling is used to connect two mild steel shafts transmitting a torque of 5000 N-m. Assuming that the shafts are subjected to torsion only, find the diameter of the shafts and pins. The allowable shear stresses for the shaft and pin may be taken as 60 MPa and 28 MPa respectively.

(a) 75 mm, 40 mm (b) 95 mm, 50 mm
(c) 40 mm, 85 mm (d) 75 mm, 60 mm

RPSC IOF, 2020

Ans. (a) : Given,
Allowable shear stress for shaft = 60 MPa
Transmitted torque,

$T = 5000$ N-m
$= 5000 \times 10^3$ N-mm
$= 5 \times 10^6$ N-mm

$$\tau_{shaft} = \frac{16T}{\pi d^3}$$

$$60 = \frac{16\times 5\times 10^6}{\pi d_{shaft}^3}$$

$$d_{shaft}^3 = \frac{16\times 5\times 10^6}{\pi\times 60}$$

$d_{shaft} = 75.15$ mm

For pin, allowable shear stress = 28 MPa

$$T = (2F)\times\left(\frac{d}{2}\right)$$

By convention, 2 Pin/key are used and both pin/key are under double shear.

So, $$T = 2\times(2F)\times\left(\frac{d}{2}\right)$$

$$5000 = 2\times(2\times F)\times\frac{75.15\times 10^{-3}}{2}$$

$F = 33.33 \times 10^3$ N

So, same force is applied in both shaft and pin/key

$$F = \tau_{pin}\times A_{pin} = \tau_{pin}\times\frac{\pi}{4}d_p^2$$

$$33.33\times 10^3 = 28\times 10^6\times\frac{\pi}{4}d_p^2$$

$d_p = 38.89$ mm
$d_p \approx 40$ mm

955. A solid shaft is used to transmit a power of 120 π kW at 120 rpm. The torque transmitted by the shaft is

(a) 30 kNm (b) 60 kNm
(c) 90 kNm (d) 120 kNm

Gujarat PSC AE 2019

Ans : (a) : Given-

$P = 120\ \pi$kW
$N = 120$ rpm

$$P = T\omega = \frac{T2\pi N}{60}$$

$$120\pi = \frac{T2\pi\times 120}{60}$$

$T = 30$ kNm

956. Hollow shafts are stronger than solid shafts having same weight because

(a) the stiffness of hollow shaft is less than that of solid shaft
(b) the strength of hollow shaft is more than that of solid shaft
(c) the natural frequency of hollow shaft is less than that of solid shaft
(d) in hollow shafts, material is not spread at large radius

ESE 2019

Search on Telegram @apna_pdf

Ans. (b) : Strength of hollow shaft is more than that of solid shaft because polar section modulus of hollow shaft is greater than that of solid shaft.

957. A propeller shaft is required to transmit 45 kW power at 500 r.p.m. It is a hollow shaft having inside diameter 0.6 times the outside diameter. It is made of plain carbon steel and the permissible shear stress is 84 N/mm^2. The inner and outer diameters of the shaft are nearly.

(a) 21.7 mm and 39.1 mm
(b) 23.5 mm and 39.1 mm
(c) 21.7 mm and 32.2 mm
(d) 23.5 mm and 32.2 mm

ESE 2019

Ans. (b) : Given,

$P = 45$ kW
$N = 500$ rpm
$d_i = 0.6\, d_o$

$$k = \frac{d_i}{d_o} = 0.6$$

$\tau_{max} = 84$ N/mm^2

$$P = \frac{2\pi NT}{60}$$

$$45 \times 10^3 = \frac{2\pi \times 500 \times T}{60}$$

$T = 859.87$ N-m $= 859.43 \times 10^3$ N-mm

For hollow shaft

$$\tau_{max} = \frac{16T}{\pi d_o^3\left[1-\left(\frac{d_i}{d_o}\right)^4\right]}$$

$$84 = \frac{16 \times 859.43 \times 10^3}{\pi d_o^3[1-0.6^4]}$$

$$d_o^3 = 59896.95$$

$d_o = 39.12$ mm
$d_i = 23.47$ mm

958. In case of a torsional problem the assumption- "Plane sections perpendicular to longitudinal axis before deformation remain plane and perpendicular to the longitudinal axis after deformation" holds true for a shaft having

(a) circular cross-section
(b) elliptical cross-section
(c) circular and elliptical cross-section
(d) any cross-section

APPSC AEE SCREENING 17.02.2019

Ans. (a) : In case of a torsional problem the assumption-
"Plane sections perpendicular to longitudinal axis before deformation remain plane and perpendicular to the longitudinal axis after deformation" holds true for a shaft having circular cross-section only. It is not valid for other shape of cross-section.

959. A shaft turns at 200 rpm under a torque of 1800 Nm. The power transmitted is

(a) 6π kW (b) 12π kW
(c) 24π kW (d) 36π kW

APPSC AEE SCREENING 17.02.2019

Ans. (b) :

$$P = \frac{2\pi NT}{60}$$

$$= \frac{2\pi(200)(1800)}{60}$$

$= 12000\ (\pi)$
$= (12\ \pi)$ kW

960. A solid circular shaft of length 4 m is to transmit 3.5 MW at 200 rpm. If permissible shear stress is 50 MPa, the radius of the shaft is:

(a) 1.286 mm (b) 12.86 mm
(c) 0.1286 mm (d) 128.6 mm

BHEL ET 2019

Ans. (d) : Given -

Length = L = 4m
P = 3.5 MW
N = 200 rpm
$\tau = 50$ MPa, radius = r = ?
$\tau = 50 \times 10^3$ kPa

Power $P = T\omega$

$$3.5 \times 10^6 = T \times \frac{2\pi N}{60}$$

$$= T \times \frac{2\pi \times 200}{60}$$

$$3.5 \times 10^6 = 20.943\ T$$

$T = 167.120$ kN-m

Torsion equation-

$$\frac{T}{J} = \frac{T}{r}$$

$$r = \frac{\tau J}{T}$$

$$r = \frac{50 \times \frac{\pi d^4}{32}}{167.120}$$

$$\frac{d}{2} = \frac{50 \times \pi d^4}{5347.84}$$

$$\frac{5347.84}{50 \times 2 \times \pi} = d^3$$

$d = 0.25724$
$2r = 0.25724$
$r = 0.12862$ m

$\boxed{r = 128.6 \text{ mm}}$

961. The maximum shear stress developed on the surface of a solid circular shaft under pure torsion is 160 MPa. If the shaft diameter is doubled, then the maximum shear stress developed corresponding to the same torque will be:

(a) 10 MPa (b) 30 MPa
(c) 40 MPa (d) 20 MPa

BHEL ET 2019

Ans. (d) : Given

$(\tau_{max}) = 160$MPa
$d_1 = d$
$d_2 = 2d$

same torque $\boxed{T_1 = T_2 = T}$

Search on Telegram @apna_pdf

$$(\tau_{max})_1 = \frac{16T}{\pi d^3} \Rightarrow \quad 160 = \frac{16T}{\pi d^3} \qquad ...(1)$$

when diameter is doubled.

$$(\tau_{max})_2 = \frac{16T}{\pi(2d)^3} = \frac{16T}{8\pi d^3} \qquad ...(2)$$

from equation (1) / equation (2)

$$\frac{160}{(\tau_{max})_2} = \frac{16T}{\pi d^3} \times \frac{8\pi d^3}{16T}$$

$$\boxed{(\tau_{max})_2 = 20\,MPa}$$

962. A 50 mm diameter solid shaft is subjected to both, a bending moment and torque of 300 kN-mm & 200 kN-mm respectively. The maximum shear stress induced in the shaft is :

(a) 10.22 MPa (b) 14.69 MPa
(c) 146.9 MPa (d) 102.2 MPa

BHEL ET 2019

Ans. (b) : Given diameter of shaft d = 50 mm
Bending moment M = 300 kN-m
Torque T = 200 kN-m

$T_e = \sqrt{M^2 + T^2}$ be the equivalent torque, which acts alone producing the same maximum shearing stress

$$\tau_{max} = \frac{T_e}{\frac{\pi d^3}{16}} = \frac{16}{\pi d^3} T_e$$

$$\tau_{max} = \frac{16 \times 10^3}{\pi \times (50)^3} \sqrt{(300)^2 + (200)^2}$$

$$= \frac{16 \times 360.555 \times 10^3}{\pi \times 125000}$$

$$= \frac{5768880}{392699.081}$$

= 14.69 MPa

963. Which of the following is correct for flexible shaft?

(a) it has very low rigidity both in bending and torsion
(b) it has very high rigidity in bending and low rigidity in torsion
(c) it has low rigidity in bending and high rigidity in torsion
(d) It has very high rigidity both in bending and torsion

SJVN ET 2019

Ans. (c) : flexible shaft has low rigidity in bending and high rigidity in torsion.

964. A steel spindle transmits 4 kW at 800 r.p.m. The angular deflection should not exceed 0.25°/m length of the spindle. If the modulus of rigidity for the material of the spindle is 84 GPa, the diameter of the spindle will be

(a) 46 mm (b) 42 mm
(c) 38 mm (d) 34 mm

ESE 2019

Ans. (d) : Given, P = 4 kW
N = 800 rpm
G = 84 GPa

$$\theta = 0.25 \times \frac{\pi}{180} \times \frac{1}{1000}$$

$\theta = 4.363 \times 10^{-6}$ rad/mm

$$T = \frac{60P}{2\pi N}$$

$$= \frac{60 \times 4 \times 10^3}{2\pi \times 800} = 47.77 \text{ N-m}$$

$= 47.77 \times 10^3$ N-mm

$$\frac{\theta}{L} = \frac{T}{GJ}$$

$$\frac{4.363 \times 10^{-6}}{1} = \frac{47.77 \times 10^3}{84 \times 10^3 \times J}$$

J = 130343.90 mm^4

$$\frac{\pi}{32} d^4 = 130343.90$$

d = 33.949 mm
d = 34 mm

965. In a propeller shaft, sometimes apart from bending and twisting, end thrust will also develop stresses which would be

(a) Tensile in nature and uniform over the cross-section
(b) Compressive in nature and uniform over the cross-section
(c) Tensile in nature and non-uniform over the cross-section
(d) Compressive in nature and non-uniform over the cross-section

ESE 2019

Ans. (b) : Due to end thrust, stresses would be compressive in nature and uniform over cross section.

966. If a shaft is required to transmit twice the power at twice the speed for which it is designed, its diameter must

(a) increase two times (b) reduce two times
(c) remain same (d) increase three times

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (c) : We know that power transmitted by shaft

$P = T.\omega$

$$T = \frac{\pi D^3}{16} \tau$$

$$\frac{\pi \times D^3 \times \tau}{16} = \frac{P}{2\pi N}$$

If P' = 2P, N' = 2N
then D' = ?

$$\frac{\pi \times D'^3 \times \tau}{16} = \frac{2P}{2 \times 2\pi \times N} = \frac{P}{2\pi N} = \frac{\pi \times D^3 \times \tau}{16}$$

D' = D

Diameter must be same.

967. The power transmitted by a shaft 60 mm diameter at 180 RPM, if the permissible stress is 85 N/mm^2

(a) 68 kW (b) 650 kW
(c) 1200 kW (d) 7 kW

ISRO Scientist/Engineer (RAC) 22.04.2018

Search on Telegram @apna_pdf

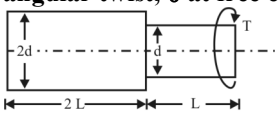
Ans. (a) : d = 60 mm, N = 180 RPM, τ = 85 MPa
We know that

$$P = T \times \omega = \frac{\pi d^3}{16} \times \tau \times \frac{2 \times \pi \times N}{60}$$

$$P = \frac{\pi \times 60^3 \times 85}{16} \times \frac{2 \times \pi \times 180}{60}$$

P = 67952226.3 N-mm/sec
P = 67.9 kW

968. Torque, *T* is applied at the free end of a stepped rod of circular cross section as shown in figure. If the shear modulus of the material is *G*, the angular twist, θ at free end will be



(a) $\frac{12TL}{G\pi d^4}$ (b) $\frac{24TL}{G\pi d^4}$
(c) $\frac{36TL}{G\pi d^4}$ (d) $\frac{48TL}{G\pi d^4}$

ISRO Scientist/Engineer 22.04.2018

Ans. (c): We know that, When Shafts are connected in series

$$\theta = \theta_1 + \theta_2$$

$$= \left(\frac{TL}{GJ}\right)_1 + \left(\frac{TL}{GJ}\right)_2$$

$$= \frac{T \times L \times 32}{G \times \pi \times d^4} + \frac{T \times 2L \times 32}{G\pi \times 2^4 \times d^4}$$

$$= \frac{T \times L \times 32}{G\pi \times d^4} + \left[1 + \frac{2}{2^4}\right]$$

$$\theta = \frac{36TL}{G\pi d^4}$$

969. The angle of twist of shaft is
(a) directly proportional to (shaft diameter)^2
(b) inversely proportional to (shaft diameter)^2
(c) directly proportional to (shaft diameter)^4
(d) inversely proportional to (shaft diameter)^4

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (d) : As we know,

Angle of twist, $\phi = \frac{TL}{JG}$

$$J = \frac{\pi D^4}{32}$$

$$\phi \propto \frac{1}{J}$$

$$\Rightarrow \quad \phi \propto \frac{1}{D^4}$$

So, ϕ is inversely proportional to (shaft diameter)^4.(d^4)

970. Torsion bars are in parallel
(a) if same torque acts on each
(b) if they have equal angles of twist and applied torque apportioned between them
(c) are not possible
(d) if their ends are connected together

TNPSC AE 2018

Ans. (b) : Torsion bars are in parallel if they have equal angles of twist and applied torque apportioned between them.

$T = T_1 + T_2$
$\theta = \theta_1 = \theta_2$

971. Shearing stress produced on the surface of a solid shaft of diameter (d_0) is τ. The shear stress produced on the surface of hollow shaft of same material, subjected to same torque, and having the outer diameter d_0 and internal diameter d_0x is given as: [Where $x < 1$]

(a) $\frac{\tau}{1-x^4}$ (b) $\left(1-x^4\right)\tau$
(c) $\left(1-x^2\right)\tau$ (d) $\frac{\tau}{1-x^2}$
(e) $\frac{\tau}{1-2x^4}$

CGPSC AE 25.02.2018

Ans. (a) : Shear stress in solid shaft

$$\tau_s = \frac{T \times \frac{d_0}{2}}{\frac{\pi}{32} \times d_0^4} = \tau$$

Shear stress in hollow shaft is

$$\tau_H = \frac{T \times (d_o/2)}{\frac{\pi}{32} d_0^4 \left[1 - x^4\right]} \qquad [d_i = x d_o]$$

$$\tau_H = \frac{T \times (d_0/2)}{\frac{\pi}{32}\left(d_0^4\right)} \times \frac{1}{\left(1-x^4\right)}$$

$$\boxed{\tau_H = \frac{\tau}{1-x^4}}$$

972. A solid shaft is subjected to bending moment of 3.46kN-m and a torsional moment of 11.5kN-m. For this case, the equivalent bending moment and twisting moment are
(a) 7.73kN-m and 12.0kN-m
(b) 14.96kN-m and 12.0kN-m
(c) 7.73kN-m and 8.04kN-m
(d) 14.96kN-m and 8.04kN-m

ESE 2018

Ans. (a) : Given,
M = 3.46 kN-m
T = 11.5 kN-m
Equivalent bending moment is given by

$$M_e = \frac{1}{2}\left[M + \sqrt{M^2 + T^2}\right]$$

$$= \frac{1}{2}\left[3.46 + \sqrt{(3.46)^2 + (11.5)^2}\right]$$

= 7.734 kN-m
Equivalent twisting moment is given by

$$T_e = \sqrt{M^2 + T^2}$$

$$= \sqrt{(3.46)^2 + (11.5)^2} = 12 \text{ kN-m}$$

Search on Telegram @apna_pdf

973. A solid shaft can resist a bending moment of 6 kN m and a torque of 8 kN m applied together. The maximum torque that the shaft can resist when applied alone is

(a) 7 kN m (b) 48 kN m
(c) 10 kN m (d) 14 kN m

ISRO Scientist/Engineer 22.04.2018

Ans. (c): T = 8kN-m
M = 6kN-m
Maximum torque means equivalent torque T_{eq}.

$$T_{eq} = \sqrt{M^2 + T^2}$$
$$= \sqrt{8^2 + 6^2}$$
$$= \sqrt{100}$$
$$T_{eq} = 10 \text{ kN-m}$$

974. The diameter of shaft in any power transmission system is proportional to:

(a) speed of the shaft
(b) horse power to be transmitted
(c) torque to be transmitted
(d) allowable shear stress of the material

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (b) : The diameter of shaft in any power transmission system is proportional to horse power to be transmitted power $P = T \times \frac{2\pi N}{60}$

and $\tau = \frac{16T}{\pi d^3}$ or $T = \frac{\tau \pi d^3}{16}$

$$P = \frac{\tau \pi d^3}{16} \times \frac{2\pi N}{60}$$
$$d^3 = \frac{480P}{\pi^2 JN}$$
$$d \propto \left(\frac{P}{N}\right)^{1/3}$$

So, diameter is directly proportional to power.

975. A 3 m long steel shaft has to transmit 7.5 kW at 3600 rpm. Required shaft diameter is given by (Take allowable shear stress = 100 N/mm^2, π^2 = 10)?

(a) 10 mm (b) 7.5 mm
(c) 25 mm (d) 12.5 mm

ISRO Scientist/Engineer 17.12.2017

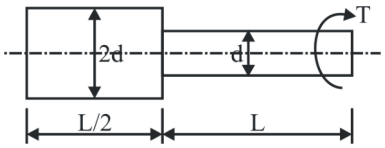
Ans. (a) : Given,
L = 3 m, P = 7.5 kW = 7500 W
N = 3600 rpm τ = 100 N/mm^2
π^2 = 10
We know that

$$P = \frac{2\pi NT}{60}$$
$$7500 = \frac{2\pi \times 3600 \times T}{60}$$
$$T = \frac{375}{6\pi} \text{N} - \text{m} = \frac{375 \times 10^3}{6\pi} \text{N} - \text{mm}$$

From torsion equation,

$$\frac{16T}{\pi d^3} = \tau$$
$$\frac{16}{\pi d^3} \times \frac{375 \times 10^3}{6\pi} = 100$$
$$d^3 = \frac{16 \times 375 \times 10^3}{\pi^2 \times 6 \times 100}$$
$$d^3 = 1013.21$$
$$d = 10.04 \text{ mm}$$

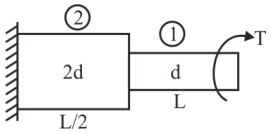
976. A torque T is applied at the free end of a stepped rod of circular cross-sections as shown in the figure. The shear modulus of the material of the rod is G. The expression for diameter 'd' to produce an angular twist θ at the free end is



(a) $\left(\frac{30TL}{\pi\theta G}\right)^{1/4}$ (b) $\left(\frac{33TL}{\pi\theta G}\right)^{1/4}$
(c) $\left(\frac{18TL}{\pi\theta G}\right)^{1/4}$ (d) $\left(\frac{24TL}{\pi\theta G}\right)^{1/4}$

ISRO Scientist/Engineer 07.05.2017

Ans. (b) :



$$\frac{T}{J} = \frac{G\theta}{L} = \frac{\tau}{R}$$
$$\boxed{\theta = \frac{TL}{GJ}}$$
$$T = T_1 = T_2$$
$$\theta = \theta_1 + \theta_2$$
$$= \frac{T_1 L_1}{G_1 J_1} + \frac{T_2 L_2}{G_2 J_2} = \frac{TL}{G\frac{\pi d^4}{32}} + \frac{T \times \frac{L}{2}}{G \times \frac{\pi}{32}(16d^4)}$$
$$= \frac{TL}{G\pi d^4}\left[32 + \frac{1}{2} \times \frac{32}{16}\right]$$
$$\theta = \frac{TL}{G\pi d^4}[33]$$
$$d^4 = \frac{TL}{G\pi\theta}[33]$$
$$d = \left[\frac{TL}{G\pi\theta}(33)\right]^{\frac{1}{4}}$$

977. The torque (T) transmitted by sleeve coupling with D and d as outer and inner diameters, respectively, is given by:

Search on Telegram @apna_pdf

(a) $T = \frac{\pi}{8} \times \tau \left(\frac{D^4 - d^4}{D} \right)$

(b) $T = \frac{\pi}{12} \times \tau \left(\frac{D^4 - d^4}{D} \right)$

(c) $T = \frac{\pi}{16} \times \tau \left(\frac{D^4 - d^4}{D} \right)$

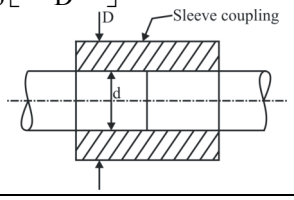
(d) $T = \frac{\pi}{32} \times \tau \left(\frac{D^4 - d^4}{D} \right)$

(e) $T = \frac{\pi}{64} \times \tau \left(\frac{D^4 - d^4}{D} \right)$

(CGPCS Polytechnic Lecturer 2017)

Ans. (c) : Torque transmitted by sleeve coupling

$$T = \frac{\pi}{16}\left[\frac{D^4 - d^4}{D}\right] \times \tau$$



978. The boring bar of a boring machine is 25 mm in diameter. During operation, the bar gets twisted though 0.01 radians and is subjected to a shear stress of 42 N/mm^2. The length of the bar is (Taking G = 0.84 × 10^5 N/mm^2)

(a) 500 mm (b) 250 mm

(c) 625 mm (d) 375 mm

GPSC EE Pre, 28.01.2017

Ans. (b) : Given-

Diameter (D) = 25 mm

$$R = \frac{25}{2} \text{ mm}$$

Twist (θ) = 0.01 radian

τ = 42 N/mm^2

G = 0.84 × 10^5 N/mm^2

From the equation of torsion

$$\frac{T}{J} = \frac{\tau_{max}}{R} = \frac{G\theta}{l}$$

$$\frac{\tau_{max}}{R} = \frac{G\theta}{l}$$

$$l = \frac{G\theta \times R}{\tau_{max}}$$

$$= \frac{0.84 \times 10^5 \times 0.01 \times \frac{25}{2}}{42}$$

l = 250 mm

979. A circular shaft of 60 mm diameter is running at 150 r.p.m. What will be the torque transmitted by the shaft if (τ = 80 MPa)?

(a) 1.1 π kN-m (b) 1.6π kN-m

(c) 2.1π kN-m (d) 2.6π kN-m

(e) 3.1π kN-m

(CGPCS Polytechnic Lecturer 2017)

Ans. (a) : d = 60 mm

N = 150 rpm

τ = 80 MPa = 80 N/mm^2

We know that

$$T = \frac{\pi d^3}{16} \times \tau = \frac{\pi \times 60 \times 60 \times 60}{16} \times 80 \text{ N} - \text{mm}$$

T = 1.08π kN-m ≃ 1.1π kN-m

980. A solid shaft is to transmit 20 kW at 200 r.p.m. The ultimate shear stress for the shaft material is 360 MPa and the factor of safety is 8. The diameter of the solid shaft shall be

(a) 42 mm (b) 45 mm

(c) 48 mm (d) 51 mm

ESE 2017

Ans. (c) : Given,

P = 20 kW = 20 × 10^3 W

N = 2000 rpm

τ_u = 360 MPa

$$T = \frac{60P}{2\pi N} = \frac{60 \times 20}{2\pi \times 200} = \frac{3}{\pi} \text{kN} - \text{m}$$

$$\tau = \frac{16T}{\pi d^3} = \frac{\tau_u}{FS} = \frac{16 \times \frac{3}{\pi}}{\pi \times d^3} = \frac{360}{8}$$

d = 47.6 mm

981. Maximum shear stress in the shaft if subjected to combine twisting moment (M_t) and bending moment (M_b)–

(a) $\frac{16}{\pi d^3}\sqrt{(M_b)^2 + (M_t)^2}$

(b) $\frac{16}{\pi d^3}\sqrt{(M_b)^2 - (M_t)^2}$

(c) $\frac{32}{\pi d^3}\sqrt{(M_b)^2 + (M_t)^2}$

(d) $\frac{32}{\pi d^3}\sqrt{(M_b)^2 - (M_t)^2}$

Nagaland PSC CTSE 2017, Paper-I

Ans. (a) : Maximum, shear stress in the shaft.

$$\tau_{max} = \frac{16}{\pi d^3}\sqrt{(M_b)^2 + (M_t)^2}$$

982. A hollow shaft of 20 mm diameter and 16 mm inside diameter is subjected to a torque of 40 Nm. The shear stress at outside of the shaft will be:

(a) 53.12 N/mm^2 (b) 43.13 N/mm^2

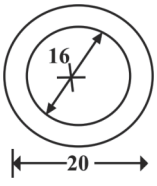
(c) 62.52 N/mm^2 (d) 34.50 N/mm^2

ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (b) : D = 20 mm

d = 16 mm

Torque T = 40 N-m



Search on Telegram @apna_pdf

Shear stress τ

$$= \frac{16T}{\pi D^3 (1-K^4)}$$

where

$$K = \frac{d}{D} = \frac{16}{20}$$

$$\tau = \frac{16 \times 40 \times 1000}{\pi \times (20)^3 \times \left[1 - \left(\frac{16}{20}\right)^4\right]}$$

$\tau = 43.13$ N/mm^2

983. Two steel shafts, one solid of diameter D and other hollow of outside diameter D and inside diameter D/2 are twisted to the same angle of twist per unit length. Ratio of maximum shear stress in solid shaft to that in the hollow shaft is

(a) $\frac{4}{9}$ (b) $\frac{8}{7}$

(c) $\frac{16}{15}$ (d) 1

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-1998

Ans. (d) : Torsion formula

$$\frac{\tau}{r_{max}} = \frac{G\theta}{\ell}$$

for solid shaft $r_{max} = D/2$

for hollow shaft $r_{max} = D/2$

Since both are made of steel

$\therefore$ G remains same

Given angle of twist per unit length is ame

$\therefore \frac{\theta}{\ell}$ for both shafts is same

$$\frac{\delta_s}{\delta_h} = \frac{(r_{max})_s}{(r_{max})_h} = \frac{D/2}{D/2} = 1$$

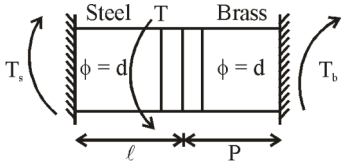
984. Steel shaft and brass shaft of same length and diameter are connected by a flange coupling. The assembly is rigidly held at its ends and is twisted by a torque through the coupling. Modulus of rigidity of steel is twice that of brass. If torque of the steel shaft is 500 Nm, then the value of the torque in brass shaft will be

(a) 250 Nm (b) 354 Nm

(c) 500 Nm (d) 708 Nm

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-2001

Ans. (a) :



$G_S = 2\ G_B$

$T_S = 500$ NM

$T_S + T_b = T$ ——— (1)

Also angle of twist at coupling is equal for both shafts

$$\frac{T_s \ell}{G_s j} = \frac{T_b \ell}{G_b J}$$

(ℓ, are equal for both shafts)

$$\frac{T_s}{T_b} = \frac{G_s}{G_b} = 2 \qquad \text{——— (2)}$$

$$T_b = \frac{500}{2} = 250\text{Nm}$$

985. When subjected to a torque, a circular shaft undergoes a twist of 1° in a length of 1200 mm, and the maximum shear stress induced is 80 N/mm^2. The modulus of rigidity of the material of the shaft is 0.8×10^5 N/mm^2. What is the radius of the shaft?

(a) $90/\pi$mm (b) $108/\pi$mm

(c) $180/\pi$mm (d) $216/\pi$mm

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : $\tau = 80$ N/mm^2

$$\frac{\theta}{\ell} = \frac{1^\circ}{1200} = \frac{1}{1200} \times \frac{\pi}{180} \qquad \text{(in radian)}$$

$G = 0.8 \times 10^5$ N/mm^2

Torsion formula

$$\frac{\tau}{r_{max}} = \frac{G\theta}{\ell}$$

$$\frac{80}{r_{max}} = \frac{0.8 \times 10^5 \times 1 \times \pi}{1200 \times 180}$$

$$r_{max} = \frac{1200 \times 180}{10^5 \pi} = \frac{216}{\pi}$$

986. Power is transmitted through a shaft, rotating at 2.5 Hz (150 rpm). The mean torque on the shaft is 20×10^3 Nm. What magnitude of power in kW is transmitted by the shaft?

(a) 50π (b) 120π

(c) 100π (d) 150π

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c) : N = 150 rpm

$T = 20 \times 10^3$ Nm

$$P = \frac{2\pi NT}{60 \times 1000} \text{kW}$$

$$= \frac{2\pi \times 150 \times 20 \times 10^3}{60 \times 1000}$$

$$= \frac{100\pi \times 10^3}{1000} = 100\pi \text{ kW}$$

987. A shaft of circular section is said to be in pure torsion when it is subjected to equal and opposite end couples whose axes coincides with the

(a) axis of the shaft

(b) normal line to the axis of the shaft

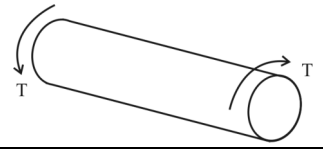
(c) any line passing through the section of the shaft

(d) parallel line to the axis of the shaft

APPSC AE Subordinate Service Civil/Mech. 2016

Search on Telegram @apna_pdf

Ans. (a) : A shaft of circular section is said to be in pure torsion when it is subjected to equal and opposite end couples whose axis coincides with the axis of the shaft.



988. A tubular shaft, having an inner diameter of 30 mm and an outer diameter of 40 mm, is to be used to transmit 80 kW of power. The speed of rotation of the shaft so that the shear stress will not exceed 50 MPa is

(a) 29.6 rpm (b) 3557.4 rpm
(c) 1778.7 rpm (d) 59.2 rpm

ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Inner diameter $d_i = 30$ mm
Outer diameter $d_o = 40$ mm

$P = 80$ kW

$\tau = 50$ MPa

$$T = \frac{P(kW)\times 60}{2\pi N(rpm)}\times 10^6 \quad \text{(N-mm)}$$

$$T = \frac{80\times 60}{2\pi\times N}\times 10^6$$

$$T = \frac{2400\times 10^6}{\pi\times N} = \frac{24\times 10^8}{\pi N} \quad \text{(N-mm)}$$

$$\boxed{\frac{T}{J} = \frac{G\theta}{L} = \frac{\tau}{R}}$$

$$\boxed{\frac{T}{J} = \frac{\tau}{R}}$$

For solid–

$$\tau_{max} = \frac{16T}{\pi d^3}$$

$$\tau_{max} = \frac{16T}{\pi d^3(1-k^4)}$$

Where $k = \frac{d_i}{d_o}$

$$50\times 10^6 = \frac{\frac{16\times 24\times 10^8}{\pi N}}{\pi d_0^3(1-k^4)}$$

$$k = \frac{d_i}{d_o} = \frac{30}{40}$$

$$k^4 = (0.75)^4$$

$$50\times 10^6 = \frac{16\times 24\times 10^8}{\pi^2\times(40)^3\times\left[1-(0.75)^4\right]\times N}$$

$$50 = \frac{16\times 24\times 10^2}{\pi^2\times 64000\times 0.68\times N}$$

$$N = \frac{16\times 24\times 100}{50\times 64000\times 0.68\times\pi^2}$$

$N = 1778.7$ rpm

989. A hollow circular shaft of outside and inside diameter 100 mm and 90 mm is subjected to a torque $T = 3\pi$ kNm. Polar moment of inertia of circular section is $\pi\times 10^{-6}$ m^4. Maximum shear stress on the shaft is given by:

(a) 175 MPa (b) 100 MPa
(c) 150 MPa (d) 125 MPa

UPRVUNL AE 07.10.2016

Ans. (c) : Data given,
$d_o = 100$ mm
$d_i = 90$ mm
$T = 3\pi$ k N-m
$J = \pi\times 10^{-6}$ m^4

$$\frac{T}{J} = \frac{\tau}{\left[\frac{d_o}{2}\right]} = \frac{G\theta}{l}$$

$$\tau = \frac{3\pi\times 10^3\times 0.05}{\pi\times 10^{-6}}$$

$\tau = 150$ MPa

990. For shaft in torsion

(a) $\frac{q}{r} = \frac{T}{J}$ (b) $\frac{C\theta}{\ell} = \frac{T}{J}$
(c) $\frac{q}{r} = \frac{C\theta}{\ell}$ (d) All the above

APPSC AEE Screening Test 2016

Ans. (d)

$$\frac{T}{J} = \frac{C\theta}{\ell} = \frac{q}{r}$$

Where,
C = Modulus of rigidity
ℓ = Length
T = Torque
q = Shear stress

991. The ratio of maximum shear stress of a solid shaft of diameter D to that of a hollow shaft having external diameter D and internal diameter 0.5D is

(a) 0.50 (b) 1.00
(c) 1.50 (d) 2.00

APPSC AEE Screening Test 2016

Ans. (*) : Given,
Inner diameter = 0.5D
Outer diameter = D, solid shaft dia = D

$$\text{Ratio} = \frac{\tau_{solid}}{\tau_{hollow}} = \frac{\frac{16T}{\pi D^3}}{\frac{16T}{\pi D^3\left[1-\left(\frac{d}{D}\right)^4\right]}}$$

$$= \frac{\pi D^3\left[1-\left(\frac{0.5D}{D}\right)^4\right]}{\pi D^3}$$

$= [1-(0.5)^4]$
$= (1-0.0625) = 0.9375 \simeq 1$

Note-Official answer given by the commission is (d).

Search on Telegram @apna_pdf

992. Which of the following assumption in the theory of pure torsion is false

(a) All radii get twisted due to torsion
(b) the twist is uniform along the length
(c) the shaft is uniform circular section through out
(d) cross section plane before torsion remain plane after torsion

APPSC AEE MAINS 2016, PAPER-III

Ans. (a) : Assumption in the theory of Torsion–

1. The material of shaft is uniform throughout the length.
2. The twist along the shaft is uniform.
3. The shaft is of uniform circular section throughout the length.
4. Cross-section of the shaft, which are plane before twist remain plane after twist.
5. All radii which are straight before twist remain straight after twist.

993. In a rectangular shaft is subjected to torsion, the maximum shear stress will occur

(a) Along the diagonal
(b) At the corners
(c) At the centre
(d) At the middle of the longer side

Nagaland PSC CTSE 2016 Paper-I

Ans. (d) : For a rectangular shaft is subjected to torsion the maximum shear stress will occur at the middle of the longer side.

994. Three shafts (spring constant k_1, k_2, k_3) are connected in series such that they carries the same torque (T), then spring constant (k) for composite shaft will be

(a) $k = k_1 + k_2 + k_3$

(b) $k = (k_1k_2 + k_2k_3 + k_3k_1)^{1/2}$

(c) $\frac{1}{k} = \frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3}$

(d) $k = \left(\frac{k_1k_2k_3}{k_1 + k_2 + k_3}\right)^{1/2}$

RPSC LECTURER 16.01.2016

Ans. (c) : In series, same torque acting on each three shafts

$T_1 = T_2 = T_3 = T$

$\theta = \theta_1 + \theta_2 + \theta_3$ ...(1)

$\theta = \frac{GJ}{TL}$

Equation No. (1) divided by T

$$\frac{\theta}{T} = \frac{\theta_1}{T} + \frac{\theta_2}{T} + \frac{\theta_3}{T}$$

$$\frac{1}{\left(\frac{T}{\theta}\right)} = \frac{1}{\left(\frac{T}{\theta_1}\right)} + \frac{1}{\left(\frac{T}{\theta_2}\right)} + \frac{1}{\left(\frac{T}{\theta_3}\right)}$$

$$\frac{T}{\theta} = K = \frac{GJ}{L}$$

$$\frac{1}{k} = \frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3}$$

995. The torque transmitted by a solid shaft of diameter 40 mm if the shear stress is not to exceed 400 N/cm^2, would be :

(a) $1.6 \times \pi$ N-m (b) 16π N-m
(c) $0.8 \times \pi$ N-m (d) $0.4 \times \pi$ N-m

HPPSC W.S. Poly. 2016

Ans : (b) Shaft diameter = 40mm

Shear stress (τ_{max}) = 400N/cm^2

$$\frac{T}{J} = \frac{G\theta}{\ell} = \frac{\tau}{r}$$

$$T = \frac{\tau.J}{r}$$

$$T = \frac{\pi d^3 \tau}{16}$$

$$T = \frac{\pi \times 40^3 \times 400}{16 \times 1000 \times 100}$$

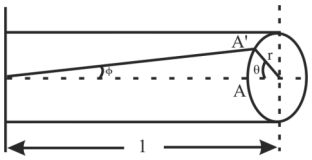
$T = 16\pi$ N-m

996. A shaft of 20 mm diameter and length 1 m is subjected to a twisting moment, due to which shear strain on the surface of the shaft is 0.001. The angular twist in the shaft is

(a) 0.1 radian (b) 0.01 radian
(c) 0.05 radian (d) 0.5 radian

UPPSC AE 12.04.2016 Paper-I

Ans : (a)



ℓ = Shaft length = 1000 mm

θ = twist angle

ϕ = shear strain = 0.001

r = shaft radius

$$\phi = \frac{AA'}{\ell} \quad .....(i)$$

$$\theta = \frac{AA'}{r} \quad .....(ii)$$

for equation (i) and (ii)

$$\phi\ell = \theta r$$

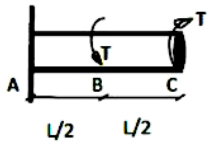
$$\theta = \frac{\phi\ell}{r}$$

$$\theta = \frac{0.001 \times 1000}{\frac{20}{2}}$$

$$\boxed{\theta = 0.1 \text{ radian}}$$

997. A shaft of J polar moment of Inertia and C modulus of rigidity is fixed at one end and subjected to torque T at the free end and the same torque at mid length in opposite direction as shown in figure, then the difference in the twist between the free end and the midpoint is equal to

Search on Telegram @apna_pdf

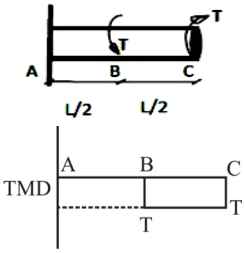


(a) $\frac{T}{2CJ}$ (b) $\frac{3T}{2CJ}$

(c) $\frac{T}{CJ}$ (d) $\frac{T}{4\,CJ}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : Beam divide this Shaft into two parts AB & BC



$\theta_C - \theta_B$ is asked $\theta_B = 0$ $\therefore [T_B = T_C]$

& No torque at AB portion.

$$\therefore \Rightarrow \theta = \frac{TL}{CJ}$$

$$\theta_C - \theta_B = \frac{T \times \frac{L}{2}}{CJ} = \frac{TL}{2CJ}$$

998. Polar moment of inertia of a hollow tube of diameter 'd' and thickness 't' is

(a) $\frac{\pi d^3 t}{32}$ (b) $\frac{\pi d^3 t}{16}$

(c) $\frac{\pi d^3 t}{4}$ (d) $\frac{\pi d^4}{16}$

RPSC ADE 2016

Ans. (c) :

$I_P = \frac{\pi d^3 t}{4}$

d = diameter

t = thickness

999. The following torsional terms is analogous to bending terms except

(a) T/J corresponds to M/I

(b) G/ℓ corresponds to E/R

(c) τ/r corresponds to σ/y

(d) Gθ/ℓ corresponds to E/R

RPSC VPITI 14.02.2016

Ans. (b) : Bending moment equation $\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$

Torsion equation $\frac{T}{J} = \frac{\tau}{r} = \frac{G\theta}{l}$

$\frac{T}{J}$ corresponds to $\frac{M}{I}$

$\frac{\tau}{r}$ corresponds to $\frac{\sigma}{y}$

$\frac{G\theta}{l}$ corresponds to $\frac{E}{R}$

1000. The unit of torsional stress in SI units is :

(a) Kg/m^2 (b) Kg-m

(c) N/m^2 (d) N-m

HPPSC Lect. (Auto) 23.04.2016

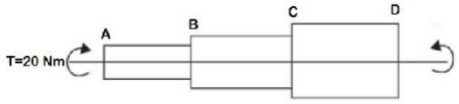
Ans. (c) : The unit of torsional stress in SI units is N/m^2

torsional shear stress

$\tau = \frac{16T}{\pi d^3}$ T = torque transmitted

d = diameter of shaft

1001. The torsional stiffness of individual sections of lengths AB, BC and CD are 40 N-m/rad, 60 N-m/rad and 120 N-m/rad respectively.



What is the angular deflection between the ends A and D of the shaft?

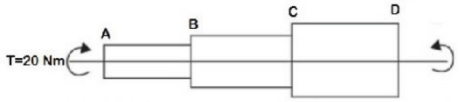
(a) 0.5 rad (b) 0.1 rad

(c) 1 rad (d) 5 rad

(e) 10 rad

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) : As we know,



$\frac{T}{\theta}$ = Torsional stiffness

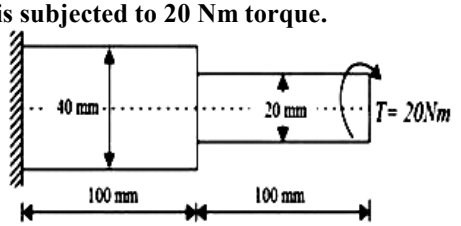
$$\theta_{AB} = \frac{1 \times 20}{40}, \quad \theta_{BC} = \frac{1 \times 20}{60}$$

$$\theta_{CD} = \frac{1 \times 20}{120}$$

So, $\theta_{AD} = \theta_{AB} + \theta_{BC} + \theta_{CD} = \frac{1 \times 20}{40} + \frac{1 \times 20}{60} + \frac{1 \times 20}{120}$

$$= \frac{1}{2} + \frac{1}{3} + \frac{1}{6} = 1 \text{rad}$$

1002. A stepped steel shaft shown in the figure below is subjected to 20 Nm torque.



If the modulus of rigidity is 80 GPa, then what is the strain energy, in N-mm, in the shaft?

(a) 6.4 (b) 10.8

(c) 12.7 (d) 16.9

(e) 23.7

CGPSC Asstt. Workshop Supt., 17.07.2016

Search on Telegram @apna_pdf

Ans. (d) : Given,
Torque (T) = 20 Nm
Modulus of rigidity (G) = 80 GPa
From figure,

$$T_1 = T_2 = T = 20 \text{ Nm}$$

$$\theta = \theta_1 + \theta_2$$

$$\theta = \frac{T_1 L_1}{J_1 G_1} + \frac{T_2 L_2}{J_2 G_2}$$

Here, $T_1 = T_2 = 20 \times 10^3$ N-mm

$L_1 = L_2 = 100$ mm

$G_1 = G_2 = 80 \times 10^3$ N/mm^2

$$\theta = \frac{TL}{G}\left[\frac{1}{J_1} + \frac{1}{J_2}\right]$$

$$\theta = \frac{20 \times 1000 \times 100}{80 \times 10^3}\left[\frac{32}{\pi \times 20^4} + \frac{32}{\pi \times 40^4}\right]$$

$$\theta = \frac{20 \times 1000 \times 100 \times 32}{\pi \times 80 \times 10^3}\left[\frac{1}{20^4} + \frac{1}{40^4}\right]$$

$$\theta = 1.69102 \times 10^{-3}$$

$$\text{Strain energy} = \frac{1}{2} T \times \theta$$

$$= \frac{1}{2} \times 20 \times 1000 \times 1.69102 \times 10^{-3}$$

Strain energy = 16.91 N-mm

1003. If the diameter of shaft is doubled its stiffness increases by a factor of:

(a) 2 (b) 6
(c) 16 (d) 24

HPPSC Asstt. Prof. 29.10.2016

Ans. (c) : Torsional stiffness $(k_t) = \frac{GJ}{\ell} = \frac{G}{\ell}\frac{\pi}{32} d^4$

$$\boxed{k_t \propto d^4}$$

$$d_2 = 2d_1$$

$$\frac{(k_t)_2}{(k_t)_1} = \left(\frac{d_2}{d_1}\right)^4 = 16$$

$$\boxed{(k_t)_2 = 16(k_t)_1}$$

1004. Polar modulus is the ratio of

(a) Polar moment of inertia of the shaft to the maximum radius
(b) Moment of inertia of the shaft to the maximum radius
(c) Polar moment of inertia of the shaft to the permissible shear stress
(d) Moment of inertia of the shaft to the maximum shear stress

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Polar modulus is defined as the ratio of polar moment of inertia of the shaft to the maximum radius of the shaft. It is also called as torsional section modulus.

$$\boxed{Z_p = \frac{J}{R}}$$

1005. Torsional flexibility is the reciprocal of

(a) Torsional stiffness (b) Torsional rigidity
(c) Polar modulus (d) Twisting moment

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Torsional flexibility → It is defined as the angle of twist produced by the unit torque applied. It is reciprocal of torsional stiffness.

$$\text{Torsional flexibility} = \frac{L}{GJ} = \frac{\theta}{T}$$

$$\text{Torsional stiffness} = \frac{GJ}{L} = \frac{T}{\theta}$$

1006. A shaft is subjected to the combined bending load 'M' and tensional load 'T', the maximum shear stress at the outer surface of the shaft will be equal to

(a) $16T / \pi d^3$
(b) $32M / \pi d^3$
(c) $16(M^2 + T^2)^{1/2} / \pi d^3$
(d) $32(M^2 + T^2)^{1/2} / \pi d^3$

VIZAG MT 2015

Ans. (c) : $\tau_{max} = \frac{16}{\pi d^3}\left[\sqrt{M^2 + T^2}\right]$

1007. In a shaft with a transverse hole, as the hole to the shaft diameter ratio increases, the torsional stress concentration factor-

(a) Increases (b) Remains constant
(c) Decreases (d) Is equal to one

NPCIL ET, 2015

Ans. (c) : • As the hole to shaft diameter increase then the torsional stress concentration factor decrease.

1008. A composite shaft, consisting of two stepped portions having spring constants of K_1 and K_2, is held firmly at one end and other end is free and subjected to a torque T. Its equivalent spring constant is:

(a) $(K_1 + K_2)/2$ (b) $(K_1 K_2) / (K_1 + K_2)$
(c) $(K_1 + K_2)$ (d) $(K_1 + K_2) / (K_1 K_2)$

NPCIL ET, 2015

Ans. (b) :

$$\frac{1}{K_{eq}} = \frac{1}{K_1} + \frac{1}{K_2}$$

$$\frac{1}{K_{eq}} = \frac{K_1 + K_2}{K_1 K_2}$$

$$K_{eq} = \frac{K_1 K_2}{K_1 + K_2}$$

1009. For two geometrically similar shafts of the same material having diameter ratio 2 : 1, if the smaller one has a torque capacity of 1 kg-m, then the larger one will carry.

(a) 2 kg-m
(b) 4 kg-m
(c) 8 kg-m
(d) 1 kg-m because of similarity

BPSC Asstt. Prof. 29.11.2015

Search on Telegram @apna_pdf

Ans. (c) : $T_1 = \frac{\pi}{16} \quad \tau(d_1)^3$

$$T_2 = \frac{\pi}{16}\tau(d_2)^3$$

$$\frac{T_1}{T_2} = \frac{\frac{\pi}{16}\tau(d_1)^3}{\frac{\pi}{16}\tau(d_2)^3}$$

$$\frac{T_1}{T_2} = \frac{(d_1)^3}{(d_2)^3}$$

$$\frac{T_1}{1} = \frac{(2)^3}{(1)^3}$$

$$\boxed{T_1 = 8\ kgm}$$

1010. In a hollow circular shaft of outer and inner diameters of 20 cm and 10 cm respectively, the shear stress is not to exceed 40 N/mm^2. The maximum torque which the shaft can safely transmit is

(a) 58.9 kN-m (b) 57.9 kN-m
(c) 56.9 kN-m (d) 58.7 kN-m

MPPSC AE 08.11.2015

Ans. (a) : Given, for hollow circular shaft
Outer dia. (d_o) = 20 cm = 0.2 m
Inner dia. (d_i) = 10 cm = 0.1 m
Shear stress (τ) = 40 N/mm^2 = 40 × 10^6 N/m^2
Let, T = maximum torque

$$\therefore\ T = \frac{\pi}{16} d_o^{.3}\left(1 - K^4\right).\tau\ ,\ \left(\text{Where, } K = \frac{d_i}{d_o} = \frac{0.1}{0.2} = \frac{1}{2}\right)$$

$$= \frac{\pi}{16} \times (0.2)^3 \times \left[1 - \left(\frac{1}{2}\right)^4\right] \times 40 \times 10^6$$

= 58.90 × 10^3 N-m
T = 58.90 kN-m

1011. Angle of twist allowed in case of camshaft is :

(a) Dependent on its length
(b) Restricted to ½ degree irrespective of length of the shaft
(c) Depending on the torque acting on it
(d) Dependent on the nature of the engine (i.e. 4 stroke or 2 stroke)

OPSC AEE 2015 Paper-I

Ans : (c) Angle of twist allowed in case of camshaft is Depending on the torque acting on it.

1012. A solid circular shaft of 60 mm diameter and 10 m length, transmits a torque of 2000 N-m. The value of maximum angular deflection, if the modulus of rigidity is 100 GPa is

(a) 18 degree (b) 13 degree
(c) 15 degree (d) 9 degree
(e) 5 degree

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Given, d = 60 mm
l = 10 m = 10000 mm
G = 100 GPa = 100 × 10^3 N/mm^2
T = 2000 N-m = 2000 × 10^3 N-mm

From torsion equation

$$\frac{T}{J} = \frac{G\theta}{l}$$

$$\theta = \frac{T.l}{GJ} = \frac{2000 \times 10}{100 \times 10^9 \times \frac{\pi}{32}(0.06)^4} = 0.157 \text{ radian}$$

$$\theta = 0.157 \times \frac{180}{\pi} = 9 \text{ degree}$$

1013. In case of shaft design, one of the following equation is known as stiffness equation:

(a) $\frac{T}{J} = \frac{\tau}{R}$ (b) $\frac{M}{J} = \frac{\sigma}{R}$
(c) $\frac{M}{I} = \frac{\tau}{R}$ (d) $\frac{T}{J} = \frac{G\theta}{L}$
(e) $\frac{M}{I} = \frac{G\theta}{L}$

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Equation $\left(\frac{T}{J} = \frac{G\theta}{L}\right)$ is known as stiffness equation.

1014. 100 kW is to be transmitted by each of two separate shafts 'A' and 'B'. 'A' is rotating at 250 rpm and 'B' at 300 rpm. Which shaft must have greater diameter.

(a) A
(b) B
(c) Both will have same diameter
(d) Unpredictable

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : We know that

$$N \propto \frac{1}{D}$$

then, $\frac{D_A}{D_B} = \frac{N_B}{N_A} = \frac{300}{250}$

then, $D_A > D_B$

1015. The strength of a hollow shaft for the same length, material and weight is ..... a solid shaft:

(a) Less than (b) More than
(c) Equal to (d) None of these

OPSC AEE 2015 Paper-I

Ans : (b) The strength of a hollow shaft for the same length, material and weight is more than a solid shaft.
When the shaft is subjected to pure torsional moment (T). the torsional shear stress is given by

for solid shaft : $\tau = \frac{16T}{\pi d^3}$

For hollow shaft : $\tau = \frac{16T}{\pi d_0^3\left(1 - C^4\right)}$

1016. A shaft of 10 mm diameter, whose maximum shear stress is 48 N/mm^2 can produce a maximum torque equal to

(a) 2000 π N - mm (b) 4000 π N - mm
(c) 1000 π N - mm (d) 3000 π N-mm

TSPSC AEE 2015

Search on Telegram @apna_pdf

Ans : (d) Shaft dia (d) = 10 mm
Max shear stress (τ_{max}) = 48 N/mm^2

$$\tau_{max} = \frac{16T}{\pi d^3}$$

$$T = \frac{\tau \times \pi d^3}{16}$$

$$T = \frac{48 \times \pi \times 10^3}{16}$$

$$T = 3000\pi \text{ N-mm.}$$

1017. The equivalent twisting moment to design a shaft subjected to the fluctuating loads will be given by

(a) $\sqrt{(K_t M)^2 + (K_m T)^2}$

(b) $\sqrt{(K_m M)^2 + (K_t T)^2}$

(c) $\sqrt{K_m M + (K_m M)^2 + (K_t T)^2}$

(d) $\frac{1}{2}\left[K_m M + \sqrt{(K_m M)^2 + (K_t T)^2}\right]$

TSPSC AEE 2015

Ans : (b) (i) Equivalent Bending moment

$$M_e = \frac{1}{2}\left[K_m M + \sqrt{(K_m M)^2 + (K_t T)^2}\right]$$

(ii) Equivalent twisting moment

$$T_e = \sqrt{(K_m M)^2 + (K_t T)^2}$$

K_m = Shock and fatigue factor for bending
k_t = shock and fatigue factor for twisting

1018. If a body is transmitting torque T kgm at angular speed of θ radians/sec, then h.p. transmitted will be-

(a) Tθ/75 (b) T/θ
(c) Tθ/50 (d) Tθ

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) We know that

$$\text{Power (P)} = T \times \omega = T \times \omega \times g\left(\frac{N-m}{sec}\right)$$

1 h.p.= 746W

$$1W = \frac{1}{746}hp$$

$$P = \frac{9.81T \times \theta}{746} \qquad \omega = \theta \text{ radian/sec}$$

$$\boxed{P = \frac{T \times \theta}{75} \text{h.p.}}$$

1019. A shaft subjected to fluctuating loads for which the normal torque (T) and bending moment (M) are 1000 N-m and 500 N-m respectively. If the combined shock and fatigue factor for bending is 1.2 and combined shock and fatigue factor for torsion is 2 then the equivalent twisting moment for the shaft is_____

(a) 2088 N-m (b) 2050 N-m
(c) 2136 N-m (d) 2188 N-m

(HPPSC AE 2014)

Ans. : (a) Equivalent twisting moment (T_e)

$$T_e = \sqrt{(K_m \times M)^2 + (K_t \times T)^2}$$

M = Bending moment = 500 N-m
T = Twisting moment = 1000 N-m
K_m = fatigue factor for bending = 1.2
K_t = fatigue factor for torsion = 2

$$T_e = \sqrt{(1.2 \times 500)^2 + (2 \times 1000)^2}$$

T_e = 2088 N-m

1020. Strain energy stored in a solid circular shaft is proportional to (GJ is torsional rigidity)

(a) GJ (b) 1/GJ
(c) 1/(GJ)^2 (d) (GJ)^2

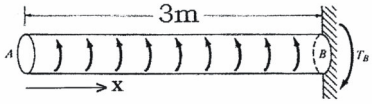
Mizoram PSC AE/SDO 2014, Paper-II

Ans. (b) : Strain energy stored in a solid circular shaft is proportional to–

$$U = \frac{1}{2}\frac{T^2 L}{GJ}$$

$$\boxed{U \propto \frac{1}{GJ}}$$

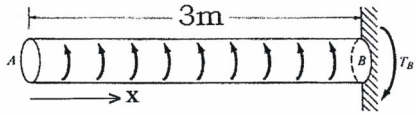
1021. Shaft AB is 3 meter long and its free at the left end and fixed torsionally at the right end. It is subjected to variable torque as shown in the figure. The intensity of the torsional loading is given by q = 2x. The internal torque T, as a function of x is



(a) $T = x^2$ (b) $T = 2x^2$
(c) $T = 4x^2$ (d) $T = 16x^2$

ISRO Scientist/Engineer 24.05.2014

Ans. (a) :



The intensity of the torsional loading q = 2x
The internal torque 'T' as the function of 'x'.

$$T = \int q\,dx$$

$$= \int 2x\,dx$$

$$= \left[\frac{2x^2}{2}\right]$$

$$T = x^2$$

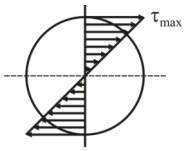
1022. The variation of shear in a circular shaft subjected to torsion is :

(a) linear (b) parabolic
(c) hyperbolic (d) None of these

MPPSC State Forest Service Exam, 2014

Search on Telegram @apna_pdf

Ans. (a) : When a shaft is subjected to a torque or twisting a shearing stress is produced in the shaft. The shear stress varies from zero in the axis to a maximum at the outside surface of the shaft. The variation due to concentration loads is linear.



Solid shaft

1023. If pure torsion is applied to a piece of classroom chalk, it may crack along a 45° helical surface due to _____.
(a) maximum shear stress
(b) maximum principal stress
(c) maximum tensile stress
(d) none of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : Chalk is a brittle material hence it will fails by maximum principle stress theory.
in case of pure torsion.

$\sigma_x = 0 \quad \& \quad \sigma_y = 0$

$$\tan(2\theta_P) = \frac{\tau_{xy}}{\frac{\sigma_x - \sigma_y}{2}} = \infty$$

$2\theta_P = 90°$

$$\boxed{\theta_P = 45°}$$

1024. The torisonal stiffness of a circular shaft is
(a) Directly proportional to its length
(b) Independent of its length
(c) Inversely proportional to its length
(d) Proportional to square of its length

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (c)

Torsional Stiffness $(k_t) = \frac{T}{\theta}$

$$\frac{T}{J} = \frac{G\theta}{L} = \frac{\tau}{R} \rightarrow \frac{T}{\theta} = \frac{GJ}{L}$$

$$\boxed{k_t = \frac{GJ}{L}}$$

1025. A torque of 50 N-m applied on the wheel operating a valve. If the wheel is rotated through two revolutions, work done in Newton-metres is given by
(a) 100 (b) 25
(c) 314 (d) 628

TNPSC AE 2014

Ans. (d) : T = 50 N-m
one revolution = 360°
$\theta = 4\pi \quad (720^o)$
Then work done will be -
$W = T\theta = 50 \times 4\pi$

$$\boxed{W = 628\ N-m}$$

1026. A solid shaft is replaced by a hollow shaft with outer diameter same as the diameter of the solid shaft. The internal diameter of the hollow shaft is kept as 3/4th of its outer diameter. What is the ratio of torque transmitting capacity of hollow shaft to that of the solid shaft?
(a) 175/256 (b) 3/4
(c) 9/16 (d) 27/64

RPSC AEN Pre-2013

Ans. (a) : Given –
For Hollow shaft-
Inner diameter (ID) = D_i
Outer diameter (OD) = D_o
For solid shaft,
Diameter (D) = D_o

$$D_i = \frac{3}{4} D_o \Rightarrow \frac{D_i}{D_o} = \frac{3}{4}$$

We know that, $\tau = \frac{16T}{\pi D^3} \Rightarrow T = \frac{\pi D^3 \tau}{16}$

$\because \quad T \propto D^3$

For hollow shaft,

$$\boxed{T_{Hollow} \propto D^3\left[1-\left(\frac{D_i}{D_o}\right)^4\right]}, \quad \frac{T_{Hollow}}{T_{Solid}} = \frac{D^3\left[1-\left(\frac{D_i}{D_o}\right)^4\right]}{D^3}$$

$$\frac{T_{Hollow}}{T_{Solid}} = 1-\left(\frac{3}{4}\right)^4$$

$$= 1-\frac{81}{256}$$

$$\boxed{\frac{T_{Hollow}}{T_{Solid}} = \frac{175}{256}}$$

1027. For the two shafts connected in parallel, which of the following in each shaft is same?
(a) Torque (b) Shear stress
(c) Angle of twist (d) Torsional stiffness

UKPSC AE-2013, Paper-I

Ans. (c) : When the two shafts connected in parallel then both shafts are subjected to same angle of twist.
$\theta = \theta_1 = \theta_2$
$T = T_1 + T_2$

1028. A hollow shaft has external and internal diameters of 10cm and 5cm respectively. Torsional section modulus of shaft is:-
(a) 375 cm^3 (b) 275 cm^3
(c) 184 cm^3 (d) 84 cm^3

UKPSC AE-2013, Paper-I

Ans. (c) : We know that torsional section modulus for hollow shaft

$$Z_p = \frac{\pi}{16} D^3\left[1-K^4\right]$$

where $K = \frac{d}{D}$

putting d = 5 cm, D = 10 cm

Search on Telegram @apna_pdf

$$Z_p = \frac{\pi}{16} \times (10)^3 \times \left[1 - \left(\frac{5}{10}\right)^4\right]$$

$$Z_p = 184 \text{ cm}^3$$

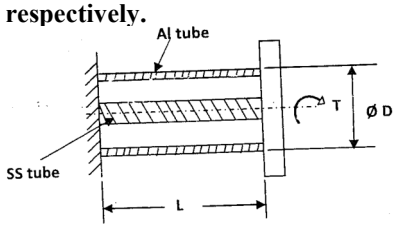
1029. Which part of the shaft cross section has maximum shear stress ?

(a) 1 mm from the centre of the surface
(b) Centre of the surface
(c) Outermost surface
(d) 2 mm from the centre of the surface

TNPSC AE (Industries) 09.06.2013

Ans. (c) : Maximum shear stress of the shaft occurs at outermost surface.

1030. A 'SS' tube is inserted into an '*Al*' tube. They are permanently fixed at one end. The other end is attached to a rigid plate. A torque 'T' is applied to the rigid plate. The circumference of the '*Al*' tube at dia 'D' at the plate and with respect to the fixed and rotates by a distance ..... mm due torque 'T'. The polar MOI & Rigidity modulus of *Al* & SS are J_{Al}, G_{Al} and J_{ss}, G_{ss} respectively.



(a) $\frac{DLT}{2(G_{Al} - G_{ss}J_{ss})}$ (b) $\frac{DLT}{2G_{Al}J_{Al}}$

(c) $\frac{DLT}{2(G_{Al}J_{Al} + G_{ss}J_{ss})}$ (d) $\frac{2DLT}{G_{ss}J_{ss}}$

ISRO Scientist/Engineer 12.05.2013

Ans. (c) : At end, Torque = T

Circumference of the *Al* tube Diameter = D

The polar moment of Inertia (MOI) and Rigidity of *Al* and SS are J_{Al}, G_{Al} and J_{ss}, G_{ss}.

Here, *Al* and SS are connected in parallel.

So, In parallel,

$$T = T_{Al} + T_{ss} \quad ...(1)$$

Let angle of twist of Al tube is θ_{Al} and angle of twist of SS tube is θ_{ss} due to applied torque acting at cross-section.

$$\theta_{Al} = \frac{T_{Al}L}{G_{Al}J_{Al}}$$

$$\theta_{ss} = \frac{T_{ss}L}{G_{ss}J_{ss}}$$

In parallel,

$$\theta_{Al} = \theta_{ss} = \theta$$

$$\therefore \quad \frac{T_{Al}L}{G_{Al}J_{Al}} = \frac{T_{ss}L}{G_{ss}J_{ss}}$$

$$\therefore \quad T_{Al} = \frac{G_{Al}J_{Al}}{G_{ss}J_{ss}}T_{ss}$$

From Equation (1)

$$T = T_{Al} + T_{ss}$$

$$= \frac{G_{Al}J_{Al}}{G_{ss}J_{ss}}T_{ss} + T_{ss}$$

$$T = T_{ss}\left[\frac{G_{ss}J_{ss} + G_{Al}J_{Al}}{G_{ss}.J_{ss}}\right]$$

$$\therefore \quad \theta = \frac{T_{Al}L}{G_{Al}J_{Al}} = \frac{T_{SS}.L}{G_{SS}J_{SS}}$$

$$\theta_{Al} = \theta_{SS} = \frac{TL}{(G_{ss}J_{ss} + G_{Al}J_{Al})} radian$$

Distance of circumferential point.

$$d = 2R \text{ mm} \qquad \left[R = \frac{D}{2}\right]$$

$$\therefore \quad d = \frac{TDL}{2(G_{AL}J_{Al} + G_{ss}J_{ss})} mm$$

1031. Torsional rigidity of a solid cylindrical shaft of diameter 'd' is proportional to

(a) d (b) d^2

(c) d^4 (d) $\frac{1}{d^2}$

UKPSC AE 2012 Paper-I

Ans. (c) : $TR = GJ$

$$TR \propto J$$

$$TR \propto \frac{\pi}{32}d^4$$

$$TR \propto d^4$$

1032. Polar moment of inertia of an equilateral triangle of side '*x*' is given by

(a) $\frac{x^4}{16}$ (b) $\frac{x^4}{16\sqrt{3}}$

(c) $\frac{x^4}{32}$ (d) $\frac{x^4}{64}$

UKPSC AE 2012 Paper-I

Ans. (b) : $\frac{x^4}{16\sqrt{3}}$

1033. Torsional rigidity of a shaft is given by

(a) $\frac{T}{\ell}$ (b) $\frac{T}{J}$

(c) $\frac{T}{\theta}$ (d) $\frac{T}{r}$

APPSC AEE 2012

Ans : (c) Torsion Equation

$$\frac{T}{J} = \frac{G\theta}{\ell} = \frac{\tau}{r}$$

T = Torque in N-mm

l = length of the shaft in mm

R = Radius of the circular shaft in mm

G = Modulus of rigidity of shaft material in N/mm^2

$$\frac{T}{J} = \frac{G\theta}{\ell} = \frac{\tau}{r}$$

$$GJ = \frac{T\ell}{\theta}$$

Search on Telegram @apna_pdf

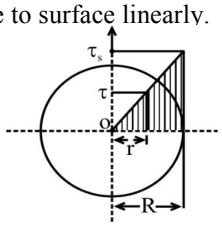
G J is known as torsional rigidity of the shaft. It is important to note that the relative stiffness of two shafts is measured by the inverse ratio of the angles of twist is equal length of shafts when subjected to equal torques.

1034. Shear stress for a circular shaft due to torque varies

(a) from surface to centre parabolically
(b) from surface to centre linearly
(c) from centre to surface parabolically
(d) from centre to surface linearly

APPSC AEE 2012

Ans : (d) Shear stress for a circular shaft due to torque varies from centre to surface linearly.



$$\frac{T}{J}=\frac{G\theta}{l}=\frac{\tau}{r}$$

The above relation states that the intensity of shear stress at any point in the cross-section of a shaft subjected to pure torsion is proportional to its distance from the centre.

1035. A circular shaft subjected to torsion undergoes a twist of 1^0 in a length of 1.2 m. If the maximum shear stress induced is 100 MPa and the rigidity modulus is 0.8×10^5 MPa, the radius of the shaft in mm should be

(a) $\frac{270}{\pi}$ (b) $\frac{\pi}{270}$
(c) $\frac{180}{\pi}$ (d) $\frac{\pi}{180}$

APPSC AEE 2012

Ans : (a) Twist angle $(\theta)=1^0$
length of shaft = 1.2 m
Maximum shear stress = 100 MPa
Modulus of rigidity $(G)=0.8\times10^5$ MPa.

Torsion equation $\frac{T}{J}=\frac{G\theta}{l}=\frac{\tau}{r}$

$$\frac{100\times10^6}{r}=\frac{0.8\times10^5\times\pi\times10^6}{180\times1.2}$$

$$\boxed{r=\frac{270}{\pi}\text{mm}}$$

1036. Two shafts are of same length and same material. The diameter and maximum shear stress of the second shaft is twice that of the first shaft. Then the ratio of power developed between the first and second shaft is

(a) 16 (b) $\frac{16}{3\sqrt{3}}$
(c) $\frac{1}{16}$ (d) $\frac{3}{16}$

APPSC AEE 2012

Ans : (c) Power develop (P) = Tω

Case 1st:-

$$T=\frac{\pi d^3\tau}{16}$$

$$P_1=\frac{\pi d^3\tau}{16}\times\omega$$

Case 2nd :-

$$P_2=\frac{\pi(2d)^3\times2\tau}{16}\times\omega$$

assume, both case angular speed same then

Ratio of power developed $\left(\frac{P_1}{P_2}\right)=\frac{1}{16}$

$$\boxed{\frac{P_1}{P_2}=\frac{1}{16}}$$

1037. The shear stress developed at a radial distance *r* is *q* . The shear stress developed at a radial stress $\frac{r}{2}$ is :

(a) 0.75 *q* (b) 0.5 *q*
(c) *q* (d) 0.25 *q*

APGENCO AE 2012

Ans. (b) : Shear stress (τ) $\propto$ radial distance (r)

$\tau \propto r \rightarrow$ In radial distance

$$\frac{\tau_1}{\tau_2}=\frac{r_1}{r_2}$$

$$\frac{q}{\tau_2}=\frac{r}{\frac{r}{2}} \Rightarrow \frac{q}{\tau_2}=\frac{2}{1}$$

$$\tau_2=\frac{q}{2}=0.5q$$

1038. The maximum shear stress occurs on the outer most fibers of a circular shaft under torsion. In a close coiled helical spring the maximum shear stress occurs on the

(a) Outermost fibers
(b) Fibers at mean diameter
(c) Innermost fiber
(d) End coils

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (c) : Helical spring the maximum shear stress occur on the inner side of the spring for both tensile & compressive load on spring, this is because, inner shear stress is the sum of shear stress due to torsion and shear stress due to force or applied load.

1039. A shaft revolving at 'ω' radians/s transmits torque 'T' N-m. the power developed is :

(a) T.ω. Watts (b) 2πT.ω Watts
(c) 2T.ω Watts (d) 2π T/ω Watts

RPSC AE GWD, 2011

Ans. (a) :

$$\text{Power } P = T\times\omega=\frac{2\pi NT}{60}$$

Search on Telegram @apna_pdf

1040. A solid shaft of 100mm diameter transmits 160 HP at 200 rpm. The modulus of rigidity G = 8 × 10^5 kg/cm^2. Then the maximum angle of twist for a length of 6 meter is

(a) 5° (b) 2.5°
(c) 3.2° (d) 2°

ISRO Scientist/Engineer 2011

Ans. (b) : P = 160 HP
N = 200 rpm
G = 8 × 10^5 kg/cm^2
l = 6m
θ = ? d = 0.100 m
P = 160 × 746
P = 119360 W
= 119.360 kW

$$P = \frac{2\pi NT}{60}$$

$$119.36 = \frac{2\times 3.14\times 200\times T}{60}$$

T = 5.70 kN/m

$$\frac{T}{J} = \frac{G\theta}{l} = \frac{\tau}{r}$$

$$\frac{T}{J} = \frac{G\theta}{l}$$

$$\frac{5.70}{\frac{\pi}{32}d^4} = \frac{8\times 10^5 \times 9.81\times 10^4 \times \theta}{6\times 1000}$$

Or θ = 0.044 rad

$$= \frac{0.044\times 180}{\pi}$$

θ ≈ 2.5°

1041. Two heavy rotating masses are connected by shafts of lengths l_1, l_2 and l_3 and the corresponding diameters are d_1, d_2 and d_3. This system is reduced to a torsionally equivalent length of the shafts is

(a) $l_1 + l_2\left(\frac{d_1}{d_2}\right)^4 + l_3\left(\frac{d_1}{d_3}\right)^4$

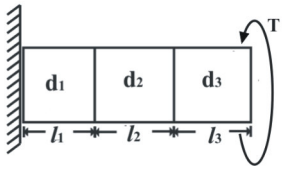
(b) $l_1 + l_2\left(\frac{d_1}{d_2}\right)^3 + l_3\left(\frac{d_1}{d_3}\right)^3$

(c) $\frac{l_1 + l_2 + l_3}{3}$

(d) $l_1 + l_2 + l_3$

ISRO Scientist/Engineer 2011

Ans. (a) :



$$\theta = \theta_1 + \theta_2 + \theta_3$$

$$\frac{Tl_e}{GJ} = \frac{Tl_1}{GJ_1} + \frac{Tl_2}{GJ_2} + \frac{Tl_3}{GJ_3}$$

$$\frac{l_e}{\frac{\pi}{32}d_e^4} = \frac{l_1}{\frac{\pi}{32}d_1^4} + \frac{l_2}{\frac{\pi}{32}d_2^4} + \frac{l_3}{\frac{\pi}{32}d_3^4}$$

$$\frac{l_e}{d_e^4} = \frac{l_1}{d_1^4} + \frac{l_2}{d_2^4} + \frac{l_3}{d_3^4}$$

$$\frac{l_e}{d_e^4} = \frac{1}{d_1^4}\left[l_1 + l_2\left(\frac{d_1}{d_2}\right)^4 + l_3\left(\frac{d_1}{d_3}\right)^4\right]$$

We assume, $d_1 = d_e$

then, we get $l_e = l_1 + l_2\left(\frac{d_1}{d_2}\right)^4 + l_3\left(\frac{d_1}{d_3}\right)^4$

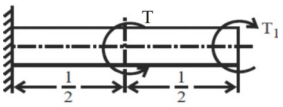
1042.

A solid circular shaft, of polar moment of inertia J and modulus of rigidity of the material G, is fixed at one end and loaded by two torques as shown in the figure. The twist at the free end of the shaft will be zero when

(a) $T_2 = 0.5\ T_1$ (b) $T_2 = T_1$
(c) $T_2 = 2T_1$ (d) $T_1 = 0$

UPSC JWM Advt. No.-50/2010

Ans. (c) :



As we know that,
According to torsion equation –

$$\frac{T}{J} = \frac{G\theta}{L}$$

$$\theta = \frac{TL}{GJ}$$

⇒ G & J are constant or same.
So, the equilibrium is zero,
∴ ΣT = 0

$$T_1 \times \ell - T_2 \times \frac{\ell}{2} = 0$$

$$\boxed{T_2 = 2T_1}$$

1043. For solid shaft subjected to a torque of 18000 Nm having a permissible shear stress of 60N/mm^2, the diameter of shaft is

(a) 115 mm (b) 121 mm
(c) 149 mm (d) 108 mm

ISRO Scientist/Engineer 2010

Ans. (a) : T = 18000 N-m
permissible shear stress τ = 60 N/mm^2

$$\tau = \frac{16T}{\pi d^3}$$

Search on Telegram @apna_pdf

$$60 = \frac{16 \times 18000 \times 1000}{\pi d^3}$$

$$\pi d^3 = 16 \times 3000 \times 100$$

$$d^3 = \frac{16 \times 3000 \times 100}{\pi}$$

$$d = \sqrt[3]{\frac{16 \times 3000 \times 100}{3.141}}$$

d = 115 mm

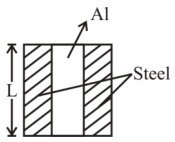
1044. A compound rod is formed by tightly inserting an aluminium rod inside a steel tube. The length of this compound rod is l and its ends are welded together so as to prevent any relative motion. This rod is subjected to a torque T, applied to its ends in opposite directions. If polar moment of inertia of the tube and rod are same and modulus of rigidity of steel is three times that of aluminium, what is the ratio of torque shared by steel tube to that of aluminium rod?

(a) 4 : 1 (b) 3 : 1

(c) 2 : 1 (d) 1 : 1

UPSC JWM Advt. No.-50/2010

Ans. (b) :



We know that,

$$\frac{T}{J} = \frac{G\theta}{L}$$

Given,

$$\ell_{A\ell} = \ell_{St} = L,\ J_{St} = J_{A\ell}$$

$$\theta = \frac{TL}{GJ} \qquad \Rightarrow \qquad G_{St} = 3\ G_{A\ell}$$

For parallel connection

$$\theta = \theta_{St} = \theta_{A\ell}$$

So, $$\frac{T_s \ell_s}{J_s G_s} = \frac{T_{A\ell} \ell_{A\ell}}{J_{A\ell} G_{A\ell}} \Rightarrow \frac{T_s}{T_{A\ell}} = \frac{G_s}{G_{A\ell}} = 3$$

$$\boxed{\frac{T_s}{T_{A\ell}} = \frac{3}{1}}$$

1045. A hollow shaft of outside diameter 40 mm and inside diameter 20 mm is to be replaced by a solid shaft of 30 mm diameter. If the maximum shear stresses induced in the two shafts are to be equal, what is the ratio of the maximum resistible torque in the hollow to that of solid shaft ?

(a) $\frac{10}{9}$ (b) $\frac{20}{9}$

(c) $\frac{30}{9}$ (d) $\frac{40}{9}$

UPSC JWM Advt. No.-50/2010

Ans. (b) : Hollow cylinder

$d_o = 40$ mm, $d_i = 20$ mm

$\tau_H = ?$

$$\frac{T}{J} = \frac{\tau}{R}$$

$$T = \tau \times \frac{J}{R} \Rightarrow k = \frac{d_i}{d_o} = \frac{1}{2}$$

$$J_H = \frac{\pi}{32} d_o^4 (1 - k^4) \Rightarrow \frac{J_H}{R} = \frac{\pi}{16} d_o^3 (1 - k^4)$$

For solid,

d = 30 mm

$\tau_s = ?$

$$J_s = \frac{\pi}{32} d^4$$

$$\therefore \qquad R = \frac{d}{2}$$

$$\frac{J}{R} = \frac{\frac{\pi}{32} d^4}{d/2}$$

$$= \frac{\pi}{16} d^3$$

$$\frac{J}{R} = \frac{\pi}{16} d^3$$

$$\frac{T_h}{T_s} = \frac{\tau_h \times \frac{\pi}{16} \times d_o^3 (1 - k^4)}{\tau_s \times \frac{\pi}{16} \times d^3} = \frac{40^3 (15/16)}{30^3} \quad \left[\because \text{Given, } \tau_H = \tau_S \right]$$

$$\boxed{\frac{T_h}{T_s} = \frac{20}{9}}$$

1046. Assertion (A) : Stress at a point is completely defined by specifying its magnitude, nature, direction and orientation of the plane containing the point.

Reason (R) : Stress is a tensor of second order.

Codes :

(a) Both A and R are individually true and R is the correct explanation of A

(b) Both A and R are individually true and R is not the correct explanation of A

(c) A is true but R is false

(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (a) : As we know, stress is a tensor of second order therefore, it is completely defined by specifying its magnitude, nature, direction & orientation of the plane containing point.

1047. Determine the diameter of solid shaft which will transmit 90 kW at 160 rpm, if the shear stress in the shaft is limited to 60 N/mm^2

(a) 50 mm (b) 60 mm

(c) 77 mm (d) 70 mm

ISRO Scientist/Engineer 2009

Ans. (c) : Power P = 90kW

N = 160 rpm

Shear stress

$\tau = 60$ N/mm^2

$$P = \frac{2\pi NT}{60}$$

Search on Telegram @apna_pdf

$$90\times10^3=\frac{2\pi\times160\times T}{60}$$

Torque, T = 5371.47 N-m

Shear stress, $\tau=\frac{16T}{\pi d^3}$

$$d^3=\frac{16\times5371.47\times10^3}{\pi\times60}$$

d = 76.96 mm

$\boxed{d=77\,mm}$

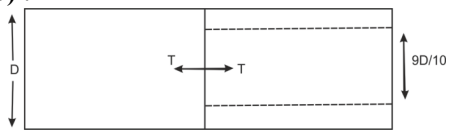
1048. One-half length of 50 mm diameter steel road is solid while the remaining half is hollow having a bore of 5 mm. The rod is subjected to equal and opposite torque at its ends. If the maximum shear stress in solid portion is τ, the maximum shear stress in the hollow portion is :

(a) $\frac{15}{16}\tau$ (b) τ

(c) $\frac{4}{3}\tau$ (d) $\frac{16}{15}\tau$

ISRO Scientist/Engineer 2009
ESE 2003, 1997

Ans. (b) :



$$\tau_{solid}=\frac{16T}{\pi D^3}$$

$$\tau_{hollow}=\frac{Tr}{J}$$

$$=\frac{T\times\frac{D}{2}}{\frac{\pi}{32}[D^4-(0.1\times D)^4]}$$

$$=\frac{16TD}{\pi D^4(1-0.1^4)}$$

$$\tau_{hollow}=\frac{16T}{\pi D^3}\times\frac{1}{0.9999}$$

$$\tau_{hollow}=\frac{\tau_{solid}}{0.9999}$$

$\Rightarrow$ $\tau_{hollow}\approx\tau_{solid}$

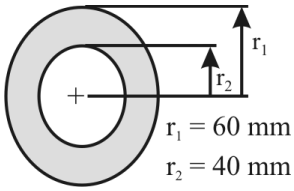
1049. A hollow cylindrical shaft is 1 m long and has inner diameter and outer diameter as 40 mm and 60 mm, respectively. When this shaft is subjected to a pure torsion of certain magnitude, maximum shear stress induced is 120 MPa. The corresponding minimum value of shear stress induced will be

(a) 20 MPa (b) 40 MPa

(c) 60 MPa (d) 80 MPa

DRDO Scientists 2009

Ans. (d) :



$$\tau\alpha\frac{1}{r}$$

$$\frac{\tau_{max}}{r_1}=\frac{\tau_{min}}{r_2}$$

$$\tau_{min}=\frac{r_2}{r_1}\tau_{max}$$

$$=\frac{40}{60}\times120=80\ MPa$$

1050. In torsion, which of the following sections will be best?

(a) triangular (b) rectangular

(c) hollow circular (d) solid cylinder

WBPSC AE 2008

Ans. (c) : $J=\frac{\pi}{32}D^4\left(1-k^4\right)$

- Hollow circular section is best in torsion as the polar moment of inertia is higher for hollow circular section (same amount of material).

1051. When a solid circular shaft is in pure tension and deforms elastically, the shearing stress in the shaft

(a) is inversely proportional to the shear modulus of elasticity

(b) varies linearly with the radial distance from the axis of the shaft

(c) varies linearly with length of the shaft

(d) is inversely proportional to the diameter of the shaft

DRDO Scientists 2008

Ans. (b) : $\frac{\tau_x}{r_x}=\frac{T}{J}=\frac{G\theta}{\ell}$

r_x – radial distance from axis of shaft.

1052. If 'T' is the torque and 'M' is the moment, then the shaft is subjected to:

(a) bending stress and direct stress

(b) shearing stress and direct stress

(c) principal stress and shearing stress

(d) principal stress and direct stress

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : If T is the torque and M is the moment, the shaft is subjected to shearing stress = $\frac{16T}{\pi d^3}$

And direct stress,

Bending stress = $\frac{32M}{\pi d^3}$

Search on Telegram @apna_pdf

1053. A bending moment of 400 kNm and a twisting moment of 300 kNm is applied on a circular solid shaft. If direct stress based on maximum principal stress theory is σ and shear stress based on maximum shear stress theory is τ, then $\frac{\sigma}{\tau}$ is:

(a) $\frac{5}{9}$ (b) $\frac{5}{3}$

(c) $\frac{3}{5}$ (d) $\frac{9}{5}$

AAI Jr. Executive 26.03.2021
ESE 2000

Ans. (d) : Given, Bending moment = 400 kN-m
Twisting moment = 300 kN-m
Direct stress (σ) based on max. principal stress theory

$$\sigma = \frac{16}{\pi d^3}\left[M + \sqrt{M^2 + T^2}\right]$$

$$\sigma = \frac{16}{\pi d^3}\left[400 + \sqrt{(400)^2 + (300)^2}\right]$$

$$= \frac{16}{\pi d^3}[400 + 500]$$

$$\sigma = \left(\frac{16}{\pi d^3}\right) \times (900)$$

Shear stress, $\tau = \left(\frac{16}{\pi d^3}\right)\left(\sqrt{M^2 + T^2}\right)$

$\Rightarrow$ $\left(\frac{16}{\pi d^3}\right)\left(\sqrt{(400)^2 + (300)^2}\right)$

$= \left(\frac{16}{\pi d^3}\right) \times (500)$

$\therefore$ $\boxed{\frac{\sigma}{\tau} = \frac{9}{5}}$

1054. At a certain cross-section, a shaft of 100 mm diameter is subjected to a bending moment of 4 kNm and a twisting moment of 8 kNm. Maximum principal stress induced (in N/mm^2) in the section is.

(a) 72.8 (b) 6.17

(c) 65.9 (d) 68.6

HPPSC ADF 05.03.2019

Ans. (c) : d = 100
Bending Moment, M = 4 kN-m
Twisting Moment, T = 8 kN-m
Max principal stress,

$$\sigma_1 = \frac{16}{\pi d^3}\left[M + \sqrt{M^2 + T^2}\right]$$

$$= \frac{16}{\pi (100)^3}\left[4 + \sqrt{(4^2) + (8)^2}\right]$$

$$= \frac{16}{\pi (100)^3}[4 + 8.94]$$

$$\sigma_1 = \frac{16}{\pi (100)^3} \times 12.94 \times 10^6$$

Max principal stress, $\sigma_1 = 65.9$ N/mm^2

6. Thick and Thin Cylinders and Spheres

1055. The ratio of hoop stress to longitudinal stress is___ for a thin cylinder subjected to internal pressure.

(a) 2 : 1 (b) 3 : 2

(c) 1 : 1 (d) 1 : 2

Hoop stress/circumferential stress $(\sigma_c) = \frac{Pd}{2t}$

Where; P = Pressure

d = dia of the cylinder

t = thickness of the cylinder

Search on Telegram @apna_pdf

1063. In a thick cylinder pressurized from inside, the hoop stress is maximum at

(a) The centre of the wall thickness
(b) The outer radius
(c) The inner radius
(d) Same at both inner and outer radii

GPSC AE 26.07.2015, APPSC AEE 2012
APPSC AE 04.12.2012, ESE 1998

Ans. (c) : Maximum hoop stress in thick cylinder pressurized from inside at the inner surface. Max hoop stress in thick cylinder under external pressure occurs of the outer surface.

1064. The longitudinal stress within cylindrical shell of diameter (D), length (L) and thickness (t), when subjected to an internal pressure (P) is

(a) PD/(4t) (b) PD/(2t)
(c) 2PD/t (d) 4PD/t

TNPSC AE 2019
APPSC AE Subordinate Service Civil/Mech. 2016
ISRO Scientist/Engineer (RAC) 29.11.2015
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (a)
Safe condition

$$\sigma_L \le S_{ut}$$

Limiting condition

$$\sigma_L = S_{ut}$$

or $F_f \le F_R$ (OR) $F_f = F_R$

$$P \times \frac{\pi}{4} D^2 = \sigma_L \times \pi D t$$

$$\boxed{\sigma_L = \frac{PD}{4t}}$$

1065. A thin gas cylinder with an internal radius of 100 mm is subject to an internal pressure of 10 MPa. The maximum permissible working stress is restricted to 100 MPa. The minimum cylinder wall thickness (in mm) for safe design must be ----------

(a) 8 mm (b) 10 mm
(c) 12 mm (d) 14 mm
(e) None of the above

OPSC AEE 2019 Paper-I
CGPSC Poly. Lect. 22.05.2016
Nagaland PSC CTSE 2016 Paper-I
GATE 2014

Ans. (b)
radius r = 100 mm
d = 200 mm
pressure (P) = 10 MPa
permissible stress = 100 MPa
For safe design–

$$\frac{Pd}{2t} \le \sigma_{permissible}$$

$$\frac{10 \times 200}{2t} = 100$$

$$\boxed{t = 10\,mm}$$

1066. A thin cylinder of diameter D, wall thickness t is subjected to an internal fluid pressure p. If E is the Young's modulus and υ is the Poisson's ratio for the material of the cylinder, the expression for volumetric strain of the cylinder is

(a) $\frac{pD}{4tE}(5-4\mu)$ (b) $\frac{pD}{4tE}(4-5\mu)$
(c) $\frac{pD}{2tE}(5-4\mu)$ (d) $\frac{pD}{2tE}(4-5\mu)$

RPSC LECTURER 16.01.2016
WBPSC AE, 2007, CSE Pre-2006
ESE 2003, CSE Pre-1997

Ans. (a)

$$\varepsilon_v = \frac{\delta v}{v} = \frac{\delta \ell}{\ell} + \frac{2\delta d}{d}$$

$$\varepsilon_\ell = \frac{\delta \ell}{\ell} = \frac{\sigma_L}{E} - \frac{\mu \sigma_h}{E} = \frac{pd}{4tE} - \frac{\mu pd}{2tE}$$

$$\boxed{\varepsilon_l = \frac{pd}{4tE}(1-2\mu)}$$

$$\varepsilon_d = \frac{\delta d}{d} = \frac{\sigma_h}{E} - \frac{\sigma_L}{E} = \frac{Pd}{2tE} - \frac{Pd}{4tE}$$

$$\boxed{\varepsilon_d = \frac{Pd}{4tE}(2-\mu)}$$

$$\varepsilon_v = \frac{Pd}{4tE}(1-2\mu) + \frac{2Pd}{4tE}(2-\mu)$$

$$= \frac{Pd}{4tE}\left[1-2\mu+4-2\mu\right]$$

$$\boxed{\varepsilon_v = \frac{Pd}{4tE}(5-4\mu)}$$

1067. A thin walled spherical shell is subjected to an internal pressure. If the radius of the shell is increased by 1% and the thickness is reduced by 1%, with the internal pressure remaining the same, the percentage change in the circumferential (hoop) stress is

(a) 0 (b) 1
(c) 1.08 (d) 2.02

UPPSC AE 13.12.2020, Paper-I
TSPSC AEE 2017, GPSC ARTO 01.05.2016
GATE 2012

Ans. (d) : Hoop stress for a thin spherical shell (σ_h) $= \frac{Pr}{2t}$

By applying logarithm on both sides,

$$\log(\sigma_h) = \log\left(\frac{P}{2}\right) + \log(r) - \log(t)$$

$$\frac{d\sigma_h}{\sigma_h} = 0 + \frac{1}{r}dr - \frac{1}{t}dt$$

Percentage change $= \frac{dr}{r} \times 100 + \frac{dt}{t} \times 100$

$= 1\% + 1\% = 2\%$

Percentage increase will be 2%.
Note-Option (d) is given by commission.

1068. What will happen in winter to a large cylindrical vessel which was sealed in summer?

(a) It buckles and collapses
(b) It becomes lighter
(c) It explodes
(d) Nothing happens to it

GPSC Asstt. Director of Transport 05.03.2017
ISRO Scientist/Engineer (RAC) 07.05.2017
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (a) : Large cylindrical vessel which was sealed in summer, is buckles and collapses in winter due pressure variation between inside and outside.

1069. A metal pipe of 1 m diameter contains a fluid having a pressure of 10 kgf/cm^2. If the permissible tensile stress in the metal is 200 kgf/cm^2, then the thickness of the metal required for making the pipe would be

(a) 5 mm (b) 10 mm
(c) 25 mm (d) 20 mm

APPSC AEE 2012 , ISRO Scientist/Engineer 2007
WBPSC AE 2003

Ans. (c) : d = 1 m
P = 10 kgf/cm^2
circumferential stress or hoop stress

$$\sigma_h = \frac{Pd}{2t} = 200$$

$$\frac{10\times1000}{2\times t} = 200$$

t = 25 mm

Note: Longitudinal stress or Axial stress

$$\sigma_l = \frac{Pd}{4t}$$

1070. A thin cylinder with both ends closed is subjected to internal pressure p. The longitudinal stress at the surface has been calculated as σ_0. Maximum shear stress at the surface will be equal to :

(a) $2\sigma_0$ (b) $1.5\sigma_0$
(c) σ_0 (d) $0.5\sigma_0$

APPSC AEE Mains 2016 (Civil Mechanical)
OPSC AEE 2015 Paper-I, ESE 1999

Ans : (d) Longitudinal stress $(\sigma_2) = \frac{Pd}{4t} = \sigma_0$

Hoop stress $(\sigma_1) = \frac{Pd}{2t} = 2\sigma_0$

Principal stresses = $2\sigma_0, \sigma_0$

Shear stress = $\frac{2\sigma_0 - \sigma_0}{2} = \frac{\sigma_0}{2} = 0.5\sigma_0$

1071. In case of thin walled cylinders the ratio of hoop strain to longitudinal strain is

(a) $\frac{2m-1}{m-2}$ (b) $\frac{2m-1}{m-1}$
(c) $\frac{m-2}{2m-1}$ (d) $\frac{m-2}{2(m-1)}$

Nagaland PSC (CTSE) 2018, Paper-I
Nagaland PSC CTSE 2016 Paper-I

Ans. (a) : In case of thin walled cylinders shell, the ratio of hoop strain to longitudinal strain is,

$$\varepsilon_c = \frac{P.d}{2tE}\left(1 - \frac{1}{2m}\right) \text{ ——(i)}$$

$$\varepsilon_\ell = \frac{P.d}{2tE}\left(\frac{1}{2} - \frac{1}{m}\right) \text{ ——(ii)}$$

from eq^n (i) & (ii)

$$\frac{\varepsilon_c}{\varepsilon_\ell} = \frac{2m-1}{m-2}$$

1072. A boiler shell of 200 cm diameter and plate thickness 1.5 cm is subjected to internal pressure of 1.5 MN/m^2 then hoop stress is:

(a) 30 MN/m^2 (b) 50 MN/m^2
(c) 100 MN/m^2 (d) 200 MN/m^2

KPSC AE 2015, SJVN ET 2013

Ans. (c) : Given,
d = 200 cm = 200 × 10^{-2} m
t = 1.5 cm = 1.5 × 10^{-2} m
P = 1.5 MN/m^2

$$\sigma = \frac{Pd}{2t}$$

$$\sigma = \frac{1.5\times200\times10^{-2}}{2\times1.5\times10^{-2}} = 100 \text{ MN/m}^2$$

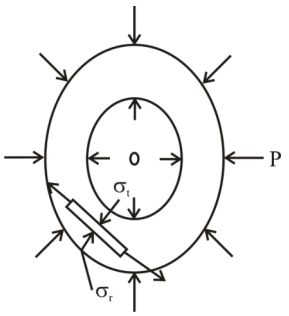
$$\boxed{\sigma = 100 \text{ MN/m}^2}$$

1073. A thin cylinder of radius r and thickness t when subjected to an internal hydrostatic pressure 'p' causes a radial displacement 'u'. Then the tangential strain caused is

(a) $\frac{du}{dr}$ (b) $\frac{1}{r}\cdot\frac{du}{dr}$
(c) $\frac{u}{r}$ (d) $\frac{2u}{r}$

APPSC AEE 2012, ESE 2002

Ans. (c) :



Data given-
Radius = r
Thickness = t
Internal hydrostatic pressure = P, σ_r = radial stress
Radial displacement = u, σ_t = tangential stress

(i) Radial strain $(\varepsilon_r) = \frac{du}{dr}$

(ii) Circumferential/Tangential strain $(\varepsilon_t) = u/r$

(iii) Axial strain $(\varepsilon_A) = \frac{\sigma_r}{E} - u\left(\frac{\sigma_r}{E} + \frac{\sigma_t}{E}\right)$

Search on Telegram @apna_pdf

1074. Pressure vessels are made of

(a) non-ferrous materials
(b) Sheet metal (steel)
(c) cast iron
(d) Any of the above

APPSC AEE 2012, APPSC AE 04.12.2012

Ans. (b) : Many pressure vessels are made of steel. To manufacture a cylindrical or spherical pressure vessel, railed and possibly forged parts would have to be welded together. Some mechanical properties of steel, achieved by rolling or forging, could be adversely affected by welding unless special precautions are taken.

1075. The stresses in a thick cylinder subjected to uniform pressure vary proportional to :

(a) r (b) $1/r$
(c) r^2 (d) $1/r^2$

APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (d) : From the Lame's equation for thick cylinder -

$\sigma_r = \frac{b}{r2} - a$

and $\sigma_C = \frac{b}{r^2} + a$

Where;
σ_r = radial stress
σ_C = Circumfrential stress
a & b is constant

1076. As per Lame's equation, the hoop stress for thick cylinder at any points is:

(a) $(A + B/r^3)$ (b) $(A/r - B)$
(c) $(A + B/r^2)$ (d) $(A + Br)^2$

HPPSC ADF 05.03.2019
TNPSC AE, 2008

Ans. (c) : According to Lame's equation, the hoop stress for thick cylinder

Hoop stress $(\sigma_h)_{hoop} = A + \frac{B}{r^2}$

$$p = A - A + \frac{B}{r^2}$$

Radial stress $(\sigma_r) = -p = A - \frac{B}{r^2}$

A, B Lame's constant

1077. A thin walled pipe contains water at a pressure of 2N/mm^2 and discharges water into a tank. If the pipe diameter is 25 mm and wall thickness 2.5 mm, the longitudinal stress induced in the pipe is

(a) 0 (b) 2 N/mm^2
(c) 5 N/mm^2 (d) 10 N/mm^2

UPSC JWM Advt. No.-52/2010
CSE Pre-2007

Ans. (c) : Solution : Given : Pressure (P) = 2N/mm^2
Diameter of pipe (d) = 25 mm
Thickness of pipe (t) = 2.5mm

$\therefore$ Longitudinal stress $(\sigma_L) = \frac{Pd}{4t}$

$$\sigma_L = \frac{2 \times 25}{4 \times 2.5} = 5 N/mm^2$$

1078. A steel hub of 100 mm internal diameter and uniform thickness of 10 mm was heated to a temperature of 300°C to shrink-fit it on a shaft. On cooling, a crack developed parallel to the direction of the length of the hub. Consider the following factors in this regard :

1. Tensile hoop stress
2. Tensile radial stress
3. Compressive hoop stress
4. Compressive radial stress

The cause of failure is attributable to :

(a) 1 alone (b) 1 and 3
(c) 1, 2 and 4 (d) 2, 3 and 4

GPSC ARTO Pre 30.12.2018
ESE 2016

Ans. (a) : In a shrink fit, the hub is subjected to tensile or hoop stress (which is greater as compared to radial stress) and the shaft is subjected to compressive stress. Therefore, the failure (or crack on surface) is due to tensile hoop stress.

1079. A thick cylinder subjected to an internal pressure of 60MPa. If the hoop stress on the outer surface is 150 MPa, then the hoop stress on the internal surface is :

(a) 105 MPa (b) 180 MPa
(c) 210 MPa (d) 135 MPa

MPPSC AE 08.11.2015, APGENCO AE 2012

Ans. (c) : If internal pressure = P_i
External pressure = 0

Circumferential or hoop stress $(\sigma_c) = \frac{P_i r_i^2}{r_0^2 - r_i^2}\left[\frac{r_0^2}{r_i^2} + 1\right]$

At, $P_i = 60$MPa, $\sigma_c = 150$ MPa
and $r = r_0$

$$\therefore \quad 150 = 60 \ \frac{r_i^2}{r_0^2 - r_i^2}\left[\frac{r_o^2}{r_o^2} + 1\right]$$

$$150 = 2 \times 60\left[\frac{r_i^2}{r_o^2 - r_i^2}\right]$$

or $\frac{r_i^2}{r_o^2 - r_i^2} = \frac{150}{120} = \frac{5}{4} \Rightarrow \left(\frac{r_0}{r_i}\right)^2 = \frac{9}{5}$

$\because$ at $r = r_i$

$$\sigma_c = 60 \times \frac{r_i^2}{r_0^2 - r_i^2}\left[\frac{r_0^2}{r_i^2} + 1\right]$$

$$= 60 \times \frac{5}{4} \times \left[\frac{9}{5} + 1\right]$$

$\sigma_c = 210$ MPa

1080. Hoop stress and longitudinal stress in a boiler shell under internal pressure are 100 MN/m^2 and 50 MN/m^2 respectively. Young's modulus of elasticity and Poisson's ratio of the shell material are 200 GN/m^2 and 0.3 respectively. The hoop strain in the boiler shell is :

(a) 0.425×10^3 (b) 0.5×10^{-3}
(c) 0.5750^{-3} (d) 0.7×10^3

APPSC IOF, 2009, ESE 1995

Search on Telegram @apna_pdf

Ans. (b) : $\sigma_h = 100\ MN/m^2$, $\sigma_\ell = 50\ MN/m^2$

$E = 200\ GN/m^2$, $\mu = 0.3$

$$\varepsilon_h = \frac{1}{E}[\sigma_h - \mu\sigma_\ell] = \frac{1}{200\times10^9}[100 - 50\times0.3]\times10^6$$

$= 0.425 \times 10^{-3}$

Nearest option is (b).

1081. A thin cylindrical shell of diameter (d) and thickness (t) is subjected to an internal pressure (p). The ratio of longitudinal strain to volumetric strain is

(a) $\frac{m-1}{2m-1}$ (b) $\frac{2m-1}{m-1}$

(c) $\frac{m-2}{3m-4}$ (d) $\frac{m-2}{5m-4}$

Sikkim PSC (Under Secretary), 2017
UPPSC AE 12.04.2016 Paper-I

Ans. (d) : Longitudinal strain $(\varepsilon_\ell) = \frac{Pd}{4tE}(1-2\mu)$ .....(i)

Volumetric strain $(\varepsilon_v) = \frac{Pd}{4tE}(5-4\mu)$ .....(ii)

eq^n (i) ÷ eq^n (ii)

$$\frac{\varepsilon_\ell}{\varepsilon_v} = \frac{\frac{Pd}{4tE}(1-2\mu)}{\frac{Pd}{4tE}(5-4\mu)}$$

$$\frac{\varepsilon_\ell}{\varepsilon_v} = \frac{1-2\mu}{5-4\mu}$$

$$\because \mu = \frac{1}{m}$$

$$\therefore = \frac{1-\frac{2}{m}}{5-\frac{4}{m}}$$

$$\frac{\varepsilon_\ell}{\varepsilon_v} = \frac{m-2}{5m-4}$$

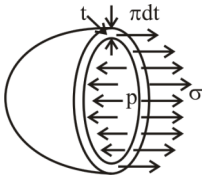
1082. A thin spherical shell of diameter (d) and thickness (t) is subjected to an internal pressure (p). The stress in the shell material is

(a) pd/t (b) pd/2t

(c) pd/4t (d) pd/8t

Sikkim PSC (Under Secretary), 2017
Karnataka PSC AE, 10.09.2017

Ans. (c) : Thin spherical shell



$$\sigma_l \times \pi dt = p \times \frac{\pi}{4}d^2$$

$$\sigma = \frac{pd}{4t}$$

1083. The typical ratio of diameter to wall thickness for a thin vessel is

(a) Less than 20 (b) More than 10

(c) Less than 2 (d) More than 20

Haryana PSC AE (PHED) 05.09.2020, Paper-II
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (d) : For thin vessel D > 20t or $\frac{D}{t} > 20$

Where, D = Diameter

t = Thickness of shell

1084. In a thick cylinder, subjected to internal and external pressures, let r_1 and r_2 be the internal and external radii respectively. Let u be the radial displacement of a material element at radius r, $r_2 \geq r \geq r_1$. Identifying the cylinder axis as z axis, the radial strain component is :

(a) u/r (b) u/θ

(c) du/dr (d) du/δθ

APPSC IOF, 2009, ESE 1996

Ans. (c) : The strains ε_r and ε_θ may be given by

$$\varepsilon_r = \frac{\partial u_r}{\partial r} = \frac{1}{E}[\sigma_r - v\sigma_\theta] \quad \text{since } \sigma_z = 0$$

$$\varepsilon_\theta = \frac{(r+u_r)\Delta\theta - r\Delta\theta}{r\Delta\theta} = \frac{u_r}{r} = \frac{1}{E}[\sigma_\theta - v\sigma_r]$$

$$\varepsilon_{rr} = \frac{du}{dr}$$

1085. A cylindrical tank with closed ends is filled with compressed air at a pressure of 500 kPa. The inner radius of the tank is 2m, and it has wall thickness of 10 mm. The magnitude of maximum in-plane shear stress (in MPa) is ___

(a) 100 (b) 50

(c) 250 (d) 25

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (d) : The maximum in plane shear stress

$$\tau_{max} = \frac{Pd}{8t}$$

$$= \frac{500\times10^3\times2\times2}{8\times10\times10^{-3}}$$

$= 25 \times 10^6\ N/m^2$

$\tau_{max} = 25\ MPa$

1086. The hoop or circumferential stress in a riveted cylindrical shell, when subjected to an internal pressure p is equal to :

(a) $\frac{pD}{4t\eta_c}$ (b) $\frac{pD}{2t\eta_c}$

(c) $\frac{pD}{2t\eta_l}$ (d) $\frac{pD}{4t\eta_l}$

Where D = internal diameter, η_l = efficiency of longitudinal joint and η_c = efficiency of circumferential joint.

CGPSC AE 15.01.2021, CGPSC AE 16.10.2016

Ans. (c) : Hoop or circumferential stress $(\sigma_c) = \frac{pD}{2t\eta_\ell}$

where, η_ℓ = Efficiency of longitudinal joint

Search on Telegram @apna_pdf

1087. A thin cylinder of 'D' internal diameter, is subjected to an internal pressure of 'P'. If the permissible tensile stress is σ_t' the cylinder wall thickness should be

(a) $\frac{2\sigma_t}{PD}$ (b) $\frac{PD}{\sigma_t}$

(c) $\frac{PD}{4\sigma_t}$ (d) $\frac{PD}{2\sigma_t}$

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
RPSC AE GWD, 2011

Ans. (d) : As we know,
Permissible tensile stress σ_t = Hoop stress in thin cylinder.

$$\text{Hoop stress} = \frac{PD}{2t}$$

$$\sigma_t = \frac{PD}{2t}$$

$$\boxed{t = \frac{PD}{2\sigma_t}}$$

1088. A thick cylinder with internal diameter d and outside diameter 2d is subjected to internal pressure P. Then the maximum hoop stress developed in the cylinder is

(a) P (b) (2/3)P

(c) (5/3)P (d) 2 P

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
ESE 2003

Ans. (c) : $d_i = d$ [internal diameter]
$d_o = 2d$ [outer diameter]
P = Pressure (internal)
In thick cylinder, maximum hoop stress,

$$\sigma_{hoop} = P \times \frac{r_2^2 + r_1^2}{r_2^2 - r_1^2} \qquad [r_1 = d, r_2 = 2d]$$

$$= P\left[\frac{(2d)^2 + (d)^2}{(2d)^2 - (d)^2}\right]$$

$$= P\left[\frac{5d^2}{3d^2}\right]$$

$$\boxed{\sigma_{hoop} = \frac{5P}{3}}$$

1089. Pick the correct statement about the hoop stress in a thick cylinder subjected to internal pressure.

(a) It varies linearly form zero at the outer surface to maximum at the inner surface.

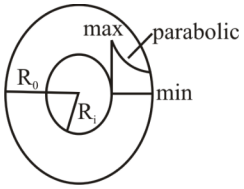
(b) It varies parabolically from a minimum stress at the outer surface (with non-zero magnitude) to a maximum value at the inner surface.

(c) It varies parabolically from zero at the outer surface to a maximum at the inner surface.

(d) It remains constant across the thickness.

HPPSC Asstt. Prof. 2014
RPSC AEN Pre-2013

Ans. (b) :



1090. The maximum shear stress in a cylinder shell of 4 m diameter and plate thickness 3 cm, subjected to an internal pressure of 3 N/mm^2 is _____.

(a) 200 N/mm^2 (b) 50 N/mm^2

(c) 100 N/mm^2 (d) 400 N/mm^2

VIZAG Steel MT 24.01.2021

Ans. (c) : Given,
Diameter (d) = 4 m = 4000 mm
Thickness (t) = 3 cm
= 30 mm
Internal pressure (P) = 3 N/mm^2

$$\text{Maximum shear tress } (\tau_{max}) = \frac{Pd}{4t}$$

$$= \frac{3 \times 4000}{4 \times 30}$$

$$\boxed{\tau_{max} = 100\,N/mm^2}$$

1091. The ratio of volumetric strain of sphere to strain in its diameter will be

(a) 2 (b) 1/3

(c) 3 (d) 1/2

GPSC DEE, Class-2 (GWSSB) 04.07.2021
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (c) :
Volumetric strain of sphere = 3 × diametric strain
Volumetric strain of cylinder = longitudinal strain + (2 × lateral strain)

1092. A 800 mm diameter pipe contains a fluid at a pressure of 3 Nmm^{-2}. If the safe stress in tension is 150 Nmm^{-2}, the minimum thickness of the pipe is

(a) 16 mm (b) 2 mm

(c) 4 mm (d) 8 mm

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) :

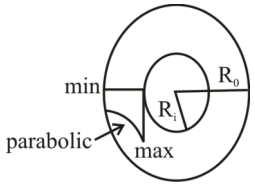
1093. In a thick cylindrical shell, the maximum radial stress at the outer surfaces of the shell is

(a) Zero (b) P

(c) –P (d) 2P

RPSC IOF, 2020

Ans. (a) : The radial stress across the thickness of a thick cylinder is maximum at the inner surface and zero at the outer surface.



Search on Telegram @apna_pdf

1094. A thin spherical shell of diameter 200 mm is subjected to an internal pressure of 2 MPa, If admissible tensile stress is 40 MPa, then thickness of the shell is:

(a) 2 mm (b) 5 mm
(c) 10 mm (d) 2.5 mm

CIL MT 27.02.2020

Ans. (d) : Diameter d = 200 mm
Internal pressure (P) = 2 MPa
Tensile stress σ = 40 MPa

$$\sigma = \frac{Pd}{4t}$$

$$t = \frac{Pd}{4\sigma} = \frac{2\times200}{4\times40} = 2.5 \text{ mm}$$

t = 2.5 mm

1095. A cylindrical pressure vessel has diameter 200 mm and thickness 2 mm. Find the hoop and axial stress (N/mm^2) in the cylindrical vessel, when it is subjected to an internal pressure of 5 MPa.

(a) 125, 125 (b) 125, 250
(c) 250, 250 (d) 250, 125

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : $\sigma_{hoop} = \frac{pd}{2t} = \frac{5\times200}{2\times2} = 250\,\text{MPa}$

$$\sigma_{long} \text{ or } \sigma_{axial} = \frac{1}{2}\sigma_{hoop} = 125\,\text{MPa}$$

1096. Which of the following statements regarding thin and thick cylinders, subjected to internal pressure only, is/are correct?

1. **A cylinder is considered thin when the ratio of its inner diameter to the wall thickness is less than 15.**
2. **In thick cylinders, tangential stress has highest magnitude at the inner surface of the cylinder and gradually decreases towards the outer surface**

(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor

ESE 2020

Ans. (b) : If the thickness of the wall of shell is greater than 1/10 to 1/15 of its diameter.

1097. A cylindrical storage tank has an inner diameter of 600 mm and a wall thickness of 18 mm. The transverse and longitudinal strains induced are 255 × 10^{-6} mm/mm and 60 × 10^{-6} mm/mm, and if G is 77 GPa, the gauge pressure inside the tank will be

(a) 2.4 MPa (b) 2.8 MPa
(c) 3.2 MPa (d) 3.6 MPa

ESE 2020

Ans. (d) : Given,
d = 600 mm
t = 18 mm

$$\in_\ell = 60\times10^{-6}$$

$$\in_{hoop} = \in_{transverse} = 255\times10^{-6}$$

$$\in_\ell = \frac{Pd}{4tE}(1-2\mu) _____ (i)$$

$$\in_{hoop} = \frac{Pd}{4tE}(2-\mu) _____ (ii)$$

Dividing equation (i) by equation (ii),

$$\frac{\in_\ell}{\in_{hoop}} = \frac{(1-2\mu)}{2-\mu} = \frac{60\times10^{-6}}{255\times10^{-6}}$$

μ = 0.3
E = 2G(1+μ)
= 2×77×(1+0.3)
= 200.2 GPa

Putting the respective values in equation (i)

$$60\times10^{-6} = \frac{P\times600}{4\times18\times200.2}\times(1-2\times0.3)$$

P = 3.603 MPa
≈ 3.6 MPa

1098. A compressed air spherical tank having an inner diameter of 450 mm and a wall thickness of 7 mm is formed by welding. If the allowable shear stress is 40 MPa, the maximum permissible air pressure in the tank will be nearly

(a) 3 MPa (b) 5 MPa
(c) 7 MPa (d) 9 MPa

ESE 2020

Ans. (b) : $\sigma_1 = \sigma_2 = \frac{Pd}{4t}$

$$\therefore \quad \tau_{max} = \frac{Pd}{8t}$$

$$40 = \frac{P\times450}{8\times7}$$

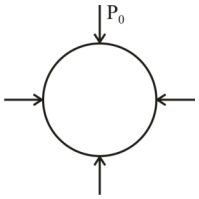
P = 4.978 MPa
P ≈ 5 MPa

1099. A thin spherical shell is subjected to an external pressure p_o. The volumetric strain of the spherical shell is
(where, d is the diameter of shell t is the thickness of the shell E is Young's modulus of elasticity of shell material
μ is Poisson's ratio of shell material)

(a) $\frac{p_o d}{4tE}(5-4\mu)$ (b) $\frac{3p_o d}{4tE}(1-\mu)$
(c) $\frac{3p_o d}{4tE}(1-2\mu)$ (d) $\frac{-3p_o d}{4tE}(1-\mu)$

UPPSC AE 13.12.2020, Paper-I

Ans. (d) :



Circumferential or hoop stress $(\sigma_c) = -\frac{P_o d}{4t}$

Volumetric strain $E_v = \frac{3\sigma}{E}(1-\mu)$

$$= -\frac{3P_o d}{4tE}(1-\mu)$$

(–ve sign is due to external pressure)

Search on Telegram @apna_pdf

1100. Internal and external radii of a thick cylinder are a and b. It is subjected to an internal pressure of p_i. The radial stress at a radius r in the cylinder is

(a) $\frac{a^2p_i}{(b^2-a^2)}\left(1-\frac{a^2}{r^2}\right)$ (b) $\frac{a^2p_i}{(b^2-a^2)}\left(1-\frac{b^2}{r^2}\right)$

(c) $\frac{b^2p_i}{(b^2-a^2)}\left(1-\frac{a^2}{r^2}\right)$ (d) $\frac{b^2p_i}{(b^2-a^2)}\left(1-\frac{b^2}{r^2}\right)$

UPPSC AE 13.12.2020, Paper-I

Ans. (b) : Given, Internal radius = a
External radius = b
Internal pressure = P_i
External pressure = 0
Circumferential or hoop stress is given by with internal radius (r_i) & external radius (r_0)

$$= \frac{P_i r_i^2}{r_o^2 - r_i^2}\left[1-\frac{r_o^2}{r^2}\right]$$

Similarly radial stress $(\sigma_r) = \frac{P_i a^2}{b^2-a^2}\left[1-\frac{b^2}{r^2}\right]$

1101. A thin cylinder of internal diameter D = 1 m and thickness t = 12 mm is subjected to internal pressure of 2 N/mm^2. Determine the hoop stress (N/mm^2) developed.

(a) 83 (b) 102
(c) 56 (d) 79

Oil India Senior Officer 23.12.2020

Ans. (a) : $\sigma_h = \frac{Pd}{2t} = \frac{2N}{mm^2}\times\frac{1000mm}{2\times 12mm}$
$= 83.33\ N/mm^2$

1102. A thin cylindrical shell of internal diameter D and thickness t is subjected to internal pressure p, E and μ are respectively the Elastic modulus and Poisson's ratio. The change in diameter is

(a) $\frac{pD^2}{4tE}(1-2\mu)$ (b) $\frac{pD^2}{4tE}(2-\mu)$

(c) $\frac{pt^2}{4DE}(2-\mu)$ (d) $\frac{pt^2}{4DE}(1-2\mu)$

APPSC AEE SCREENING 17.02.2019 ,CSE Pre-1998

Ans. (b) : Circumferential strain in thin cylinder

$$\epsilon_h = \frac{\sigma_h}{E}\left(1-\frac{\mu}{2}\right)$$

$$\left(\text{where } \sigma_h = \frac{PD}{2t}\right)$$

$$\therefore \quad \frac{\delta D}{D} = \frac{PD}{2tE}\left(\frac{2-\mu}{2}\right)$$

$$\therefore \quad \delta D = \frac{PD^2}{4tE}(2-\mu)$$

1103. Where does the maximum hoop stress in a thick cylinder under external pressure occur?

(a) At the outer surface
(b) At the inner surface
(c) At the mid-thickness
(d) At the 2/3rd outer radius

OPSC AEE 2019, 2015 Paper-I

Ans : (b) :

Hoop stress, $\sigma_h = \frac{A}{r^2} + B$

Hence hoop stress will be maximum at inner radius and minimum at outer radius.

1104. Thin cylindrical pressure vessel of 500 mm diameter is subjected to an internal pressure of 2 N/mm^2. If the thickness of the vessel is 20 mm, the hoop stress is

(a) 10 (b) 12.5
(c) 25 (d) 50

Gujarat PSC AE 2019

Ans : (c) :

Hoop stress $(\sigma_h) = \frac{Pd}{2t}$

P = 2 N/mm^2
d = 500 mm
t = 20 mm

$$\sigma_h = \frac{2\times 500}{2\times 20} = \frac{1000}{40}$$

$$\boxed{\sigma_h = 25\ N/mm^2}$$

1105. A spherical shell with internal diameter 320 mm and external diameter 640 mm is subjected to an internal fluid pressure of 75 N/mm^2. The hoop stress developed at the outer surface will be:

(a) 15.132 N/mm^2 (b) 16.071 N/mm^2
(c) 14.067 N/mm^2 (d) 17.173 N/mm^2

HPPSC ADF 05.03.2019

Ans. (*) : d_i = 320 mm
d_0 = 640 mm
t = $d_0 - d_i$ = 320 mm
p = 75 N/mm^2

$$\sigma_h = \frac{pd_0}{2\times t} = \frac{75\times 640}{2\times 320}$$

$$\sigma_h = 75 N/mm^2$$

1106. A spherical steel pressure vessel 400 mm in diameter with a wall thickness of 20 mm, is coated with brittle layer that cracks when strain exceeds 100 × 10^{-7}. What internal pressure will cause the layer to develop cracks? (E = 200GPa, μ = 0.3)

(a) 0.057 MPa (b) 5.7 MPa
(c) 0.57 MPa (d) 57 MPa

BHEL ET 2019

Ans. (c) : Diameter (d) = 400 mm
Thickness (t) = 20 mm
Strain (ϵ) = 100 × 10^{-7}
E = 200 GPa, μ = 0.3

$$\boxed{\epsilon = \frac{Pd}{4tE}(1-\mu)}$$

$$100\times 10^{-7} = \frac{P\times 400}{4\times 20\times 200\times 10^3}[1-0.3]$$

$$10^{-5}\times 16\times 10^6 = p\times 400\times 0.7$$

$$\frac{160}{400\times 0.7} = P \ldots \quad \boxed{P = 0.57\ MPa}$$

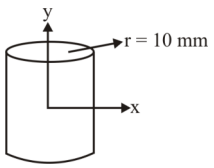
Search on Telegram @apna_pdf

1107. A welded steel cylindrical drum made of a 10 mm thick plate has an internal diameter of 1.20 m. Find the change in diameter that would be caused by an internal pressure of 1.5 MPa. Assume that Poisson's ratio is 0.30 and E = 200 GPa (longitudinal stress, σ_y = PD/4t circumferential stress , σ_x = PD/2t).

(a) 4.590 mm (b) 0.459 mm
(c) 45.90 mm (d) 0.0459 mm

BHEL ET 2019

Ans. (b) :



t = 10 mm
P = 1.5 MPa
d = 1.20 m = 1200 mm
$\mu = 0.30$
E = 200 GPa

$$\sigma_y = \frac{Pd}{4t} = \frac{1.5\times1200}{4\times10}$$

$$\sigma_y = 45\,MPa$$

$$\sigma_x = \frac{Pd}{2t} = \frac{1.5\times1200}{2\times10} = 90\ MPa$$

$$\varepsilon_x = \frac{\sigma_x}{E} - \mu\frac{\sigma_y}{E}$$

$$= \frac{90}{20000} - 0.3\left(\frac{45}{20000}\right)$$

$$\varepsilon_x = 3.825\times10^{-4}$$

$$\varepsilon_x = \frac{\Delta D}{D}$$

$$\Delta D = \varepsilon_x \times D$$

$$= 3.825 \times 10^{-4} \times 1200 = 0.459\ mm$$

1108. Pressure vessel is said to be thin cylindrical shell, if the ratio of the wall thickness of the shell to its diameter is

(a) equal to 1/10 (b) less than 1/10
(c) more than 1/10 (d) none of these

Gujarat PSC AE 2019

Ans : (b) A thin cylindrical shell is the ratio of the wall thickness of the shell to its diameter is less than 1/10.

1109. The thickness of thin cylinder is determined on the basis of

(a) Radial stress
(b) Longitudinal stress
(c) Circumferential stress
(d) Principal shear stress

Gujarat PSC AE 2019

Ans : (c) : The thickness of thin cylinder is determined on the basis of circumferential stress.

1110. The inner diameter of a cylindrical tank for liquefied gas is 250 mm. The gas pressure is limited to 15 MPa. The tank is made of plain carbon steel with ultimate tensile strength of 340 N/mm^2, Poisson's ratio of 0.27 and the factor of safety of 5. The thickness of the cylinder wall will be.

(a) 60 mm (b) 50 mm
(c) 40 mm (d) 30 mm

ESE 2019

Ans. (d) : Maximum stress = Hoop stress in cylinder

$$\sigma_{max} = \sigma_h$$

$$\frac{\sigma_u}{FOS} = \frac{pd}{2t}$$

$$\frac{340}{5} = \frac{15\times250}{2\times t}$$

$$t = 27.57\ mm \simeq 30\ mm$$

1111. A spherical shell of 1.2 m internal diameter and 6 mm thickness is filled with water under pressure until volume is increased by 400 × 10^3 mm^3. If E = 204 GPa, Poisson's ratio ν = 0.3, neglecting radial stresses, the hoop stress developed in the shell will be nearly

(a) 43 MPa (b) 38 Mpa
(c) 33 Mpa (d) 28 Mpa

ESE 2019

Ans. (a) : Given,
d = 1.2 m = 1200 mm
r = 600 mm
t = 6 mm
$\Delta v = 400 \times 10^3\ mm^3$
$E = 204\ GPa = 204 \times 10^3\ MPa$
$\mu = 0.3$

$$\in_v = \frac{\Delta v}{v} = \frac{400\times10^3}{\frac{4}{3}\pi r^3} = \frac{400\times10^3}{\frac{4}{3}\pi(600)^3}$$

$$\in_v = 4.42 \times 10^{-4}$$

Volumetric strain ($\in_v$) = 3 × hoop strain

$$4.42 \times 10^{-4} = 3 \times \in_h$$

$$\in_h = 1.47 \times 10^{-4}$$

$$\in_h = \frac{\sigma_n}{E}(1-\mu)$$

$$1.47 \times 10^{-4} = \frac{\sigma_h}{204\times10^3}(1-0.3)$$

$$\sigma_h = 42.94 \simeq 43\ MPa$$

1112. Consider the following statements:

1. In case of a thin spherical shell of diameter d and thickness t, subjected to internal pressure p, the principal stresses at any point equal $\frac{pd}{4t}$
2. In case of thin cylinders the hoop stress is determined assuming it to be uniform across the thickness of the cylinder
3. In thick cylinders, the hoop stress is not uniform across the thickness but it varies from a maximum value at the inner circumference to a minimum value at the outer circumference.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) : (i) In case of a thin spherical shell of diameter d and thickness t, subjected to internal pressure p, the principal stresses at any point is given by

Search on Telegram @apna_pdf

$$\sigma = \frac{pd}{4t}$$

(ii) In case of thin cylinders, the hoop stress is determined assuming it to be uniformly distributed over the thickness of the wall, provided that the thickness is small compared to radius.

(iii) For a thick cylinder hoop stress is given by

$$\sigma_h = \frac{pR^2}{r^2 - R^2}\left(\frac{r^2 + x^2}{x^2}\right) \qquad \text{(here } r \le x \le R\text{)}$$

where r and R are inner and outer radius, respectively.

σ_h is maximum when x is minimum.

σ_h is maximum at x = r

i.e. at inner surface.

Hence all the statement are correct.

1113. A thin walled cylinder (diameter = D, length = L, thickness of cylinder material = t, modulus of elasticity = E, Poission's ratio *ν*) is subjected to fluid pressure (P) inside it. The total volume of fluid that an be stored in the cylinder will be:

(a) $\frac{\pi}{4}D^2L\left[1+\frac{PD}{4tE}(5-4\nu)\right]$

(b) $\frac{\pi}{4}D^2L\left[1+\frac{PD}{4tE}(5+4\nu)\right]$

(c) $\frac{\pi}{4}D^2L$

(d) $\frac{\pi}{4}D^2L\left[\frac{PD}{4tE}(5-4\nu)\right]$

(e) $\frac{\pi}{4}D^2L\left[1+\frac{PD}{4tE}(1-\nu)\right]$

CGPSC AE 25.02.2018

Ans. (a) : We know that volumetric strain in thin walled cylinder is given as:

$$\frac{dV}{V} = \frac{Pd}{4tE}[5-4\nu]$$

$$dV = \frac{Pd}{4tE}[5-4\nu]\times V$$

Then total volume of thin walled cylinder

$$V_{Total} = V + dV$$

$$= \frac{\pi}{4}D^2 \times L + \frac{Pd}{4tE}[5-4\nu]\times\frac{\pi}{4}D^2\times L$$

$$V_{Total} = \frac{\pi}{4}D^2\times L\left[1+\frac{Pd}{4tE}(5-4\nu)\right]$$

1114. The Hoop stresses are acting across the

(a) Circumferential section
(b) Longitudinal section
(c) Radial section
(d) None of the above

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (b) :

- The Hoop stress are acting across the longitudinal section.
- The Longitudinal stress acting when two cross sectional areas of the cylinder are subjected to equal and opposite forces the stress experienced by the cylinder.

1115. A boiler shell 180cm diameter and plate thickness of 12mm is subjected to an internal pressure of 1.2MN/m^2. The hoop stress will be

(a) 45 N/mm^2 (b) 90 N/mm^2
(c) 135 N/mm^2 (d) 155 N/mm^2

WBPSC AE, 2017

Ans. (b) : $\sigma_h = \frac{pd}{2t}$

$$\sigma_h = \frac{1.2\times10^6\times180\times10^{-2}}{2\times12\times10^{-3}}$$

$$= 90\text{N/mm}^2$$

1116. In case of thin walled cylinders the ratio of hoop stress to radial stress is

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$
(c) 2 (d) None of the above

WBPSC AE, 2017

Ans. (d) : $\frac{\sigma_h}{\sigma_R} = \frac{\text{hoop stress}}{\text{radial stress}}$

$\sigma_R = 0$

- Radial stress in thin cylindrical shell and sphere radial stress is neglected and assumed zero. However its value at inner phase equal to outer pressure and outer phase it is equal to atmospheric pressure is zero but for all practical purpose its value taken zero from inner to outer surface.

1117. A cylinder is said to be thin if the thickness to diameter ratio is less than

(a) $\frac{1}{5}$ (b) $\frac{1}{10}$
(c) $\frac{1}{15}$ (d) $\frac{1}{20}$

Karnataka PSC Lect., 27.05.2017

Ans (d) : $\frac{t}{D} \le \frac{1}{20}$ —— Thin cylinder

$\frac{t}{D} > \frac{1}{20}$ —— Thick cylinder

1118. A thin cylinder of 4 m diameter has a wall thickness of 50 mm. It is subjected to an internal pressure of 2 MPa, What is the maximum shear stress induced in an element considered on the inner surface?

(a) 80 MPa (b) 41 MPa
(c) 40 MPa (d) 160 MPa

APGENCO AE, 2017

Ans. (c) : In thin cylinder inner surface is subject to three stresses

$\sigma_c = \frac{pd}{2t}$

$\sigma_{(l)} = \frac{pd}{4t}$ and radial pressure (Negligible)

Max shear stress at inner surface $= \frac{\sigma_c - 0}{2}$

$$\tau = \frac{pd}{4t} = \frac{2\times10^6\times4}{4\times50\times10^{-3}}$$

, $\tau = 40$ MPa

Search on Telegram @apna_pdf

1119. A 300 mm diameter basketball of 2mm wall thickness has been inflated to a pressure of 100 kPa. The value of hoop stress developed is equal to

(a) 10 MPa (b) 5 MPa
(c) 3.75 MPa (d) 2.75 MPa

Punjab PSC (Lect.) 06.08.2017

Ans. (c)

$$\text{Hoop stress} = \frac{Pd}{4t}$$
$$= \frac{100\times1000\times300}{4\times2}$$
$$= \frac{10^7\times3}{4\times2}$$
$$= 3.75 \text{ MPa}$$

1120. The purpose of longitudinal butt-joint in boiler shell is :

(a) to make cylindrical ring from steel plate
(b) to increase the length of boiler shell by connecting one ring to another.
(c) to make diameter and length of boiler shell
(d) to connect openings to shell

HPPSC Asstt. Prof. 20.11.2017

Ans. (a) : The purpose of longitudinal butt joint in boiler shell is to make cylindrical ring from steel plate.

1121. A seamless pipe of 600 mm diameter contains a fluid under a pressure of 3 N/mm^2. If the permissible tensile stress be 100 N/mm^2, the minimum thickness of the pipe is

(a) 8 mm (b) 9 mm
(c) 11 mm (d) 10 mm

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (b) : Given, d = 600 mm
P = 3 N/mm^2
Permissible tensile stress = 100 N/mm^2

$$\text{Hoop stress} = \frac{Pd}{2t}$$

Hoop stress = permissible tensile stress

$$\frac{Pd}{2t} = 100$$

$$t = \frac{3\times600}{2\times100} = 9 \text{ mm}$$

1122. The reason why the pressure vessels are not made of rectangular shape is

(a) These are difficult to fabricate
(b) It has been a practice to use cylindrical vessels
(c) They are not economical
(d) None of the above

GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : Because gas cylinders contain high internal pressure, so we cannot use shapes like rectangle and cube because there will be many stresses associated with such shapes. They are not economical.

1123. A thin cylinder pressure vessel of 1m diameter generates steam at a pressure of 1.4 N/mm^2. What will be the wall thickness when longitudinal stress does not exceed 28 MPa?

(a) 10.5 mm (b) 12.5 mm
(c) 14.5 mm (d) 16.5 mm
(e) 18.5 mm

(CGPCS Polytechnic Lecturer 2017)

Ans. (b) : Pressure vessel diameter = 1 m = 1000 mm
Steam pressure = 1.4 N/mm^2
Longitudinal stress (σ_ℓ) = 28 MPa = 28 N/mm^2
Thickness (t) = ?
We know that

$$\sigma_\ell = \frac{Pd}{4t}$$

$$t = \frac{P\times d}{4\times\sigma_\ell} = \frac{1.4\times1000}{4\times28}$$

$$\boxed{t = 12.5 \text{ mm}}$$

1124. A thin cylindrical pressure vessel of 500 mm internal diameter is subjected to an internal pressure of 2 N/mm^2. What will be the hoop stress if the thickness of the vessel is 20 mm?

(a) 25 N/mm^2 (b) 23 N/mm^2
(c) 27 N/mm^2 (d) 29 N/mm^2

CIL (MT) 2017 IInd Shift

Ans. (a) : Hoop stress in the cylindrical pressure vessel

$$= \frac{pd}{2t} = \frac{2\times500}{2\times20} = 25 \text{ N/mm}^2.$$

1125. A 2.0 m diameter penstock pipe carries water under a pressure head of 100 m. If the wall thickness is 7.5 mm, the tensile stress in the pipe wall, in MPa, is

(a) 65.3 (b) 130.5
(c) 231.0 (d) 1305.0

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : D = 2 m
H = 100 m
t = 7.5 mm = 0.0075 m
P = ρgh (N/m^2)

$$\sigma_t = \frac{PD}{2t} = \frac{(1000\times9.81\times100)\times2}{2\times0.0075}$$

$= 130.8 \times 10^6$ N/m^2
= 130.8 MPa

1126. In design of thin cylinder, the thickness of cylinder plate is calculated from the relations:

(a) $T = \frac{PD}{ft}$ (b) $T = \frac{PD}{2ft}$
(c) $T = \frac{2PD}{ft}$ (d) None of these

Where:
D = Internal diameter of cylinder
T = Thickness of cylinder plate
ft = Tangential or hoop stress
P = Internal pressure

PTCUL AE 25.06.2017

Ans. (b) : $T = \frac{PD}{2ft}$

Search on Telegram @apna_pdf

1127. A cylinder of internal diameter 200 mm is subjected to internal pressure of 15 MPa. Determine the thickness of the cylinder if the material has a yield strength of 300 MPa. Take Factor of safety =2.

(a) 10 mm (b) 5 mm
(c) 7.5 mm (d) None of these

RPSC AE (GWD) 06.05.2016

Ans. (a) : Diameter D = 200 mm
P = 15 MPa
Thickness t = ?
Yield strength (S_{ys}) = 300 MPa
Factor of safety (N) = 2

$$\sigma_{hoop} = \frac{PD}{2t}$$

Or $\sigma_{hoop} \le (\sigma_{yt})$

$$\frac{PD}{2t} = \frac{S_{ys}}{N}$$

$$\frac{15\times 200}{2\times t} = \frac{300}{2}$$

$$t = \frac{3000}{300}$$

t = 10 mm

1128. A cylinder is called a thick wall cylinder when the ratio of inner diameter of the cylinder to wall thickness is

(a) between 20 to 30 (b) less than 15
(c) between 25 to 30 (d) greater than 25

Rajasthan Nagar Nigam AE 2016, Shift-II

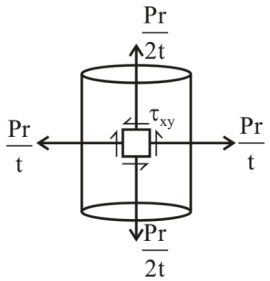
Ans. (b) : When the ratio of the inner diameter of the cylinder to the wall thickness is less than $\frac{1}{10}$ to $\frac{1}{15}$, the cylinder is called thick walled cylinder.
Example – Hydraulic cylinder
High pressure pipe
Gun barrels

1129. A thin cylinder of 100 mm internal diameter and 5 mm thickness is subjected to an internal pressure of 10 MPa and a torque of 2000 Nm. What is the magnitude of the principal stresses?

(a) 75 MPa, 25 MPa (b) 75 MPa, 50 MPa
(c) 100 MPa, 50 MPa (d) 125 MPa, 50 MPa
(e) 125 MPa, 70 MPa

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (*) : Given, d = 100 mm; r = 50 mm, t = 5 mm
P = 10 MPa
Torque, T = 2000 N-m



$$\tau_{xy} = \frac{T}{2\pi r^2 t} = \frac{2000\times 10^3}{2\pi(50)^2(5)} = 25.46\,MPa$$

$$\sigma_x = \frac{Pr}{t} = \frac{10\times 50}{5} = 100\,MPa$$

$$\sigma_y = \frac{Pr}{2t} = \frac{100}{2} = 50\,MPa$$

Principal stress,

$$\sigma_{1,2} = \frac{\sigma_x+\sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x-\sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$= \left(\frac{100+50}{2}\right) \pm \sqrt{\left(\frac{100-50}{2}\right)^2 + (25.46)^2}$$

$\sigma_{1,2} = 75 \pm 35.68$

Max. principal stress $\Rightarrow \sigma_1 = 75 + 35.68 = 110.68$ MPa
Min. principal stress $\Rightarrow \sigma_2 = 75 - 35.68 = 39.32$ MPa

1130. The volumetric strain in case of thin spherical shell when subjected to internal pressure P is

(a) $\frac{Pd}{2tE}\left(\frac{1}{2}-\frac{1}{m}\right)$ (b) $\frac{Pd}{2tE}\left(1-\frac{1}{2m}\right)$
(c) $\frac{Pd}{4tE}\left(1-\frac{1}{m}\right)$ (d) $\frac{3Pd}{4tE}\left(1-\frac{1}{2m}\right)$
(e) None of these

CGPSC AE 16.10.2016

Ans. (e) : As we know,
For thin cylinder,

$$\epsilon_v = \epsilon_\ell + 2\epsilon_h \qquad \therefore \epsilon_h = \frac{Pd}{4Et}(1-\nu)$$

$$= \frac{Pd}{4tE}(5-4\nu)$$

For spherical thin shell,

$$\epsilon_v = 3\epsilon_h \qquad \therefore \epsilon_\ell = \epsilon_h$$

$$= \frac{3Pd}{4tE}(1-\nu)$$

1131. In thick cylinder, if hoop stress is plotted w.r.t. $\left(\frac{1}{r^2}\right)$, then the curve will be

(a) Parabolic (b) Hyperbolic
(c) Linear (d) Elliptical

RPSC LECTURER 16.01.2016

Ans. (c) : In thick cylinder, if hoop stress is plotted w.r.t. $\left(\frac{1}{r^2}\right)$, then the curve will be linear.

1132. A thick cylinder, having r_o and r_i as outer and inner radii, is subjected to an internal pressure P. The maximum tangential stress at the inner surface of the cylinder is

(a) $\frac{P(r_o^2+r_i^2)}{r_o^2-r_i^2}$ (b) $\frac{P(r_o^2-r_i^2)}{r_o^2+r_i^2}$
(c) $\frac{2Pr_i^2}{(r_o^2-r_i^2)}$ (d) $\frac{P(r_o^2-r_i^2)}{r_i^2}$

UPPSC AE 12.04.2016 Paper-I

Search on Telegram @apna_pdf

Ans. : (a) For a thick cylinder, the hoop stress is maximum at the inner surface and is given by.

$$\sigma = \frac{\left(d_o^2 + d_i^2\right)}{\left(d_o^2 - d_i^2\right)}.p$$

$$\sigma = P.\frac{\left(r_o^2 + r_i^2\right)}{\left(r_o^2 - r_i^2\right)}$$

1133. Compound tubes are used in internal pressure cases, for following reasons

(a) For increasing the thickness.
(b) For increasing the outer diameter o the tube.
(c) The strength is more.
(d) It evens out stresses.

UPPSC AE 12.04.2016 Paper-I

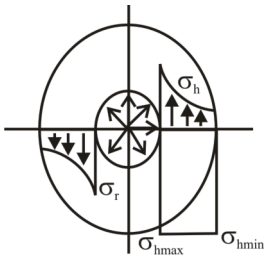
Ans. : (d) Compound tubes are used in internal pressure cases, for it evens out stresses

1134. In a thick cylinder subjected to internal pressure, the hoop stress is _____ at the outer surface and is _____ at the inner surface

(a) min, min (b) max, max
(c) max, min (d) min, max

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : The hoop stress is minimum at outer surface & its maximum at inner surface (σ_h)



1135. If a steel tyre is heated and struck on a rigid wheel, after cooling the tyre will be subjected to

(a) Bending (b) Torsion
(c) Hoop stress (d) Compression

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : If a steel tyre is heated and struck on a rigid wheel, after cooling the tyre will be subjected hoop stress, due to shrinkage from outside & expansion on inside, due to temperature variation property varies.

1136. If the hoop stress in a thin cylinder is 24 N/sq.mm, then its longitudinal stress is equal to

(a) 36 N/sq.mm (b) 24 N/sq.mm
(c) 12 N/sq.mm (d) 6 N/sq.mm

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : As we know, for cylinder

$$\sigma_H = \frac{Pd}{2t} \quad \& \quad \sigma_L = \frac{Pd}{4t}$$

So, $\sigma_H = 2\sigma_L$

$24 = 2 \times \sigma_L$

$\sigma_L = 12\,N/mm^2$

1137. A thin cylindrical shell of diameter (d), length (ℓ) and thickness (t) is subjected to an internal pressure (p). The ratio of the longitudinal strain to hoop strain is

(a) $\frac{m-2}{2m-1}$ (b) $\frac{2m-1}{m-2}$
(c) $\frac{m-2}{2m+1}$ (d) $\frac{m+2}{2m+2}$

ISRO Scientist/Engineer 11.10.2015
ESE 2004

Ans. (a) : Longitudinal strain $(\in_\ell) = \frac{1}{E}\left[\sigma_\ell - \mu\sigma_h\right]$

$$= \frac{1}{E}\left[\frac{\sigma_h}{2} - \mu\sigma_h\right]$$

$$\in_\ell = \frac{\sigma_h}{2E}[1-2\mu]$$

Hoop strain $(\in_h) = \frac{1}{E}\left[\sigma_h - \mu\sigma_\ell\right]$

$$= \frac{1}{E}\left[\sigma_h - \frac{\mu\sigma_h}{2}\right]$$

$$\in_h = \frac{\sigma_h}{2E}[2-\mu]$$

Required ratio $(\in_\ell/\in_h) = \frac{\text{Longitudinal strain}}{\text{Hoop strain}}$

$$= \frac{\frac{\sigma_h}{2E}[1-2\mu]}{\frac{\sigma_h}{2E}[2-\mu]}$$

$$= \frac{(1-2\mu)}{(2-\mu)}$$

$$= \frac{\left[1-2\times\frac{1}{m}\right]}{\left[2-\frac{1}{m}\right]} \qquad \left[\because \mu = \frac{1}{m}\right]$$

$$= \frac{m-2}{2m-1}$$

1138. A spherical vessel with an inside diameter of 2 m is made of material having an allowable stress in tension of 500 kg/cm^2. The thickness of a shell to withstand a pressure of 50 kg/cm^2 should be-

(a) 5 cm (b) 2.5 cm
(c) 10 cm (d) 1.25 cm

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) For spherical vessel

$$\sigma_h = \sigma_\ell = \frac{PD}{4t}$$

$$500 = \frac{50\times 200}{4\times t}$$

$\boxed{t = 5cm}$

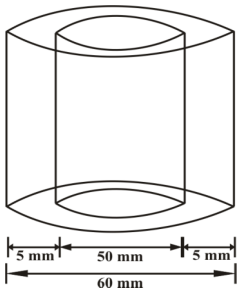
Search on Telegram @apna_pdf

1139. The cross section area of a hollow cylinder has an internal diameter of 50 mm and a thickness of 5 mm. Moment of inertia of the cross-section about its centroidal axis is

(a) 2.848×10^5 mm^4 (b) 4.294×10^5 mm^4
(c) 1.424×10^5 mm^4 (d) 1.647×10^5 mm^4
(e) 3.294×10^5 mm^4

CGPSC AE 26.04.2015 Shift-I

Ans. (e) :



Given $d_i = 50$ mm

$d_o = 60$ mm

$$k = \frac{d_i}{d_0}$$

Moment of inertia (I) $= \frac{\pi}{64} d_0^4 \left[1 - \left(\frac{d_i}{d_o}\right)^4\right]$

$$= \frac{\pi}{64} \; 60^4 \left[1 - \left(\frac{50}{60}\right)^4\right]$$

$= 329209.37 = 3.29 \times 10^5$ mm^4

1140. A thin cylinder of internal diameter D = 1 m and thickness t = 12 mm is subjected to internal pressure of 4 N/mm^2. Determine hoop stresses developed.

(a) 83.33 N/mm^2 (b) 83.33×10^{-3} N/mm^2
(c) 166.67×10^{-3} N/mm^2 (d) 166.67 N/mm^2
(e) 166.67 N/m^2

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Given

D = 1 m = 1000 mm

t = 12 mm

P = 4 N/mm^2

In a thin cylinder pressure vessel, hoop (circumferential) stress

$$\sigma = \frac{Pd}{2t}$$

$$= \frac{4 \times 1000}{2 \times 12}$$

$= 166.67$ N/mm^2

1141. Which of the following equation is used to determine the thickness of thick cylindrical shell with closed ends and made of brittle material?

(a) Lame's equation
(b) Clavarino's equation
(c) Birnie's equation
(d) Barlow's equation

UPRVUNL AE 2014

Ans : (a) Lame's equation is used to determine cylindrical shell with closed end

$$\sigma_x = \frac{b}{r^2} + a \qquad p_x = \frac{b}{x^2} - a$$

Where p_x= Compressive Nature

σ_x= Tensile Nature

1142. A thin-walled cylinder with closed ends for which inner radius is 0.50 meter and outer radius is 0.52 meter, is subjected to internal pressure 2 MPa. The absolute maximum shearing stress on the inner surface of the cylinder shall be

(a) 37.5 MPa (b) 75 MPa
(c) 26 MPa (d) 24 MPa

ISRO Scientist/Engineer 24.05.2014

Ans. (c) : Inner Radius r = 0.50 m

Outer Radius R = 0.52 m

Internal pressure P = 2 MPa

$$\tau_{max} = \frac{Pd}{4t}$$

So, outer diameter D = 2 × 0.52

= 1.04 m

Thickness t = R – r

= 0.52 - 0.50

t = 0.02 m

$$\tau_{max} = \frac{2 \times 1.04}{4 \times 0.02}$$

= 26 MPa.

1143. The initial hoop stress in a thick cylinder when it is wound with a wire under tension will be :

(a) zero (b) tensile
(c) compressive (d) bending

(HPPSC AE 2014)

Ans : (c) The initial hoop stress in a thick cylinder when it is wound with a wire under tension will be compressive.

Analysis of Thick Cylinders/Lame's Theorem:-

* Lame's assumption

(i) Material of shell is homogeneous

(ii) Plane section of cylinder, perpendicular to longitudinal axis remains plane under pressure.

* Subjected to internal pressure

(i) $x = R_i, \sigma_h = \frac{P\left[R_0^2 + R_i^2\right]}{R_0^2 - R_i^2}$

(ii) $x = R_0, \sigma_h = \frac{2PR_i^2}{R_0^2 - R_i^2}$

1144. Shrinking a thick cylinder over another helps:

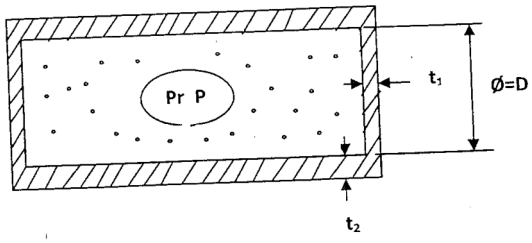
(a) reduce the magnitude of tensile hoop stress
(b) reduce the difference between the higher and lower magnitude of tensile hoop stress
(c) remove the longitudinal stress
(d) reduce the cost

(HPPSC AE 2014)

Ans : (b) Shrinking a thick cylinder over another helps reduce the difference between the higher and lower magnitude of tensile hoop stress.

Search on Telegram @apna_pdf

1145. A thick cylinder of inner dia 'D', wall thickness t_2 and length 'L' is sealed at its both ends with caps. The thickness of the cap is t_1. Allowable tensile yield stress = σ_y and allowable shear stress = τ_y. A gas is pumped this cylinder at pressure 'p'. The cap will yield in shear at circumference of diameter 'D' when the gas pressure applied is more than

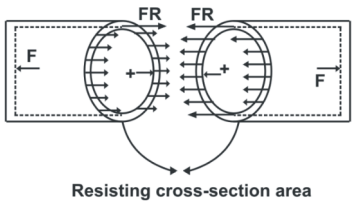


(a) $\frac{4t_1\tau_y}{D}$ (b) $\frac{8t_1\tau_y}{D}$

(c) $\frac{4t_2\sigma_y}{D}$ (d) $\frac{2t_1\tau_y}{D}$

ISRO Scientist/Engineer 12.05.2013

Ans. (a) : Busting of pressure variation (P.V.) occurs "circumferential/Axial"



$A = \pi D t_1$

Safe Condition

$F \le FR$

$F = FR$

$$P \times \frac{\pi}{4} D^2 = \tau_y \times \pi \times D \times t_1$$

or, $$P = \frac{4t_1\tau_y}{D}$$

1146. A pipe of diameter 800 mm contains fluid under a pressure of 2 N/mm^2. If the tensile strength is 100 N/mm^2, the thickness of the pipe is

(a) 16 mm (b) 4 mm

(c) 8 mm (d) 10 mm

TNPSC AE 2013

Ans. (c) : Data given -

d = 800 mm, P = 2 N/mm^2

σ_H = 100 N/mm^2

we know that

$$\sigma_H = \frac{Pd}{2t}$$

$$t = \frac{2 \times 800}{2 \times 100}$$

$$\boxed{t = 8 \text{ mm}}$$

1147. A thin spherical shell of 1.5 m diameter is 8 mm thick is filled with a liquid at the pressure of 3.2 N/mm^2, The stress induced in the shell is

(a) 75 N/mm^2 (b) 150 N/mm^2

(c) 200 N/mm^2 (d) 180 N/mm^2

TNPSC AE 2013

Ans. (b) : Data given-

d = 1.5 m = 1500 mm

t = 8 mm

P = 3.2 N/mm^2

$$\sigma_l = \sigma_H = \frac{Pd}{4t} = \frac{3.2 \times 1500}{4 \times 8}$$

$$\sigma_H = 150 \text{ N/mm}^2$$

1148. In thick cylinder, the radial stresses in the wall thickness:-

(a) is zero

(b) negligible small

(c) varies from the inner face to outer face

(d) None of the above

UKPSC AE-2013, Paper-I

Ans. (c) : In thick cylinder, the radial stresses in the wall thickness varies from inner face [maximum] to outer face [zero].

1149. A cylindrical shell of diameter 200 mm and wall thickness 5 mm is subjected to internal fluid pressure of 10 N/mm^2. Maximum shearing stress induced in the shell in N/mm^2, is

(a) 50 (b) 75

(c) 100 (d) 200

UKPSC AE 2012 Paper-I

Ans. (d) : Data Given

Diameter of shell (d) = 200 mm

thickness (t) = 5 mm

pressure (P) = 10 N/mm^2

then, maximum shear stress

$$\tau = \frac{Pd}{2t}$$

$$= \frac{10 \times 200}{2 \times 5}$$

τ = 200 N/mm^2

1150. The bursting pressure for a cold drawn seamless steel tubing of 60 mm inside diameter with 2 mm wall thickness is (The ultimate strength of steel is 380 MN/m^2)

(a) 25.33 MN/m^2 (b) 24.33 MN/m^2

(c) 26.33 MN/m^2 (d) 50.66 MN/m^2

APPSC AEE 2012

Ans. (a) : Given, d = 60 mm, t = 2m, σ_h = 380 MN/m^2

Solution- $$\sigma_h = \frac{pd}{2t} \Rightarrow P = \frac{\sigma_h \times 2t}{d} = \frac{380 \times 2 \times 2}{60}$$

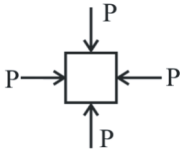
P = 25.33 MN/m^2

1151. A solid thick cylinder is subjected to an external hydrostatic pressure 'P'. The state of stress in the material of the cylinder is represented as :

(a) 
(b) 
Search on Telegram @apna_pdf

(c) 
(d) 
APPSC AE 04.12.2012

Ans. (c) : A solid thick cylinder is subjected to an external hydrostatic pressure 'P'. The state of stress represented by –



In case of hydrostatic state of stress only pure compressive stress acts on all the faces.

1152. Thin cylinders are frequently required to operate under pressures upto :

(a) 5 MN/m^2 (b) 15 MN/m^2
(c) 30 MN/m^2 (d) 250 MN/m^2

APPSC AE 04.12.2012

Ans. (c) : Thin cylinders are frequently required to operate upto 30 MN/m^2.

1153. The bursting pressure for a cold drawn seamless steel tubing of 60 mm inside diameter with 2 mm wall thickness is (The ultimate strength of steel is 380 MN/m^2)

(a) 25.33 MN/m^2 (b) 24.33 MN/m^2
(c) 26.33 MN/m^2 (d) 50.66 MN/m^2

APPSC AE 04.12.2012

Ans. (a) : For thin cylinder -

$$\sigma_c = \frac{Pd}{2t}$$

P = Bursting pressure = ?

Given,

d = Inside diameter of steel tube = 60mm

t = Wall thickness of seamless steel tube = 2mm

σ_c = Circum perential stress (or) Bursting stress (or)
= Ultimate strength of steel = 380 MN/m^2

$$\therefore P = \frac{\sigma_c \times 2t}{d} = \frac{380\,MN/m^2 \times 2 \times 2mm}{60mm}$$

$P = 25.33\ MN/m^2$

1154. For a thick-walled shell, the diameter-thickness ratio is

(a) less than 20 (b) greater than 20
(c) equal to 20 (d) equal to 20

BPSC AE 2012 Paper - VI

Ans : (a) : For a thick walled shell the diameter-thickness ratio is greater than 20

1155. In a thick cylinder, radial stress at inner surface is

(a) independent of fluid pressure
(b) more than fluid pressure
(c) less than fluid pressure
(d) equal to fluid pressure

BPSC AE 2012 Paper - VI

Ans : (d) : The radial stress for a thick walled cylinder is equal and opposite to the gauge pressure on the inside surface and zero on the outside.

1156. A thin cylindrical shell is subjected to internal pressure, such that hoop strain developed in shell is 850 microstrain. If Young's modulus is 100 GPa and Poisson's ratio is 0.3, what is hoop stress developed in shell :

(a) 200 MPa (b) 100 MPa
(c) 50 MPa (d) None of these

PSPCL AE, 2012

Ans. (b) : $\varepsilon_c = \frac{1}{E}(\sigma_c - \mu\sigma_l)$

$$850 \times 10^{-6} = \frac{1}{100 \times 10^9} \times \left[\sigma_c - 0.3 \times \frac{\sigma_c}{2}\right]$$

$$\sigma_c = 2\sigma_l = \frac{pd}{2t}$$

σ_c = 100 MPa

1157. A thick cylindrical shell is subjected to internal pressure 'p', such that maximum hoop stress developed in shell is 100 MPa. If external radius of shell is two times the internal radius, what is the magnitude of 'p'.

(a) 100 MPa (b) 60 MPa
(c) 40 MPa (d) None of these

PSPCL AE, 2012

Ans. (b) : $\sigma_h = A + \frac{B}{x^2}$

r_i = Inner radius

r_o = Outer radius

Using boundary condition –

$$A = \frac{Pr_i^2}{r_o^2 - r_i^2}$$

$$B = \frac{P \times r_i^2 \times r_o^2}{r_o^2 - r_i^2}$$

Given, $r_i = r$

$r_o = 2r$

$$A = \frac{P \times r^2}{4r^2 - r^2} = \frac{P}{3}$$

$$B = \frac{P \times 4r^2 \times r^2}{4r^2 - r^2} = \frac{4P \times r^2}{3}$$

$$\sigma_h = \frac{P}{3} + \frac{4P \times r^2}{3 \times r^2} = \frac{5P}{3} \qquad (\sigma_h = 100\ MPa)$$

$$100 = \frac{5P}{3}$$

$$\boxed{P = 60\,MPa}$$

1158. A compound cylinder with inner radius 50 mm and outer radius 70 mm is made by shrinking one cylinder to the other cylinder. The junction radius is 60 mm and the junction pressure is 11 N/mm^2. The maximum hoop stress developed in the inner cylinder would be ?

(a) 3.6 N/mm^2 compression
(b) 3.6 N/mm^2 tension
(c) 7.2 N/mm^2 compression
(d) 7.2 N/mm^2 tension

VIZAG STEEL MT 2011

Search on Telegram @apna_pdf

Ans. (c) : $P = 1.1\ N/mm^2$

Junction radius, $R_2 = 60$ mm

Inner radius, $R_1 = 50$ mm

Hoop stress, $\sigma_h = \dfrac{-2PR_2^2}{R_2^2 - R_1^2}$

$= \dfrac{-2 \times 1.1 \times (60)^2}{(60)^2 - (50)^2}$

$\sigma_h = 7.2 N/mm^2$ (Compressive)

1159. A thin cylinder contains fluid at a pressure of 30 kg/cm^2. The inside diameter of the shell is 60 cm and the tensile stress in the material is to be limited to 900 kg/cm^2. The shell must have minimum wall thickness of

(a) 1 mm (b) 2.7 mm

(c) 10 mm (d) 9 mm

ISRO Scientist/Engineer 2011

Ans. (c) : $P = 30\ kg/cm^2$

$d = 60$ cm

$\sigma = 900\ kg/cm^2$

$\sigma = \dfrac{Pd}{2t}$

Hoop stress (Circumferential) $\sigma = \dfrac{Pd}{2t}$

$900 = \dfrac{30 \times 60}{2 \times t}$

$t = \dfrac{30 \times 60}{900 \times 2}$

t = 1cm = 10mm

1160. A long thin cylindrical shell is fabricated by making longitudinal and circumferential weld seams. The efficiencies of longitudinal and circumferential weld seams are 80% and 75% respectively. Now this shell is subjected to internal fluid pressure. The ratio of the larger to smaller principal stresses induced in the shell material is

(a) 2 (b) $\dfrac{15}{8}$

(c) 1.75 (d) 1.50

UPSC JWM Advt. No.-50/2010

Ans. (b) : We know that, for riveted & welded,

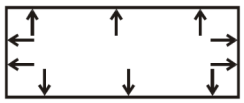
Hoop/circumferential stress,

$\sigma_h = \dfrac{pd}{2t\eta_\ell} = \dfrac{pd}{2 \times 0.8 \times t} = \dfrac{pd}{1.6t}$

Given, longitudinal stress, $\sigma_L = \dfrac{pd}{4t\eta_h} = \dfrac{pd}{4 \times 0.75 \times t} = \dfrac{pd}{3t}$

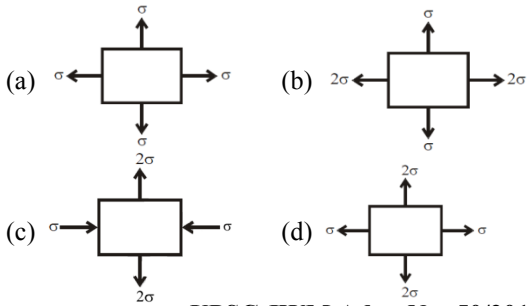
So, $\dfrac{\sigma_h}{\sigma_L} = \dfrac{pd}{1.6t} \times \dfrac{3t}{pd} = \dfrac{15}{8}$

1161.



Cylindrical shell

Principal stresses on the outside surface element of a thin cylindrical shell subjected to internal fluid pressure as shown in the figure, are represented by



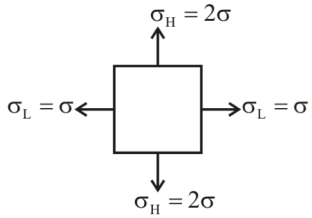
UPSC JWM Advt. No.-50/2010

Ans. (d) : As we know that,

Hoop stress, $\sigma_H = \dfrac{PD}{2t}$

Longitudinal stress, $\sigma_L = \dfrac{PD}{4t} \Rightarrow \sigma_H > \sigma_L$

So,



1162. A compound cylinder with inner radius 5 cm and outer radius 7 cm is made by shrinking one cylinder on to the other. The junction radius is 6 cm and the junction pressure is 11 kg/cm^2. The maximum hoop stress developed in the inner cylinder is :

(a) 36 kgf/cm^2 compression

(b) 36 kgf/cm^2 tension

(c) 72 kgf/cm^2 compression

(d) 72 kgf/cm^2 tension

APPSC IOF, 2009

Ans. (c) : Hoop stress $= \dfrac{-2PR_2^2}{R_2^2 - R_1^2}$

$R_1 = 50$ mm, $R_2 = 60$ mm

$P = 11\ N/mm^2$

$= 72\ kgf/cm^2$ (Compression)

1163. A thin cylindrical shell of mean diameter D and thickness t is subjected to internal fluid pressure p_i. The ends of this shell are rigidly closed by flat circular plate. If the longitudinal stress in the shell is to be zero what external pressure p_e must be applied at the ends?

(a) $2p_i$ (b) $1.5p_i$

(c) p_i (d) $0.5p_i$

UPSC JWM Adv. No-16/2009

Search on Telegram @apna_pdf

Ans. (c) : If the longitudinal stress in the shell is zero i.e., In equilibrium condition, the internal fluid pressure (P_i) is equal to external (P_e).

$\boxed{P_e = P_i}$

1164. A 10 m radius thin spherical tank is to be used to store gas. If the wall thickness of the tank is 10 mm and the allowable tensile stress for the material of the tank is 125 MPa, the maximum possible gas pressure (neglecting radial stress) is

(a) 0.25 MPa (b) 0.125 MPa
(c) 0.5 MPa (d) 1 MPa

DRDO Scientists 2008

Ans. (a) : For spherical tank hoop stresses :

$$\sigma_1 = \frac{pd}{4t} \le 125$$

$$p \le 125 \times \frac{4t}{d}$$

or $$p \le 125 \times \frac{4 \times 10}{20000}$$

or $$p \le 0.25 \text{ MPa}$$

$$p_{max} = 0.25 \text{ MPa}$$

1165. A thin cylindrical pressure vessel with mean diameter 10 m and wall thickness 20 mm is subjected to an internal fluid pressure of 0.4 MPa. If the yield strength of the material of the cylinder is 200 MPa, the factor of safety according to maximum shear stress theory (neglecting radial stress) is

(a) 0.5 (b) 1
(c) 1.5 (d) 2

DRDO Scientists 2008

Ans. (d) : Maximum shear stress in thin cylindrical pressure vessel,

$$\tau_{max} = \frac{PD}{4t} = \frac{0.4 \times 10}{4 \times 20 \times 10^{-3}}$$

$\tau_{max} = 50$ MPa

According to shear stress theory,

$$\tau_{max} = \frac{\sigma_y}{2\,FOS} \Rightarrow FOS = \frac{\sigma_y}{2\tau_{max}}$$

$$FOS = \frac{200}{2 \times 50} = 2$$

1166. In thick cylinders the radial stress in the wall thickness

(a) zero
(b) negligibly small
(c) not negligible and varies from the inner surface to outer surface
(d) any of the above

WBPSC AE 2008

Ans. (c)

In thick cylinder the radial stress in the wall thickness varies from the inner surface to outer surface.

1167. Which of the following is usually considered as thin cylinders?

(a) Boiler (b) Tanks
(c) Steam pipes (d) All of the above

WBPSC AE 2008

Ans. (d) : Boilers, Tanks and steam pipes are usually considered as thin cylinder.

1168. Which of the following assumptions is made while solving problems of thick cylinders using Lame's theory

(a) the material is homogeneous and isotropic
(b) the material is stressed within the elastic limit
(c) plane sections perpendicular to the longitudinal axis of the cylinder remain plain after the application of internal pressure
(d) all of the above

WBPSC AE 2008

Ans. (d) : Assumptions in Lame's theory for thick cylinder–

1. Material is homogeneous and isotropic in which hooke's law is valid.
2. The plane section perpendicular to longitudinal axis remain plane after fluid pressure is applied. It means there will be no bending i.e. longitudinal strain is constant.
3. The material is stressed within the elastic limit and each fibre of material is free to contract and expand individually.

1169. When a thin cylinder shell is subjected to internal fluid pressure. Which of the following stress is developed in. its wall?

(a) circumferential stress (b) longitudinal stress
(c) both of (A) and (B) (d) none of the above

WBPSC AE 2008

Ans. (c)

$$\sigma_{hoop} \text{ or } \sigma_{circumferential} = \frac{Pd}{2t}$$

$$\sigma_{longitudinal} = \frac{Pd}{4t}$$

where

P = internal pressure
d = diameter of thin cylinder
t = thickness of cylinder

1170. If water in closed pipe freezes, the pipe will

(a) Rupture along a plane perpendicular to the axis of pipe
(b) Rupture of zig-zag along the length
(c) Rupture along weakest circumferential section
(d) Rupture along a line running longitudinally along the pipe

ISRO Scientist/Engineer 2007

Ans. (d) : The failure will take place along the longitudinal joint because of the circumferential/hoop stress.

Search on Telegram @apna_pdf

1171. In a thick cylindrical shell subjected to internal fluid pressure, the state of stress at the outer surface is

(a) three-dimensional (b) two-dimensional
(c) isotropic (d) none of the above

UKPSC AE 2007 Paper -I

Ans. (b) : Two-dimensional

1172. The design of this cylindrical shells is based on:

(a) hoop stress
(b) longitudinal stress
(c) volumetric stress
(d) average of hoop and longitudinal

J & K PSC Screening, 2006

Ans. (a) : In thin cylindrical shell loop stress is more as compared to longitudinal stress so hoop stress is used for designing of thin cylinder.

$$\text{Hoop stress } \sigma_h = \frac{Pd}{2t}$$

$$\text{Longitudinal stress } \sigma_L = \frac{Pd}{4t}$$

1173. A thin cylindrical shell has closed hemispherical ends. The material properties are Young's modulus (E) and Poisson's Ratio (v). For no distortion to take place at the junction of cylindrical and hemispherical portions, the ratio of shell thickness of spherical portion to that to cylindrical portion is

(a) $\frac{1-v}{2+v}$ (b) $\frac{1+v}{2-v}$
(c) $\frac{1-v}{2-v}$ (d) $\frac{1+v}{2+v}$

OPSC Civil Services Pre 2006

Ans. (c) : t_1 = thickness in cylindrical portion
t_2 = thickness in spherical portion
circumferential strain in cylindrical portion

$$\in_{c_1} = \frac{Pd}{4t_1} \times \frac{1}{E}\left[2 - \frac{1}{m}\right]$$

circumferential strain in hemispherical portion

$$\in_{c_2} = \frac{1}{E}\frac{Pd}{4t_2}\left[1 - \frac{1}{m}\right]$$

For no distortion at junction $\in_{c_1} = \in_{c_2}$

$$\frac{t_2}{t_1} = \frac{m-1}{2m-1} = \frac{1-v}{2-v}$$

7. Theory of Columns

1174. A column of length '*l*' is fixed at both the ends. The equivalent length of the column is:-

(a) 2 *l* (b) 0.5 *l*
(c) 4 *l* (d) *l*

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
TNPSC AE 2018
UPPSC AE 12.04.2016
UKPSC AE-2013, Paper-I
APPSC AEE 2012, APPSC AE 04.12.2012
RPSC AE GWD, 2011, TNPSC AE, 2008
WBPSC AE 2007

Ans. (b) :

Conditions	Effective length
(i) Both end fixed	$\ell/2$
(ii) Both end hinge	ℓ
(iii) One fixed, one hinge	$\ell/\sqrt{2}$
(iv) One fixed, other free	2ℓ

1175. For a long slender column of uniform cross section, the ratio of critical buckling load for the case with both ends clamped to the case with both ends hinged is :

(a) 1 (b) 2
(c) 4 (d) 16

Gujarat PSC AE 2019, BHEL ET 2019
GPSC ARTO Pre 30.12.2018
UP Jal Nigam AE 2016, RPSC 2016

VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 2012

Ans. (c) :
Ratio of critical buckling

$$= \frac{\text{Critical load with both ends clamped}}{\text{Critical load with both ends hinged}}$$

$$\frac{P_{cr_1}}{P_{cr_2}} = \frac{\left(\frac{\pi^2 EI}{\ell_e^2}\right)_{\text{clamped column}}}{\left(\frac{\pi^2 EI}{\ell_e^2}\right)_{\text{hinged column}}}$$

$$\frac{P_{cr_1}}{P_{cr_2}} = \frac{\left[\frac{\pi^2 EI}{\left(\frac{\ell}{2}\right)^2}\right]_{\text{clamped column}}}{\left(\frac{\pi^2 EI}{\ell^2}\right)_{\text{hinged column}}}$$

$$= \frac{4}{1} = 4$$

1176. Slenderness ratio of a column is defined as the ratio of its length to its

(a) least radius of gyration
(b) least lateral dimension
(c) maximum lateral dimension
(d) maximum radius of gyration

Nagaland PSC (CTSE) 2018, Paper-I
HPPSC Asstt. Prof. 18.09.2017
Vizag Steel (MT) 2017, CILMT 26.03.2017
OPSC AEE 2015 Paper-I
TRB Asstt. Prof., 2012, APPSC AEE 2012
UPSC JWM Advt. No.-52/2010
ESE 2003

Search on Telegram @apna_pdf

Ans. (a) : Slenderness Ratio (S)

$$S = \frac{\text{Effective Length of column}}{\text{Least Radius of Gyration}}$$

$$S = \frac{L_e}{K_{min}}$$

Where $k = \sqrt{\frac{I_{min}}{A}}$

1177. If the diameter of a long column is reduced by 20 percent, the reduction in Euler buckling load in percentage is nearly:-

(a) 4 (b) 36
(c) 49 (d) 59

HPPSC W.S. Poly. 2016
TSPSC AEE 2015
UKPSC AE-2013, Paper-I
APPSC AEE 2012
APPSC AE 04.12.2012
ESE 2000

Ans. (d) : We know that

$$P_e = \frac{\pi^2 E I_{min.}}{L_e^2}$$

$$P_e \propto I_{min}$$

$$P_e \propto \frac{\pi}{64} d^4$$

$$P_e \propto d^4$$

$$P_{e_1} = kd^4$$

$$P_{e_2} = k(0.8)^4 . d^4$$

$$P_{e_2} = 0.4096\ P_{e_1}$$

Then percentage reduction in Euler buckling load

$$= \frac{P_{e_1} - P_{e_2}}{P_{e_1}} \times 100$$

$$= kd^4 \frac{[1 - 0.4096]}{kd^4} \times 100$$

$$= 59\%$$

1178. A short column of external diameter D and internal diameter d carries an external load W. The greatest ecentricity which the load can have without producing tension on the cross section of the column is-

(a) $(D+d)/8$ (b) $(D^2+d^2)/8$
(c) $(D^2+d^2)/8D$ (d) $(D^2+d^2)/8d$

GPSC Engg. Class-II Pre-19.01.2020

ISRO Scientist/Engineer 12.05.2013
ISRO Scientist/Engineer 2008
ISRO Scientist/Engineer 2006
ESE 1999

Ans. (c) : External diameter = D
Internal diameter = d
External load = W, ecentricity e = ?
Stress due to bending moment (σ_b)
= Stress due to axil load (σ_a)

$\sigma_b = \sigma_a$

$$\frac{M}{Z} = \frac{4W}{\pi(D^2 - d^2)}$$

$$\frac{64 \times W \times e \times D}{2\pi(D^4 - d^4)} = \frac{4W}{\pi(D^2 - d^2)}$$

$$e = \frac{D^2 + d^2}{8D}$$

1179. In Rankine's formula, the material constant for mild steel is

(a) $\frac{1}{9000}$ (b) $\frac{1}{5000}$
(c) $\frac{1}{1600}$ (d) $\frac{1}{7500}$

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
Karnataka PSC AE (WRD) 31.07.2021
Karnataka PSC AE, 10.09.2017
GPSC Lect. Poly. 07.12.2014, APPSC AEE 2012

Ans : (d)

Material	Value of 'a'
wrought iron	1/9000
cast iron	1/1600
Mild Steel	1/7500
Timber	1/750

1180. For a column of length L is fixed at both the ends, corresponding Euler's critical load is

(a) $\pi^2 EI / L^2$ (b) $2\pi^2 EI / L^2$
(c) $3\pi^2 EI / L^2$ (d) $4\pi^2 EI / L^2$

ISRO Scientist/Engineer 22.04.2018
APPSC AEE Mains 2016 (Civil Mech.)
ISRO Scientist/Engineer 2011
ISRO Scientist/Engineer 2007
OPSC Civil Services Pre 2006

Ans. (d) : Euler's critical load

$$P_{cr} = \frac{\pi^2 E I_{min}}{L_e^2}$$

L_e = effective length

Both end fixed

$$L_e = \frac{1}{2} l$$

Critical load

$$P_{cr} = \frac{\pi^2 E I_{min}}{\left(\frac{1}{2} l\right)^2}$$

$$P_{cr} = \frac{4\pi^2 E I_{min}}{l^2}$$

1181. Euler's formula holds good only for

(a) short columns
(b) long columns
(c) both short and long columns
(d) weak columns

Sikkim PSC (Under Secretary), 2017
Haryana PSC Civil Services Pre, 2014

Search on Telegram @apna_pdf

UKPSC AE-2013, Paper-I, BPSC AE 2012 Paper-VI
APPSC AE 04.12.2012, APPSC AEE 2012

Ans. (b) :
(1) Euler's Formula applicable only for long column which fails due to buckling.

$$P_b = \frac{\pi^2 EI_{min}}{l_e^2}$$

(2) Rankine formula is applicable for both long and short column means they consider both failure buckling as well as crushing.

$$\frac{1}{P_R} = \frac{1}{P_c} + \frac{1}{P_b}$$

$P_R \rightarrow$ Rankine load
$P_c \rightarrow$ Crushing load
$P_b \rightarrow$ Buckling load.

1182. Match List I with List II and select the correct answer using the codes given below the lists :

	List I (End conditions of columns)		List II (Lowest critical load)
(A)	Column with both ends hinged	(I)	$(\pi^2EI)/L^2$
(B)	Column with both ends fixed	(II)	$(2\pi^2EI)/L^2$
(C)	Column with one end fixed and other end hinged	(III)	$(4\pi^2EI)/L^2$
(D)	Column with one end fixed and other end free	(IV)	$(\pi^2EI)/4L^2$

(a) A-I, B-II, C-III, D-IV
(b) A-III, B-II, C-I, D-IV
(c) A-I, B-III, C-II, D-IV
(d) A-II, B-IV, C-III, D-I

Punjab PSC (Lect.) 06.08.2017
TRB Asstt. Prof. 2012
APPSC IOF, 2009, ESE 1995

Ans. (c) : Column with both end hinged $\Rightarrow L = L_e \Rightarrow \frac{\pi^2EI}{L^2}$

Column with both ends fixed, $L_e = \frac{L}{2} \Rightarrow \frac{4\pi^2EI}{L^2}$

Column with one end fixed and other end hinged, $L_e = \frac{L}{\sqrt{2}} \Rightarrow \frac{2\pi^2EI}{L^2}$

Column with one end fixed and other is free, $L_e = 2L \Rightarrow \frac{\pi^2EI}{4L^2}$

1183. When both ends of the column are hinged the crippling load at which the column just buckled is
(Where E is Young's modulus of column, I is the Moment of inertia of column and L is effective length of column)

(a) $\frac{\pi^2EI}{L^2}$ (b) $\frac{\pi^2EI}{2L^2}$
(c) $\frac{\pi EI}{L^2}$ (d) $\frac{2\pi^2EI}{L^2}$

GATE 2018

APPSC AEE Screening Test 2016
CGPSC 26th April Shift-I
APPSC AEE 2012, GATE 2006

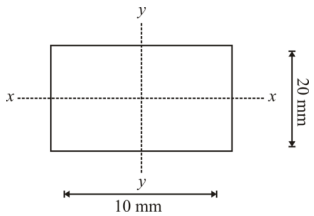
Ans. (a) :

Description	Crippling load	Eff. length	Eff. length as per IS code
	$\frac{2\pi^2EI}{L^2}$	$l_{eff} = \frac{l}{\sqrt{2}}$	$0.8\,l$
	$\frac{4\pi^2EI}{L^2}$	$leff = \frac{l}{2}$	$0.65\,l$
	$\frac{\pi^2EI}{4L^2}$	$l_{eff} = 2l$	$2\,l$
	$\frac{\pi^2EI}{L^2}$	$l_{eff} = l$	l

1184. A column has a rectangular cross-section of 10 mm × 20 mm and a length of 1 m. The slenderness ratio of the column is close to :
(a) 200 (b) 346
(c) 625 (d) 1000

Vadodara Municipal Corp. DEE 2018
GPSC Asstt. Director of Transport 05.03.2017
UP Jal Nigam AE 2016
GATE 2011

Ans. (b) : Cross sectional area (A) = 10 × 20 = 200 mm^2



$$I_{xx} = \frac{10 \times 20^3}{12} = 6666.67 \text{ mm}^4$$

$$I_{yy} = \frac{20 \times 10^3}{12} = 1666.67 \text{ mm}^4$$

Search on Telegram @apna_pdf

Least radius of gyration,

$$K_{min} = \sqrt{\frac{I_{min}}{A}} = \sqrt{\frac{1666.67}{10\times 20}}$$

$= 2.88$ mm

Slenderness ratio (λ) is given by :

$$= \frac{\text{Effective length of column } (\ell_e)}{\text{Least radius of gyration } (K_{min})}$$

$$\lambda = \frac{1000}{2.88} = 346.409$$

1185. According to Euler's column theory, the crippling load of a column of length (l), with one end is fixed and the other end is hinged is

(a) $\pi^2 EI/l^2$ (b) $\pi^2 EI/4l^2$

(c) $2\pi^2 EI/l^2$ (d) $4\pi^2 EI/l^2$

Karnataka PSC AE (WRD) 31.07.2021
Nagaland PSC CTSE 2018 Paper-I
APPSC AEE MAINS 2016, PAPER-III
WBPSC AE, 2007

Ans. (c) :

End Condition	Euler's crippling load
Both ends hinged	$\frac{\pi^2 EI}{\ell^2}\ (l_e = l)$
Both ends fixed	$\frac{4\pi^2 EI}{\ell^2}\left(l_e = \frac{l}{2}\right)$
one end hinged and other end fixed	$\frac{2\pi^2 EI}{\ell^2}\left(l_e = \frac{l}{\sqrt{2}}\right)$
one end fixed and other end free	$\frac{\pi^2 EI}{4\ell^2}\ (l_e = 2l)$

1186. What is the expression for crippling load for a column of length L, with one end fixed and other end free?

(a) $P = \pi^2 EI/4L^2$ (b) $P = \pi^2 EI/L^2$

(c) $P = 2\pi^2 EI/L$ (d) $4\pi^2 EI/L^2$

UPRVUNL AE 21.08.2016
ESE 2012
ISRO Scientist/Engineer 2009, 2008
ESE 2006, GATE 1994

Ans. (a) : Crippling load = P_e

Column length = L

$$P = \frac{\pi^2 EI}{(L_e)^2}$$

$L_e = 2L$ (one end fixed and other end free)

$$P = \frac{\pi^2 EI}{(2L)^2} = \frac{\pi^2 EI}{4L^2}$$

1187. The buckling load for a column pinned at both ends is 10 kN. If the ends are fixed, the buckling load changes to

(a) 40 kN (b) 2.5 kN

(c) 5 kN (d) 20 kN

Karnataka PSC AE, 10.09.2017
TRB Asstt. Prof., 2012
WBPSC AE 2003, GATE 1998

Ans. (a) : We know that,

$$P_e = \frac{\pi^2 EI_{min}}{L_e^2}$$

Where, L_e = effective length

I_{min} = Moment of Inertia about centroidal axis.

$$\because \quad P_e \propto \frac{1}{L_e^2}$$

Then ratio, $\frac{(P_e)_2}{(P_e)_1} = \frac{(L_e)_1^2}{(L_e)_2^2} \Rightarrow \frac{(L)^2}{(L/2)^2}$

$(P_e)_2 = 4(P_e)_1$

$= 4 \times 10$ kN$= 40$ kN

1188. The section of a column is circular with diameter d. What is the diameter of its core :

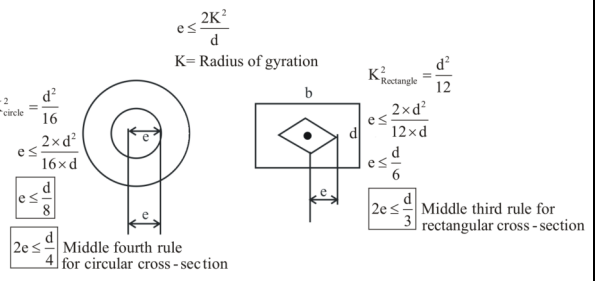
(a) d/2 (b) d/3

(c) d/4 (d) None of these

PSPCL AE, 2012
APPSC AE 04.12.2012
OPSC Civil Services Pre-2006

Ans. (c) :

Diameter of core or kernel$= \frac{2\times d}{8} = \frac{d}{4}$ for circular section



Core or kernel in column is region of cross section, when eccentric force is applied with in the region, there is no tensile force any of the fibre of column. Column are designed to bear compressive load only.

1189. Four vertical columns of the same material, height and weight have the same end conditions. The buckling load will be largest for a column having.

(a) Square cross section

(b) Hollow circular cross section

(c) Circular cross section

(d) I-section

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
MPPSC State Forest Service Exam, 2014
ESE 2009

Ans. (b) : As we know,

$$P = \frac{\pi^2 EI_{min}}{L^2}$$

So, $P \propto I_{min}$

In this inertia of the hollow circular cross section is minimum, can carry least weight, have maximum buckling.

Search on Telegram @apna_pdf

1190. The Euler load for a column is 1000 kN and crushing load is 1500 kN. The Rankine load is equal to:

(a) 600 kN (b) 1000 kN
(c) 1500 kN (d) 2500 kN

MPSC Poly. Lect. 2014
MPPSC State Forest Service Exam, 2014

Ans. (a) : As we know,

$$\frac{1}{P_R}=\frac{1}{P_E}+\frac{1}{P_C}$$

$$P_R=\frac{P_E\times P_C}{P_E+P_C}=\frac{1000\times1500}{1000+1500}$$

$P_R = 600$ kN

1191. Rankine Gordon formula for buckling is valid for :

(a) long column
(b) short column
(c) short and long column
(d) very long column

APPSC AEE 2019, APPSC IOF, 2009

Ans. (c) : $P=\sigma_A=\dfrac{\sigma_c A}{1+a\left(\dfrac{L}{k}\right)^2}$

σ_c = Crushing stress
A = Cross sectional area
a = Rankine's constant
L = Effective length
k = Slenderness ratio

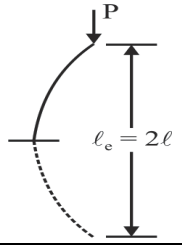
It is valid for both short and long column buckling.

1192. A column has an effective length twice the actual length, then the ends of column are:

(a) Fixed at both the ends
(b) Fixed at one end and free at the other end
(c) Hinged at both the ends
(d) Fixed at one end and hinged at the other end

CIL MT 27.02.2020
Assam PSC AE (PHED) 18.10.2020

Ans. (b) : A column has an effective length twice the actual length, then the ends of column are fixed at one end and free at the other end.



1193. If the length of a column is doubled, the critical load becomes :

(a) 1/2 of the original value
(b) 1/4 of the original value
(c) 1/8 of the original value
(d) 1/16 of the original value

HPPSC Asstt. Prof. 18.11.2016
APPSC AE Subordinate Service Civil/Mech. 2016
GATE 1998

Ans. (b) : $P_c=\dfrac{\pi^2 EI_{min}}{L_e^2}$

$$P_c\propto\frac{1}{L_e^2}$$

$$\frac{P_{c_2}}{P_{c_1}}=\frac{L_{e_1}^2}{L_{e_2}^2}=\left(\frac{1}{2}\right)^2$$

$$\boxed{P_{c_2}=\frac{P_{c_1}}{4}}$$

1194. A long column of length *l* is hinged at its ends. The equivalent length in buckling is :

(a) $2l$ (b) l
(c) $l/2$ (d) $l/4$

UKPSC AE 2012 Paper-I
UPSC JWM Advt. No.-52/2010

Ans. (b) : The equivalent Length (L_e) of a column which is hinged at both ends, if length of column is 'l'

$\therefore$ $\boxed{L_e = l}$

1195. A column that fails due to direct stress is called

(a) short column (b) long column
(c) Medium column (d) Slender column

TSPSC Manager (Engg.) HMWSSB 12.11.2020
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a)

- Short column fails due to direct stress and failure is crushing failure.
- Long column fails due to bending stresses and failure is buckling failure.
- Intermediate medium column fails due to combination of both direct stresses and bending stress and mode of failure is crushing and buckling.

1196. The buckling load will be maximum for a column, if

(a) One end of the column is fixed and other end is hinged
(b) Both ends are fixed
(c) One end is fixed and other end is free
(d) Both ends are hinged

Kerala PSC IOF 19.04.2016
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
APPSC AEE 2012

Ans. (b)

Both end Hinged $=\dfrac{\pi^2 EI_{min}}{L^2}$

Both end fixed $=\dfrac{4\pi^2 EI_{min}}{L^2}$

One end hinged and one end fixed $=\dfrac{2\pi^2 EI_{min}}{L^2}$

One end fixed and other is free $=\dfrac{\pi^2 EI_{min}}{4L^2}$

Search on Telegram @apna_pdf

1197. In the theory of columns, Rankine's constant is given by:

(a) $\frac{\sigma_c}{\pi^2 E}$ (b) $\frac{\sigma_c}{\pi^2}$

(c) $\frac{\sigma_c}{E}$ (d) $\frac{\sigma_c^2}{\pi^2 E}$

Oil India Ltd. Sr. Engg. (Production) 30.11.2019
APPSC AEE 2012

Ans. (a) : Design of intermediate column- Intermediate column fails by both crushing and buckling. Rankine's formula is used in the design of intermediate column. It is an imperical equation (Relation):

If P = Rankine's crippling load

$$\frac{1}{P}=\frac{1}{P_c}+\frac{1}{P_e}=\frac{P_c+P_e}{P_c P_e}$$

$$\Rightarrow P=\frac{P_c P_e}{P_c+P_e}=\frac{P_c}{1+\frac{P_c}{P_e}} \text{ but } P_c=\sigma_c A \ \& \ P_c=\frac{\pi^2 EI}{L_e^2}$$

$$\therefore \ P=\frac{\sigma_c A}{1+\frac{\sigma_c A}{\frac{\pi^2 EI}{L_e^2}}} \qquad \left[\because I=Ak^2 \ \& \ \lambda=\left(\frac{L_e}{k}\right)^2\right]$$

$$P=\frac{\sigma_c A}{1+\frac{\sigma_c A}{\frac{\pi^2 EAk^2}{L_e^2}}}$$

$$P=\frac{\sigma_c A}{1+\frac{\sigma_c}{\pi^2 E\lambda^2}}$$

$$P=\frac{\sigma_c A}{1+\alpha\lambda^2} \Rightarrow \alpha=\frac{\sigma_c}{\pi^2 E}$$

Where α is Rankine constant which depends on type of material of column and λ is slenderness ratio.

1198. A column is said to be a short column, when

(a) its length is very small
(b) its cross-sectional area is small
(c) the ratio of its length to the least radius of gyration is less than 80
(d) the ratio of its length to the least radius of gyration is more than 80

Vizag Steel (MT) 2017
JPSC AE 2013, Paper-V

Ans : (c) : A column is said to be short column, when the ratio of its length to the least radius of gyration is less than 80.

1199. The bucking load for a column one end fixed and other end free is 10kN. If both ends of this column is fixed, then what would be the buckling load capacity of this column ?

(a) 10 kN (b) 20 kN
(c) 80 kN (d) 160 kN

***MPPSC AE 2016,* PSPCL AE, 2012**

Ans : (d) Euler's formula for a column one end fixed and other end free

$$P_{e_1}=\frac{\pi^2 EI}{(2\ell)^2}=\frac{\pi^2 EI}{4\ell^2} \qquad (l_e=2l)$$

Euler's formula for a column both end fixed

$$P_{e_1}=\frac{4\pi^2 EI}{l^2} \qquad \left(l_e=\frac{l}{2}\right)$$

$$4\times 10=\frac{\pi^2 EI}{l^2} _____ (i)$$

$$P_{e_2}=\frac{4\pi^2 EI}{l}$$

$$(P_e)_2=4\times 40$$

$$\boxed{(P_e)_2=160\text{kN}}$$

1200. Match List I with List II and select the correct answer using the odes given below the Lists:

List-I		List II	
A	Both ends hinged	1	L
B	One end fixed and other end free	2	$L/\sqrt{2}$
C	One end fixed and other pin-joined	3	L/2
D	Both ends fixed	4	2L

Code:

	A	B	C	D
(a)	1	3	4	2
(b)	1	4	2	3
(c)	3	1	2	4
(d)	3	1	4	2

APPSC AEE 2012, ESE 2000

Ans. (b) :

Joined		**Equivalent length (l_e)**
A. Both end hinged	-	L
B. One end fixed and other end free	-	2 L
C. One end fixed and the other pin-joined	-	$L/\sqrt{2}$
D. Both end fixed	-	L/2

1201. The safe compressive load on a hollow cast iron column (one end fixed other hinged) of 150 mm external diameter, 100 mm internal diameter and 10 m length is (Use Euler's formula with a factor of safety of 5, and E = 95 GN/m^2)

(a) 74.8 kN (b) 149.6 kN
(c) 37.4 kN (d) 299.2 kN

APPSC AE 04.12.2012, APPSC AEE 2012

Ans. (a) : Given- D_o = 150 mm, D_i = 100 mm, L = 10 m
F.O.S. = 5, E = 95 GN/m^2
M.O.I.

$$I=\frac{\pi}{64}\left(D_o^4-D_i^4\right)=\frac{\pi}{64}\left(0.15^4-0.1^4\right)=1.99418\times 10^{-5}\text{ m}^4$$

Equivalent length $l_e=\frac{L}{\sqrt{2}}=\frac{10}{\sqrt{2}}=7.071\text{m}$

Search on Telegram @apna_pdf

Buckling load $P_e = \frac{\pi^2 EI}{l_e^2} = \frac{\pi^2 \times 95 \times 10^9 \times 1.99418 \times 10^{-5}}{(7.071)^2}$

Euler buckling load $P_e = 37.4 \times 10^4 = 374$ kN

For safe compressive load $P_c = \frac{P_e}{F.O.S.} = \frac{374}{5}$

$P_c = 74.8$ kN

1202. What is the cause of failure of a short MS strut under an axial load?

(a) Fracture stress (b) Shear stress
(c) Buckling (d) Yielding

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-2007

Ans. (d) : The cause of failure of a short MS strut under an axial load is yielding.

1203. If one end of a hinged column is made fixed and other end free. how much is the critical load to the original value?

(a) Four times (b) One-fourth
(c) Half (d) Twice

UPRVUNL AE 07.10.2016
BPSC POLY. TEACH 2016

Ans : (b) Euler load = $\frac{\pi^2 EI}{l_e^2}$

Case– I

Initially condition [Both ends hinged]

$(P_1) = \frac{\pi^2 EI}{l_e^2}$

Case - II

One end fixed and other and free

$P_2 = \frac{\pi^2 EI}{(2l)^2} = \frac{\pi^2 EI}{4l^2} = \frac{P_1}{4}$

$P_2 = \frac{P_1}{4}$

1204. The effective length of the column of length 2.5 m, when one end is fixed and other end is free is

(a) 5 m (b) 2.5 m
(c) 1.25 m (d) 1.77 m

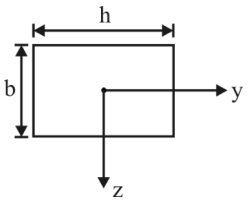
GPSC DEE, Class-2 (GWSSB) 04.07.2021

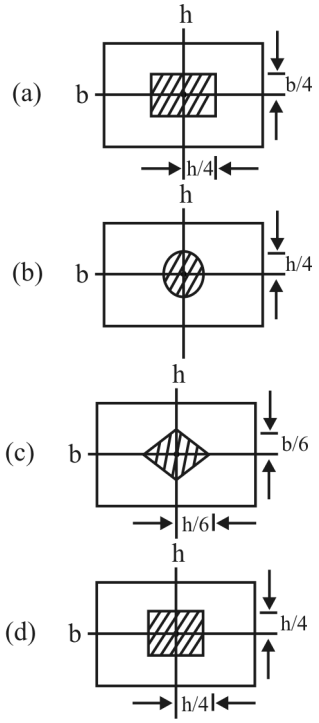
Ans. (a) : Effective length for one end fixed and other free, $L_e = 2 \times L$

$= 2 \times 2.5$

$= 5$ m

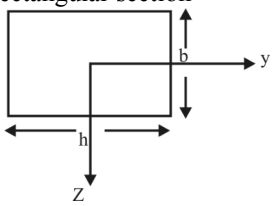
1205. The core of a section in a strut within which the load P will induce compression over the entire section for the rectangular section will be :

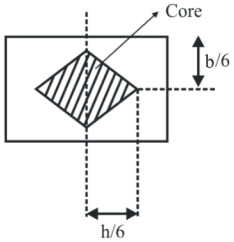




JPSC AE 10.04.2021, Paper-II

Ans. (c) : For rectangular section

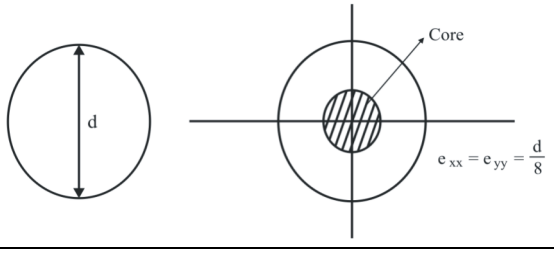




$e_{xx} = \frac{h}{6}$

$e_{yy} = \frac{b}{6}$

For Circular section –



1206. Euler's theory assumes that failure within a column is solely due to _____

(a) torsion (b) buckling
(c) sagging (d) bending

UPRVUNL AE 05.07.2021

Search on Telegram @apna_pdf

Ans. (b) : Euler's theory assumes that failure within a column is solely due to buckling.

1207. _____ is elastic instability which results in sudden large lateral deflection.

(a) Sagging (b) Fatigue
(c) Buckling (d) Failure

UPRVUNL AE 05.07.2021

Ans. (c) : Buckling is elastic instability which results in sudden large lateral deflection.

1208. For long column, which of the following relations holds true?

(a) Crushing load is negligible as compared to buckling load
(b) Crushing load is equal to buckling load
(c) Crushing load is more than buckling load
(d) Crushing load is less than buckling load

UPRVUNL AE 05.07.2021

Ans. (c) : Crushing load is more than buckling load

1209. The assumptions made in Euler's column theory is that

(a) the failure of column occurs due to buckling alone
(b) the length of column is very large as compared to its cross-sectional dimensions
(c) the column material obeys Hooke's law
(d) All of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (d) : Assumptions Made in Euler's Theory of Column–

(1) The failure of column occurs due to buckling alone.
(2) The length of column is very large as compared to its cross-sectional dimensions.
(3) The column material obeys Hooke's law.

1210. The relation between equivalent length (L) and actual length (*l*) of a column whose one end is fixed and other end is hinged is given by :

(a) $L = l$ (b) $L = l/\sqrt{2}$
(c) $L = l/2$ (d) $L = 2l$

RPSC ACF & FRO, 26.02.2021

Ans. (b)

Conditions of columns	Equivalent length
Both hinged	$L_e = l$
One hinged and other fixed	$L_e = \frac{l}{\sqrt{2}}$
Both fixed	$L_e = \frac{l}{2}$
One fixed and other free	$L_e = 2l$

1211. For a long slender column of uniform cross section, the ratio of critical buckling load for the case with both ends hinged to the case with both ends clamped is

(a) 0.25 (b) 4.0
(c) 0.125 (d) 0.5

ISRO Scientist/Engineer 12.01.2020

Ans. (a) : For both ends hinged,

$$(P_{cr})_1 = \frac{\pi^2 EI}{L^2} \quad .....(i)$$

For both ends clamped,

$$(P_{cr})_2 = \frac{4\pi^2 EI}{L^2} \quad .....(ii)$$

So, $$\frac{(P_{cr})_1}{(P_{cr})_2} = \frac{1}{4} = 0.25$$

1212. If the length of a column subjected to compressive load is increase by three times its original length, the critical buckling load becomes

(a) 1/3 of the original value
(b) 3 times the original value
(c) 1/9 of the original value
(d) 1/27 of the original value

ISRO Scientist/Engineer 12.01.2020

Ans. (c) : Critical buckling load $P_e \propto \frac{1}{L^2}$

$L_{e2} = 3L_{e1}$

$$\frac{P_{e2}}{P_{e1}} = \left(\frac{L_1}{L_2}\right)^2 = \left(\frac{1}{3}\right)^2$$

$$P_{e2} = \frac{P_{e1}}{9}$$

1213. While applying Euler's theory of columns to calculate the crippling load, equivalent length calculations are made by referencing _____.

(a) column with both ends are fixed
(b) column with one end fixed and other end hinged
(c) column with one end fixed and other free
(d) column with both ends hinged

VIZAG MT, 14.12.2020

Ans. (d) : While applying Euler's theory of columns to calculate the crippling load, equivalent length calculations are made by referencing column with both ends hinged.

1214. A structural member subjected to an axial compressive force is called

(a) beam (b) column
(c) frame (d) strut

Assam PSC AE (PHED), 18.10.2020
ESE 2008

Ans. (d) : A structural member subjected to an axial compressive force is called strut.

As per definition strut may be horizontal, inclined or even vertical.

The vertical strut is called a column.

Beam- Beam is a structural element that primarily resists loads applied laterally to the beam axis.

Frame- The frame structure is the combination of beams column and slab. Rigid structural frame refers to the frames which are capable in resisting the deformation.

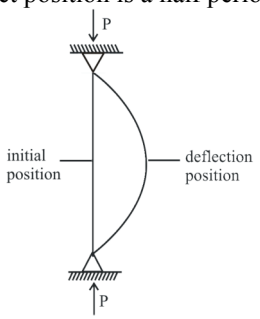
Search on Telegram @apna_pdf

1215. The buckled shape (node shape) of a pinned-pinned end column in the first node of buckling

(a) is a half period sine wave
(b) is a full period sine wave
(c) is a quarter period sine wave
(d) none of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Deflect position is a half period sine wave.



1216. The slenderness ratio in the case of column with length L, area moment of inertia I and cross-sectional area A, is given by

(a) $L\sqrt{\frac{I}{A}}$ (b) $L\sqrt{\frac{L}{A}}$

(c) $L\sqrt{\frac{A}{I}}$ (d) $L\sqrt{\frac{LA}{I}}$

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (c) : Slenderness ratio = $\frac{\text{Length}}{\text{Radius of Gyration}}$

and it is unitless.

Radius of gyration (k) = $\sqrt{\frac{I}{A}}$

Slenderness ratio = $L\times\sqrt{\frac{A}{I}}$

1217. The critical load in buckling of columns

(a) can be increased by increasing the strength of the column material
(b) can be increased by decreasing the strength of column material
(c) is independent of the strength of the column material
(d) none of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Critical load in buckling of column

$P_c = \frac{\pi^2 EI}{l_e^2}$

$P_c \propto E$

1218. A 2 m long pin ended column having Young's modulus (E) equal to 13 GPa can sustain 250 kN Euler's critical load for buckling. The permissible cross sectional size (I) of the column will be

(a) $7.8\times10^{-06}\ m^4$ (b) $3.9\times10^{-06}\ m^4$
(c) $1.95\times10^{-06}\ m^4$ (d) $0.975\times10^{-06}\ m^4$

Gujarat PSC AE 2019

Ans : (a) : Using Euler's formula critical buckling load is given by,

$$P_{cr} = \frac{\pi^2 EI_{min}}{\ell_e^2}$$

Given, $\ell = 2m$
$E = 13\ GPa = 13\times10^9\ Pa$
$P_{cr} = 250\ kN = 250\times10^3\ N$
$I_{min} = ?$

$$250\times10^3 = \frac{\pi^2\times13\times10^9\times I_{min}}{(2)^2}$$

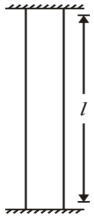
$I_{min} = 7.79\times10^{-6}\ m^4$
$= 7.8\times10^{-6}\ m^4$

1219. The slenderness ratio of a 4 m column with fixed ends having a square cross-sectional area of side 40 mm is :

(a) 173 (b) 17.3
(c) 1.73 (d) 100

BHEL ET 2019

Ans. (a) : Given A = 40 mm × 40 mm



$l = 4$ m

slenderness ratio = $\frac{L_e}{k}$

effective length of column = $L_e = \alpha L$
where α = length fixity coefficient
value 'α' for fixed end column-

$\alpha = \frac{1}{2}$

so, $L_e = \frac{1}{2}\times4 = 2m$

Slenderness ratio (s) = $\frac{L_e}{k}$

$k = \sqrt{\frac{I_{min}}{A}} = \sqrt{\frac{\frac{a^4}{12}}{a^2}}$

$= \sqrt{\frac{a^2}{12}}$

$= \sqrt{\frac{40\times40\times10^{-6}}{12}}$

$= \sqrt{\frac{1600}{12\times10^6}}$

$k = 0.01154$ m

$(s) = \frac{L_e}{k} = \frac{2}{0.01154} = 173.310$

1220. Which of the following statements is correct?

(a) Euler's buckling load increases with increase in effective length.
(b) Buckling load of a column does not depend on its cross-section

Search on Telegram @apna_pdf

(c) If free end of a cantilever column is propped then the buckling load increases
(d) Two geometrically identical columns made of different material have same buckling load.

APPSC AEE SCREENING 17.02.2019

Ans. (c) : If the free end is supported by a propped, the effective length of column decreases. The load carrying capacity increase.

$$P_B \propto \frac{1}{L_e}$$

1221. Euler's formula for a mild steel column is not valid if the slenderness ratio is

(a) 60 (b) 90
(c) 100 (d) 120

Nagaland PSC (CTSE) 2018, Paper-I

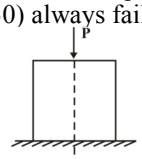
Ans. (a) : As we know, when slenderness ratio is less than 80 it is a short column from Euler's formula for mild steel column is not valid if the slenderness ratio is less than 80.

1222. What is the mode of failure of a short mild steel column (having slenderness ratio less than 10) under axial compressive load?

(a) Fracture (b) Buckling
(c) Yielding (d) Both (b) and (c)

RPSC AE 2018

Ans. (c) : Yielding is the mode of failure of short mild steel column under axial compressive load because short column (SR < 30) always fail in crushing.



In this question, given material of short column is mild steel so fracture or bucking failure not occur because fracture failure related to brittle material and buckling failure occurs in long columns (SR > 120)

1223. A Column of rectangular section ($I_{xx} > I_{yy}$) is subjected to an axial load. What is the axis about which the column will have a tending to buckle?

(a) X–X
(b) Y–Y
(c) The diagonal of the section
(d) X–X or Y–Y axis without any preference

RPSC Vice Principal ITI 2018

Ans. (b) : Column will buckle around the axis with the lowest moment of Inertia.

1224. Which one of the following statements is correct?

(a) Euler's formula holds good only for short columns
(b) A short column is one which has the ratio of its length to least radius of gyration greater than 100
(c) A column with both ends fixed has minimum equivalent length or effective length
(d) The equivalent length of column with one end fixed and other end hinged is half of its actual length

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c) : Euler's formula holds good for long columns only

for a short column

$$\frac{\ell}{R_{min}} < 100$$

equivalent length of column with one end fixed and other end hinged is

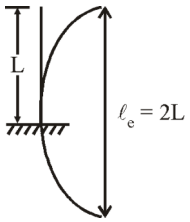
$$\ell_e = \frac{L}{\sqrt{2}}$$

1225. Which one of the following columns has effective length twice the value of actual length?

(a) Hinged-Hinged column
(b) Fixed-Fixed column
(c) Fixed-Hinged column
(d) Fixed-Free column

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : fixed-free column



1226. Critical Euler bucking load for a long column of diameter D was evaluated as P. If the diameter of the section is reduced to D/2, what is the load carrying capacity of the modified column ?

(a) P/2 (b) P/4
(c) P/8 (d) P/16

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : $P_{cr} = \frac{\pi^2 EI}{\ell_e^2}$

$P_{cr} \propto I$

$P_{cr} \propto D^4$

$$\frac{P_{cr_1}}{P_{cr_2}} = \frac{D^4}{\left(\frac{D}{2}\right)^4}$$

$$P_{cr_2} = \frac{P}{16}$$

1227. Column C_1, has both the ends hinged while the column C_2 has one end hinged and other end fixed. What is the ratio of the critical load for C_1 to that of C_2 according to the Euler's formula?

(a) 2 (b) 1/2
(c) 4 (d) 1/4

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Search on Telegram @apna_pdf

Ans. (b) : $P_{cr} \propto \frac{1}{\ell_e^2}$

$$\frac{(P_{cr})_{hinged-hinged}}{(P_{cr})_{hinge-fixed}} = \frac{\left(\frac{L}{\sqrt{2}}\right)^2}{(L)^2} = 1:2$$

1228. In an axially loaded compressive member with a circular cross-section of radius, r, what is the radius of the core section which is proof against tensile stress?

(a) r/2 (b) r/3
(c) r/4 (d) r/6

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c) : Core section which is proof against tensile stresses in case of circular reaction is of diameter $\frac{D}{4}$

$\therefore$ Core section radius will be $\frac{D}{8}$

if radius of circular section is r' then radius of core section will be

$$r' = \frac{2r}{8} = \frac{r}{4}$$

1229. A column of length 4 m, an area of cross-section 2000 mm^2. moments of inertia, I_{xx} = 720 cm^4, I_{yy} = 80 cm^4, is subjected to a buckling load. Both the ends of the column are fixed. What is the slenderness ratio of the column?

(a) 200 (b) 120
(c) 100 (d) 80

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (c) : Length of column L = 4 m area of cross – section = A = 2000 mm^2

I_{xx} = 720 cm^4

I_{yy} = 80 cm^4

ℓ_e fixed-fixed $= \frac{L}{2} = 2m$

Slenderness ratio $\lambda = \frac{\ell_e}{k_{min}}$

$$K_{min} = \sqrt{\frac{I_{min}}{A}}$$

$$= \sqrt{\frac{80\ cm^4}{2000 \times 10^{-2}\ cm^2}}$$

$$= \sqrt{\frac{80 cm^4}{20 cm^2}} = 2 cm$$

$$\therefore \lambda = \frac{\ell_e}{k_{min}} = \frac{200 cm}{2 cm} = 100$$

1230. A pin ended column of length L modulus of elasticity E and second moment of the cross sectional area I is loaded centrally by a compressive load P. The critical buckling load (P_{cr}) is given by

(a) E/π^2L^2 (b) $\pi^2EI/3L^2$
(c) $\pi EI/L^2$ (d) π^2EI/L^2

TSPSC AEE 2017

Ans. (d) : The critical buckling load (P_{cr}) for a column having length L, modulus of elasticity E and second moment of cross sectional area I is loaded centrally both ends hinged.

$$n = 1, \quad P_{cr} = \frac{n\pi^2 EI}{L^2} = \frac{\pi^2 EI}{L^2}$$

1231. For thin cylindrical shell structures loaded in compression, the design is based on

(a) Yield strength of material
(b) Ultimate strength of material
(c) Buckling strength of the structure
(d) Shear strength of the structure

ISRO Scientist/Engineer 17.12.2017

Ans. (c)

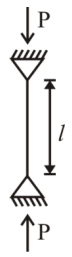
(1) Yield strength is the point where the material tends to deform. For the structures that should not deform on usage, the design is based on yield strength of material.
(2) Brittle materials generally fail at the ultimate strength of material.
(3) Buckling under axial compression is normally the controlling design consideration for thin cylindrical structures.
Thin and long cylindrical structures fail before the yield strength of the member is reached.
(4) Shear strength of a component is important for designing the dimensions and materials to be used for the manufacture or construction of the component e.g. beams, plates or bolts.

1232. In designing a connecting rod, it is considered like.....for buckling about X-axis.

(a) both ends fixed
(b) both ends hinged
(c) one end fixed and the other end hinged
(d) one end fixed and the other end free

GPSC EE Pre, 28.01.2017

Ans. (b) : In designing a connecting rod, it is considered like both end hinged for buckling about x-axis.



1233. Which of the following are correct?

P. Slenderness ratio is defined as the ratio of the length of the column to the radius of gyration.
Q. Euler's formula is applicable for short columns
R. Rankine's constant for a mild steel column is 1/7500

(a) Only P and Q are correct
(b) Only Q and R are correct
(c) Only P and R are correct
(d) P, Q and R are correct

APGENCO AE, 2017

Search on Telegram @apna_pdf

Ans. (c) : Euler formula is used for long column which fails due to buckling only.
Rankine formula is used for long as well as short column.

1234. If both the length and the diameter of a steel column are doubled, the elastic buckling load of the column will increase by a factor of

(a) 2 (b) 4
(c) 8 (d) 16

GPSC Asstt. Director of Transport 05.03.2017

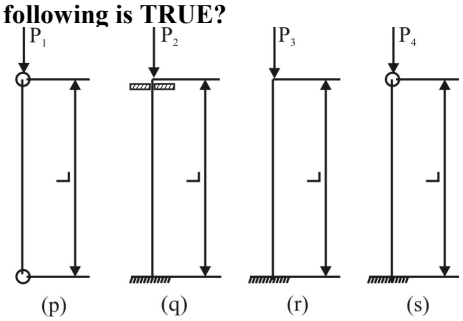
Ans. (b) : $P_{cr} = \frac{\pi^2 EI}{(L)^2}$ $L_{new} = 2$ load, $D_{new} = 2D$

$$P_{cr} \propto \frac{I}{(L)^2} \qquad I = \frac{\pi}{64} D^4$$

$$P_{cr} \propto \frac{D^4}{(L)^2} \Rightarrow P_{cr} \propto \frac{(2D)^4}{(2L)^2}$$

$P_{cr\,new} = 4\, P_{cr\,old}$

1235. Buckling loads (P_i) of 4 columns of equal length and cross section, but with different and conditions are shown below. Which of the following is TRUE?



(p) (q) (r) (s)

(a) $P_1 < P_2 < P_3 < P_4$ (b) $P_3 < P_1 < P_4 < P_2$
(c) $P_1 < P_4 < P_2 < P_3$ (d) $P_3 < P_4 < P_1 < P_2$

ISRO Scientist/Engineer 17.12.2017

Ans. (b) :

Diagram	End Condition	Effective Length	Buckling Load
p	Both ends hinged	$\ell_e = \ell$	$P_1 = \frac{\pi^2 EI}{\ell^2}$
q	Both ends fixed	$\ell_e = \frac{\ell}{2}$	$P_2 = \frac{4\pi^2 EI}{\ell^2}$
r	One end fixed and other end free	$\ell_e = 2\ell$	$P_3 = \frac{\pi^2 EI}{4\ell^2}$
s	One end fixed and other end hinged	$\ell_e = \frac{\ell}{\sqrt{2}}$	$P_4 = \frac{2\pi^2 EI}{\ell^2}$

Hence $P_3 < P_1 < P_4 < P_2$

1236. A column is known as short column if

(a) The length is more than 30 times the diameter
(b) Slenderness ratio is more than 120
(c) The length is less than 8 times the diameter
(d) The slenderness ratio is more than 32

Nagaland CTSE 2016, 2017 Ist Paper

Ans. (c) : For short column

$\frac{\ell}{d} < 8$, S.R. < 32

Medium column

$8 \geq \frac{\ell}{d} \leq 32$, $32 <$ S.R. < 120

Long column

$\frac{\ell}{d} > 32$, S.R. > 120

1237. The equivalent length of a column supported firmly at one-end and free at other end is

(or)

A compression member effectively held in position and restrained in direction at one end but not held in position or restrained in direction at the other end. If it's actual length is L, then its effective length is equal to

(a) 2L (b) 0.7 L
(c) L (d) 0.5L

Nagaland PSC CTSE 2017, Paper-I
APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : Equivalent length of a column supported firmly at one-end so other end is free,

$L = 2l$

1238. Consider the following assumptions made in developing Euler's column theory:

1. The column material obeys Hooke's law
2. The failure of the column occurs due to buckling
3. The column is 'long' compared to its cross-sectional dimensions

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

JWM 2017

Ans. (d) : Euler's column theory assumption-
(i) The column is perfectly straight and of uniform cross-section.
(ii) The material is homogenous and isotropic
(iii) The material behaves elasticaly.
(iv) The load is perfectly axial and passes through the centroid of column section.
(v) The weight of the column is neglected.

1239. As the slenderness ratio of column increase, its compressive strength

(a) Increases
(b) Decreases
(c) Remains unchanged
(d) May increase or decrease depending on length

Vizag Steel (MT) 2017

Ans. (b) :

$$\text{Slenderness ratio} = \frac{\text{Effective Length}}{\text{Least Radius of gyration}}$$

So, the slenderness ratio of column increases as its compressive strength decrease.

1240. For Euler formula to be valid for mild steel struts which has yield stress of 3200 kg(f)/ sq.cm, the slenderness ratio should not be less than

Search on Telegram @apna_pdf

(a) 80.48 (b) 40.28
(c) 160.96 (d) 53.65

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : As we know, Euler's formula is applicable for long columns, (Long columns have slenderness ratio is greater than 80).

$$P_c = \frac{\pi^2 E I_{min}}{L_e^2}$$

$$I = AK^2$$

$$\frac{L}{K} = \text{slenderness ratio}$$

1241. Condition for no tension in a solid column of dia D the eccentricity e must be less than or equal to

(a) D/8 (b) D/6
(c) D/4 (d) D/2

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : As we know, for no tension condition

$$\sigma_b \le \sigma_a$$

$$\frac{P_e}{\left(\frac{\pi d^3}{32}\right)} \le \frac{4p}{\pi d^2}$$

$$\boxed{e \le \frac{D}{8}}$$

1242. A column that fails essentially by direct crushing at ultimate load is called

(a) Euler's column
(b) long column
(c) short column
(d) None of the given answers

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : Medium column is a column which fails due to direct stress or buckling stress. (S.R. = 32 to 120)
Shorter column (S.R is less than 32) is column which fails due to direct crushing at ultimate load.

1243. The Rankine's constant for a cast iron column with both ends hinged

(a) 1/7500 (b) 1/1600
(c) 1/9000 (d) 0.00016

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know,
The Rankine's constant for cast Iron column with both ends hinged is given by.

$$a = \frac{1}{1600}, \qquad \sigma_C = 550 \text{ N/mm}^2$$

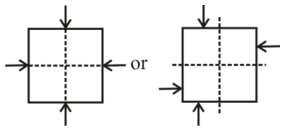
Because $\tau_{effective}$ = Length of column

1244. A short rectangular column has zero tensile stress if the eccentric, compressive load acts:

(a) In the middle three quarters of the section.
(b) In the middle half section
(c) In the middle third of the section
(d) It is not possible

GPSC Asstt. Prof. 28.08.2016

Ans. (c) :



Middle third rule states that no tension is developed in a wall or foundation if the resultant compressive force lies within the middle third of the structure.
Tensile stress is zero, if the eccentric, compressive load acts in the middle third of the section.

1245. If the length of a column is halved, the critical load _____.

(a) remains the same
(b) becomes 2 times of the original value
(c) becomes 4 times of the original value
(d) becomes 8 times of the original value
(e) becomes 16 times of the original value

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) : As we know,

$$P_e = \frac{\pi^2 EI}{L_e^2}$$

$$L_{e1} = \frac{L_e}{2}$$

$$P_{e1} = \frac{4\pi^2 EI}{L_{e1}^2}, \qquad \boxed{P_{e1} = 4P_e}$$

1246. The critical load for an ideal elastic column is often called the..... load.

(a) Gordan (b) Rankine
(c) Shanley (d) Euler

TSPSC AEE 28.08.2017 (Civil/Mechanical)
HPPSC AE (PWD) 10.09.2016

Ans. (d) : Euler's critical load is the compressive load at which a slender column will suddenly bend of buckle

$$P_{cr} = \frac{\pi^2 EI_{min}}{(L_e)^2}$$

Where,
P_{cr} = Euler critical load
E = Young's modulus
I = Minimum moment of inertia
L_e = Effective length of column

1247. The load at which the member just buckles is called

(a) Critical load (b) crushing load
(c) equilibrium load (d) ultimate load

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : The critical load is the greatest load that will not cause lateral deflection (buckling). For loads greater than the critical load, the column will deflect laterally. The critical load puts the column in a state of unstable equilibrium. A load beyond the critical load causes the column to fail by buckling.
Crushing load – It is the intensity of load required to crush the material.
Ultimate local – Absolute maximum load that a structure can bear without failing.

Search on Telegram @apna_pdf

1248. Eulers critical load is proportional to (Where L = length of the column k = constant, k = constant depends on end conditions and EI = flexural rigidity)

(a) EI (b) L^2

(c) 1/EI (d) k^2/EI

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Crippling load = $\frac{\pi^2 EI}{L^2}$

$P \propto \frac{1}{L^2} \propto EI$

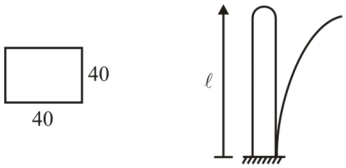
1249. The slenderness ratio of free standing column of length 4 m and 40 mm × 40 mm section is

(a) 115.2 (b) 230.4

(c) 692.8 (d) 346.8

APPSC AEE Screening Test 2016

Ans. (c)



Slenderness (λ) = $\frac{\ell_e}{k_{min}}$

effective length (ℓ_e) = 2ℓ

[$\because$ free end column]

$\ell_e = 2 \times 4$

$= 8$ m

$\ell_e = 8000$ mm

where

ℓ_e = effective length

$$k_{min} = \sqrt{\frac{I_{min}}{A}} = \sqrt{\frac{\frac{bd^3}{12}}{bd}} = \sqrt{\frac{\frac{a^4}{12}}{a^2}}$$

$$= \sqrt{\frac{a^4}{12} \times \frac{1}{a^2}}$$

$$= \sqrt{\frac{a^2}{12}} = \sqrt{\frac{40 \times 40}{12}}$$

$$\boxed{k_{min} = 11.547 mm}$$

Slenderness ratio (λ) = $\frac{8000}{11.547} = 692.82$

1250. In case of eccentrically loaded struts

(a) Hollow section is preferred

(b) Solid section is preferred

(c) Composite section is preferred

(d) Any of the above section may be used

Nagaland PSC CTSE 2016 Paper-I

Ans. (c) : A structural member subjected to an axial compressive stress is called strut. It is case of eccentrically loaded struts, a composite section is preferred. Strut may be horizontal, vertical or inclined.

1251. The factor of safety considered for Euler's formula for crippling load is

(a) 1 (b) 3

(c) 5 (d) 6

APPSC AEE MAINS 2016, PAPER-III

Ans. (a) : The factor of safety considered for Euler's formula for crippling load is 1.

1252. Which of the following is true for ideal column compressed by an axial load (P)?

(a) Column will be in stable equilibrium if P > $P_{critical}$

(b) Column will be in stable equilibrium if P < $P_{critical}$

(c) Column will be in unstable equilibrium if P < $P_{critical}$

(d) Column will buckle if P < $P_{critical}$

UPRVUNL AE 07.10.2016

Ans. (b) : If axial load P = $P_{critical}$ (Neutral)
If axial load P < $P_{critical}$ (Stable equilibrium)
If axial load P > $P_{critical}$ (Unstable equilibrium)

1253. The buckling load for a column hinged at both ends is 15kN. If the ends are fixed, the buckling load changes to :

(a) 60 kN (b) 30 kN

(c) 45 kN (d) 3.75 kN

Kerala PSC IOF 19.04.2016

Ans. (a) $P_{cr} = \frac{\pi^2 EI}{L_e^2}$

For both end hinged

$$15 = \frac{\pi^2 \times E \times I}{L^2}$$

For both end fixed

$$L_e = \frac{L}{2}$$

$$P_{cr} = \frac{4 \times \pi^2 \times E \times I}{L^2}$$

$$P_{cr} = 4 \times 15$$

$$\boxed{P_{cr} = 60 kN}$$

1254. The Euler's load for a column is 1 MN and crushing load is 1.5 MN. The Rankine load is :

(a) 1 MN (b) 0.6 MN

(c) 1.5 MN (d) 2.5 MN

Kerala PSC IOF 19.04.2016

Ans. (b) $P_R = \frac{P_c \cdot P_e}{P_c + P_e}$

$$= \frac{1.5 \times 1}{1.5 + 1} = \frac{1.5}{2.5} = \frac{3}{5} = 0.6$$

1255. Compression members tend to buckle in the direction of

(a) least radius of gyration

(b) axis of load

(c) perpendicular to axis of load

(d) minimum cross-section

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) Compression members tend to buckle in the direction of least radius of gyration.

Search on Telegram @apna_pdf

1256. A certain high tensile strength steel has a modulus of elasticity of 2×10^6 kg/cm^2 and a yield point stress of 6,000 kg/cm^2. Find the minimum limiting value of the slenderness ratio for which Euler's equation is valid

(a) 99 (b) 80
(c) 57 (d) 75

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (c) $P_{cr.} = \dfrac{\pi^2 EI}{\ell_e^2}$ $\quad I = AK^2$

$P_{cr.} = \dfrac{\pi^2 EA}{(SR)^2}$ $\quad \left[\text{Slenderness Ratio}(SR) = \dfrac{\ell_e}{K}\right]$

So critical stress –

$$\sigma_{cr.} = \frac{\pi^2 E}{(SR)^2}$$

$$(SR)^2 = \frac{\pi^2 \times 2\times10^6}{6000}$$

$$\boxed{SR=57.357}$$

1257. A vertical column has two moments of inertia I_{xx} and I_{yy}. The column will tend to buckle in the direction of the

(a) axis of load
(b) perpendicular to the axis of load
(c) maximum moment of inertia
(d) minimum moment of inertia

ISRO Scientist/Engineer 11.10.2015

Ans. (d) : Vertical Column–
Moment of Inertia = I_{XX} and I_{YY}
We know that,
Euler's formula (P_e)

$$(P_e) = \frac{\pi^2 EI_{min}}{L_e^2} \text{ or } \frac{n\pi^2 EI_{min}}{L^2}$$

P_e = Euler's buckling load
I_{min} = min of [$I_{X\text{-}X}$ & $I_{Y\text{-}Y}$]
L = Actual length of the column
L_e = Effective length of the column
$L_e = \alpha L$
α = Length finite coefficient
$P_e \propto E$
$P_e \propto I_{min}$
$P_e \propto \dfrac{1}{L^2}$
$\boxed{P_e \propto I_{min}}$

1258. Rankine's formula is valid upto the slenderness ratio of

(a) 180 (b) 240
(c) 300 (d) 60
(e) 120

CGPSC AE 26.04.2015 Shift-I

Ans. (e) : The Rankine's formula is applicable for both long and short column.
For short column slenderness ratio is less than 32 and for long column it is more than 120.

1259. Two columns of different lengths having circular cross-sections have the same L/d ratio as 100. Both have hinged ends and the material is the same. The compressive stress P/A at the critical buckling load for the larger column will be:

(a) less
(b) equal
(c) greater than that for the smaller column
(d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (b) : Compressive stress $\left(\dfrac{P}{A}\right)$ at critical buckling load for both columns are equal.

$$P_{cr} = \frac{\pi^2 EI}{l_e^2}$$

$$P_{cr} = \frac{\pi^2 E\pi D_1^4}{64\ell_e^2}$$

$$\frac{P_{cr}}{\frac{\pi D_1^2}{4}} = \frac{\pi^2 ED_1^2}{16\ell_e^2}$$

$$\sigma_{C_1} = \left(\frac{P_{cr}}{\frac{\pi D_1^2}{4}}\right)_{column1} = \frac{\pi^2 E}{16}\left(\frac{1}{100}\right)^2 \qquad \because \frac{l}{D} = 100$$

Similarly,

$$\sigma_{C2} = \left(\frac{P_{cr}}{\frac{\pi D_2^2}{4}}\right)_{column2} = \frac{\pi^2 E}{16}\left(\frac{1}{100}\right)^2$$

1260. A 1.5 m long column has a circular cross-section of 5 cm diameter. One end of the column is fixed and other end is free. Taking factor of safety as 3 and E = 120 GN/m^2, safe load according to Euler's theory is

(a) 13.00 kN (b) 13.27 kN
(c) 13.47 kN (d) 13.87 kN

MPPSC AE 08.11.2015

Ans. (c) : Given, E = 120 GN/m^2, Factor of safety = 3
Length of column (L) = 1.5 m
Diameter of column (d) = 5 cm = 5×10^{-2} m
For one end fixed and other end is free for a column effective length of column = $L_e = 2L = 2 \times 1.5 = 3$ m

$$FOS = \frac{P_{max}}{P_e}$$

$$P_e = \frac{P_{max}}{3}$$

$\therefore$ Euler's load formula-

$$P_e = \frac{\pi^2 E.I_{min}}{3L_e^2} \qquad \because I_{min} = \frac{\pi}{64}d^4$$

Search on Telegram @apna_pdf

$$= \frac{\pi^2 \times 120 \times 10^9 \times \pi \times \left(5 \times 10^{-2}\right)^4}{3 \times 64 \times (3)^2}$$

$= 1345.75 \times 10^9 \times 10^{-8}$

$= 13457.5$ Newton

$\Rightarrow P_e = 13.457$ kN

1261. The buckling load for a given column depends on

(a) least radius of gyration (b) length of column

(c) modulus of elasticity (d) all of these

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (d) :

$$P_e = \frac{\pi^3 E I_{min}}{L_e^2}$$

P_e = Buckling load

I_{min} minimum value of I_{xx} and I_{yy}

L = actual length

$P_e \propto E$

$P_e \propto I_{min}$

$$P_e \propto \frac{1}{L_e}$$

1262. Rankine's formula for determining the load carrying capacity of a column is valid for

(a) long column only (b) short column only

(c) columns with hinged (d) all columns

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (d) : Rankine's formula for determining the load carrying capacity of column is valid for–

(i) Long column

(ii) Short column

1263. For a circular column having its ends hinged, the slenderness ratio is 160. The L/d ratio of the column is :

(a) 80 (b) 57

(c) 40 (d) 20

MPPSC State Forest Service Exam, 2014

Ans. (c) : $Ak^2 = \frac{\pi}{64} d^4$

$$A = \frac{\pi}{4} d^2$$

$$\frac{\pi}{4} d^2 \times k^2 = \frac{\pi}{64} d^4$$

$$\boxed{k = \frac{d}{4}}$$

Slenderness ratio $(\lambda) = \frac{\ell_e}{k}$

$\ell_e = \ell$ (because both ends are hinged)

$$\lambda = \frac{\ell}{d/4} = 160$$

$$\boxed{\frac{\ell}{d} = 40}$$

1264. Which of the following strength forms the basis in designing of a push rod?

(a) Tensile strength

(b) Compression strength

(c) Bending strength

(d) Buckling strength

UPRVUNL AE 2014

Ans : (d) : The push rod is designed as a column based on buckling criteria, push rods are often subjected to a compressive force which results in buckling.

1265. Short column is usually defined as one whose slenderness ratio is less than about ____

(a) 2 (b) 5

(c) 8 (d) 10

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (d) : For short column

Slenderness ratio $(\lambda) \le 32$

For medium column

$32 \le \lambda \le 100$

For long column

$\lambda > 120$

1266. Secant formula is applicable for :

(a) short columns under axial loading

(b) long columns under axial loading

(c) short columns under eccentric loading

(d) long columns under eccentric loading

(HPPSC AE 2014)

Ans : (d) Secant formula is applicable for long column under eccentric loading.

Secant formula for ν_{max} and σ_{max}

In the Euler's buckling formula we assume that the load P acts through the centroid of the cross - section. However in reality this might not always be the case : the load P might applied at an offset or the slender member might not be completely straight.

To account for this, we assume that the load P is applied at a certain distance away from the centroid. This would obviously change the way we calculate our buckling load, which is what the Secant formula is for.

1267. If the slenderness ratio for a column is 100, then it is said to be a _____ column.

(a) long (b) medium

(c) short (d) expand

Haryana PSC Civil Services Pre, 2014

Ans. (b) :

$$\text{Slenderness ratio } (\lambda) = \frac{\text{Effective length of column}}{\text{least radius of gyration}}$$

(1) Short column	–	$\lambda < 32$
(2) Medium Column	–	$32 < \lambda < 120$
(3) Long Column	–	$\lambda > 120$

1268. A loaded column fails due to

(a) stress due to direct load

(b) stress due to bending

(c) both (1) and (2)

(d) None of the above

APPSC Poly. Lect. 2013

Search on Telegram @apna_pdf

Ans. (c) : A loaded column fails due to both direct & bending stress.

→ The long columns, commonly fail because of buckling stress, it has direct stress very small compare to bending stress.

→ The short column primarily fails due to direct stress

1269. The ratio of the compressive critical load for a long column fixed at both the ends and a column with one end fixed and the other end being free is:-

(a) 2 : 1 (b) 4 : 1
(c) 8 : 1 (d) 16 : 1

UKPSC AE-2013, Paper-I
ESE 1997

Ans. (d) : Case I- When both ends of column are fixed

$$[P_e]_1 = \frac{4\pi^2 EI}{l^2}$$

Case II- When one end fixed and other end is free

$$[P_e]_2 = \frac{\pi^2 EI}{4l^2}$$

Then

$$\frac{[P_e]_1}{[P_e]_2} = \frac{16}{1} = 16:1$$

1270. The crippling load of a column with one end fixed and other end hinged is

(a) $\sqrt{2}$ times that of a both ends hinged colum
(b) Two times that of a both ends hinged column
(c) Four times that of a both ends hinged column
(d) Eight times that of a both ends hinged column

APPSC AEE 2012

Ans : (b)

End Conditions	Effective length
Both end hinged	L
One fixed other free	2L
Both end fixed	L/2
One end fixed and other hinged	$L/\sqrt{2}$

(i) Crippling load of a column with one end fixed and other end hinged.

$$P_1 = \frac{\pi^2 EI}{(L/\sqrt{2})^2} = \frac{2\pi^2 EI}{L^2} \quad \text{..... (i)}$$

(ii) Crippling load of a column when both end hinged

$$P_2 = \frac{\pi^2 EI}{L^2} \quad \text{.....(ii)}$$

$$\boxed{P_1 = 2 \times P_2}$$

1271. The formula given by I.S. code in calculating allowable stress for the design of eccentrically loaded columns is based on

(a) Johnson's parabolic formula
(b) Straight line formula
(c) Perry's formula
(d) Secant formula

APPSC AEE 2012

Ans : (c) The formula given by I.S. code in calculating allowable stress for the design of eccentrically loaded columns is based on Perry's formula.

1272. If the flexural rigidity of the column is doubled, then the strength of the column is increased by

(a) 16 (b) 8
(c) 2 (d) 4

APPSC AEE 2012

Ans : (c) Case 1st :-

Strength of column $(P_1) = \frac{\pi^2 EI}{L^2}$

(Flexural rigidity of column = E ×I)

Case 2st :-

Flexural rigidity of column is doubled.

strength of column $(P_2) = \frac{\pi^2 \times 2EI}{L^2}$

$$P_2 = 2 \times P_1$$

In the flexural rigidity of the column is doubled, then the strength of the column is increased by two times.

1273. The least radius of gyration for solid circular column is

(a) d (b) $\frac{d}{2}$ (c) $\frac{d}{4}$ (d) $\frac{d}{3}$

APPSC AEE 2012

Ans : (c) The least radius of gyration for solid circular column is d/4.

Radius of gyration-Radius of gyration is defined as the square root of moment of inertia divided by the area of itself.

$$r_x = \sqrt{\frac{I_{xx}}{A}}; r_y = \sqrt{\frac{I_{yy}}{A}}$$

$$= \sqrt{\frac{\pi/64 \times d^4}{\pi/4 \times d^2}} = \sqrt{\frac{d^2}{16}} = \frac{d}{4}$$

1274. In a mild steel tube 4 m long, the flexural rigidity of the tube is 1.2×10^{10} N – mm². The tube is used as a strut with both ends hinged. The crippling load in kN is given by

(a) 14.80 (b) 7.40
(c) 29.60 (d) 1.85

APPSC AEE 2012

Ans : (b) tube length = 4mm
flexural rigidity (E×I) = 1.2×10^{10} N – mm²
End condition = Both ends hinged
Effective length = *l*

Crippling load $= \frac{\pi^2 EI}{\ell^2}$

$$P_e = \frac{\pi^2 \times 1.2 \times 10^{10}}{4^2}$$

$$\boxed{P_e = 7.40 \text{ kN}}$$

1275. A member under tension is called :

(a) strut (b) tie
(c) strut-tie (d) column

APPSC AE 04.12.2012

Ans. (b) : A member under tension is called tie.

Search on Telegram @apna_pdf

1276. Two long columns A and B are of the same material, the same length, and the same cross-section. Column A is hinged at both ends, while column B is fixed at one end and hinged at the other. The ratio of the Euler-crippling loads for A and B is :

(a) 2 (b) 1

(c) $\sqrt{2}$ (d) $\frac{1}{2}$

VIZAG Steel MT 24.01.2021, Shift-I
APGENCO AE 2012

Ans. (d) : Column-A– both ends hinged.

$$(P_{cr})_A = \frac{\pi^2 E\, I_{min}}{l_e^2} = \frac{\pi^2 E I_{min}}{l^2}$$

Both ends hinged ($l_e = l$)

Column-B– One end hinged and other fixed

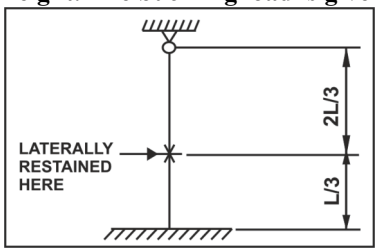
$$\left(l_e = \frac{l}{\sqrt{2}}\right)$$

$$(P_{cr})_B = \frac{\pi^2 E\, I_{min}}{\left(\frac{l}{\sqrt{2}}\right)^2} = \frac{\pi^2 E\, I_{min} \times 2}{l^2}$$

$$\text{Ratio} = \frac{(P_{cr})_A}{(P_{cr})_B} = \frac{\pi^2 E\, I_{min}}{l^2} \times \frac{l^2}{\pi^2 E\, I_{min} \times 2}$$

$$= \frac{1}{2}$$

1277. A column of length 'L' is fixed at bottom end and hinged at the other end. This column is restrained from lateral displacement at 1/3rd height. The buckling load is given by

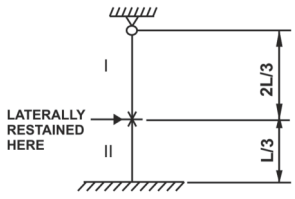


(a) $9\pi^2 EI/(4L^2)$ (b) $4\pi^2 EI/L^2$

(c) $4\pi^2 EI/(9L^2)$ (d) $\pi^2 EI/L^2$

ISRO Scientist/Engineer 2012

Ans. (a) : The column will behaves as 2 columns and restrained means it's hinged.



(i) for upper part length $= \frac{2L}{3}$

Conditions- Both ends hinged Buckling load,

$$P_{cr} = \frac{\pi^2 EI}{(Le)^2} \qquad \left[\because L_e = \frac{2L}{3}\right]$$

$$= \frac{\pi^2 EI}{\left(\frac{2L}{3}\right)^2} = \frac{9\pi^2 EI}{4L^2}$$

II for lower part length $= \frac{L}{3}$

Conditions- Up one end hinged and other end fixed

$\therefore$ Buckling load,

$$P_{cr} = \frac{\pi^2 EI}{(L_e)^2} \qquad \left[\because L_e = \frac{L}{3\sqrt{2}}\right]$$

$$= \frac{\pi^2 EI}{\left(\frac{L}{3\sqrt{2}}\right)^2} = \frac{18\pi^2 EI}{L^2}$$

Hence, we take the min. of the two buckling load, that is $\frac{9\pi^2 EI}{4L^2}$

1278. Slenderness ratio has dimension of

(a) cm (b) cm^{-1}

(c) cm^2 (d) None

UKPSC AE 2012 Paper-I

Ans. (d) : It is a dimensionless quantity.

$$S = \frac{L_e}{k}$$

$$k = \sqrt{\frac{I_{min}}{A}}$$

1279. Given that

P_E = the crippling load given by Euler

P_C = the load at failure due to direct compression

P_R = the load in accordance with the Rankine's criterion of failure

Then P_R is given by

(a) $\frac{(P_E + P_C)}{2}$ (b) $\sqrt{P_E \times P_C}$

(c) $\frac{P_E . P_C}{P_C + P_E}$ (d) None of the above

APPSC AEE Mains 2016 (Civil Mechanical)
ISRO Scientist/Engineer 2010

Ans. (c) : P_R = The load with Rankine's criterion of failure.

P_C = Load due to direct compression

P_E = Crippling load given by Euler.

$$\frac{1}{P_R} = \frac{1}{P_C} + \frac{1}{P_E}$$

$$P_R = \frac{P_C P_E}{P_C + P_E}$$

1280. Assertion (A) : A long column fails (becomes elastically unstable) due to excessive bending.

Reason (R) : Euler's buckling load is inversely proportional to the equivalent length of the column.

Search on Telegram @apna_pdf

Codes :

(a) Both A and R are individually true and R is the correct explanation of A

(b) Both A and R are individually true and R is not the correct explanation of A

(c) A is true but R is false

(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (c) : As we know,

$$\text{Buckling load}\left(P_e\right)=\frac{\pi^2 EI}{L_e^2}$$

$$P_e \propto \frac{1}{L_e^2}$$

Euler's buckling load is inversely proportional to the square of equivalent length of the column.

1281. An aluminium column of square cross-section (10 mm × 10 mm) and length 300 mm has both ends pinned. This is replaced by a circular cross-section (of diameter 10 mm) column of the same length and made of the same material with the same end conditions. The ratio of critical stresses for these two columns corresponding to Euler's critical load, $(\sigma_{critical})_{square} : (\sigma_{critical})_{circular}$, is

(a) 1 : 4 (b) 3 : 4

(c) 4 : 3 (d) 4 : 1

DRDO Scientists 2009

Ans. (c) : Euler load P_e is given by

$$P=\frac{\pi^2 EI}{l_e^2}$$

$$\frac{P}{A}=\sigma_c=\frac{\pi^2 EI}{Al_e^2}$$

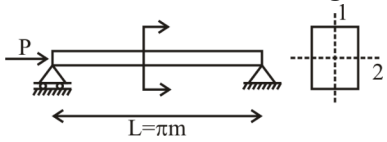
$$\sigma_c \propto \frac{I}{A}$$

$$\left(\sigma_c\right)_{circular}=\frac{\left(\pi d^4\right)(4)}{64\left(\pi d^2\right)}=\frac{d^2}{16}=\frac{(10)^2}{16}$$

$$\left(\sigma_c\right)_{square}=\frac{a^4}{12\left(a^2\right)}=\frac{a^2}{12}=\frac{(10)^2}{12}$$

$$\left(\sigma_c\right)_{square}/\left(\sigma_c\right)_{circular}=4:3$$

1282. A long slender column is pin-supported at the ends and compressed by an axial load P as shown in figure. If I_{11} = 100 cm^4, I_{22} = 200 cm^4 and Young's modulus of elasticity = 100 GPa, then the critical load for buckling is



(a) 500 kN (b) 200 kN

(c) 100 kN (d) 1000 GN

DRDO Scientists 2008

Ans. (c) : $P_{cr}=\frac{\pi^2 EI}{L^2}$ (Hinged-hinged end condition)

P_{cr} = EI (Taking I as least moment of inertia)

$= 100 \times 10^9 \times 100 \times 10^{-8}$

= 100000 N = 100 kN

1283. If the slenderness ratio of a column is more than 120 it is termed as

(a) short column (b) medium column

(c) long column (d) none of the above

WBPSC AE 2008

Ans. (c) : For long column slenderness ratio is greater than 120.

8. Strain Energy Method

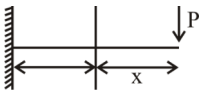
1284. A cantilever beam of length L and flexural modulus EI is subjected to a point load P at the free end. The elastic strain energy stored in the beam due to bending (neglecting transverse shear)

(a) $\frac{P^2L^3}{4EI}$ (b) $\frac{P^2L^3}{6EI}$

(c) $\frac{P^2L^3}{2EI}$ (d) $\frac{P^2L^3}{8EI}$

Assam Engg. College AP/Lect. 18.01.2021
Gujarat PSC AE 2019
GATE 2017, MPPSC AE 2016
CGPSC Poly. Lect. 22.05.2016
APPSC AEE Screening Test 2016
APPSC AEE Mains 2016 (Civil Mechanical)
(HPPSC LECT. 2016)
ISRO Scientist/Engineer 11.10.2015, 2006
OPSC Civil Services Pre. 2011, ESE 2009

Ans. (b) :



$$\text{Strain energy } U=\frac{1}{2}\times P\delta$$

$$=\frac{1}{2}\times P\times\frac{PL^3}{3EI}$$

$$\left(\delta=\frac{PL^3}{3EI}\right)$$

$$U=\frac{P^2L^3}{6EI}$$

Or

$$\text{Strain energy } U=\int_0^L\frac{M^2dx}{2EI} \qquad M=px$$

$$=\int_0^L\frac{(px)^2dx}{2EI}$$

$$=\frac{P^2}{2EI}\times\left(\frac{x^3}{3}\right)_0^L$$

$$U=\frac{P^2L^3}{6EI}$$

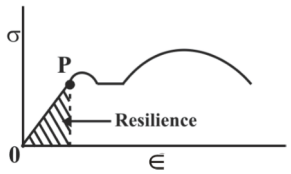
1285. The property of a material to absorb energy within elastic limits is known as

(a) Elasticity (b) Toughness
(c) Tensile strength (d) Stiffness
(e) Resilience

SJVN ET 2019
JPSC AE PRE 2019
Nagaland PSC (CTSE) 2018, Paper-I
(CGPSC Polytechnic Lecturer 2017)
RPSC LECTURER 16.01.2016
RPSC 2016
CGPSC AE 26.04.2015 Shift-I
TNPSC AE (Industries) 09.06.2013

Ans. (e) :



Resilience—The capacity of material to absorb and release strain energy within elastic limit.
Toughness—Strain energy store upto fracture point.
Modulus of toughness—Capacity of material to absorb maximum strain energy upto fracture per unit volume is called MOT.

1286. The strain energy stored in a body, when the load is gradually applied, is

(a) $\sigma E/V$ (b) $\sigma V/E$
(c) $\sigma^2 E/2V$ (d) $\sigma^2 V/2E$

where σ = stress in the material of the body, V = volume of the body and E = modulus of elasticity of the material.

RPSC IOF, 2020
Nagaland PSC (CTSE) 2018, Paper-I
Assam PSC CCE Pre 2015
TSPSC AEE 2015, TNPSC AE 2014
TRB Asstt. Prof., 2012
ESE 2006, 2002

Ans. (d) : Strain energy = $\frac{1}{2}$ stress × Strain × Vol.

The strain energy stored in a body, when the load is gradually applied is $\frac{\sigma^2 V}{2E}$.

1287. Strain energy stored in a beam due to bending is given by (Where M is bending moment, E is modulus of elasticity, I is moment of inertia, G is modulus of rigidity, L is the length of the beam, and σ is the tensile strength.)

(a) $\int \frac{M^2 dx}{2EI}$ (b) $\int \frac{\sigma^2 dx}{2EI}$
(c) $\int \frac{M^2 dx}{2GI}$ (d) $\int \frac{M^2 dx}{2EL}$

HPPSC AE 2018
UPPSC AE 12.04.2016 Paper-I
APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (a) : Strain energy stored in a beam
1. when beam is subjected to bending moment (M)

$$U_{B.M} = \int \frac{M^2.dx}{2EI}$$

2. when beam is subjected to Twisting moment (T)

$$U_{T.M} = \int \frac{T^2.dx}{2GI_P}$$

3. When beam is subjected to axial load P

$$U_{A.L} = \int \frac{P^2.dx}{2AE}$$

1288. Proof resilience may be defined as

(a) Work done in straining the material
(b) Max. strain energy that can be stored in a material per unit volume
(c) Max. strain energy that can be stored in a material under elastic condition
(d) Max. load which can be applied to a member

Nagaland CTSE 2017 Paper-I
Nagaland CTSE 2016 Paper-I
ISRO Scientist/Engineer 2009

Ans. (c) : Proof Resilience
Maximum strain energy that can be stored in a material under elastic limit.

1289. The maximum energy that can be absorbed per unit volume without creating a permanent distortion is called _____

(a) Resilience
(b) Distortion limit
(c) Modulus of resilience
(d) None of these

RPSC ACF & FRO, 26.02.2021
VIZAG Steel MT 24.01.2021
KPCL AE 2016

Ans. (c) : Modulus of Resilience- The maximum energy that can be absorbed per unit volume without creating a permanent distortion-

$$\text{Modulus of Resilience (MOR)} = \frac{\text{Strain energy}}{\text{Volume}}$$

$$(MOR) = \frac{\frac{\sigma^2}{2E} \times \text{Volume}}{\text{Volume}}$$

$$(MOR) = \frac{\sigma^2}{2E}$$

$$MOR = \frac{1}{2}\sigma_{EL}\varepsilon_{EL} \quad (\because \text{EL = Elastic limit})$$

1290. The strain energy stored in a spring, when subjected to maximum load, without suffering permanent distortion, is known as

(a) impact energy
(b) proof resilience
(c) proof stress
(d) modulus of resilience

Sikkim PSC (Under Secretary), 2017
Nagaland PSC CTSE 2017, Paper-I
Nagaland PSC CTSE 2016 Paper-I

Search on Telegram @apna_pdf

Ans. (b) : The strain energy stored in a spring, when subjected to maximum load, without suffering permanent distortion is known as proof resilience.

1291. Resilience of a material is considered when it is subjected to

(a) Fatigue (b) Creep

(c) Frequent heat treatment (d) Shock Loading

RPSC IOF, 2020

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (d) : Resilience– It is the strain energy that can be absorbed by the material without plastic deformation upto elastic limit. Toughness is the maximum strain energy that can be absorbed by the material upto fracture.

Creep– The permanent deformation of a material over a period of time at constant load and at elevated temperature is called creep.

Fatigue–The behaviour of the material under fluctuating loads is called fatigue.

1292. "Total Strain Energy" theory of failure is also known as _____.

(a) Couloumb Guest Theory

(b) Lame Rankine Theory

(c) Von - Mises Theory

(d) Beltrami-Haigh Theory

HPPSC Workshop Suptd. 08.07.02021

Ans. (d) : Total Strain Energy theory of failure is also known as Beltrami-Haigh Theory.

1293. The property of material whereby it absorbs energy due to straining actions by undergoing plastic deformation is called

(a) Elasticity (b) Fatigue

(c) Resilience (d) Toughness

Oil India Senior Officer 23.12.2020

Ans. (d) : It is the property of material which absorb energy while straining by undergoing plastic deformation without fracture.

1294. If a gradual tensile load (P) is applied to an elastic bar axially, the change in the length of bar is x. What will be the strain energy stored in the material of the bar?

(a) Px (b) $\frac{1}{2}$Px

(c) 2 Px (d) Zero

APPSC Poly Lect. 13.03.2020

Ans. (b) :

Strain energy (U) = $\frac{1}{2}\times$ load $\times$ change in the length

$$\boxed{U=\frac{1}{2}P.x}$$

1295. A square bar of size 10 mm × 10 mm and length 1000 mm is subjected to 200 N axial tensile force. The bar is made of mild steel having modulus of elasticity of 200 GPa. Find the strain energy density stored in the bar under this state of loading?

(a) 10 J/m^3 (b) 20 J/m^3

(c) 2 J/m^3 (d) 5 J/m^3

ISRO Scientist/Engineer 12.01.2020

Ans. (a) : Strain energy per unit volume = modulus of resilience

$$=\frac{\sigma_a^2}{2E}=\frac{(P/A)^2}{2E}=\frac{\left(\frac{200}{10\times10}\right)^2}{2\times200\times10^3}$$

$$=\frac{1}{10^5}N-mm/mm^3=10N-m/m^3$$

$$=10\ J/m^3$$

1296. For the state of stress of pure shear τ, the strain energy stored per unit volume in the elastic, homogeneous, isotropic material having elastic constants – Young's modulus, E and Poisson's ratio μ will be

(a) $\frac{\tau^2}{E}(1+\mu)$ (b) $\frac{\tau^2}{2E}(1+\mu)$

(c) $\frac{2\tau^2}{E}(1+\mu)$ (d) $\frac{\tau^2}{2E}(2+\mu)$

UPPSC AE 13.12.2020, Paper-I

ESE 1998

Ans. (a) : Strain energy per unit volume

$$U=\frac{\tau^2}{2G}$$

$$E=2G(1+\mu)$$

$$2G=\frac{E}{1+\mu}$$

$$U=\frac{\tau^2}{E/(1+\mu)}$$

$$\boxed{U=\frac{\tau^2(1+\mu)}{E}}$$

1297. A cantilever beam, 2 m in length is subjected to a uniformly distributed load of 10 kN/m. If E = 200 GPa and I = 1000 cm^4, the strain energy stored in the beam will be

(a) 7 Nm (b) 12 Nm

(c) 8 Nm (d) 40 Nm

UPPSC AE 13.12.2020, Paper-I

Ans. (d) : $U=\frac{\int_0^L M_x^2dx}{2EI}=\frac{\int_0^{\ell}\left(\frac{Wx^2}{2}\right)^2dx}{2EI}$

$$=\frac{W^2}{8EI}\int_0^2x^4dx$$

$$=\frac{(10\times10^3)^2}{8\times200\times10^9\times1000\times(10^{-2})^4}\times\left(\frac{2^5}{5}\right)$$

$$=\frac{200}{5}$$

$$=40\ N\text{-}m$$

1298. Two elastic bars of equal length and same material, one is of circular cross-section of 80 mm diameter and the other of square cross-section of 80 mm side. Both absorbs same amount of strain energy under axial force. What will be the ratio of stress in circular cross-section to that of square cross-section?

Search on Telegram @apna_pdf

(a) 0.972 (b) 0.886
(c) 1.013 (d) 1.128

SJVN ET 2019

Ans. (d) : $U_c = U_s$

$$\frac{\sigma_c^2}{2E} \times A_c \times L = \frac{\sigma_s^2}{2E} \times A_s \times L$$

$$\frac{\sigma_c^2}{\sigma_s^2} = \frac{A_s}{A_c} = \frac{80^2}{\frac{\pi}{4} \times 80^2}$$

$$\frac{\sigma_c^2}{\sigma_s^2} = \frac{4}{\pi}$$

$$\frac{\sigma_c}{\sigma_s} = \frac{2}{\sqrt{\pi}} = \frac{2}{\sqrt{3.14}}$$

$$\frac{\sigma_c}{\sigma_s} = 1.128$$

1299. The resilience of steel can be found by integrating stress-strain curve up to the

(a) ultimate fracture point (b) upper yield point
(c) lower yield point (d) elastic point

ESE 2018

Ans. (d) : Resilience is the ability of a material to absorb energy per unit volume without permanent deformation and is equal to the area under the stress-strain curve upto the elastic limit.

1300. A circular shaft of length 'L' a uniform cross-sectional area 'A' and modulus of rigidity 'G; is subjected to a twisting moment that produces maximum shear stress 'τ' in the shaft. Strain energy in the shaft is given by the expression AL/kG, where k is equal to

(a) 2 (b) 4
(c) 8 (d) 16

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (b) : Strain energy stored in a shaft due to torque

$$U = \left(\frac{\tau^2}{4G}\right) \text{vol.}$$

$$U = \frac{\tau^2}{4G} \times A \times L$$

$$U = \frac{AL}{kG}$$

Then k = 4

1301. The strain energy corresponding to the stress at the elastic limit is known as _____

(a) Modulus of resilience (b) Toughness
(c) Proof resilience (d) Resilience

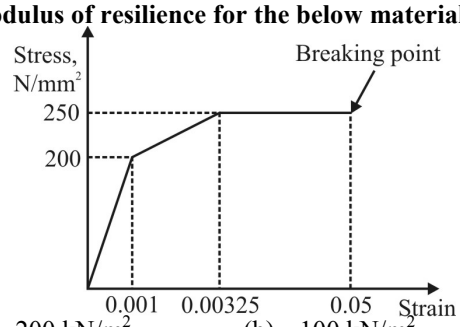
APGENCO AE, 2017

Ans. (c) : Total strain energy stored within elastic limit is known as resilience.

Total strain energy stored corresponding to elastic limit is called proof resilience.

Strain energy stored per unit volume corresponding to elastic limit is called modulus of resilience and its value remains constant and not depend upon dimension of work piece.

1302. Modulus of resilience for the below material is



(a) 200 kN/m² (b) 100 kN/m²
(c) 606.25 kN/m² (d) 12.29 MN/m²

ISRO Scientist/Engineer 17.12.2017

Ans. (b) : Modulus of resilience
= Area under stress–strain diagram up to elastic limit (EL)

$$= \frac{1}{2} \sigma_{EL} \times \in_{EL}$$

$$= \frac{1}{2} \times 200 \times 0.001 \text{ N/mm}^2$$

$= 0.1 \times 1000 \text{ kN/m}^2$

$= 100 \text{ kN/m}^2$

1303. Which one of the following statements is correct?

(a) The strain produced per unit volume is called resilience.
(b) The maximum strain produced per unit volume is called proof resilience.
(c) The least strain energy stored in a unit volume is called proof resilience.
(d) The greatest strain energy stored in a unit volume of a material without permanent deformation is called proof resilience.

ESE 2017

Ans. (d) : The greatest strain energy stored in a unit volume of a material with permanent deformation is called proof resilience.

1304. The strain energy stored in a solid circular shaft, under pure torque, per unit its volume (take max. shear stress = q and modulus of rigidity = (C) is expressed as

(a) q^2/C (b) $q/(4C)$
(c) $q^3/(4C)$ (d) $q^2/(4C)$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : We know, strain energy stored =

$$= \frac{1}{2C} \times \text{shear stress}^2 \times \frac{V}{2}$$

For per unit volume under pure torque

$$= \frac{1}{4C} \times \text{shear stress}^2$$

$$= \frac{q^2}{4C}$$

1305. A prismatic bar 1 m long and 4 sq.cm in cross sectional area is compressed by a force of 80 kN. If E = 200 kN/sq.mm, the total strain energy stored in the bar is equal to

Search on Telegram @apna_pdf

(a) 40 kN-mm (b) 0.05 kN-mm
(c) 400 kN-mm (d) 80 kN-mm

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : For cantilever

Strain energy (u) = $\frac{1}{2}\times\text{stress}\times\text{strain}\times\text{volume}$

Given :

F = 80 kN

L = 1m

A = 4 cm^2

$$U=\frac{F^2L}{2EA}=\frac{(80\times10^3)^2\times1000}{2\times200\times10^3\times400}$$

$$\boxed{U=40kN-mm}$$

1306. A uniform rod of length 'L', cross-section area 'A' and modulus of elasticity 'E' is held rigidly at the fixed ends and an axial load 'P' is applied at mid length of the rod. The strain energy stored is :

(a) $\frac{P^2L}{EA}$ (b) $\frac{P^2L}{4EA}$

(c) $\frac{P^2L}{8EA}$ (d) None of these

RPSC ADE 2016

Ans. (c) :

L = length of rod

A = cross-section area

E = modulus of elasticity

P = Applied load

$$U=\frac{1}{2}W\delta$$

$$\frac{1}{2}W\times\frac{WL}{AE}$$

$$W=\frac{P}{2}$$

Strain energy = $\frac{P^2L}{8EA}$

1307. A specimen 160mm^2 in cross section stretches by 0.06 mm over a 50 mm gauge length under an axial load of 35 kN. The strain energy is

(a) 1050 N-mm (b) 780 N-mm
(c) 1435 N-mm (d) 1298 N-mm

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Given,

Area of specimen A = 160 mm^2

Gauge length L = 50mm

Change in gauge length ΔL = 0.06 mm

Axial load applied P = 35 kN = 35 × 10^3 N

Now, strain energy (U) = $\frac{1}{2}\times P\times\Delta L$

$$U=\frac{1}{2}\times35\times10^3\times0.06=1050N-mm$$

1308. As compared to uniaxial tension or compression, the strain energy stored in bending is only

(a) 1/3 (b) 1/8
(c) 1/4 (d) 1/2

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) : Strain energy due to tension or compression

$$U_1=\frac{1}{2}\times\text{stress}\times\text{strain}\times\text{volume}$$

$$U_1=\frac{\sigma^2}{2E}\times\text{Volume} \quad \text{.... (i)}$$

Strain energy due to bending

$$U_2=\int_0^L\frac{M^2dx}{2E}=\int_0^L\frac{(Wx)^2}{2E}dx=\frac{W^2}{2E}\int_0^L x^2dx$$

$$U_2=\frac{w^2L^3}{6E} \quad \text{..... (ii)}$$

From equation (i) and (ii)

$$\frac{U_1}{U_2}=\frac{1}{3}$$

1309. What will be the strain energy stored in the metallic bar of cross sectional area of 2 cm^2 and gauge length of 10 cm if it stretches 0.002 cm under the load of 12 kN?

(a) 10 N-cm (b) 12 N-cm
(c) 14 N-cm (d) 16 N-cm

RPSC LECTURER 16.01.2016

Ans. (b) : Data given,

A = 2 cm^2, l = 10 cm

δl = 0.002 cm

P = 12 × 10^3 N

Strain energy

$$U=\frac{\sigma^2}{2E}\times volume$$

$$\sigma=\frac{P}{A}$$

$$\frac{\delta l}{l}=\frac{\sigma}{E}=e$$

then we get

$$U=\frac{1}{2}\times P\times\delta$$

$$=\frac{1}{2}\times12\times10^3\times2\times10^{-3}$$

= 12 N-cm

1310. Strain energy stored in a prismatic bar suspended from one end due to its own weight (elastic behaviour) [x = specific weight of material, A = cross-sectional area, L = length of bar]:

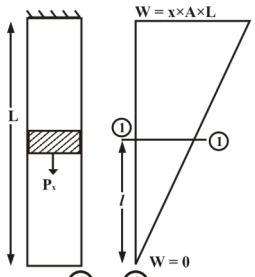
(a) $U=\frac{xAL^3}{6E}$ (b) $U=\frac{x^2A^2L^2}{6E}$

(c) $U=\frac{x^2AL^3}{3E}$ (d) $U=\frac{x^2AL^3}{6E}$

UPRVUNL AE 07.10.2016

Search on Telegram @apna_pdf

Ans. (d) :



Self weight at section ① - ①

$$P_l = \frac{W.l}{L}$$

We know that strain energy for prismatic bar suspended from one end due to its self weight

$$U = \int_o^L \frac{(P_l)^2 dl}{2(AE)_l}$$

AE = constant

$$= \int_O^L \frac{\left(\frac{Wl}{L}\right)^2 dl}{2AE}$$

$$= \frac{W^2}{2AE \times L^2}\left[\frac{l^3}{3}\right]_O^L$$

$$= \frac{(xAL)^2}{2AEL^2} \times \frac{L^3}{3}$$

$$U = \frac{x^2 AL^3}{6E}$$

1311. A square bar of side 4 cm and length 100 cm is subjected to axial load P. The same bar is then used as a cantilever beam and subjected to an end load P. The ratio of the strain energies, stored in the bar in the second case to that stored in first case, is

(a) 16 (b) 400
(c) 1000 (d) 2500

MPPSC AE 2016

Ans : (d) Square bar Area = $16cm^2$
length = 100cm.

moment of Inertia of square bar

$$= \frac{bh^3}{12} = \frac{4^4}{12} = 21.33cm^4$$

case 1^{st} : –

$$\text{Strain Energy}(U_1) = \frac{\sigma^2}{2E} \times \text{volume}$$

$$U_1 = \left(\frac{P}{16}\right)^2 \times \frac{16}{2E} \times 100 \qquad \sigma = \left(\frac{P}{16}\right)$$

$$U_1 = \frac{3.125P^2}{E}$$

case – II : –

$$U_2 = \frac{P^2L^3}{6EI}$$

$$U_2 = \frac{P^2}{E}\left[\frac{100^3 \times 12}{6 \times 4^4}\right]$$

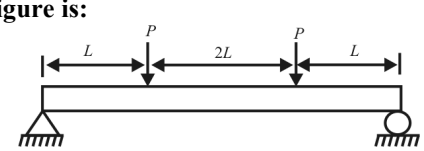
$$U_2 = \frac{7812.5P^2}{E}$$

Ratio of strain energies

$$\frac{U_2}{U_1} = \frac{7812.5P^2 \times E}{E \times 3.125P^2}$$

$$\boxed{\frac{U_2}{U_1} = 2500}$$

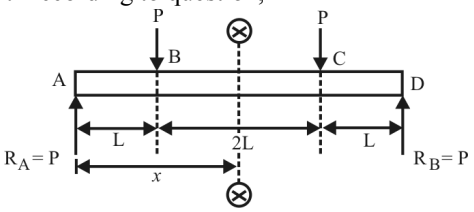
1312. The strain energy stored in the beam with flexural rigidity EI and loaded as shown in the figure is:



(a) $\frac{-P^2L^3}{3EI}$ (b) $\frac{2P^2L^3}{3EI}$
(c) $\frac{4P^2L^3}{3EI}$ (d) $\frac{8P^2L^3}{3EI}$

BPSC Asstt. Prof. 29.11.2015

Ans. (c) : According to question,



$M_x = Px - |P(x - L)|$

For portion AB and CD,

$(M_x)_{AB} = Px = (M_x)_{CD}$

For portion BC,

$(M_x) = Px - P(x - L) = Px - Px + PL$

$(M_x)_{BC} = PL$

Strain energy in the beam due to bending is

$$U = U_{AB} + U_{BC} + U_{CD}$$

$$U = 2\int_0^L \frac{(M_x)_{AB}^2 dx}{2EI} + \int_L^{3L} \frac{(M_x^2)_{BC} dx}{2EI}$$

$$U = \frac{4P^2L^3}{3EI}$$

1313. Proof resilience is the property of the materials which indicated their capacity to bear :

(a) shocks
(b) static compressive loads
(c) static tensile loads
(d) none of these

VIZAG MT 2015

Ans. (a) : Proof resilience– The maximum energy which a body stores 'upto' elastic limit is called the 'proof resilience'. It indicates shock bearing capacity of material.

Search on Telegram @apna_pdf

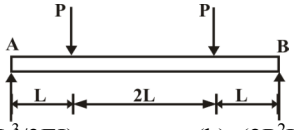
1314. Proof resilience per unit volume of a material is known as-

(a) modulus of resilience (b) resilience
(c) Proof resilience (d) toughness

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) Proof resilience per unit volume of a material is known as modulus of resilience.

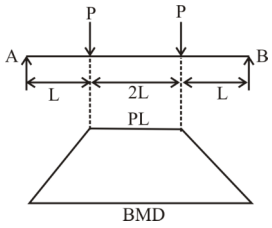
1315. Strain energy stored in beam with flexural rigidity EI and loaded as shown figure is



(a) $(P^2L^3/3EI)$ (b) $(2P^2L^3/3EI)$
(c) $(4P^2L^3/3EI)$ (d) $(6P^2L^3/3EI)$
(e) $(8P^2L^3/3EI)$

CGPSC AE 26.04.2015 Shift-I

Ans. (c) :



$R_A = R_B = P$

Total strain energy,

$$U = 2\int_0^L \frac{(Px)^2\,dx}{2EI} + \frac{(PL)^2(2L)}{2EI}$$

$$U = \frac{P^2L^3}{3EI} + \frac{P^2L^3}{EI}$$

$$\boxed{U = \frac{4}{3}\frac{P^2L^3}{EI}}$$

1316. Strain energy stored in a solid circular shaft is proportional to

(a) GJ (torsional rigidity) (b) $1/(GJ)^2$
(c) GJ^2 (d) $1/(GJ)$
(e) $1/\sqrt{GJ}$

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : For solid shaft—Let us suppose that a solid shaft is subjected to a torque which increases gradually from zero to a value T. Let θ represent the resultant angle of twist. Then, the energy stores in the shaft is equal to work done in twisting i.e.

$$U = \frac{1}{2}.T.\theta$$

$$= \frac{1}{2}.T.\left(\frac{T.l}{GJ}\right)$$

$$\left(\frac{T}{J} = \frac{G\theta}{l}\right)$$

$$= \frac{1}{2}\left(\frac{T^2l}{GJ}\right)$$

$$U \propto \frac{1}{GJ}$$

1317. Strain energy stored in a body due to a suddenly applied load compared to when applied slowly is:

(a) twice (b) four times
(c) eight times (d) half

(HPPSC AE 2014)

Ans : (b) Strain energy stored in a body due to suddenly applied load compared to when applied slowly is four times.

Stress in a body due to
gradually applied load gradually = σ
stress in a body due to suddenly applied load = 2σ
strain energy due to gradually applied load

$$U_{GAL} = \frac{\sigma^2}{2E} \times \text{Volume} \quad \text{.....(i)}$$

strain energy due to suddenly applied load

$$U_{SAL} = \frac{(2\sigma)^2}{2E} \times \text{Volume}$$

$$U_{SAL} = 4 \times \left[\frac{\sigma^2}{2E} \times \text{volume}\right]$$

$$\boxed{U_{SAL} = 4 \times U_{GAL}}$$

1318. Strain energy U, in the case of axially loaded bar is expressed as (where P is axial load, L is bar length, A is cross-section area of the bar, E is Young's Modulus of the bar, σ is axial stress, δL is elongation due to axial load)

(a) $\frac{P^2L^2}{2AE(\delta L)}$

(b) Area under stress versus strain diagram of axially loaded bar

(c) $\frac{\sigma}{2}\frac{(\delta L)}{L}$

(d) $\frac{P^2L}{2AE}$

ISRO Scientist/Engineer 24.05.2014

Ans. (d) : Strain energy = U
Axial Load = P
Length = L
Cross-Section = A
Young's modulus = E
Axial stress = σ

Elongation $\delta L = \frac{PL}{AE}$

Strain Energy U = $\frac{1}{2}$ × Force × deflection

$$= \frac{1}{2} \times P \times \frac{PL}{AE} = \frac{P^2L}{2AE}$$

1319. If the area, length and the stress to which a bar is subjected be all doubled, then the elastic strain energy of the bar will be :

(a) Doubled (b) Three times
(c) Four times (d) Sixteen times

J&K PSC Civil Services Pre, 2013

Search on Telegram @apna_pdf

Ans. (d) : Energy stored within elastic limit is called resilience.
Strain energy stored upto elastic limit is called proof resistance.
Energy stored upto elastic per unit volume is called modulus of resilience.

Strain energy $U_1 = \frac{\sigma^2}{2E} \times \text{volume} = \frac{\sigma^2}{2E} \times A \times l$

$$U_2 = \frac{(2\sigma)^2}{2E} \times 2A \times 2l = 16\frac{\sigma^2}{2E} \times A \times l$$

1320. The unit of strain energy in S.I. unit is
(a) watt (b) joule
(c) joule/sec (d) joule/m.
TNPSC ACF 2012

Ans. (b) : Strain Energy- It is defined as the energy stored in a body due to deformation.

$$U = \frac{1}{2}P\delta$$

$$U = \frac{1}{2} \times P \times \frac{PL}{AE} = \frac{1}{2}\frac{P^2L}{AE}$$

Unit of strain energy N-m or Joule.

1321. Principal stresses induced in a material are 60 MPa, 30 MPa and –20 MPa, E = 80 GPa, μ = 0.20. The value of total strain energy per unit volume is:
(a) 24.5 kN-m/m^3 (b) 49 kN-m/m^3
(c) 30.63 kN-m/m^3 (d) 61.25 kN-m/m^3
HPPSC ADF 05.03.2019

Ans. (c) : Given,
$\sigma_1 = 60$ MPa, $\sigma_2 = 30$ MPa, E = 80 GPa, $\mu = 0.20$
$\sigma_3 = -20$ MPa,

$$\frac{\text{Total strain energy}}{\text{Volume}} =$$

$$= \frac{1}{2E}\left[\sigma_1^2 + \sigma_2^2 + \sigma_3^2 - 2\mu(\sigma_1\sigma_2 + \sigma_2\sigma_3 + \sigma_3\sigma_1)\right]$$

$$= \frac{1}{2\times80\times10^3}\left[(60)^2 + (30)^2 + (-20)^2 - 2\times0.20(60\times30 - 30\times20 - 60\times20)\right]$$

$$= \frac{1}{2\times80\times10^3}\left[3600 + 900 + 400 - 0.40(1800 - 600 - 1200)\right]$$

$$= \frac{1}{160\times10^3}\left[4900 - 0.40(0)\right]$$

$$= \frac{1}{160\times10^3} \times 4900 = \frac{4900}{160} \quad \frac{\text{kN} - \text{m}}{\text{m}^3}$$

$$= 30.625\frac{\text{kN} - \text{m}}{\text{m}^3}$$

$$\approx 30.63\frac{\text{kN} - \text{m}}{\text{m}^3}$$

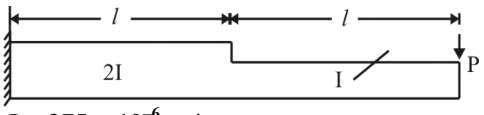
1322. If the cross-section of a member is subjected to a uniform shear stress of intensity 'q', then the strain energy stored per unit volume will be given by (C = modulus of rigidity)
(a) $2q^2/C$ (b) $2C/q^2$
(c) $q^2/2C$ (d) $C/2q^2$
APPSC AEE 2012

Ans. (c) : Shear stress intensity $\tau = q$
modules of rigidity $G = C$
Hence

$$\text{Strain energy stored per unit volume} = \frac{\tau^2}{2G}$$

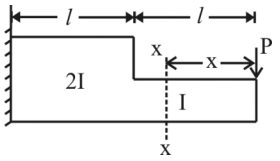
$$\boxed{\frac{\text{S.E}}{\text{Volume}} = \frac{q^2}{2c}}$$

1323.



I = 375 × 10^{-6} m4
***l* = 0.5 m**
E = 200 GPa
Determine the stiffness of the beam shown in the above fig.
(a) 12×10^{10} N/m (b) 10×10^{10} N/m
(c) 4×10^{10} N/m (d) 8×10^{10} N/m
APPSC AE 04.12.2012

Ans. (*) :



Given,
$I = 375\times10^{-6}$ m^4
$l = 0.5$ m
$E = 200$ GPa $= 200\times10^9$ Pa
Let, K = stiffness of beam
∴ Bending moment $(M_x) = P.x$

$$U = \int_0^l \frac{(Px)^2}{2EI}.dx + \int_l^{2l} \frac{(Px)}{2E(2I)}.dx$$

$$= \left[\frac{P^2x^3}{3\times2EI}\right]_0^l + \left[\frac{P^2x^3}{3\times2E\times2I}\right]_l^{2l}$$

$$= \frac{P^2l^3}{6EI} + \frac{P2(8l^3 - l^3)}{12EI} = \frac{P^2l^3}{6EI} + \frac{7\rho^2l^3}{12EI}$$

$$U = \frac{9P^2l^3}{12EI} = \frac{3P^2l^3}{4EI} \quad \text{(i)}$$

$\because$ $U = \frac{1}{2}P\times\delta = \frac{1}{2}\frac{P^2}{k}$ _____(ii) $\left\{\because \delta = \frac{p}{k}\right.$

From eq^n (1) and (2)

$$\frac{1}{2}\frac{P^2}{k} = \frac{3P^2l^3}{4EI} \Rightarrow k = \frac{2EI}{3l^3}$$

$$\Rightarrow \quad k = \frac{2\times200\times10^9\times375\times10^{-6}}{3\times(0.5)^3} = 4\times10^8 \text{ N/m}$$

No any option matching with the solution.

1324. The strain energy per unit volume of a body subjected to a direct stress σ is given by

(a) $\frac{\sigma^2}{2E}$ (b) $\frac{\sigma}{2E}$

(c) $\frac{\sigma^2}{3E}$ (d) $\frac{\sigma}{3E}$

WBPSC AE, 2007, ESE 2016
UKPSC AE 2007 Paper-I

Ans. (a) : Strain energy per unit volume (S_{vol})

$$S_{vol} = \frac{1}{2} \times \sigma \times \varepsilon$$

$$S_{vol} = \frac{1}{2} \times \sigma \times \frac{\sigma}{E}$$

$$\boxed{S_{vol} = \frac{\sigma^2}{2E}}$$

1325. What will be the total strain energy stored in a simply supported beam of span 'L' and flexural rigidity 'EI' subjected to a concentrated load 'W' at the centre?

(a) $\frac{W^2L^3}{40\,EI}$ (b) $\frac{W^2L^3}{60\,EI}$

(c) $\frac{W^2L^3}{192\,EI}$ (d) $\frac{W^2L^3}{96\,EI}$

WBPSC AE 2003

Ans. (d) : We know that deflection $\delta = \frac{WL^3}{48EI}$ for simply supported beam in concentrated load (W) at mid span then,

$$\delta = \frac{WL^3}{48EI} = \frac{\partial U}{\partial W} \qquad (\text{Strain energy} = U)$$

Deflection, $\delta = \frac{WL^3}{48EI} = \frac{\partial U}{\partial W}$

$$\int \partial U = \int \frac{WL^3}{48EI} \partial W$$

$$\boxed{U = \frac{W^2L^3}{96EI}}$$

9. Deflection of Beams

1326. What is the maximum deflection in a cantilever beam carrying a uniformly distributed load of w per unit length? (L-length of the beam, EI-flexural rigidity of the section of the beam)

(a) $\frac{wL^4}{3EI}$ (b) $\frac{wL^3}{192EI}$

(c) $\frac{5wL^4}{384EI}$ (d) $\frac{wL^4}{8EI}$

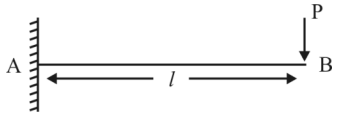
APSC AEE 2012
APSC AE 04.12.2012
TNPSC AE, 2008

Ans. (a) : Let,

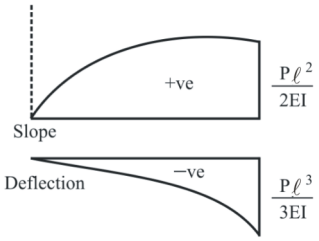
l = length of cantilever

I = moment of inertia.



Bending moment at the section = Px

or $EI\frac{d^2y}{dx^2} = -P.x$



Integrating $EI\frac{dy}{dx} = -\frac{Px^2}{2} + C_1$

at $x = l$, $\frac{dy}{dx} = 0$ $C_1 = \frac{Pl^2}{2}$

$$EI\frac{dy}{dx} = -\frac{Px^2}{2} + \frac{Pl^2}{2}$$

Search on Telegram @apna_pdf

Slope $\frac{dy}{dx} = \frac{P}{2EI}(l^2 - x^2)$

Integrating this equation

$$EI\ y = -\frac{Px^3}{6} + \frac{Pl^2}{2}x + C_2$$

at $x = l$, $y = 0$ $C_2 = -\frac{Pl^3}{3}$

$$EI\ \ y = -\frac{Px^3}{6} + \frac{Pl^2}{2}x - \frac{Pl^3}{3}$$

Thus deflection given by

$$y = -\frac{P}{6EI}(2l^3 - 3l^2x + x^3)$$

At the free end (x = 0), the slope and deflection are maximum

$$\boxed{\text{Deflection} = -\frac{Pl^3}{3EI}}$$

–ve sign represent deflection is downward.

1328. Maximum deflection in cantilever due to pure bending moment M at its ends is-

(a) $\frac{ML^2}{2EI}$ (b) $\frac{ML^2}{3EI}$

(c) $\frac{ML^2}{4EI}$ (d) $\frac{ML^2}{6EI}$

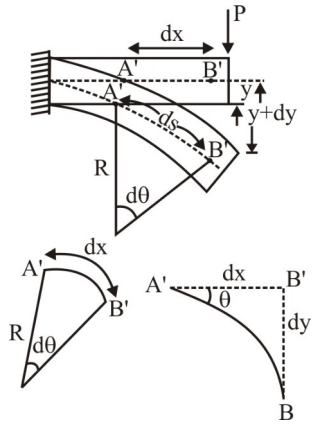
Oil India Ltd. Sr. Engg. (Production) 30.11.2019
APPSC AEE Screening Test 2016
APPSC AEE 2012

Ans. (c)



Curvature equation of beam-

Let ds ≅ dx

dx = Rdθ…….(i)

$$\tan\theta = \frac{dy}{dx}$$

θ is very small ⇒ tanθ = θ

$$\theta = \frac{dy}{dx} \ldots\ldots\ldots\ldots (ii)$$

From equation (i)

$$\frac{1}{R} = \frac{d\theta}{dx}$$

$$= \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d^2y}{dx^2}$$

$$\therefore \frac{1}{R} = \frac{d^2y}{dx^2}$$

Now we know that equation of theory of bending

$$\frac{M}{I} = \frac{\sigma}{y} = \frac{E}{R}$$

$$\therefore \frac{M}{EI} = \frac{I}{R}, \text{ put the value of } \frac{1}{R}$$

$$\frac{M}{EI} = \frac{d^2y}{dx^2} \Rightarrow M = EI\frac{d^2y}{dx^2}$$

1332. The simple supported beam 'A' of length 'l' carries a central point load 'W'. Another beam 'E' is loaded with a uniformly distributed load such that the total load on the beam is 'W'. The ratio of maximum deflections between beams A and B is

(a) 5/8 (b) 8/5
(c) 5/4 (d) 4/5

1346. A simply supported laterally loaded beam was found to deflect more than a specified value. Which of the following measures will reduce the deflection?

(a) Increase the area moment of inertia
(b) Increase the span of the beam
(c) Select a different material having lesser modulus of elasticity
(d) Magnitude of the load to be increased

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
GPSC ARTO Pre 30.12.2018

Ans. (a) : For deflection, deflection is inversely proportional to moment of inertia,

$$\text{Deflection}(\delta) = \frac{W\ell^3}{48EI}$$

$$\delta \propto \frac{1}{I}$$

Therefore, increase in moment of inertia, reduces deflection.

1347. For a fixed end of a long column, _____.

(a) The deflection and the slope is zero
(b) The deflection is zero, but the slope is maximum
(c) The deflection is maximum, but the slope is zero
(d) The deflection is zero, but the slope is minimum

VIZAG Steel MT 24.01.2021
APPSC AEE 2012

Ans. (a) : For a fixed end of a long column, the deflection and slope are zero. The fixed beam is stronger, stiffen and more stable. The slope at the supports is zero. Maximum bending moment at the centre is reduced because of fixing moments developed at supports. The deflection is zero for hinged end.

1348. The flexural rigidity for the deflection of beam is expressed as

(a) $\frac{I}{E}$ (b) $\frac{E}{I}$
(c) EI (d) $\frac{1}{EI}$

APPSC AEE Mains 2016 (Civil Mechanical)
APPSC Poly. Lect. 2013
APPSC AEE 2012

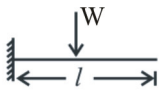
Ans. (c) : The flexural rigidity for the deflection of beam is expressed as EI.

1349. A cantilever beam of length L, moment of inertia of inertia I and Young modulus E carries a concentrated load W at the middle of its length. The slope of cantilever at the free end is:

(a) $(W\ell^2)/2EI$ (b) $(W\ell^2)/4EI$
(c) $(W\ell^2)/8EI$ (d) $(W\ell^2)/16EI$

OPSC AEE 2015 Paper-I
ESE 2001

Ans : (c)



When load acts free end then slope $= \frac{W\ell^2}{2EI}$

When load acts mid span the slope $= \frac{W(\ell/2)^2}{2EI}$

$$\text{Slope} = \frac{W\ell^2}{8EI}$$

1350. The resultant deflection of a beam under symmetrical bending is

(a) perpendicular to the neutral axis
(b) parallel to the axis of symmetry
(c) perpendicular to the axis of symmetry
(d) parallel to the neutral axis

Assam PSC AE (IWT) 14.03.2021
UKPSC AE-2013, Paper-I

Ans. (a) : The resultant deflection of a beam under symmetrical bending is perpendicular to the neutral axis.

1351. A simply supported beam is of rectangular section. It carries the uniformly distributed load over the span. The deflection at the centre is y. If the depth of the beam is doubled, the deflection at the centre is _____.

(a) 2y (b) y/8
(c) y/2 (d) 4y

VIZAG Steel MT 24.01.2021, Shift-I
WBPSC AE, 2017

Ans. (b) : Given,
Figure

Then, deflection (y) = $\frac{5wl^4}{384EI}$

$\therefore$ If depth of beam is doubled $d_1 = 2d, b_1 = b$

Now, $y_1 = \frac{5wl^4}{384 \times E \times \frac{bd^3}{12}}$

$$y_1 = \frac{5wl^4}{384 \times E \times \frac{b \times (2d)^3}{12}}$$

$$= \frac{5wl^4}{384 \times E \times \frac{bd^3}{12} \times 8} = \frac{5wl^4}{384EI8}$$

$$y_1 = \frac{1}{8} \times \frac{5wl^4}{384EI} = \frac{1}{8} \times y$$

$$\boxed{y_1 = \frac{y}{8}}$$

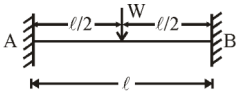
1352. A fixed beam of length *l* carries a point load W at the centre. The deflection at the centre is _____.

Search on Telegram @apna_pdf

(a) one-fourth of a deflection of a simply supported beam
(b) half of the deflection of a simply supported beam
(c) double the deflection of a simply supported beam
(d) same as for a simply supported beam

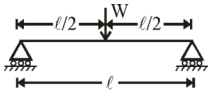
VIZAG Steel MT 24.01.2021, Shift-I

Ans. (a) :



deflection at centre,

$$(y)_1 = \frac{W\ell^3}{192EI}$$



$$(y_2) = \frac{W\ell^3}{48EI}$$

$\therefore$ So, there deflection at centre of fixed beam,

$$(y_1) = \frac{1}{4}(y_2)$$

$$= \frac{1}{4} \times \frac{W\ell^3}{48EI}$$

$$(y_1) = \frac{1}{4} \times \text{deflection of simply supported beam}$$

1353. The equation for the deflected shape of a beam carrying a uniformly distributed load and simply supported at the ends is given by :

$$y = \frac{1}{EI}\left(2x^3 - \frac{x^4}{6} - 36x\right)$$

where E is the elastic modulus of beam material and I is the second moment of beam cross-section area about neutral axis. What is the intensity of uniformly distributed load over the beam span?

(a) 12 kN/m (b) 8 kN/m
(c) 6 kN/m (d) 4 kN/m

RPSC ACF & FRO, 26.02.2021

Ans. (d) : Equation of deflected shape of beam

$$y = \frac{1}{EI}\left(2x^3 - \frac{x^4}{6} - 36x\right)$$

$$\text{Intensity of loading (q)} = -\left(EI\frac{d^4y}{dx^4}\right)$$

$$y = \frac{1}{EI}\left(2x^3 - \frac{x^4}{6} - 36x\right)$$

$$EIy = 2x^3 - \frac{x^4}{6} - 36x$$

$$EI\frac{dy}{dx} = 2 \times 3x^2 - \frac{4x^3}{6} - 36$$

$$EI\frac{d^2y}{dx^2} = 2 \times 3 \times 2x - \frac{12x^2}{6} - 0$$

$$EI\frac{d^3y}{dx^3} = 12 - \frac{24x}{6}$$

$$EI\frac{d^4y}{dx^4} = 0 - \frac{24}{6}$$

$$EI\frac{d^4y}{dx^4} = -4$$

$$q = -EI\frac{d^4y}{dx^4}$$

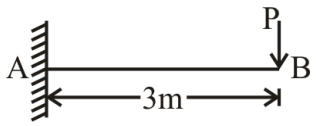
$$\boxed{q = -(-4) = 4\,kN/m}$$

1354. A cantilever beam of 3 m is carrying a point load of unknown mass and produce a slope at the free end as 0.01 rad. The deflection at the free end is _____.

(a) 20 mm (b) 5 mm
(c) 15 mm (d) 10 mm

VIZAG Steel MT 24.01.2021

Ans. (a) :



At point 'B'

$$\text{Slope } (\theta) = \frac{P\ell^2}{2EI}$$

$$\frac{P\ell^2}{2EI} = \theta$$

Given, $\theta = 0.01$ radian, $\ell = 3m$

$$0.01 = \frac{P \times (3)^2}{2EI}$$

$$P = \frac{0.01 \times 2EI}{9} = \frac{0.02EI}{9}$$

Deflection at free end 'B',

$$(\delta) = \frac{P\ell^3}{3EI}$$

$$\delta = \frac{\frac{0.02EI}{9} \times 27}{3EI}$$

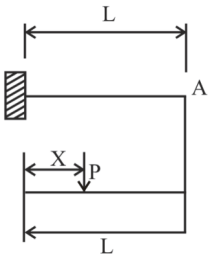
$$= \frac{0.02EI \times 3}{3EI}$$

$$\delta = 0.02 \text{ m}$$

$$\delta = 20 \text{ mm}$$

1355. A force P is applied at a distance x from the end of the beam as shown in the figure. What would be the value of x so that the displacement at A is equal to zero?

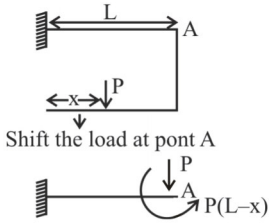
Search on Telegram @apna_pdf



(a) 0.33L (b) 0.25L
(c) 0.5L (d) 0.66L

Assam Engg. College AP/Lect. 18.01.2021
GATE 2014

Ans. (a) : 0.33L



Deflection (displacement) at point 'A' will be zero

So, $\delta_A = \delta_1 + \delta_2 = 0$

$$-\frac{PL^3}{3EI} + \frac{P(L-x)L^2}{2EI} = 0$$

$$\frac{PL^3}{3EI} = \frac{P(L-x)L^2}{2EI}$$

$$\frac{PL^3}{3} = \frac{PL^3 - PL^2x}{2}$$

$$2PL^3 = 3PL^3 - 3PL^2x$$

$$3PL^2x = PL^3$$

$$x = L/3$$

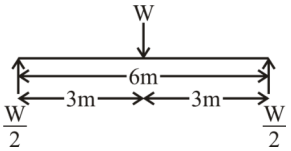
$$x = 0.33L$$

1356. A simply supported beam of length 6 m is carrying a point load W at the centre. When the slope at the ends of the beam is 0.002 radians, the deflection at the centre would be_____.

(a) 2 mm (b) 1 mm
(c) 8 mm (d) 4 mm

VIZAG MT, 14.12.2020

Ans. (d) :



Slope at ends of simply supported beam = 0.002 radians

$$\frac{W\ell^2}{16EI} = 0.002$$

Deflection at centre of beam δ_c

$$\delta_c = \frac{W\ell^3}{48EI}$$

$$\delta_c = \frac{W\ell^2}{16EI} \times \frac{\ell}{3}$$

$$\delta_c = 0.002 \times \frac{6}{3}$$

$$\delta_c = 0.004 \text{ m}$$

$$\boxed{\delta_c = 4\text{mm}}$$

1357. In deflection curve of beams, the point of contraflexure or inflection point is the point

(a) of maximum curvature
(b) of zero-curvature
(c) of zero slope
(d) none of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (b) : Point of contraflexure or inflection point occur in bending moment diagram. At this point bending moment change its sign from positive to negative and vice-versa. At this point (the point of contraflexure) bending moment becomes zero.

$$\frac{\sigma}{y} = \frac{M}{I} = \frac{E}{R}$$

R = Radius of curvature

At point of contraflexure, BM = 0

$$\frac{M}{I} = \frac{E}{R}$$

$$\frac{1}{R} = \frac{M}{EI} = 0$$

1358. A cantilever beam of length 100 mm is subjected an end load of 150 N. If Young's Modulus is 200 GPa and Moment of Inertia is 5000 mm^4, the maximum deflection of this beam is:

(a) 5 mm (b) 0.01 mm
(c) 0.5 mm (d) 0.05 mm

CIL MT 27.02.2020

Ans. (d) : Given, ℓ = 100 mm

Load W = 150 N

E = 200 GPa

I = 5000 mm^4

$$\text{Maximum deflection} = \frac{W\ell^3}{3EI}$$

$$y_{max} = \frac{150 \times (100)^3}{3 \times 200 \times 10^3 \times 5000}$$

$$y_{max} = 0.05 \text{ mm}$$

1359. Which of the following states, "The deflection between any two points is equal to the moments of its area of bending moment diagram between the two points about the last point divided by EI"?

(a) Macaulay's Method
(b) Mohr's theorem
(c) Castigliano's first theorem
(d) Double integration method

VIZAG MT, 14.12.2020

Ans. (b) : Mohr's Theorem–It states that deflection between any two points is equal to the moments of its area of bending moment diagram between the two points about the last point divided by EI.

Search on Telegram @apna_pdf

1360. Simply supported beam of span (l) carries UDL (w kgf/m) throughout. Deflection at center is (y). If length is doubled, deflection at center would be:

(a) 2y (b) 4y
(c) 8y (d) 16y

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (d) : For simply supported beam carrying UDL,

Deflection, $\delta = \frac{5}{384}\frac{w\ell^4}{EI}$

$\delta \propto \ell^4$

If length is doubled, deflection at centre,

$$\delta_f = \frac{5}{384}\frac{w(2\ell)^4}{EI}$$

$$\delta_f = (16)\frac{5}{384}\left(\frac{w\ell^4}{EI}\right)$$

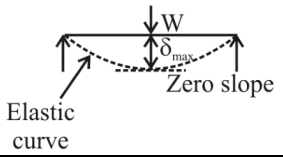
$$\boxed{\delta_{final} = 16\delta_{initial}}$$

1361. Assertion (A) : In a simply supported beam subjected to a concentrated load P at mid-span, the elastic curve slope becomes zero under the load.
Reason (R) : The deflection of the beam is maximum at mid-span.

(a) Both (A) and (R) are individually true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are individually true but (R) is NOT the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

OPSC AEE 2019 Paper-I

Ans : (a) : Elastic curve slope becomes zero at the point of maximum deflection in this case. Hence, of both assertion and reason are correct and reason is correct explanation of assertion.

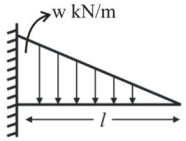


1362. The value of maximum deflection for a cantilever beam of length l and carrying uniformly varying load from zero at free end to w per unit length at fixed end is :

(a) $wl^3/8$ EI (b) $wl^3/16$ EI
(c) $wl^4/30$ EI (d) $wl^3/48$ EI

ISRO Scientist/Engineer (RAC), 10.03.2019
GATE 2019

Ans. (c) :



$$\text{Slope}(\theta) = \frac{w\ell^3}{24EI}$$

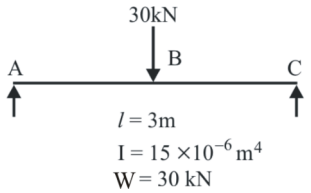
$$\text{Deflection}(\delta) = \frac{w\ell^4}{30EI}$$

1363. A girder of uniform section and constant depth is freely supported over a span of 3 metres. The point load at the midpoint is 30 kN and Moment of inertia = 15×10^{-6} m^4 and Young's Modulus = 200 GN/m^2. The deflection at centre will be :

(a) 6.6 cm (b) 8.6 cm
(c) 5.6 cm (d) 6.6 cm

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (c) :



Deflection of mid

$$\delta_B = \frac{Wl^3}{48EI}$$

$$= \frac{30\times10^3\times(3000)^3}{48\times200\times10^3\times15\times10^{-6}\times(10^3)^4}$$

$$\boxed{\delta_B = 5.625mm}$$

1364. A cantilever beam with rectangular cross-section is subjected to uniformly distributed load. The deflection at the tip is δ_1. If the width and depth of the beam are doubled then deflection at tip is δ_2. Then $\frac{\delta_2}{\delta_1}$ is

(a) 0.0625 (b) 16
(c) 0.5 (d) 2

APPSC AEE SCREENING 17.02.2019

Ans. (a) : Deflection $\propto \frac{1}{I}$

$$\therefore \quad \frac{\delta_2}{\delta_1} = \frac{I_1}{I_2} = \frac{\left(\frac{bd^3}{12}\right)}{\frac{(2b)(2d)^3}{12}} = \frac{1}{16} = 0.0625$$

1365. In the case of a beam simply supported at both ends, if the same load instead of being concentrated at centre is distributed uniformly throughout the length, then deflection at centre will get reduced by

(a) 1/2 times (b) 1/4 times
(c) 5/8 times (d) 3/8 times

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (d) : Case-I
Center point load on SSB, we have deflection.

$$\delta_P = \frac{WL^3}{48EI}$$

Case-II
Deflection for UDL

$$\delta_{UDL} = \frac{5wL^4}{384EI}$$

If, W = w × L

Search on Telegram @apna_pdf

then

$$\delta_{UDL} = \frac{5}{384} \times \frac{WL^3}{EI} \times \frac{48}{48}$$

$$\frac{\delta_{UDL}}{\delta_P} = \frac{5}{384} \times 48 = \frac{5}{8}$$

So the reduction is given by

$$\delta_P - \delta_{UDL} = \delta_P - \frac{5}{8}\delta_P = \frac{3}{8}\delta_P$$

1366. The ratio of area under the bending moment diagram to the flexural rigidity between two points along a beam gives the change in

(a) deflection (b) slope

(c) shear force (d) bending moment

TSPSC AEE 28.08.2017 (Civil/Mechanical)

CSE Pre-1998

Ans. (b) : $\frac{d^2y}{dx^2} = \frac{M}{EI}$

Integrating it between two points A and B on elastic curve

$$\int_A^B \frac{d^2y}{dx^2} = \int_A^B \frac{M}{EI}$$

$$= \left[\frac{dy}{dx}\right]_A^B = \int_A^B \frac{Mdx}{EI}$$

$\int_A^B Mdx$ = (area of bending moment diagram between A and B)

1367. A simply supported beam AB of span L is subjected to a concentrated load W at the centre C of the span. According to Mohr's moment area method, which of the following gives the deflection under the load?

(a) Moment of the area of M/EI diagram between A and C taken about C

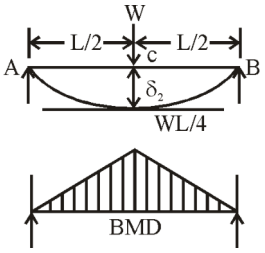
(b) Moment of the area of M/EI diagram between A and B taken about B

(c) Moment of the area of M/EI diagram between A and B taken about A

(d) Moment of the area of M/EI diagram between A and C taken about A

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) :



Moment of the area of M/EI diagram between A and C taken about A.

1368. The maximum deflection of a simply supported beam, 4 m long due to mid span concentrated load of 5 kN is

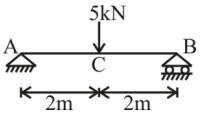
(Take E = 200 GN/m^2, I = 16 × 10^{-6} m^4)

(a) –6.8 mm (b) –3.8 mm

(c) –5.2 mm (d) –2.083 mm

Karnataka PSC AE, 10.09.2017

Ans. (d) :



$$\text{Deflection}\left(\delta_c\right) = \frac{PL^3}{48EI}$$

$$= \frac{5 \times 10^3 \times (4000)^3}{48 \times 200 \times 10^9 \times 10^{-6} \times 16 \times 10^{-6} \times 10^{12}}$$

$$= \frac{5 \times 64 \times 10^{12}}{48 \times 200 \times 16 \times 10^9}$$

= 2.083 mm

Note-(–ve) sign shows the downward deflection of beam.

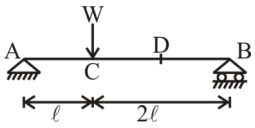
1369. A simply supported beam AB carries a point load W at a point C at a distance less than half from the left end A. The maximum deflection will be

(a) at C (b) between A and C

(c) between C and B (d) None of the above

Karnataka PSC AE, 10.09.2017

Ans. (c) :



- Deflection is maximum slope is zero in the region between point of application of load and mid span.
- Slope is maximum at a support which is nearer to the load.

1370. Governing differential equation for small deflections of elastic beams is given by

(a) $\frac{d^2y}{dx^2} = \frac{M}{EI}$ (b) $EI\frac{d^3y}{dx^3} = V(x)$

(c) $EI\frac{d^4y}{dx^4} = q(x)$ (d) All the above

ISRO Scientist/Engineer 17.12.2017

Ans. (d) : Differential equation of the elastic line is

$$EI\frac{d^2y}{dx^2} = M(x)$$

$$\frac{d^2y}{dx^2} = \frac{M(x)}{EI}$$

For shear force

$$EI\frac{d^3y}{dx^3} = V(x)$$

For shear force density (distributed load)

$$EI\frac{d^4y}{dx^4} = q(x)$$

Search on Telegram @apna_pdf

1371. We can find the deflection of beam carrying:
(a) Uniformly distributed load
(b) Central point load
(c) Gradually variable load
(d) All of these loads

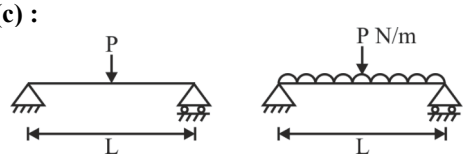
TRB Polytechnic Lecturer 2017

Ans. (d) : A subjected to UDL, central point load and also gradually variable load, deflection can find out.

1372. A uniform bar, simply supported at the ends, carries a concentrated load P at mid-span. If the same load be, alternatively, uniformly distributed over the full length of the bar the maximum deflection of the bar will decrease by.
(a) 25.5% (b) 31.5%
(c) 37.5% (d) 50.0%

ESE 2017

Ans. (c) :



$$\delta_1 = \frac{PL^3}{48EI} \qquad \delta_2 = \frac{5}{384}\frac{PL^3}{EI}$$

$$\% \text{ decrease in max deflection} = \frac{\delta_1 - \delta_2}{\delta_1} \times 100$$

$$= \frac{\frac{1}{48} - \frac{5}{384}}{\frac{1}{48}}$$

$$= 37.5\%$$

1373. A cantilever beam of length L is subjected to a point load W at free end. Then the slope at the free end is equal to
(a) $\frac{WL^3}{3EI}$ (b) $\frac{WL^2}{60EI}$
(c) $\frac{WL^3}{60EI}$ (d) $\frac{WL^2}{2EI}$

APPSC AEE Mains 2016 (Civil Mechanical)

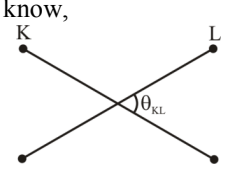
Ans. (d) : For cantilever beam,

Slope of free end (θ) = $\frac{WL^2}{2EI}$

1374. The mathematical expression for moment area theorem I for angle θ_{KL} between tangents drawn at K and L to elastic curve is
(a) $\theta_{KL} = \int_K^L \frac{MI}{E} dx$ (b) $\theta_{KL} = \int_K^L \frac{M}{EI} dx$
(c) $\theta_{KL} = \frac{M}{EI}$ (d) $\theta_{KL} = \frac{E}{MI}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (b) : As we know,



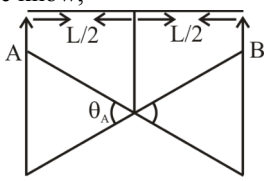
Theorem I = The change in slope between tangents draw to plastic curve at any point K & L is equal to the product of $\frac{1}{EI}$, Multiplied by area of moment.

$$\theta_{kL} = \frac{1}{EI}(\text{Area KL}) = \int_K^L \frac{M}{EI} dx$$

1375. A simply supported beam AB of L span and EI flexural rigidity is subjected to M_B moment at B. Then the rotation at A is given by
(a) $\theta_A = \frac{ML}{6EI}$ (b) $\theta_A = \frac{ML}{4EI}$
(c) $\theta_A = \frac{ML}{3EI}$ (d) $\theta_A = \frac{ML}{3EI}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (a) : As we know,



$$\theta_A = \frac{1}{EI}(\text{Area AB})$$

$$\theta_A = \int_A^B \frac{M}{EI} dx$$

We get,

$$\theta_A = \frac{ML}{6EI}$$

1376. The width b and depth d of a cantilever beam carrying a point load at its free end are changed into 0.5b and 2d respectively. Then its maximum deflection for the same load condition reduces by
(a) one-fourth (b) half
(c) three-fourth (d) zero

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : As, we know,
Max. deflection formula for cantilever

$$\delta_{max_1} = \frac{WL^3}{3EI_1}$$

$$\therefore I_1 = \frac{bd^3}{12} \qquad \ldots(i)$$

$$I_2 = \frac{0.5b \times (2d)^3}{12} = \frac{8d^3b}{2 \times 12} = \frac{4bd^3}{12}$$

$$\therefore I_2 = 4I_1$$

$$\delta_{max_2} = \frac{WL^3}{3EI_2} = \frac{\delta_{max_1}}{4}$$

$$\text{Ratio} \Rightarrow \text{Reduction} = \delta_{max_1} - \frac{\delta_{max_1}}{4}$$

$$= \frac{3\delta_{max_1}}{4}$$

Search on Telegram @apna_pdf

1377. The elastic curve of a beam means

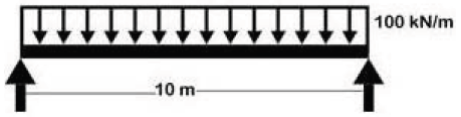
(a) BMD (b) SFD

(c) Deflection curve (d) Stress-stain curve

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : Deflection curve, is the elastic curve of a beam,

1378. A steel beam of breadth 100 mm and height 1000 mm is loaded as shown in the figure below. Assume modulus of elasticity as 200 GPa.



What is the maximum deflection in the beam?

(a) 751.25 mm (b) 781.25 mm

(c) 805.25 mm (d) 821.75 mm

(e) 851.75 mm

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (*) : Given, L = 10 m = 10000 mm

$E = 200\ GPa = 200 \times 10^9\ N/m^2$

$= 200 \times 10^3\ MPa\ or\ N/mm^2$

Breath (b) = 100 mm

Height (h) = 1000 mm

w = 100 kN/m

$W = 100 \times 10\ kN = 10^6\ N$

$$\boxed{I = \frac{bh^3}{12} = \frac{0.1\times(1)^3}{12}}$$

We know,

$$\delta = \frac{5WL^4}{384EI}$$

$$= \frac{5\times10^6\times(10000)^4\times12}{384\times200\times10^3\times(1000)^3\times100}$$

$$= 78125.0\ mm$$

Note-Official answer given by the commission (b).

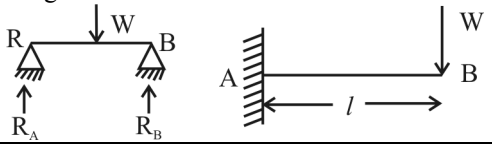
1379. Which of the following describes a single load or force that has a small contact area as to be negligible compared with the entire surface area of the supporting member?

(a) Contact load (b) Concentrated load

(c) Common load (d) None of these

KPCL AE 2016

Ans. (b) : Concentrated load describes a single load or force that has a small contact area to be negligible compared with the entire surface of area of the supporting member.



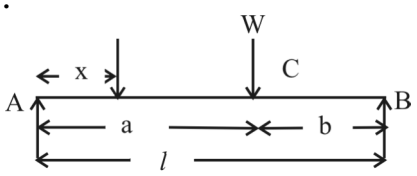
1380. A beam of length *l* simply supported at the ends carries a point load W at a distance 'a' from the left end. Also *l* -a= b. The deflection under load is given by :

(a) $\frac{Wa^2b^2}{3EIl}$ (b) $\frac{Wabl}{3EI}$

(c) $\frac{Wab}{6EIl}$ (d) $\frac{Wa^2bl}{3EI}$

APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (a) :



Reaction at $A = \frac{Wb}{l}$

Reaction at $B = \frac{Wa}{l}$

The strain energy stored by the Beam AB (U)

$U_{AB} = U_{AC} + U_{BC}$

$$= \int_0^a \left(\frac{Wb}{l}x\right)^2 \frac{dx}{2EI} + \int_0^b \left(\frac{Wa}{l}x\right)^2 \frac{dx}{2EI}$$

$$= \frac{W^2b^2a^3}{6EIl^2} + \frac{W^2a^2b^3}{6EIl^2}$$

$$= \frac{W^2a^3b^2}{6EIl^2} + \frac{W^2a^2b^3}{6EIl^2}$$

$$= \frac{W^2a^2b^2}{6EIl^2}(a+b)$$

$\because\ a + b = l$

$$U_{AB} = \frac{W^2a^2b^2}{6EIl}$$

Deflection under load 'W' is given by –

$$\delta = \frac{\partial u}{\partial W} = \frac{(2W)a^2b^2}{6EIl}$$

$$\boxed{\delta = \frac{Wa^2b^2}{3EIl}}$$

1381. A simply supported beam of 10 m span is carrying a load of 4.8 kN at mid span. If Young's modulus of elasticity (E) is 2×10^8 kN/m^2 and moment of inertia (I) is 20 cm^4, then the maximum deflection will be

(a) 5.00 mm (b) 2.50 mm

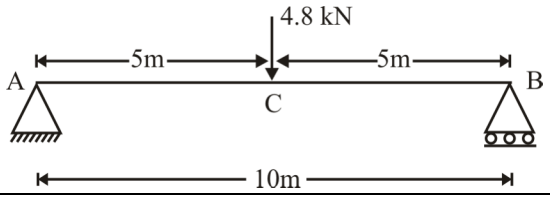
(c) 0.50 mm (d) 0.25 mm

APPSC AEE Screening Test 2016

Ans. (b) : given

$I = 20\ cm^4$

$E = 2\times10^8\ kN/m^2$



Search on Telegram @apna_pdf

Maximum deflection $(y_c) = \frac{W\ell^3}{48EI}$

$$= \frac{4.8\times10^3\times(10)^3}{48\times2\times10^8\times10^3\times20\times10^{-8}}$$

$$= \frac{4.8\times10^3\times10^3}{48\times2\times10^3\times20} = \frac{4.8\times10^3}{48\times2\times20}$$

$$= \frac{4800}{48\times2\times20} = \frac{100}{40} = 2.5\,\text{mm}$$

1382. A cantilever beam rectangular in cross section is subjected to a load W at its free end, causing deflection δ_1. If the load is increased to 2W, causing deflection δ_2, the value of $\frac{\delta_1}{\delta_2}$ would be

(a) 1 (b) 2
(c) 4 (d) 1/2

Nagaland PSC CTSE 2016 Paper-I

Ans. (d) : A cantilever beam rectangular in cross-section subjected, load (W), then deflection (δ_1).

$$\delta_1 = \frac{WL^3}{3EI} \quad \text{——(i)}$$

When, Load is increased to (2W), then deflection (δ_2) will be,

$$\delta_2 = \frac{2WL^3}{3EI} \quad \text{——(ii)}$$

from (i) 2 (ii)

$$\frac{\delta_1}{\delta_2} = \frac{\frac{WL^3}{3EI}}{\frac{2WL^3}{3EI}} = \frac{1}{2}$$

1383. If the depth of a rectangular beam is halved, the deflection for a beam carrying a mid point load shall be–

(a) halved (b) doubled
(c) four times (d) eight times

RPSC 2016

Ans : (d) Given, $d_1 = \frac{d}{2}$, $d_2 = d$

$$\delta = \frac{WL^3}{48EI} = \frac{WL^3}{48E\frac{bd^3}{12}}$$

$$\delta \propto \frac{1}{d^3}$$

If depth is halved $\left(d_2 = \frac{d}{2}\right)$

$$\frac{\delta_1}{\delta_2} = \frac{\left(\frac{d_1}{2}\right)^3}{d_1^3} = \frac{1}{8}$$

$$\boxed{\delta_2 = 8\delta_1}$$

1384. Maximum slope in case of a cantilever of length *l* carrying a load P at its end is

(a) $Pl^2/2EI$ (b) Pl^2/EI
(c) $Pl^2/4EI$ (d) $Pl^2/6EI$
(e) $Pl^2/8EI$

CGPSC AE 26.04.2015 Shift-I

Ans. (a) :

Type of load	Slope at end	Maximum deflection
	$\theta = \frac{Pl^2}{2EI}$	$\delta = \frac{Pl^3}{3EI}$
	$\theta = \frac{wl^3}{6EI}$	$\delta = \frac{wl^4}{8EI}$

1385. The ratio of central deflection due to a central load in the case of a beam freely supported at both ends to the beam fixed at both ends will be-

(a) 1/2 (b) 4
(c) 1/4 (d) 2

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (b) Central deflection for simply supported beam for central load W.

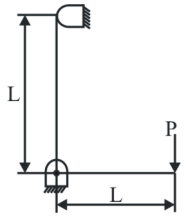
$$\delta_1 = \frac{WL^3}{48EI}$$

Central deflection for fixed beam (at both ends) for central load W.

$$\delta_2 = \frac{WL^3}{192EI}$$

Then, $\boxed{\delta_1/\delta_2 = 4}$

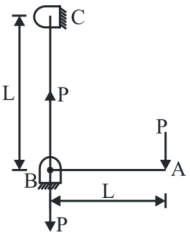
1386. A frame of two arms of equal length L is shown in the figure. The flexural rigidity of each arm of the frame is EI. The vertical deflection at the point of application of load P is



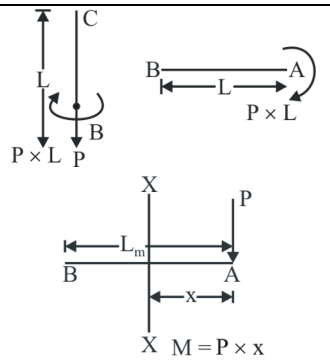
(a) $\frac{PL^3}{3EI}$ (b) $\frac{2PL^3}{3EI}$
(c) $\frac{4PL^3}{3EI}$ (d) None of the above

ISRO Scientist/Engineer 11.10.2015
GATE 2009

Ans. (c) :



Search on Telegram @apna_pdf



For section 'AB'

$$U_{AB} = \int \frac{M^2 dx}{2EI}$$

$$= \int_0^L \frac{M^2 dx}{2EI}$$

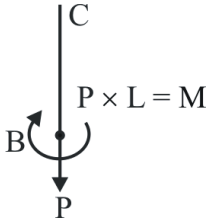
$$= \int_0^L \frac{(P \times x)^2 dx}{2EI} = \int_0^L \frac{P^2 \times x^2 dx}{2EI}$$

$$= \frac{P^2}{2EI}\int_0^L x^2 dx = \frac{P^2}{2EI}\left[\frac{x^3}{3}\right]_0^L$$

$$= \frac{P^2}{2EI}\left[\frac{L^3}{3}\right]$$

$$U_{AB} = \frac{P^2 L^3}{6EI}$$

For Section 'B'



$$U_{BC} = \int_0^L \frac{M^2 dx}{2EI}$$

$$= \int_0^L \frac{(P \times L)^2 dx}{2EI}$$

$$= \int_0^L \frac{P^2 \times L^2 dx}{2EI}$$

$$= \frac{P^2 L^2}{2EI}\int_0^L dx = \frac{P^2 L^2}{2EI}[x]_0^L$$

$$U_{BC} = \frac{P^2 L^3}{2EI}$$

So, vertical deflection,

$$= \frac{\partial U_{AB}}{\partial P} + \frac{\partial U_{BC}}{\partial P}$$

$$U_{AB} = \frac{P^2 L^3}{6EI}$$

$$\frac{\partial U_{AB}}{\partial P} = \frac{2PL^3}{6EI} = \frac{PL^3}{3EI}$$

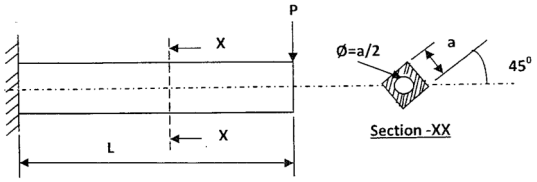
$$U_{BC} = \frac{P^2 L^3}{2EI}$$

$$\frac{\partial U_{BC}}{\partial P} = \frac{2PL^3}{2EI} = \frac{PL^3}{EI}$$

$$\text{Vertical deflection} = \frac{\partial U_{AB}}{\partial P} + \frac{\partial U_{BC}}{\partial P}$$

$$= \frac{PL^3}{3EI} + \frac{PL^3}{EI} = \frac{4}{3}\frac{PL^3}{EI}$$

1387. A concentrated load P is applied at the end of a cantilever as shown in Fig. The cross section of the beam is a square of side 'a' with a hole of dia 'a/2'. The deflection at the tip of the cantilever is given by



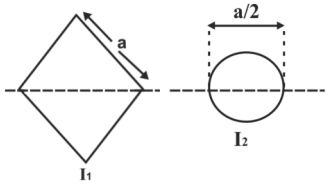
(a) $\frac{3P}{E}\frac{L^3}{a^4}$ (b) $\frac{1024P}{(256-3\pi)E}\frac{L^3}{a^4}$

(c) $\frac{1024P}{(256-\frac{\pi}{64})E}\frac{L^3}{a^4}$ (d) $\frac{256P}{(1024-3\pi)E}\frac{L^3}{a^4}$

ISRO Scientist/Engineer 12.05.2013

Ans. (b) : Firstly find the moment of inertia of a Hollow cross-section.

Let moment of Inertia I_1 and I_2



$$I = I_1 - I_2$$

$$= \frac{a^4}{12} - \frac{\pi(a/2)^4}{64}$$

$$= \frac{a^4}{12} - \frac{\pi a^4}{16 \times 64}$$

$$= \frac{a^4}{4}\left[\frac{1}{3} - \frac{\pi}{4 \times 64}\right]$$

$$I = \frac{a^4}{4}\left[\frac{256 - 3\pi}{4 \times 3 \times 64}\right]$$

So, Deflection of Cantilever beam

$$\delta = \frac{PL^3}{3EI}$$

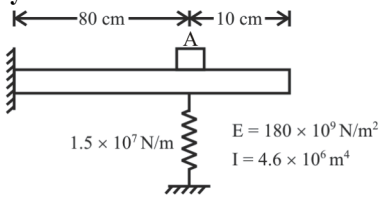
$$= \frac{PL^3}{3E\frac{a^4}{4}\left[\frac{256-3\pi}{4\times 3\times 64}\right]}$$

Search on Telegram @apna_pdf

$$= \frac{4\times4\times64P\times L^3}{(256-3\pi)E\times a^4}$$

$$\therefore \text{ Deflection, } \delta = \frac{1024P}{(256-3\pi)E}\left(\frac{L^3}{a^4}\right)$$

1388. Determine the equivalent stiffness of the system shown below



(a) 6.35×10^7 N/m (b) 4×10^7 N/m
(c) 3×10^7 N/m (d) 5×10^5 N/m

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (a) : Given, $E = 180 \times 10^9$ N/m^2, $I = 4.6 \times 10^6$ m^4

$k_s = 1.5 \times 10^7$ N/m

$L_1 = 80$ cm $= 0.8$ m

$L_2 = 10$ cm $= 0.1$ m

Deflection at A, $\delta_A = \frac{PL^3}{3EI}$

Beam stiffness, $k_0 = \frac{P}{\delta_A} = \frac{3EI}{L^3}$

Equivalent stiffness, $k_{eq} = \frac{3EI}{L_1^3} + k_s$

$$= \frac{3\times180\times10^9\times4.6\times10^6}{(0.8)^3} + 1.5\times10^7$$

$$= 4851.5625 \times 10^{15} + 1.5 \times 10^7$$

$$\approx 4852 \times 10^{15} \text{ N/m}$$

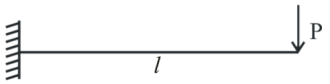
No option is matching.
But official answer is (a).

1389. If a cantilever beam of length *l*, the concentrated load *P* at the end is replaced by a bending moment *P* × *l*, the deflection will increase by :

(a) 1 time (b) 1.5 times
(c) 1.25 times (d) 2 times

J&K PSC Civil Services Pre, 2013

Ans. (b) : Case-I



Deflection at free end,

$$\delta_1 = \frac{Pl^3}{3EI} \quad \text{.....(i)}$$

Case-II

$$\delta_2 = \frac{Ml^2}{2EI} = \frac{(Pl)l^2}{2EI} \quad \text{.....(ii)}$$

From $\left(\frac{\text{ii}}{\text{i}}\right)$ –

$$\frac{\delta_2}{\delta_1} = \frac{Pl^3/2EI}{Pl^3/3EI} = \frac{3}{2} = 1.5$$

$$\boxed{\delta_2 = 1.5\delta_1}$$

1390. The slope and deflection at the centre of a simple beam carrying a central point load are

(a) zero and zero
(b) zero and maximum
(c) maximum and zero
(d) minimum and maximum

BPSC AE 2012 Paper - VI

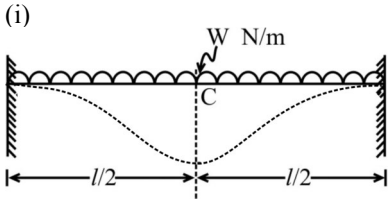
Ans : (b) : zero and maximum

1391. A beam of length, l, fixed at both ends carries a uniformly distributed load of w per unit length. If EI is the flexural rigidity, then the maximum deflection in the beam is

(a) $\frac{wl^4}{192EI}$ (b) $\frac{wl^4}{24EI}$
(c) $\frac{wl^4}{384EI}$ (d) $\frac{wl^4}{12EI}$

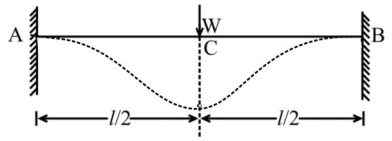
APPSC AEE 2012

Ans : (c) (i)



$$\text{Deflection } (\delta_c) = \frac{W\ell^4}{384EI}$$

(ii)



$$\text{Deflection } (\delta_c) = \frac{W\ell^3}{192EI}$$

1392. A simply supported beam span 3m, is subjected to a central point load of 5kN, then the slope at the mid span is equal to

(a) $\frac{25}{24EI}$ (b) $\frac{256}{EI}$
(c) $\frac{40}{48EI}$ (d) Zero

APPSC AEE 2012

Ans : (d) At mid span of the beam, deflection is maximum and slope is zero.

1393. A list of some theories of failure is given below:

(1) Maximum normal stress theory
(2) Maximum shear stress theory
(3) Maximum distortion theory

Which of these will be used for designing the machine components made of Cast Iron?

Search on Telegram @apna_pdf

(a) (2) only (b) (2) and (3)
(c) (1) an (3) (d) (1) only

RPSC AE GWD, 2011

Ans. (d) : Cast iron is a brittle material so for designing the machine components made of cast iron maximum normal stress theory is the best suited.

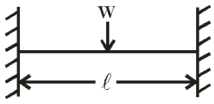
1394. The maximum deflection of a fixed beam of length 'ℓ' carrying a central point load w is

(a) $\frac{w\ell^3}{48EI}$ (b) $\frac{w\ell^3}{96EI}$

(c) $\frac{w\ell^3}{192EI}$ (d) $\frac{w\ell^3}{384EI}$

TNPSC ACF 2012

Ans. (c) :



$Y_{max} = \frac{w\ell^3}{192EI}$

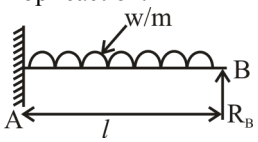
1395. The reaction at the prop in a propped cantilever beam subjected to u.d.*l*. is

(a) $\frac{Wl}{4}$ (b) $\frac{3Wl}{8}$

(c) $\frac{5Wl}{8}$ (d) $\frac{6Wl}{7}$

APPSC AEE 2012

Ans. (b) : R_B = Prop reaction.



Deflection of cantilever beam for u.d.*l*

$$\delta_B = \frac{Wl^4}{8EI} \text{.....(i)}$$

$$\Sigma\delta_B = 0$$

$$\frac{Wl^4}{8EI} - \frac{R_B.l^3}{3EI} = 0$$

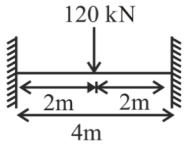
$$R_B = \frac{3}{8}Wl$$

1396. A beam length 4 m, fixed at both ends carries a point load of 120 kN at the centre. If EI for the beam is 2000 kN m^2, deflaction at the centre of beam is

(a) 1.0 mm (b) 2.0 mm
(c) 5.0 mm (d) 10.0 mm

APPSC AEE 2012

Ans. (*) :



Given,
Beam length = 4 m
P = 120 kN
EI = 2000 kN-m^2
Deflection of centre of beam

$$\delta_{max} = \frac{PL^3}{192EI} = \frac{120\times4^3}{192\times2000} = 0.02m$$

δ_{max} = 2 cm = 20 mm

1397. A simply supported beam with width 'b' and depth 'd' carries a central load W and undergoes deflection δ at the centre. If the width and depth are interchanged, the deflection at the centre of the beam would attain the value :

(a) $\frac{d}{b}\delta$ (b) $\left(\frac{d}{b}\right)^2\delta$

(c) $\left(\frac{d}{b}\right)^3\delta$ (d) $\left(\frac{d}{b}\right)^{3/2}\delta$

ISRO Scientist/Engineer 2011

Ans. (b) : In reactangle
width = b
depth = d
Deflection for S.S.B. when load acting at center of beam.

$$\delta = \frac{WL^3}{48EI}$$

$$I_1 = \frac{bd^3}{12}$$

Then Interchanged depth and width

$$I_2 = \frac{db^3}{12}$$

$$\frac{\delta_1}{\delta_2} = \frac{I_2}{I_1} = \frac{\frac{1}{12}db^3}{\frac{1}{12}bd^3}$$

$$\frac{\delta_1}{\delta_2} = \left(\frac{b}{d}\right)^2$$

$$\delta_2 = \left(\frac{d}{b}\right)^2\delta_1$$

$$\delta_1 = \delta$$

$$\delta_2 = \left(\frac{d}{b}\right)^2\delta$$

1398. If the diameter of a circular section is doubled its deflection is reduced by :

(a) 16 times (b) 8 times
(c) 4 times (d) 2 times

J&K PSC Civil Services Pre, 2010

Ans. (a) : Given, Deflection =δ
Diameter- d

$$\delta \propto \frac{1}{d^4}$$

Search on Telegram @apna_pdf

$$\frac{\delta_1}{\delta_2} = \left(\frac{d_2}{d_1}\right)^4 = \left(\frac{2d_1}{d_1}\right)^4$$

$$\frac{\delta_1}{\delta_2} = 16$$

$$\delta_2 = \frac{1}{16}\delta_1$$

1399. Maximum slope of a cantilever of length 6 m carrying load at a distance of 4 m from fixed end is _____.

(a) Fixed end (b) Under the load

(c) Free end (d) Can't predict

J&K PSC Civil Services Pre, 2010

Ans. (*) : Both (c) & (b) are correct.

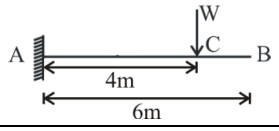
Slope at a point 'C' =

$$\theta_C = \frac{WL^2}{2EI}$$

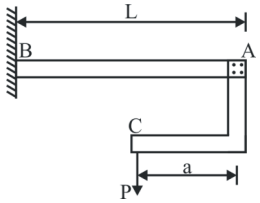
$$\theta_C = \frac{W(4)^2}{2EI} = \frac{16W}{2EI}$$

Maximum slope, $\theta_{max} = \theta_C = \theta_B = \frac{16W}{2EI}$

$\therefore$ So, hence maximum slope at free end and under the load is same.



1400. A cantilever beam *AB* of length *L* and uniform flexural rigidity *EI* has a bracket *AC* attached to its free end shown in Fig. Vertical load is applied to the free end *C* of the bracket. In order that the deflection of point *A* to be zero the ratio *a/L* should be

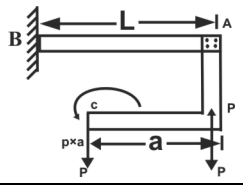


(a) $\frac{1}{2}$ (b) $\frac{1}{3}$

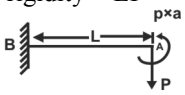
(c) $\frac{1}{4}$ (d) $\frac{2}{3}$

ISRO Scientist/Engineer 2010

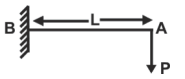
Ans. (d) :



Flexural rigidity = EI

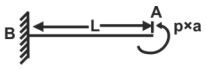


$\Downarrow$



...(1)

+



...(2)

$Y_A = Y_1 + Y_2$

$$Y_1 = -\frac{PL^3}{3EI}$$

$$Y_2 = \frac{ML^2}{2EI}$$

$Y_A = 0$ [deflection at point A is zero)

$$-\frac{PL^3}{3EI} + \frac{ML^2}{2EI} = 0$$

$M = P \times a$

$$\frac{P \times a \times L^2}{2EI} = \frac{PL^3}{3EI}$$

$$\frac{a}{2} = \frac{L}{3}$$

$$\frac{a}{L} = \frac{2}{3}$$

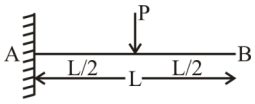
1401. A cantilever beam of length 'L' carries a concentrated load 'P' at its midpoint. What is the deflection of the free end of the beam?

(a) $\frac{PL^3}{24EI}$ (b) $\frac{PL^3}{48EI}$

(c) $\frac{PL^3}{16EI}$ (d) $\frac{5PL^3}{48EI}$

UKPSC AE 2007 Paper -I

Ans. (d) :



$$Y_{AB} = \frac{5PL^3}{48EI}$$

1402. A cantilever of length 4 m carries a uniformly distributed load w throughout its length. If the maximum bending moment in the cantilever is 80 KNm, and El is the flexural rigidity, the slope at the end of the cantilever is

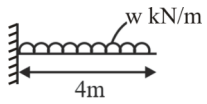
(a) $\frac{640}{3EI}$ (b) $\frac{620}{3EI}$

(c) $\frac{160}{3EI}$ (d) $\frac{80}{3EI}$

WBPSC AE, 2007

Search on Telegram @apna_pdf

Ans. (*)



Slope $\theta = \frac{w\ell^3}{6EI}$

$\because$ Maximum bending moment $M = \frac{w\ell^2}{2}$ at fixed end in cantilever beam with UDL

$$80 = \frac{w \times (4)^2}{2}$$

$$w = \frac{160}{10} = 10 kN/m$$

$$\text{Slope } (\theta) = \frac{10 \times (4)^3}{6EI}$$

$$= \frac{64 \times 10}{6EI} = \frac{320}{3EI}$$

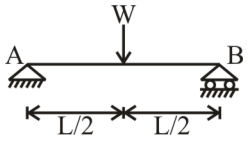
1403. A beam is simply supported at its ends over a span *l* . If the load applied at the middle of the beam is W, the minimum slope in the beam is

(a) $\frac{Wl^2}{16\ EI}$ (b) $\frac{Wl^2}{3\ EI}$

(c) $\frac{Wl^2}{2\ EI}$ (d) none of these

WBPSC AE, 2007

Ans. (a)



$$\boxed{\text{Slope}(\theta) = \frac{WL^2}{16EI}}$$

$$\boxed{\text{Deflection}(\delta) = \frac{WL^3}{48EI}}$$

1404. A simply supported beam of rectangular section 4 cm by 6 cm carries a mid-span concentrated load such that the 6 cm side lies parallel to line of action of loading and the deflection under the load is δ. If the beam is now supported with the 4 cm side parallel to line of action of loading, then the deflection under the load will be-

(a) 0.44 δ (b) 2.25 δ

(c) 1.5 δ (d) 1.75 δ

WBPSC AE 2003

Ans. (a) : Deflection at center $(\delta) = \frac{wl^3}{48EI} = \frac{wl^3}{48E\left(\frac{bd^3}{12}\right)}$

$\because$ Question says that the 6 cm side lies parallel to the line of action of loading.

$\therefore$ deflection $\delta' = \frac{wL^3}{48EI'}$ ...(i)

$$\text{Deflection, } \delta' = \frac{wL^3}{48E\frac{db^3}{12}} = \frac{wL^3 \times 12 \times d^2}{48E(db^3) \times d^2} \quad \left(I' = \frac{db^3}{12}\right)$$

$$= \frac{wL^3 \times 12 \times d^2}{48E \times (db^3) \times b^2}$$

$$= \frac{wL^3 \times d^2}{48E \times (bd^3) \times b^2}$$

$$= \left(\frac{wL^3}{48EI}\right) \times \frac{d^2}{b^2}$$

$$= \delta . \frac{d^2}{b^2} \quad \text{...(ii)}$$

$d = 4$, $b = 6$ substitute in equation (ii)

$$\delta' = \delta \times \frac{16}{36} = \delta \times \frac{4}{9} = 0.44\delta$$

$$\boxed{\delta' = 0.44\delta}$$

10. Theory of Failure

1405. Which of the following is applied to brittle materials?

(a) maximum principal stress theory
(b) maximum principal strain theory
(c) maximum strain energy theory
(d) maximum shear stress theory

JPSC AE 10.04.2021, Paper-II
APPSC Poly Lect. 13.03.2020

TANGEDCO AE 2015
TRB Poly. Lect., 2012
RPSC ACF-2011
WBPSC AE, 2007

Ans. (a) : Maximum Principal Stress Theory (MPST) (Rankine Theory)–

Assumption–

- Neglect the shear stress
- Neglect the other principal stress (σ_2)
- It is suitable for brittle materials

(because brittle material are weak in tension) under all loading condition.

- It's not suitable for ductile material

($\because$ Shear stress is neglected)

- MPST suitable for ductile material under uni-axial state of stress and biaxial state of stress when principal stress are in same nature.

Search on Telegram @apna_pdf

1406. In case of crystalline and brittle materials criterion of failure, that takes place under maximum principal stress, is put forwarded by

(a) Theory of Rankine
(b) Theory due to Guest
(c) Theory of St. Venant
(d) Theory due to Beltrami and Haigh

GPSC DEE Class-2 GWSSB 04.07.2021

RPSC AE GWD, 2011

Ans. (a) :

(i) Max. Principle Stress Theory/Rankine's Theory/ Lames Theory/Maximum Stress Theory

- Applicable for brittle materials (Best for brittle materials)
- Not suitable for ductile materials
- Not suitable for pure shear case.

(ii) Maximum Principal Strain Theory/Saint Venant's Theory

- Satisfactory for brittle materials
- Not suitable for pure shear case and hydrostatic loading.

(iii) Maximum Shear Stress Theory/Tresca's Theory / Guest Theory

- Applicable for ductile materials
- Most conservative theory
- Not suitable for hydrostatic loading.

(iv) Maximum Strain Energy Theory / Haigh's Theory

- Applicable for ductile material
- Not suitable for brittle material and pure shear case.

(v) Maximum Shear Strain Energy Theory / Distortion Energy Theory / Hencky Theory / Von-Mises Theory

- Most appropriate theory for ductile materials
- Perfect for pure shear case.

1407. Shear stress theory is applicable to

(a) ductile materials (b) brittle materials
(c) elastic materials (d) plastic materials

GATE 1998

Ans. (d) : Aluminium is ductile material and loading is static so we will use, maximum shear stress theory only.
Maximum shear stress theory

$$\tau_{max} = \max\left\{\left|\frac{\sigma_1-\sigma_2}{2}\right|, \left|\frac{\sigma_2-\sigma_3}{2}\right|, \left|\frac{\sigma_1-\sigma_3}{2}\right|\right\}$$

$\tau_{max} > S_{sy} \rightarrow$ failed
$\tau_{max} \le S_{sy} \rightarrow$ Safe

1409. A transmission shaft subjected to bending and torsional moments should be designed on the basis of

(a) Maximum principal stress theory
(b) Maximum shear stress theory
(c) Permissible bearing pressure
(d) None of the mentioned above

GPSC EE Pre, 28.01.2017
TNPSC AE 2017
MPPSC AE 08.11.2015
TNPSC ACF 2012

Ans. (b) : Torsional moment is due to shear force, so that the design of shaft based on maximum shear stress theory, where as bending moment is due to normal force, so that the design of shaft based on maximum principal normal stress.

1410. As per maximum shear stress theory of failure. The relation between yield strength in shear (τ_y) and yield strength in tension (σ_t) is:

(a) $\tau_t = 1.2\ \sigma_t$ (b) $\tau_t = 0.7\ \sigma_t$
(c) $\tau_t = 0.3\ \sigma_t$ (d) $\tau_t = 0.5\ \sigma_t$

TNPSC AE 2019, Vizag Steel (MT) 2017
CIL MT 26.03.2017

Ans. (d) : Maximum shear stress theory (or) Guest & Tresca's Theory-According to this theory, failure of specimen subjected to any combination of load when the maximum shearing stress at any point reaches the failure value equal to that developed at the yielding in an axial tensile or compressive test of the same material.

$$\tau_y \le \frac{\sigma_t}{2}$$

Where σ_t is the yield strength in tension and τ_y is the yield strength in shear.

1411. The maximum distortion energy theory of failure is suitable to predict the failure of one of the materials is :

(a) Brittle material (b) Ductile material
(c) Plastics (d) Composite materials

UJVNL AE 2016
OPSC AEE 2015 Paper-I, ESE 2004

Search on Telegram @apna_pdf

Ans : (b)
Maximum Principal Stress Theory : Brittle material
Maximum Shear Stress Theory : Ductile material
Maximum Strain Energy Theory : Ductile material
Maximum Shear Strain Energy Theory : Ductile material
Maximum Principal Strain Theory : The theory can be applied for ductile and Brittle material both but result are not accurate for either case.

1412. A shaft subjected to maximum bending stress of 80N/mm^2 and maximum shearing stress equal to 30N/mm^2 at a particular section. If the yield point in tension of the material is 280 N/mm^2 and maximum shear stress theory of failure is used, then the factor of safety obtained will be :

(a) 2.5 (b) 2.8
(c) 3.0 (d) 3.5

MPSC Poly. Lect. 2014
UPRVUNL AE 2014
APPSC IOF, 2009

Ans. (b) : $\sigma_{max} = 80\ N/mm^2$
$\tau_{xy} = 30\ N/mm^2$
$\sigma_{yt} = 280\ N/mm^2$
FOS = ?

$$\text{Maximum shear stress} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$$

$$\tau_{max} = \sqrt{\left(\frac{80-0}{2}\right)^2 + 30^2}$$

$$\tau_{max} = 50\,MPa$$

From maximum shear stress theory

$$\tau_{max} = \frac{\sigma_{yt}}{2FOS}$$

$$50 = \frac{280}{2 \times FOS}$$

$$FOS = \frac{280}{50 \times 2}$$

$$\boxed{FOS = 2.8}$$

1413. The failure at a point in a member, when the maximum principal stress in a bi-axial stress system reaches the elastic limit of the material, in a sample tension test. This is according to

(a) Rankine's theory (b) Guest's theory
(c) Lame's theory (d) Goodman's theory

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
WBPSC AE 2003

Ans. (a) : Rankine's theory– Rankine's theory assumes that failure will occur when maximum principal stress at any point reaches a value equal to the tensile stress in a simple tension specimen at failure. Rankine's theory applied for Brittle material, and not applicable for ductile material.

Guest's theory- According to this theory, the elastic failure occurs when the greatest shear stress reaches a value equal to the shear stress at elastic limit in a simple tension test. This theory is considered for Ductile material.

$$\boxed{\left(\frac{\sigma_1 - \sigma_3}{2}\right) = \left(\frac{\sigma_e}{2}\right)}$$

maximum shear stress is also known as Guest's 'or' Tresca's theory.

1414. Match the following criterion of material failure under biaxial stresses σ_1 and σ_2 and yield stress σ_y, with their corresponding graphic representations.

A.	Maximum shear stress criterion	L.	B.	Maximum distortion energy criterion	M.	C.	Maximum normal stress criterion	N.	
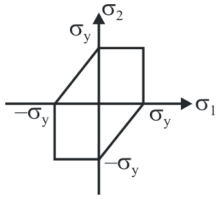
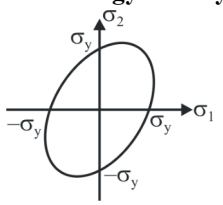
(a) A – L, B – N, C – M
(b) A – N, B – L, C – M
(c) A – M, B – N, C – L
(d) A – N, B – M, C – L

ISRO Scientist/Engineer 07.05.2017
GATE 2011, ESE 1997

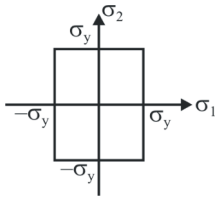
Ans. (b) : Maximum Shear Stress Theory–



Maximum Distortion Energy Theory–



Maximum Normal Stress Theory–



Search on Telegram @apna_pdf

1415. Guest's theory of failure is applicable for following type of materials

(a) brittle (b) ductile
(c) elastic (d) plastic
(e) tough

GPSC DEE, Class-2 (GWSSB) 04.07.2021
CGPSC AE 26.04.2015 Shift-I

Ans. (b) : Maximum shear stress theory or Guest or Tresca's theory is well justified for ductile material.

1416. Which of the following theories of failure is not suitable for ductile material

(a) Maximum shear stress theory
(b) Maximum principal strain theory
(c) Maximum total strain energy theory
(d) Maximum principal stress theory

RPSC LECTURER 16.01.2016
MPSC HOD (Govt. Poly. Colleges) 04.10.2014

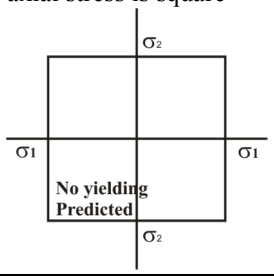
Ans. (d) : Maximum principal stress theory (Rankine's theory) is suitable for brittle material not for ductile material whereas Maximum shear stress theory (Guest's and Tresca theory), maximum principal strain theory (Saint-Venant theory) and maximum total strain energy theory (Haigh's theory) are used for ductile material.

1417. Region of safety for maximum principal stress theory under bi-axial stress is shown by:

(a) Ellipse (b) Square
(c) Pentagon (d) Hexagon

APPSC AEE SCREENING 17.02.2019
UPRVUNL AE 07.10.2016

Ans. (b) : Maximum principal stress theory— Maximum principal stress theory or normal stress theory says that, yielding occurs at a point in a body, when principle stress (maximum normal stress) in a biaxial system reaches limiting yield value of that material under simple tension test. This theory used for brittle material. This theory also known as Rankine theory. Region of safety for maximum principal stress theory under bi-axial stress is square



1418. Failure of the component occurs when the maximum shear stress in the complex system reaches the value of maximum shear stress in simple tension at the elastic limit. This is known as:

(a) Rankine theory
(b) Guest and Tresca theory
(c) Haigh theory
(d) St. Venant theory
(e) Carnot theory

CGPSC AE 25.02.2018
ISRO Scientist/Engineer 2008

Ans. (b) : Maximum shear stress theory [Guest and Tresca theory]– Failure of the component occurs when the maximum shear stress in the complex system reaches the value of maximum shear stress in simple tension at the elastic limit. This theory is used for ductile material.

1419. According to the distortion-energy theory, the yield strength in shear is

(a) 0.277 times the yield stress
(b) 0.377 times the maximum shear stress
(c) 0.477 times the yield strength in tension
(d) 0.577 times the yield strength in tension

ESE 2020
BPSC AE Mains 2017 Paper - VI

Ans. (d) : According to distortion energy theory,

$$S_{sy} = \frac{S_{yt}}{\sqrt{3}} = 0.577 S_{yt}$$

1420. Von-Mises and Tresca criteria give different yield stress for :

(a) Uni-axial stress
(b) Balanced bi-axial stress
(c) Pure shear stress
(d) All

Vadodara Muncipal Corp. DEE, 2018
GPSC EE Pre, 28.01.2017

Ans. (c) : Von-Mises and Tresca criteria gives different yield stress for pure shear stress.

1421. For designing ductile material, which of the following theories is/are used?

(a) Maximum shear stress theory
(b) Shear strain energy theory
(c) Both (A) and (B)
(d) None of the above

Assam PSC AE (PHED), 18.10.2020
APPSC AEE SCREENING 17.02.2019

Ans. (c) : For designing ductile material- Most important appropriate failure theory is maximum shear stress theory or shear strain energy theory.
For brittle material- Maximum normal stress or principal stress theory is more suitable for brittle material.

1422. Maximum distortion energy theory of failure is also called :

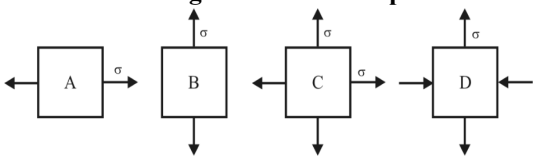
(a) Rankine's theory
(b) Guest's or Tresca's theory
(c) Von Mises theory
(d) St. Venant's theory

CGPSC AE 15.01.2021
UPRVUNL AE 05.07.2021

Ans. (c) : (i) Maximum Principal Stress Theory
⇒ Rankine's Theory
(ii) Maximum Shear Stress Theory
⇒ Guest's or Tresca's Theory
(iii) Maximum distortion energy Theory
⇒ Von Mises Theory
(iv) Maximum Principal Strain Theory
⇒ St. Venant's Theory

Search on Telegram @apna_pdf

1423. Shown below are four elements a, b, c and d with different states of plane stress. Using maximum shear stress theory yield, which of the following will yield first? Assume the material is homogenous and isotropic.



(a) A (b) B
(c) C (d) D

RPSC ACF & FRO, 26.02.2021

Ans. (d) : According to max shear stress theory,

$$\tau_{max} = \max\left\{\left|\frac{\sigma_1}{2}\right|, \left|\frac{\sigma_2}{2}\right|, \left|\frac{\sigma_1-\sigma_2}{2}\right|\right\}$$

$$(\tau_{max})_A = \frac{\sigma_1}{2} = \frac{\sigma}{2}$$

$$(\tau_{max})_B = \frac{\sigma_2}{2} = \frac{\sigma}{2}$$

$$(\tau_{max})_C = \frac{\sigma_1}{2} (or) \frac{\sigma_2}{2} = \frac{\sigma}{2}$$

$$(\tau_{max})_D = \frac{\sigma_1-\sigma_2}{2} = \frac{\sigma-(-\sigma)}{2}$$

$= \sigma$ (max)

(So, element d will yield first).

1424. A tension member of diameter d is designed with F.O.S. of 3. If the load and diameter are doubled F.O.S. will be

(a) Reduced to half (b) Unchanged
(c) Tripled (d) Doubled

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : $FOS = \frac{\sigma_{allowable}}{\sigma_{max}}$

$$\frac{\sigma_{allowable}}{(P/A)} = 3$$

$$\frac{\sigma_{allowable}}{(2P/4A)} = N$$

Hence, $\frac{1}{2} = \frac{3}{N}$

$\boxed{N = 6}$

1425. A rod having cross-sectional area 100×10^{-6} m^2 subjected to a tensile load. Based on the Teresa failure criterion, if the uniaxial yield stress of the material is 200 MPa, the failure load is :

(a) 10 kN (b) 20 kN
(c) 100 kN (d) 200 kN

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (b) : We know, Tresca's failure,

$$\tau_{max} = \frac{P}{2A} = \frac{\sigma_{yt}}{2} \text{ or } P = \sigma_{yt} \times A$$

$P = 200 \times 10^6 \times 100\times10^{-6} m^2$

$P = 20 \times 10^3 N = 20$ kN

1426. A cold rolled steel shaft is designed on the basis of maximum shear stress theory. The Principal stresses induced at its critical section are 500 MPa and -50 MPa respectively. If the shear yield stress for the shaft material is 400 MPa, the factor of safety of the design is

(a) 3 (b) 4
(c) 6 (d) 2

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : As we know,

$$\frac{\sigma_t - \sigma_c}{2} = \frac{\tau_{sy}}{FOS}$$

$$\frac{500-(-50)}{2} = \frac{400}{FOS}$$

$$\frac{550}{2} = \frac{400}{FOS}$$

$FOS = 1.45 \simeq 2$

1427. If a machine member is loaded in such a way that the three principal stresses are 600 kPa tension, 800 kPa tension and zero, the maximum shear stress at the point is :

(a) 1150 N/m^2 (b) 1000 N/m^2
(c) 700 kN/m^2 (d) 400 kN/m^2

CGPSC AE 15.01.2021

Ans. (d) : Given, rincipal stress,

$\sigma_1 = 600$ kPa, $\sigma_2 = 800$ kPa, $\sigma_3 = 0$

$$\text{Max. shear stress} = \left\{\left(\frac{\sigma_1-\sigma_2}{2}\right), \left(\frac{\sigma_2-\sigma_3}{2}\right), \left(\frac{\sigma_1-\sigma_3}{2}\right)\right\}$$

$$= \left\{\left|\frac{600-800}{2}\right|, \left|\frac{800-0}{2}\right|, \left|\frac{600-0}{2}\right|\right\}$$

$$= \{100, 400, 300\}$$

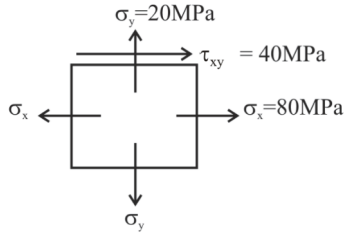
$\boxed{\tau_{max} = 400 kN/m^2}$

1428. A machine element is subjected to bi-axial state of stress : σ_x = 80 MPa; σ_y = 20 MPa; τ_{xy} = 40 MPa. If the shear strength of the material is 100 MPa, the factor of safety as per Tresca's Maximum Shear Strength theory is_____.

(a) 1.0 (b) 2.5
(c) 2.0 (d) 3.3

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (c) : 2.0



σ_x = 80 MPa
σ_y = 20 MPa
τ_{xy} = 40 MPa
τ_{xy} = 100 MPa

Search on Telegram @apna_pdf

Maximum shear stress $= \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}$

$= \sqrt{\left(\frac{80-20}{2}\right)^2 + 40^2}$

$= 50$

Tresca's maximum shear stress theory

$$\tau_{max} = \frac{\tau_{sy}}{FOS}$$

$$50 = \frac{100}{FOS}$$

$FOS = 2$

1429. For the condition of principal stresses σ_1, σ_2 positive and $\sigma_3 = 0$, and also $\sigma_1 > \sigma_2 > \sigma_3$, the equation of boundary line of failure envelope as per maximum shear stress theory will be :

(a) $\sigma_2 - \sigma_2 = S_{yt}$ (b) $\sigma_1 = S_{sy}$

(c) $\sigma_1 = S_{yt}$ (d) $\sigma_2 = S_{yt}$

JPSC AE 10.04.2021, Paper-II

Ans. (c) : Given, $\sigma_1 > \sigma_2 > \sigma_3 = 0$

maximum shear stress $\tau_{max} = \frac{\sigma_1 - \sigma_3}{2}$

$$\frac{\sigma_1 - \sigma_3}{2} = \tau_{max}$$

$$\frac{\sigma_1}{2} = \frac{S_{yt}}{2}$$

$$\boxed{\sigma_1 = S_{yt}}$$

1430. Failure of material is called fatigue when it fails

(a) at the elastic limit

(b) at the yield point

(c) below the elastic limit

(d) below the yield point

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : Failure of material is called fatigue when it fails below the yield point.

1431. In theory of failure, maximum strain energy theory is also called _____.

(a) Tressca theory (b) Rankine theory

(c) Haigh's theory (d) Von Mises theory

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) : In theory of failure, maximum strain energy theory is ab called Haigh's theory.

$$\sigma_1^2 + \sigma_2^2 + \sigma_3^2 + 2\mu(\sigma_1\sigma_2 + \sigma_2\sigma_3 + \sigma_3\sigma_1) \le \left(\frac{S_{yt}}{N}\right)^2$$

1432. The theory of failure used in designing the ductile materials in a most accurate way is by

(1) maximum principal stress theory

(2) distortion energy theory

(3) maximum strain theory

Select the correct answer using the code given below.

(a) 1, 2 and 3 (b) 1 only

(c) 2 only (d) 3 only

ESE 2019, 2020

Ans. (c) : Since ductile materials, under static conditions, mostly fail due to shear or distortion, distortion energy theory or Von-mises theory produces most accurate results.

1433. Tresca's theory of failure is also known as,

(a) Maximum principle stress theory

(b) Maximum principle strain theory

(c) Maximum shear stress theory

(d) Maximum distortion energy theory

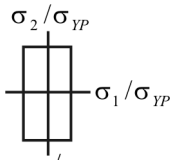
Oil India Senior Officer 23.12.2020

Ans. (c) : Tresca's theory of failure is also known as maximum shear stress theory.

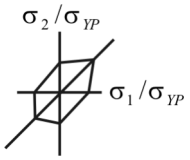
1434. Which one of the following figures represents the maximum principal stress theory?

(a) 
(b) 
(c) 
(d) 
OPSC AEE 2019 Paper-I

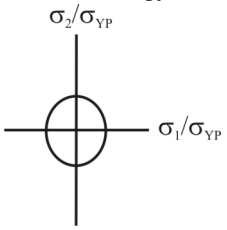
Ans : (a)



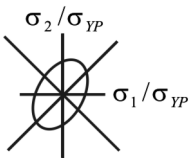
(i) Maximum shear stress theory



(ii) Maximum shear strain energy theory

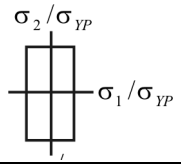


(iii) Maximum strain energy theory



Search on Telegram @apna_pdf

(iv) Maximum principal theory

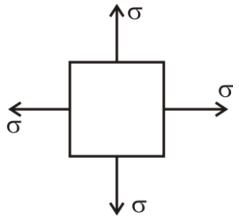


1435. Steel machine element at the critical section is in biaxial stress state with two principal stress being 300 N/mm^2 and 300 N/mm^2 (equal magnitude). Find the von Mises stress (in N/mm^2) in the member

(a) 212.1 (b) 600
(c) 424.2 (d) 300

ISRO Scientist/Engineer 12.01.2020

Ans. (d) :



$\sigma_1 = \sigma_2 = 300$

By using maximum distortion energy theory, Von-Mises Theory-

For plane stress condition,

$$\sigma_{per} = \sqrt{\sigma_1^2 + \sigma_2^2 - \sigma_1\sigma_2}$$

$\sigma_{per} = \sigma = 300$ MPa

1436. The uniaxial yield stress of a material is 300 MPa. According to von Mises criterion, the shear yield stress (in MPa) of the material is ---

(a) 173.28 (b) 150.55
(c) 124 (d) 99.87
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (a) : Given,

300 MPa = S_{yt}

According to Von - Mises criterion–

$$\frac{S_{ys}}{S_{yt}} = \frac{1}{\sqrt{3}}$$

$$\frac{S_{ys}}{300} = \frac{1}{\sqrt{3}}$$

$$S_{ys} = \frac{300}{\sqrt{3}}$$

$$\boxed{S_{ys} = 172.20 \text{ MPa}}$$

1437. Failure occurs when the maximum shear stress in the part exceeds shear stress in the tensile specimen at yield is a statement of

(a) Distortion energy theory
(b) Maximum shear stress theory
(c) Maximum strain energy theory
(d) Maximum normal stress theory

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (b) : Maximum shear stress theory

1438. The uniaxial tensile stress that would create the same distortion energy as is created by the actual combination of applied stresses is called as

(a) Effective distortion stress
(b) Impact stress
(c) Joint effective stress
(d) Von mises effective stress

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : Distortion energy is associated with Von-mises.

1439. If S is the applied stress, c is the width of the crack and r the radius of curvature at the tip of the crack, Griffith's crack theory gives the concentrated stress S_c as

(a) $2S\,(c/r)^{1/2}$ (b) $2S\,(c/r)^{1/3}$
(c) $S\,(c/r)^{1/2}$ (d) $2S\,(2c/r)^{1/2}$

ISRO Scientist/Engineer 12.01.2020

Ans. (a) : Griffith crack theory- The Griffith theory states that a crack will propagates when the reduction in potential energy that occurs due to crack growth is greater than or equal to the increase in surface energy due to the creation of new free surface. This theory is applicable to elastic materials that fracture in brittle fashion.

Griffith crack theory gives,

$$S_c = 2S\left(\frac{c}{r}\right)^{1/2}$$

1440. At a material point the principal stresses are σ_1 = 100 MPa and σ_2 = 20 MPa. If the elastic limit is 200 MPa, what is the factor of safety based on maximum shear stress theory?

(a) 1.5 (b) 2
(c) 2.5 (d) 3

APPSC AEE SCREENING 17.02.2019

Ans. (b) : $\sigma_1 = 100$ MPa

$\sigma_2 = 20$ MPa

$\sigma_3 = 0$ (Minimum principal stress)

$\sigma_y = 200$ MPa

According to Maximum Shear Stress theory

$$\tau_{max} = \frac{\sigma_y}{2FOS}$$

$$\Rightarrow \quad \frac{\sigma_1 - \sigma_3}{2} = \frac{\sigma_y}{2FOS}$$

$$\Rightarrow \quad \sigma_1 - \sigma_3 = \frac{\sigma_y}{FOS}$$

$$\Rightarrow \quad 100 - 0 = \frac{200}{FOS}$$

$$FOS = \frac{200}{100} = 2$$

1441. A point in a structural member with allowable yield strength of 300 MPa is subjected to Principal stresses σ_1 = 200 MPa, σ_2 = 50 MPa and σ_3 = –100MPa. What is the calculated value of yield stress (σ_0) and does yielding occurs?

Search on Telegram @apna_pdf

(a) $\sigma_0 = 150$ MPa and yielding occurs
(b) $\sigma_0 = 300$ MPa and yielding occurs
(c) $\sigma_0 = 300$ MPa and yielding does not occurs
(d) $\sigma_0 = 150$ MPa and yielding does not occurs

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (a) : Using Tresca's criteria

$$\frac{\sigma_1 - \sigma_3}{2} \le \frac{S_{yt}}{2}$$

$$\frac{200+100}{2} \le \frac{300}{2}$$

$$150 = 150$$

Hence yielding occurs

1442. Let σ_1, σ_2 and σ_3 are the principal stresses at a material point. If the yield stress of the material is σ_y, then according to Von Mises theory yielding will not occur if

(a) $(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2 < 2(\sigma_y)^2$
(b) $\max[(\sigma_1 - \sigma_2), (\sigma_2 - \sigma_3), (\sigma_3 - \sigma_1)] < \sigma_y$
(c) $(\sigma_1)^2 + (\sigma_2)^2 + (\sigma_3)^2 < (\sigma_y)^2$
(d) $(\sigma_1)^2 + (\sigma_2)^2 + (\sigma_3)^2 - 2\nu(\sigma_1\sigma_2 + \sigma_2\sigma_3 + \sigma_3\sigma_1) < (\sigma_y)^2$

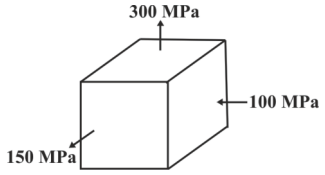
APPSC AEE SCREENING 17.02.2019

Ans. (a) : Von Mises Yielding Failure theory

$$\sigma_y \ge \sqrt{\frac{(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2}{2}}$$

$$(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2 \le 2\sigma_y^2$$

1443. If an element is loaded as shown in figure below, the Von Mises stress will be close to



(a) 180 MPa (b) 350 MPa
(c) 255 MPa (d) 495 MPa

ISRO Scientist/Engineer 22.04.2018

Ans. (b) : Data given

$$\sigma_1 = -100MPa,\ \sigma_2 = 300MPa,\ \sigma_3 = 150MPa$$

We know that (according to Von Mises theory)

$$(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2 = 2\sigma_y^2$$

$$(-100 - 300)^2 + (300 - 150)^2 + (150 - (-100))^2 = 2\sigma_y^2$$

$$160000 + 22500 + 62500 = 2 \times \sigma_y^2$$

$$\sigma_y^2 = \frac{1}{2} \times 245000 = 122500$$

$$\sigma_y = 350 \text{ MPa}$$

1444. A particular section of a shaft is subjected to a maximum shear stress equal to 30 N/mm^2 and a maximum bending moment of 80 N/mm^2. If the yield point in tension for this material is 200 N/mm^2 and maximum shear stress theory of failure for static loading is used, then the factor of safety will be:

(a) 1.75 (b) 1.5
(c) 2.0 (d) 1.2

AAI Jr. Executive 29.11.2018

Ans. (c) : Shear stress = 30 N/mm^2
Maximum bending moment = 80 N/mm^2

$$\sigma_{yield} = 200 \text{ N/mm}^2$$

$$\tau_{max} = \sqrt{\left(\frac{80-0}{2}\right)^2 + 30^2} = 50 \text{ N/mm}^2$$

According to maximum shear stress theory –

$$\tau_{max} = \frac{\sigma_{yield}}{2N}$$

$$50 = \frac{200}{2N}$$

Factor of safety (N) = 200/100 = 2

1445. For a ductile material, the limiting value of octahedral shear stress (τ_o) is related to the yield stress (S_y) as

(a) $\tau_o = S_y \frac{\sqrt{2}}{3}$ (b) $\tau_o = S_y 3\sqrt{2}$
(c) $\tau_o = S_y \frac{\sqrt{3}}{2}$ (d) None of the above

BPSC AE Mains 2017 Paper - VI

Ans : (a) : According to Von-mises (theory of failure)

$(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2 = 2\sigma^2_{yield}$ .....(i)

The octahedral shear stress can be given by the expression,

$$\tau_{ys} = \frac{1}{3}\sqrt{(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2} \quad \text{.....(ii)}$$

from equation (i) and (ii)

$$\tau_{ys} = \frac{1}{3}\sqrt{2\sigma^2_{yield}}$$

$$\tau_{ys} = \frac{\sqrt{2}}{3}\sigma_{yield}$$

1446. As per Von Mises theory the shear yield stress (K) can be related with yield stress (σ_y) under state of pure shear by _____

(a) $K = \sigma_y / (3)^{0.5}$ (b) $K = \sigma_y$
(c) $K = (\sigma_y)^{0.5}/3$ (d) None of the above

Punjab PSC SDE 12.02.2017

Ans. (a) : Von Mises theory is also known as maximum shear strain energy theory or distortion energy theory this assumes that failure occur when shear strain energy (distortion energy) in the complex system is equal to that the yield point in tensile compression test.

1447. Distortion energy theory of failure is applicable to:

(a) components made of plain carbon steel
(b) components made of composites
(c) components made of cast iron
(d) components made of non-metals

HPPSC Asstt. Prof. 20.11.2017

Ans. (a) : Maximum distortion energy theory [Von-mises theory]

– best theory of failure for ductile material because it given safe and economic design.

Plain carbon steels are ductile materials.

Search on Telegram @apna_pdf

1448. One of the theories of failure generally used is Maximum principal strain theory. This is also known as

(a) Coulomb's Tresca and Guest's theory
(b) St. Venant's theory
(c) Haigh's theory
(d) Rankine's Theory

UPRVUNL AE 05.07.2021
Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (b) : The maximum principle strain in the complex stress system must be less than the elastic in simple tension if there is to be no failure.

In the limit $\varepsilon_1 = \frac{\sigma_1 - \nu\sigma_2 - \nu\sigma_3}{E}$

$$\varepsilon_1 = \frac{\sigma}{E}$$

$$\boxed{\sigma_1 - \nu\sigma_2 - \nu\sigma_3 = \sigma}$$

1449. The most applicable failure theory for metals like aluminium is

(a) Maximum principal stress theory
(b) Maximum principal strain theory
(c) Total strain energy theory
(d) Maximum distortion energy theory

ISRO Scientist/Engineer 17.12.2017

Ans. (d) The most applicable theory of failure for metals
(1) Ductile material
(a) Maximum shear stress theory
(b) Maximum distortion energy theory
(2) Brittle material
(a) Maximum principal stress theory
(b) Maximum principal strain theory
(c) Total strain energy theory

1450. A cold rolled steel shaft is designed on the basis of maximum shear stress theory. The principal stresses induced at its critical section are 60 MPa and -60 MPa respectively. If the yield stress for the shaft material is 360 MPa, the factor of safety of the design is_____

(a) 6 (b) 4
(c) 2 (d) 3

UPRVUNL AE 21.08.2016, HPPSC W.S. Poly. 2016
OPSC AEE 2015 Paper-I, ESE 2002

Ans. : (d) Maximum stress (σ_{max}) = 60 Mpa
Minimum stress (σ_{min}) = –60 Mpa

Maximum shear stress (τ_{max}) = $\frac{\sigma_{max} - \sigma_{min}}{2}$

$$\tau_{max} = \frac{60+60}{2} = 60 \text{ Mpa}$$

According to maximum shear stress theory

$$\tau_y = \text{FOS} \times \tau_{max}$$

yield point shear stress = $\frac{\text{yield stress}}{2}$

$$\tau_y = 180 \text{ MPa}$$

$$\text{FOS} = \frac{\tau_y}{\tau_{max}} = \frac{180}{60} = 3$$

FOS = 3

1451. Pick the wrong statement about various theories of failure

(a) Rankine's theory is suitable for brittle materials.
(b) Maximum shear stress theory is more suitable for ductile materials.
(c) Distortion theory is suitable for ductile materials.
(d) Distortion energy theory is easy to apply as compared to maximum shear stress theory.

RPSC AE (GWD) 06.05.2016

Ans. (d)

- Rankine's theory (maximum, principle stress theory) is suitable for brittle materials
- Maximum shear stress theory in more suitable for ductile materials.
- Distortion theory is suitable for ductile materials.

1452. Three principal stresses of 10 MPa, 20 MPa and 30 MPa (tensile in nature) are acting on a homogeneous material. Using Von Mises yield criterion, what is the value, in MPa, of the estimated shear yield stress?

(a) 16.07 (b) 17.3
(c) 18.8 (d) 19.3
(e) 20.6

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) : $\sigma_x = 10$ MPa, $\sigma_y = 20$ MPa, $\sigma_z = 30$ MPa
Von-Mises, yield criterion,

$$\frac{S_{yt}}{\text{FOS}} = \sqrt{\sigma_1^2 + \sigma_2^2 + \sigma_3^2 - (\sigma_1\sigma_2 + \sigma_2\sigma_3 + \sigma_3\sigma_1)}$$

$$= \sqrt{10^2 + 20^2 + 30^2 - (10\times 20 + 30\times 20 + 30\times 10)}$$

$$= \sqrt{900 + 400 + 100 - (1100)}$$

$$\frac{S_{yt}}{F_s} = \sqrt{300} \text{ MPa} = 17.3 \text{ MPa}$$

Estimated shear stress,

$$\frac{\tau_{xy}}{F_s} = 0.577\frac{S_{yt}}{F_s} = 0.577\sqrt{300}$$

1453. What is the relationship between tensile (σ_y) and shear (K) yield stresses as per Tresca and Von mises yield criteria

(a) $K = \frac{\sigma_y}{\sqrt{2}}$ and $K = \frac{\sigma_y}{\sqrt{3}}$

(b) $K = \frac{\sigma_y}{\sqrt{2}}$ and $K = \sqrt{3}\sigma_y$

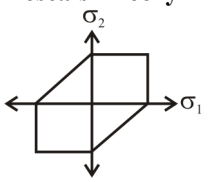
(c) $K = \frac{\sigma_y}{2}$ and $K = \frac{\sigma_y}{\sqrt{3}}$

(d) $K = \frac{\sigma_y}{2}$ and $K = \frac{\sqrt{2}}{3}\sigma_y$

GPSC Asstt. Prof. (Prod.) 21.08.2016

Search on Telegram @apna_pdf

Ans. (c) : Tresca's Theory–



Hexagon

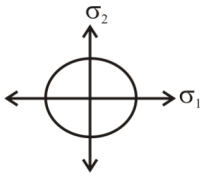
$K = \frac{\sigma_y}{2}$

K = Shear yield stress

σ_y = tensile yield stress

Tresca's theory is well used for ductile materials

Von-Mises Theory–



Ellipse

$K = \frac{\sigma_y}{\sqrt{3}}$

This is the most economical theory of failure used for ductile materials.

1454. In the case of analysis of fracture of brittle specimens and structures when all three principal stresses are compressive, ...theory seems to predict lower strengths than are actually obtained.

(a) Mcaulay's (b) Von-Tresca's
(c) Griffith's (d) Albert's

HPPSC Asstt. Prof. 29.10.2016

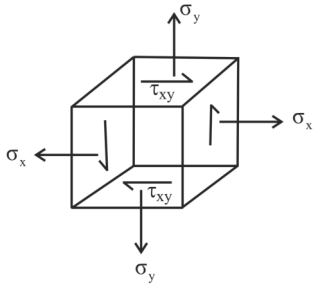
Ans. (c) : Griffith Theory of brittle fracture– Griffith proposed that a brittle material contains a population of fine small cracks and flows that have a variety of sizes, geometries and orientation which produces a stress concentration of sufficient magnitude so that the theoretical cohesive strength is reached in localized regions at a normal stress which is well below the theoretical value.

1455. The State of stress at a point is given as σ_x= 100 N / mm^2, σ_y= 40 N / mm^2 strength τ_{xy} = 40 N / mm^2. If the yield strength S_y of the material is 300 MPa, the factor of safety using maximum shear stress theory will be

(a) 3 (b) 2.5
(c) 7.5 (d) 1.25

BPSC Poly. Lect. 2016

Ans : (a)



$\sigma_x = 100$ N/mm^2, $\sigma_y = 40$ N/mm^2, $\tau_{xy} = 40$N/mm^2

$$\tau_{max} = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + (\tau_{xy})^2}$$

$$\tau_{max} = \sqrt{900 + 1600}$$

$$\tau_{max} = 50 N/mm^2$$

According to maximum shear stress theory

τ_y= FOS × τ_{max}

S_y= 300 MPa

then τ_y= 150 MPa $\quad \tau_y = \frac{S_y}{2} = 0.5\ S_y$

150 = FOS × 50

$\boxed{FOS = 3}$

1456. Which theory of failure is applicable for copper components under steady load?

(a) Principal stress theory
(b) Strain energy theory
(c) Maximum shear stress theory
(d) Principal strain theory

MPPSC AE 2016

Ans : (c) Maximum shear stress theory of failure is applicable for copper components under steady load. Maximum shear stress theory or Guest and Trecas's theory is well justified for ductile materials.

1457. A transmission shaft subjected to bending loads must be designed on the basis of

(a) Maximum shear stress theory
(b) Fatigue strength
(c) Maximum normal stress and maximum shear stress theories
(d) Maximum normal stress theory

MPPSC AE 2016
ESE 1996

Ans : (b) A transmission shaft subjected to bending load must be designed on the basis of Fatigue strength
Note-As per MPPSC, official answer is (d).

1458. The factor of safety in bending for rectangular beams in terms of yield point stress (σ_{yp}) and working stress (σ_w) is

(a) $1.5\frac{\sigma_{YP}}{\sigma_W}$ (b) $1.3\frac{\sigma_{YP}}{\sigma_W}$
(c) $1.33\frac{\sigma_{YP}}{\sigma_W}$ (d) $\frac{\sigma_{YP}}{\sigma_W}$

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (d) : As we know,

$$\text{Working stress} = \frac{\text{yield strength}}{\text{FOS}}$$

For ductile material

So, $\boxed{FOS = \frac{\sigma_{yp}}{\sigma_w}}$

1459. Consider the following

1. hard materials 2. brittle materials
3. malleable materials 4. ductile materials
5. elastic materials

Search on Telegram @apna_pdf

Of the above, Shear stress theory is applicable for which material

(a) 1 and 2 (b) 2 and 3
(c) 3 (d) 4
(e) 4 and 5

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Shear stress theory is applicable for ductile material.
Shear stress theory is also know as Guest & Tresca theory.

1460. Tresca theory of failure is applicable for which of the following type of materials?

(a) Elastomers (b) Plastic
(c) Ductile (d) Brittle

MPPSC AE 08.11.2015

Ans. (c) : Tresca's theory of failure is applicable for ductile materials.

1461. A solid circular shaft is subjected to a bending moment of 3000 N-m and a torque of 10000 N-m. The shafts is made of 45 C8 steel having ultimate tensile stress of 700 MPa and an ultimate shear stress of 500 MPa. Assume a factor of safety as 6. The diameter of the shaft according to the maximum shear stress theory is

(a) 84 mm (b) 85 mm
(c) 86 mm (d) 87 mm

MPPSC AE 08.11.2015

Ans. (c) : Given, Bending moment (M) = 3000 N-m
Torque(T) = 10000 N-m
σ_{ut} = 700 MPa & τ_{ut} = 500 MPa
$= 500\times10^6\ N/m^2$

Factor of safety (FOS) = 6
Let d = diameter of the shaft.

$\therefore$ Equivalent torque$(T_e) = \sqrt{M^2+T^2}$

$$\sqrt{(3000)^2+(10000)^2} = 10440.306\,N-m$$

According to the maximum shear stress theory-

$$\tau = \frac{\tau_{ut}}{FOS} = \frac{500\times10^6}{6}$$

$\therefore$ Diameter of shaft is-

$$d^3 = \frac{16T_e}{\pi\times\tau} = \frac{16\times10440.306}{\pi\times500\times\frac{10^6}{6}}$$

$$= \frac{6\times16\times10440.306\times10^{-6}}{\pi\times500}$$

$\Rightarrow$ $d^3 = 638.06\times10^{-6}$
$d = 8.609\times10^{-2}$ m
$d \approx 0.086$ m
$\Rightarrow$ d = 86 mm

1462. The slip line theory is developed to analyse:

(a) non-homogeneous plane stress deformation
(b) homogeneous plane stress deformation
(c) non-homogeneous plane strain deformation
(d) homogeneous plane strain deformation

HPPSC Asstt. Prof. 2014

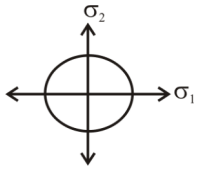
Ans. (c) : The slip line theory is developed to analyse non homogeneous plane strain deformation.

1463. The yield locus for von Mises yield criterion on π- plane is:

(a) Circle (b) Ellipse
(c) Hexagon (d) Circular cylinder

HPPSC Asstt. Prof. 2014

Ans. (b) :



Ellipse

1464. SEQA effective Von Mises stress at phase difference of 90º is minimum when the ratio of torsion stress amplitude and bending stress amplitude is near to :

(a) 0.2 (b) 0.6
(c) 1 (d) 1.6

HPPSC Asstt. Prof. 2014

Ans. (b) : According to Von-Mises

Shear yield stress $\tau_{xy} = \frac{\sigma_{yt}}{\sqrt{3}}$

$$\tau_{xy} = 0.577\,\sigma_{yt}$$

$$\frac{\tau_{xy}}{\sigma_{yt}} = 0.577 \approx 0.6$$

1465. From a uniaxial tension test, the yield strength of steel was found to be 200 N/mm^2. A steel shaft is subjected to a torque 'T', and a bending moment 'M'. The theory of failure which gives safest dimensions for the shaft and the relationship for design is

(a) Maximum Principal Strain Theory $\sigma_1 = \sigma_y$
(b) Maximum Principal Strain Theory $\frac{\sigma_1}{E} - \frac{\mu\sigma_2}{E} = \frac{\sigma_y}{E}$
(c) Maximum Shear Stress Theory $\frac{\sigma_1-\sigma_2}{2} = \frac{\sigma_y}{2}$
(d) Total Strain Energy Theory $\frac{\sigma_1^2}{2E} + \frac{\sigma_2^2}{2E} = \frac{\sigma_y^2}{2E}$

TNPSC AE 2014

Ans. (c) : Maximum shear stress theory [Guest and Tresca] of failure gives safest dimensions for the shaft and the relationship for design.

1466. If a shaft made of ductile material is subjected to combined bending and twisting moments, calculation based on which one of the following theories would give the most conservative values ?

(a) Maximum principle stress theory
(b) Maximum shear stress theory
(c) Maximum strain energy theory
(d) Maximum distortion energy theory

J&K PSC Civil Services Pre, 2013
ESE 1996, GATE 1988

Search on Telegram @apna_pdf

Ans. (b) :

Material	Theory of failure criterion
Brittle	max principle stress theory
ductile	max shear stress theory

1467. A rod of diameter 20 mm is subjected to a tensile load. Based on Tresca's failure criterion, if the uniaxial yield stress of the material is 300 MPa, the failure load is

(a) 20.75 kN (b) 54.00 kN
(c) 94.25 kN (d) 105.50 kN

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (c) : Maximum shear stress theory (Guest and Tresca's theory)

$$\tau_{max} \le \frac{\sigma_y}{2} \text{(For no failure)}$$

For design max of shear stress,

$$\left[\frac{(\sigma_1-\sigma_2)}{2}, \frac{(\sigma_2-\sigma_3)}{2}, \frac{(\sigma_3-\sigma_1)}{2}\right] \le \left(\frac{\sigma_y}{2FOS}\right)$$

For uni-axial loading, ($\sigma_2 = \sigma_3 = 0$)

$$\sigma_1 \le \sigma_{yt} \quad [\because \text{FOS} = 1]$$

$d = 20$ mm, $\sigma_{yt} = \sigma_1 = 300$ MPa

$$\sigma_1 = \frac{\text{Load}}{\text{Area}}$$

$$\Rightarrow \quad \text{Load} = \sigma_1 \times \text{Area} = \sigma_1 \times \frac{\pi}{4} d^2$$

$$\text{Load} = 300 \times \frac{\pi}{4} 20^2 = 94.25\,\text{kN}$$

1468. A small element at the critical section of a component is in a bi-axial state of stress with the two principal stresses being 360 MPa and 140 MPa. The maximum working stress according to Distortion energy theory is :

(a) 220 MPa (b) 110 MPa
(c) 314 MPa (d) 330 MPa

APGENCO AE 2012

Ans. (c) : Given, $\sigma_1 = 360$ MPa

$\sigma_2 = 140$ MPa

According to maximum Distortion theory -

$$\sigma_{working} = \sqrt{\sigma_1^2 + \sigma_2^2 - \sigma_1\sigma_2}$$

$$= \sqrt{(360)^2 + (140)^2 - 360 \times 140}$$

$$= 314.32 \text{ MPa}$$

1469. At a point in a strained material the principal stresses are P_1, P_2, and zero. In order that the factor of safety obtained by using the maximum shear stress theory of failure is the same as that obtained by using the distortion energy theory, the ratio of P_1, to P_2, should be

(a) -1 (b) $\frac{1}{2}$
(c) 1 (d) -2

WBPSC AE, 2007

Ans. (c) : According to maximum shear stress theory

$$\frac{\sigma_1 - \sigma_3}{2} \le \frac{\sigma_y}{N \times 2}$$

$$N = \frac{\sigma_y}{\sigma_1 - \sigma_3} = \frac{\sigma_y}{P_1 - 0} = \frac{\sigma_y}{P_1}$$

Squaring both sides

$$\boxed{N^2 = \frac{\sigma_y^2}{P_1^2}} \quad -------(1)$$

According to distortion energy theory

$$\frac{1}{2}\left[(\sigma_1-\sigma_2)^2 + (\sigma_2-\sigma_3)^2 + (\sigma_3-\sigma_1)^2\right] \le \frac{\sigma_y^2}{N^2}$$

$$N^2 = \frac{2\sigma_y^2}{(P_1-P_2)^2 + P_2^2 + P_1^2}$$

$$\boxed{N^2 = \frac{\sigma_y^2}{P_1^2 + P_2^2 - P_1P_2}} \quad -------(2)$$

Equating (1) & (2)

$$\frac{\sigma_y^2}{P_1^2} = \frac{\sigma_y^2}{P_1^2 + P_2^2 - P_1P_2}$$

$$P_1^2 = P_1^2 + P_2^2 - P_1P_2$$

$$P_1^2 = P_1P_2$$

$$P_2 = P_1$$

$$\boxed{\frac{P_1}{P_2} = 1}$$

11. Springs

1470. A coil is cut into two halves, the stiffness of cut coil will be:

(a) Double (b) Half
(c) Same (d) None of above

VIZAG Steel MT (Re-Exam) 24.11.2013
GATE 2008

Ans. (c) : $D_1 = 20$ mm

$D_2 = 10$ mm

Stiffness of spring

$$k = \frac{Gd^4}{8D^3n}$$

$$k \propto \frac{1}{D^3}$$

$$\frac{k_1}{k_2} = \left(\frac{D_2}{D_1}\right)^3$$

$$\frac{k_1}{k_2} = \left(\frac{10}{20}\right)^3$$

$$k_2 = 8k_1$$

1481. If both the mean coil diameter and wire diameter of a helical compression or tension spring be doubled, then the deflection of the spring close coiled under same applied load will:

Search on Telegram @apna_pdf

(a) be doubled
(b) be halved
(c) increase four times
(d) get reduced to one-fourth

GPSC ARTO Pre 30.12.2018
OPSC AEE 2019 Paper-I
ESE 2012

Ans. (b) : Deflection, $\delta_1 = \frac{8WD_1^3n}{Gd_1^4}$

Given, $D_2 = 2D_1$ $\quad \delta_2 = \frac{8WD_2^3n}{Gd_2^4}$

$d_2 = 2d_1$ $\quad \delta_2 = \frac{8W(2D_1)^3n}{G(2d_1)^4} = \frac{8}{16}\left(\frac{8WD_1^3n}{Gd_1^4}\right)$

$$\boxed{\delta_2 = \frac{\delta_1}{2}}$$

1482. In helical compression spring design formula :
$\tau = 8FCK/(\pi d^2)$
Where
F = load
τ = shear stress
C = spring index
d = wire dia.
K = Wahl factor.
The Wahl factor takes into account.
(a) the bending stress and the curvature of the spring
(b) the direct shear and the curvature of the spring
(c) the elastic constants (modulus of rigidity and Poisson's ratio) of the spring.
(d) the effect of the inactive number of coils at the ends of the spring.

NLC GET 17.11.2020, Shift-II
MPPSC AE 2016
BPSC Asstt. Prof. 29.11.2015

Ans. (b) : $K_w = K_{sh} \cdot K_c = \frac{4C-1}{4C-4} + \frac{0.615}{C}$

Where, K_w = Wahl factor
K_{sh} = Direct shear stress factor
K_c = Curvature effect factor
C = Spring index = $\frac{D}{d}$

The Wahl factor takes into account the direct shear and the curvature of the spring.

1483. The spring index in helical spring is
(a) a ratio of coil diameter to wire diameter
(b) a ratio of wire diameter to coil diameter
(c) slope of its force-deflection curve
(d) slope of its deflection force curve

Haryana PSC AE (PHED) 05.09.2020, Paper-II
Kerala PSC Poly. Lect. 09.01.2014
WBPSC AE 2008

Ans. (a) : Spring Index = $\frac{\text{Coil dia.}}{\text{Wire dia.}} = \frac{D}{d}$

1484. Stiffness of a close coiled helical spring in terms of wire diameter d, modulus of rigidity G, number of turns n and mean coil radius R is given by
(a) $\frac{Gd^4}{16nR^3}$ (b) $\frac{Gd^4}{32nR^3}$
(c) $\frac{Gd^4}{64nR^3}$ (d) $\frac{Gd^4}{96nR^3}$

APPSC IOF, 2009
WBPSC AE, 2007, ESE 1996

Ans. (c)

$$K = \frac{Gd^4}{8D^3n}$$

$$K = \frac{Gd^4}{8\times 8R^3n}$$

Stiffness, $\boxed{K = \frac{Gd^4}{64R^3n}}$

1485. Two closely coiled helical springs 'A' and 'B' are equal in all respects but the number of turns of spring 'A' is half that of spring 'B' The ratio of deflections in spring 'A' to spring 'B' is
(a) 1/8 (b) 1/4
(c) 1/2 (d) 2

Sikkim PSC (Under Secretary), 2017
APPSC AE Subordinate Service Civil/Mech. 2016

Ans. (c) : $\delta_A = \frac{64wR^3n}{Gd^4}$

Given, if $n = \frac{1}{2}$

$$\delta_A = \frac{64wR^3 1}{Gd^4 2} \quad \text{.....(i)}$$

$$\delta_B = \frac{64wR^3n}{Gd^4}$$

If, n = 1

$$\delta_B = \frac{64wR^3\times 1}{Gd^4} \quad \text{.....(ii)}$$

Ratio of deflection $\frac{\delta_A}{\delta_B}$

$$= \frac{\frac{64wR^3\times 1}{Gd^4\times 2}}{\frac{64wR^3\times 1}{Gd^4}}$$

$$\frac{\delta_A}{\delta_B} = \frac{1}{2}$$

Search on Telegram @apna_pdf

1486. A helical spring has spring constant k. If the wire diameter, spring diameter and the number of coils are all doubled then the spring constant of the new spring is _____

(a) k (b) 0.5 k

(c) 8 k (d) 16 k

Assam Engg. College AP/Lect. 18.01.2021
MPPSC AE 2016

Ans. (a) :

Spring Constant

$$k = \frac{W}{\delta} = \frac{W}{\frac{64WR^3n}{Gd^4}} = \frac{Gd^4}{64R^3n} = \frac{Gd^4}{64\left(\frac{D}{2}\right)^3 n}$$

$$k = \frac{Gd^4}{8D^3n}$$

[Given, if coil diameter, wire diameter and no. of coil is doubled]

$$\text{Then, } k' = \frac{G(2d)^4}{8(2D)^3 \times 2n} = \frac{16}{16}\left[\frac{Gd^4}{8D^3n}\right]$$

$$k' = k$$

1487. In a helical coil spring, if C is the spring index, then the shear correction factor is given by :

(a) $K_s = \frac{1}{2C}$ (b) $K_s = \frac{2C}{2C+1}$

(c) $K_s = \frac{2C+1}{2C}$ (d) $K_s = \frac{C+1}{2C}$

APPSC Poly Lect. 13.03.2020
CIL MT 27.02.2020

Ans. (c) :

Shear stress concentration factor $(K_s) = \frac{2C+1}{2C}$

Where; $C = \frac{D}{d}$ = Spring index for helical coil spring.

1488. The deflection of a spring with 20 active turns under a load of 1000 N is 10 mm. The spring is made into two pieces each of 10 active coils and placed in parallel under the same load. The deflection of this system is

(a) 20 mm (b) 10 mm

(c) 5 mm (d) 2.5 mm

UPPSC AE 13.12.2020 Paper-I
TRB Poly. Lect., 2012
GATE 1995

Ans. (d) : Δx= 10 mm, N= 20 turn , F= 1000N

$$K = \frac{F}{\Delta x} = \frac{1000}{10} = 100\,N/mm$$

On cutting spring in two equal parts, new 'K' will be equal 2K

Under parallel arrangement, K of the system will become 2K+2K = 4K. i.e 400 N/mm

Under same force (F), we get $\Delta x' = \frac{1000}{400} = 2.5mm.$

1489. A helical coil spring with wire diameter 'd' and mean coil diameter 'D' is subjected to axial load. A constant ratio of 'D' and 'd' has to be maintained, such that the extension of the spring is independent of 'D' and 'd' what is the ratio?

(a) D^3/d^4 (b) d^3/D^4

(c) $D^{4/3}/d^3$ (d) $d^{4/3}/D^3$

BPSC Poly. Lect. 2016
VIZAG MT 2015, ESE 2008

Ans. (a) : Deflection of spring $(\delta) = \frac{8WD^3n}{Gd^4}$

If extension of spring is independent of "D" and "d" than the ratio of "D" & "d" is –

$$\boxed{\frac{D^3}{d^4}}$$

1490. Spring driven watches and clocks utilize

(a) involute gears (b) cyloid gears

(c) epricycloid gears (d) straight rack gears

Karnataka PSC AE (WRD) 31.07.2021
RPSC ACF-2011

Ans. (b) : Spring driven watches and clock utilize cycloid gears whereas spiral spring are used in watches and toys. Torsion springs are used in places where a static position is required to be maintained against impact and load fluctuation.

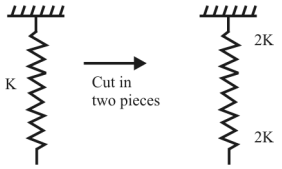
1491. A helical compression spring of stiffness K is cut into two pieces, each having equal number of turns and kept side-by-side under compression. The equivalent spring stiffness of this new arrangement is equal to :

(a) 4K (b) 2K

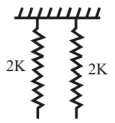
(c) K (d) 0.5K

RPSC ACF & FRO, 26.02.2021
CGPSC AE 26.04.2015 Shift-I

Ans. (a) :



Keep side by side under compression.



$$K_{eq} = 2K + 2K = 4K$$

1492. A load applied at centre of the carriage spring to straighten its leaves is known as

(a) Yield load (b) Ultimate load

(c) Proof load (d) Safe load

TSGENCO AE 14.11.2015
APPSC AEE 2012

Search on Telegram @apna_pdf

Ans. (c) : Proof Load– Proof load is the maximum load carrying capacity of the spring, without getting permanently distorted.

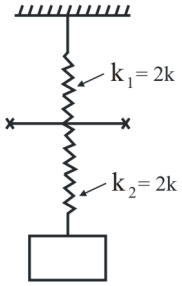
$$f_s = \frac{8WD}{\pi d^3}$$

1493. If a compression coil spring of stiffness 10 N/m is cut into two equal parts and the used in parallel the equivalent spring stiffness will be :

(a) 10 N/m (b) 20 N/m
(c) 40 N/m (d) 80 N/m

Kerala PSC AE 06.08.2015
KPSC AE 2015

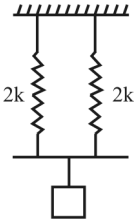
Ans. (c) : Given spring –



∴ previously stiffness of spring was K and after cutting into parts k_1 & k_2

$k_1 = 2k$ $k_2 = 2k$

Connected then in parallel



$k_{eq} = k_1 + k_2$
$= 2k + 2k$
$= 4k$ ....(i)

Putting, $k = 10$ N/m

$[k_{eq} = 4 \times 10 = 40$ N/m]

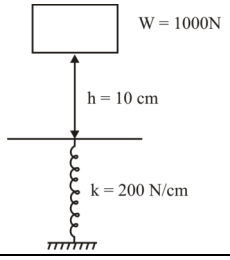
1494. A body having weight of 1000 N is dropped from a height of 10 cm over a closed coiled helical spring of stiffness 200 N/cm. The resulting deflection of spring is nearly :

(a) 5 cm (b) 16 cm
(c) 35 cm (d) 100 cm

GPSC ARTO Pre 30.12.2018
APPSC AE 04.12.2012

Ans. (b) : By conservation of energy,

Potential energy lost by body = strain energy stored in spring.



$$mg(h + x) = \frac{1}{2}kx^2$$

$$1000(10 + x) = \frac{1}{2} \times 200 \times x^2$$

$$1000 \times 10 = \frac{1}{2} \times 200 \times x^2 - 1000x$$

$$x^2 - 10x - 100 = 0$$

$$x = \frac{10 + \sqrt{(10)^2 + 400}}{2}$$

$x = 16.18$ cm

1495. A torsion bar with a spring constant 'k' is cut into 'n' equal lengths. The spring constant for each portion would be

(a) nk (b) k^n
(c) k/n (d) $k^{1/n}$

Kerala PSC Poly. Lect. 09.01.2014
ISRO Scientist/Engineer 12.05.2013

Ans. (a) : We know that

$$K \propto \frac{1}{L}$$

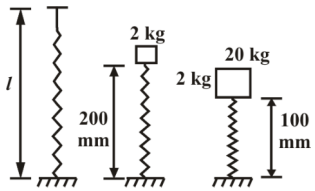
Hence, if we decrease the length into n parts the value of K increase by n times.

1496. A 2 kg pan is placed on a spring. In this condition, the length of the spring is 200 mm. When a mass of the 20 kg is placed on the pan, the length of the spring becomes 100 mm. For the spring, the un-deformed length L and the spring constant k (stiffness) are

(a) L = 220 mm, k = 1862 N/m
(b) L = 210 mm, k = 1862 N/m
(c) L = 210 mm, k = 1960 N/m
(d) L = 200 mm, k = 1960 N/m
(e) L = 200 mm, k = 2156 N/m

CGPSC AE 26.04.2015 Shift-I
ISRO Scientist/Engg. 12.05.2013
GATE 2005

Ans. (c) :



Spring force F = - kx

F = kx (compressive force)

Case (i)—When 2 kg pan is placed on spring

Force (F) = mg = 2g N

x = (*l* - 200) mm

Case (ii)—When 20 kg mass is placed on the pan

Force (F) = mg = 22g N

x = (*l* - 100) mm

From case (i) and case (ii) spring force

F = kx

2g = k (*l* - 200) ...(1)

22g = k (*l* - 100) ...(2)

Search on Telegram @apna_pdf

Divide equation (2) by (1)

$$\frac{22}{2}=\frac{l-100}{l-200}$$

$11l$ - 2200 = l - 100

10 l = 2100

l = 210 mm

From equation (1)

2g = k (l - 200)

2g = k (210 - 200)

$$k=\frac{2g}{10}=\frac{2\times 9.81}{10}$$

k = 1.962 N/mm

k = 1962 N/m

1497. If the wire diameter of a closed coil helical spring subjected to compressive load is increased from 1 cm to 2 cm, other parameters remaining same, then deflection will decrease by a factor of :

(a) 16 (b) 8

(c) 4 (d) 2

GPSC ARTO Pre 30.12.2018

GPSC AE 26.07.2015

Ans. (a) : Deflection $\delta_1=\frac{8WD^3n}{Gd_1^4}$

Given, d_1 = 1 cm

d_2 = 2 cm $\quad \delta_2=\frac{8WD^3n}{G(2d_1)^4}=\frac{8WD^3n}{16Gd_1^4}$

$d_2 = 2d_1$

$$\boxed{\delta_2=\frac{\delta_1}{16}}$$

1498. When a helical compression spring is subjected to an axial compressive load, then which one of the following stress will be induced?

(a) Shear (b) Bending

(c) Compressive (d) Tensile

TNPSC AE (Industries) 09.06.2013

UPSC JWM Adv. No-16/2009

Ans. (a) : When a helical compression spring is subjected to an axial compressive/tensile load, then there will be shear stress (direct + torsional) induced in the spring.

1499. Two helical tensile springs of the same material and also having identical mean coil diameter and weight, have wire diameter d and d/2. The ratio of their stiffness is

(a) 1 (b) 4

(c) 64 (d) 128

VIZAG STEEL MT 18.08.2013

VIZAG STEEL MT 10.06.2012

Ans. (c) : $\delta=\frac{64PR^3n}{Gd^4}$ or, $\left[\frac{P}{\delta}=\frac{Gd^4}{64R^3n}\right]$

Stiffness $K \propto \frac{d^4}{n}$

Since wire weight is the same,

therefore $\frac{\pi}{4}d_1^2n_1=\frac{\pi}{4}d_2^2.n_2$

$$\frac{n_1}{n_2}=\left(\frac{d_2}{d_1}\right)^2=\left(\frac{1}{2}\right)^2$$

or, $\frac{n_1}{n_2}=1/4$

$$\frac{K_1}{K_2}=\frac{d^4}{(d/2)^4}\times\frac{n_2}{n_1}$$

$$\frac{K_1}{K_2}=16\times 4$$

$$\boxed{\frac{K_1}{K_2}=64}$$

1500. A spring used to absorb shocks and vibrations is

(a) Torsion spring (b) Conical spring

(c) Leaf spring (d) Disc spring

Assam PSC AE (IWT) 14.03.2021

UPPSC AE 13.12.2020, Paper-I

Ans. (c) : Leaf spring is used to absorb shocks and vibrations. Leaf springs are an integral part of vehicle's suspension system. They are installed to help and support the entire weight of car or truck.

1501. In design of helical springs the spring index is usually taken as

(a) 3 (b) 5

(c) 8 (d) 12

TSPSC AEE 2015

Kerala PSC Poly. Lect. 09.01.2014

Ans. (b) : In design of helical springs the spring index is usually taken as 5.

1502. A truck of mass 20 tonnes traveling a 1.6 m/s impacts with a buffer spring which compress 2 mm per kN. The maximum compression of the spring is _____.

(a) 160 mm (b) 240 mm

(c) 80 mm (d) 320 mm

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : Given,

Mass of truck (m) = 20 tonne = 20 × 10^3 kg

Velocity of truck (v) = 1.6 ms

Buffer spring constant (k) = 2 mm/kN

x = maximum compression of the spring

We know that kinetic energy of truck (kE) = $\frac{1}{2}mv^2$

$$=\frac{1}{2}\times 20\times 10^3\times(1.6)^2$$

= 25600 kN-m …… (i)

Now, compression load, W = $\frac{x}{k}=\frac{x}{2}$

= 0.5x kN

∴ Work done in compressing the spring = Average compressive load × displacement

Search on Telegram @apna_pdf

$$= \frac{0.5x}{2} \times x = 0.25x^2 \text{ kN} - \text{m} \ldots..(ii)$$

Since, the entire kinetic energy of the truck is used to compare the spring.

$\therefore$ from equation (i) and (ii)–

$0.25x^2 = 25600$

$x^2 = \frac{25600}{0.25}$

$x = 320$ mm

1503. A closed coiled helical spring is subjected to an axial load. the stress which is not produced in the wire of the spring is___.

(a) Torsional shear stress
(b) Compressive stress
(c) Direct shear stress
(d) Bending stress

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : The stress which are produced in a closed coil helical springs are only torsional shear stress, there is not bending stress, compressive and direct shear stress are produced in wire coiled spring (helical). (tension & compressions)

1504. The longest leaf in Semi-elliptic leaf spring is known as

(a) chief leaf (b) master leaf
(c) major leaf (d) higher leaf

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (b) : The longest leaf in semi-elliptic leaf spring is known as master leaf through which the spring from one end of bushing to other end.

1505. If a spring deflect 50 mm under a 2 kN load, the energy absorbed by the spring in one gradual application of this load is :

(a) 100 J (b) 50 J
(c) 75 J (d) 25 J

CGPSC AE 15.01.2021

Ans. (b) : Given,

deflection, $\delta = 50 \text{ mm} = 0.05 \text{ m}$

Load, $P = 2\text{kN}$

Energy absorbed by the spring,

$$E = 1/2 \times P \times \delta$$

$$= \frac{1}{2} \times 2 \times 10^3 \times 0.05$$

$E = 50$ J

1506. Two springs with stiffness 2 N/m and 3 N/m are connected in parallel, then the equivalent stiffness is _____.

(a) 3 N/m (b) 1 N/m
(c) 5 N/m (d) 2 N/m

VIZAG Steel MT 24.01.2021

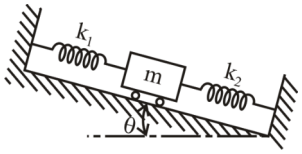
Ans. (c) : Given, $k_1 = 2$ N/m, $k_2 = 3$ N/m

Parallel connected,

$k_{eq} = k_1 + k_2$

$= 2 + 3 = 5$ N/m

1507. For the shown figure, if $k_1 = 10$ N/m, $k_2 = 20$ N/m and $\theta = 30°$, then equivalent stiffness of the system will be _____ N/m.



(a) 30 (b) 12
(c) 6.66 (d) 15

AAI Jr. Executive 26.03.2021

Ans. (a) : Stiffness of the system are in parallel,

$k_{eq} = k_1 + k_2$

$= 10 + 20$

$= 30$ N/m

1508. A helical spring is made of 12 mm diameter wire by winding it on a 120 mm diameter mandrel. If there are 10 active turns and modulus of rigidity of material is 8.2×10^4 N/mm^2 the spring constant will be

(a) 2.94 Nmm^{-1} (b) 3.64 Nmm^{-1}
(c) 9.24 Nmm^{-1} (d) 11.58 Nmm^{-1}

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (*) : Given,

Wire dia, $d = 12$ mm

Coil dia, $D = 120$ mm

No. of turn, $n = 10$

Modulus of rigidity, $G = 8.2 \times 10^4$ N/mm^2

Spring constant, $k = ?$

$$k = \frac{Gd^4}{8D^3n}$$

$$= \frac{8.2 \times 10^4 \times (12)^4}{8 \times (120)^3 \times 10}$$

$$\boxed{k = 12.3 \text{ N/mm}}$$

Note-Official answer given by commission is (c).

1509. Free length for helical compression springs having

(a) $P_n = 2d$ (b) $P_n + 3d$
(c) $2(p+d)$ (d) $P_n + 4d$

TNCSC AE 2020

Ans. (b) : Free length for helical compression springs having square ends is given as

free length (l_0) = $\boxed{P_n + 3d}$

Where, P_n = pitch

d = wire diameter

1510. A simple spring mass vibrating system has a natural frequency of N. If the spring stiffness is halved and mass is doubled, then natural frequency will become

(a) N/2 (b) 2 N
(c) 4 N (d) 8 N

RPSC IOF, 2020

Search on Telegram @apna_pdf

Ans. (a) : Natural frequency $f_n = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$

$$N = \frac{1}{2\pi}\sqrt{\frac{k}{m}} \text{ .....(i)}$$

[Given, if spring stiffness is halved and mass doubled]

$$f_n = \frac{1}{2\pi}\sqrt{\frac{k/2}{2m}}$$

$$f_n = \frac{1}{2\pi}\sqrt{\frac{k}{4m}} \text{ .....(ii)}$$

From equation (ii) & (ii)

$$\frac{N}{f_n} = \frac{\frac{1}{2\pi}\sqrt{\frac{k}{m}}}{\frac{1}{2\pi}\sqrt{\frac{k}{4m}}}$$

$$\frac{N}{2} = f_n$$

$$f_n = \frac{N}{2}$$

So, natural frequency will be come halved

1511. The Wahl's factor is involved in the design of

(a) Gear (b) Clutch
(c) Hooke's Joint (d) Spring

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : Wahl's correction factor is used in shear stress spring formula to compensate the effect of curvature and direct shear stress.

1512. For squared - ground ends in helical coil compression spring, the number of active coils is theoretically

(a) Two coils less than the total number of coils
(b) One coil less than the total number coils
(c) $\frac{1}{2}$ coil less than the total number of coils
(d) Same as the total number of coils

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) :

Spring ends	Number of effective coil
Plain end	Total coil
Plain and grounded	Total coil –1
flat/squared	total coil –2
squared and grounded	Total coil –2

1513. The angle of twist for the equivalent bar to spring is given by:

(a) $16PD^2N/Gd^4$ (b) $8PD^2N/Gd^4$
(c) $6PDN/Gd^3$ (d) $4PD^2N/Gd^4$

CIL MT 27.02.2020

Ans. (a) : Angle of twist

$$\theta = \frac{TL}{GJ}$$

$$\theta = \frac{PD/2 \times \pi DN}{G \times \pi d^4/32} \quad \left[\because M = \frac{PD}{2},\ \ell = \pi DN,\ J = \frac{\pi d^4}{32}\right]$$

$$\theta = \frac{16PD^2N}{Gd^4}$$

1514. With compression of close coiled helical spring, the wire gets subjected to

(a) tension
(b) compression
(c) shear and bending
(d) a combination of shear and tension

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : With compression of close coiled helical spring the wire gets subjected to a combination of shear and tension.

1515. A compression coil spring made of an alloy steel has mean diameter of coil as 50 mm and wire diameter as 5 mm? What will be the shear stress factor?

(a) 1.04 (b) 1.05
(c) 1.02 (d) 1.03

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : Given, Coil diameter (D) = 50 mm
Wire diameter (d) = 5 mm
We know that spring index

$$C = \frac{D}{d} = \frac{50}{5} = 10$$

Shear stress factor

$$k_s = 1 + \frac{1}{2C} = 1 + \frac{1}{2\times 10}$$

$$\boxed{k_s = \frac{21}{20} = 1.05}$$

1516. When two springs are connected in parallel with stiffness 'k' and 's', the effective stiffness is:

(a) 1/k + 1/s (b) k+s
(c) k/s (d) s/k

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : Spring stiffness in parallel

$k_{eq} = k_1 + k_2$

Where, $k_1 = k$

$k_2 = s$

So, $k_{equivalent} = k + s$

1517. If two identical helical coil springs are placed one over the other, total stiffness is

(a) doubled (b) halved
(c) increased four times (d) remains same

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (b) : If two helical springs are identical then stiffness of both springs are equal.

$k_1 = k_2$

Hence connection is in series –

$$\frac{1}{k_{eq}} = \frac{1}{k_1} + \frac{1}{k_2}$$

Putting $k_1 = k_2 \Rightarrow \boxed{k_{eq} = \frac{k_1}{2}}$

Search on Telegram @apna_pdf

1518. In which applications is leaf springs mostly used?

(a) Two-wheeler front suspensions
(b) In bicycles
(c) Airplanes
(d) In four-wheelers

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : The laminated or leaf spring (also known as flat spring or carriage spring) consists of a number of flat plates (known as leaves) of varying length held together by means of clamps and bolts. They are mostly used in automobiles.

1519. A leaf spring is to be made with seven steel plates 65 mm wide 6.5 mm thick. Calculate the length of spring to carry a central load of 2.75 kN and the bending stress is limited to 160 MPa

(a) 644.2 mm (b) 64.42 mm
(c) 74.42 mm (d) 744.2 mm

TNPSC AE 2019

Ans. (d) : Data given-

σ_b = 160 MPa b = 65 mm
t = 6.5 mm P = 2.75 kN
L = ? n = 7

We know that

$$\sigma_b = \frac{3PL}{2nbt^2}$$

$$L = \frac{2nbt^2\sigma_b}{3P} = \frac{2\times7\times65\times6.5^2\times160}{3\times2.75\times10^3}$$

$$\boxed{L = 745.64\text{mm} \simeq 744.2\text{mm}}$$

1520. Which is true statement about Belleville springs?

(a) These are used for dynamic loads
(b) These are composed of coned discs which may be stacked upto obtain variety of load-deflection characteristics
(c) These are commonly used in clocks and watches
(d) These take up torsional load

TNPSC AE 2019

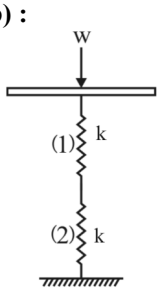
Ans. (b) : These are composed of coned discs which may be stacked upto obtain variety of load-deflection characteristics is true statement about Belleville springs.

1521. When two springs are in series (having stiffness k), the equivalent stiffness will be

(a) k (b) k/2
(c) 2k (d) k^2

Gujarat PSC AE 2019

Ans : (b) :



When two spring having stiffness k and are connected in series, then the combined stiffness of the spring ($k_{eq.}$) is given by

$$\frac{1}{k_{eq}} = \frac{1}{k} + \frac{1}{k}$$

$$\frac{1}{k_{eq}} = \frac{1+1}{k}$$

$$\boxed{k_{eq} = \frac{k}{2}}$$

1522. A helical spring is subjected to an axial load W and corresponding deflection in the spring is δ. Now if the mean diameter of the spring is made half of its initial diameter keeping the material, number of turns and wire cross-section same, the deflection will be

(a) $\frac{\delta}{2}$ (b) $\frac{\delta}{8}$
(c) $\frac{\delta}{4}$ (d) 2δ

APPSC AEE SCREENING 17.02.2019

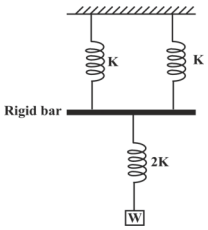
Ans. (b) : Deflection in spring $(\delta) = \frac{8WD^3n}{Gd^4} \Rightarrow \delta \alpha D^3$

$$\therefore \quad \frac{\delta_2}{\delta_1} = \left(\frac{D_2}{D_1}\right)^3$$

$$\frac{\delta_2}{\delta_1} = \left(\frac{\frac{D}{2}}{D}\right)^3$$

$$\Rightarrow \quad \delta_2 = \frac{\delta}{8}$$

1523. For the spring system given in figure, the equivalent stiffness is



(a) 5*K*/2 (b) 2 *K*/5
(c) *K* (d) 3*K*

ISRO Scientist/Engineer 22.04.2018

Ans. (c): In this system upper two springs are in parallel then equivalent spring stiffness is

$K_1 = K + K = 2K$

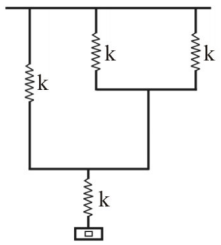
Then K_1 and 2K are in series then equivalent spring stiffness is K_2

$$\frac{1}{K_2} = \frac{1}{K_1} + \frac{1}{2K} = \frac{1}{2K} + \frac{1}{2K}$$

$$K_2 = K$$

Search on Telegram @apna_pdf

1524. Calculate equivalent stiffness of the spring for the system shown below, which has spring stiffness of 1000 N/m



(a) 7500 (b) 2000
(c) 750 (d) 4000

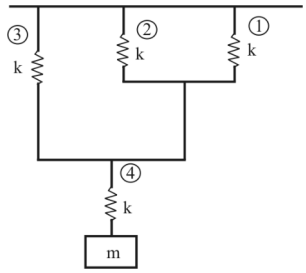
Vadodara Muncipal Corp. DEE, 2018

Ans. (c) : Given,

$k = 1000$ N/m

$k_{eq} = ?$

①&②in parallel



$k_{12} = 2k$

Now, k_{12} will be parallel with ③

$k_{13} = 2k + k = 3k$

k_{13} in series with ④

so, $k_{eq} = \frac{3k \times k}{3k + k} = \frac{3k^2}{4k} = \frac{3}{4} \times k$

$= \frac{3}{4} \times 1000$

$= 750 N/m$

1525. A closed coil helical spring has 15 coils. If five coils of this spring are removed by cutting the stiffness of the modified spring will :

(a) Increase to 2.5 times
(b) Increase to 1.5 times
(c) Reduced to 0.66 times
(d) Remain unaffected

GPSC ARTO Pre 30.12.2018

Ans. (b) : Given,

$$n = 15; \quad \text{stiffness } (k) = \frac{Gd^4}{8D^3 n} = \frac{Gd^4}{8D^3(15)}$$

$\because$ After cutting 5 coils,

$$n = 10 \quad k' = \frac{Gd^4}{8D^3(10)} \times \frac{15}{15}$$

$$k' = \frac{15}{10}\left[\frac{Gd^4}{8D^3(15)}\right]$$

$$\boxed{k' = 1.5k}$$

1526. Angle of helix in a closed coiled spring is :

(a) $< 10°$ (b) $> 10°$
(c) $= 10°$ (d) None

Kerala PSC Poly. Lect., 2017

Ans. (a)

- Helix angle of closed coil helical spring is below 10°.
- Helix angle of open coil helical spring is more than 10°.

1527. A Leaf spring in automobiles is used-

(a) To apply forces
(b) To measure forces
(c) To absorb shocks
(d) To store strain energy

GMB AAE 25.06.2017

Ans. (c) : The overall purpose a leaf spring is to provide support for a vehicle. It is also provides for a smoother ride absorbing any bumps in the road. Leaf spring are also used to locate the axle and control the height at which the vehicle rides and helps keep the tires aligned on the road.

1528. A 0.5 kg weight is attached to a light spring elongates it by 0.981 mm. The natural frequency of the system would be approximately

(a) 6 cps (b) 11 cps
(c) 16 cps (d) 21 cps

WBPSC AE, 2017

Ans. (c) : Given, $m = 0.5$ kg

Elongation, $\delta = 0.981$ mm

$$k = \frac{W}{\delta} = \frac{mg}{\delta}$$

$$= \frac{0.5 \times 9.81}{0.981 \times 10^{-3}}$$

$k = 5000$ N/m

Natural frequency, $f_n = \frac{1}{2\pi} \times \sqrt{\frac{k}{m}}$

$$\frac{1}{2\pi} \times \sqrt{\frac{5000}{0.5}} = \sqrt{\frac{50000}{5}}$$

$$f_n = \frac{1}{2\pi} \times 100 = \frac{50}{\pi}$$

$f_n = 15.916$

$f_n \approx 16$ cps or 16 cycle/sec

1529. Which of the following springs are subjected to both the torsion and bending?

P. Closed coil helical spring
Q. Closed coil helical spring subjected to axial couple
R. Open coil helical spring subjected to axial force
S. Open coil helical spring subjected to axial torque

(a) Only P and Q (b) Only Q and R
(c) Only R and S (d) P, Q and R

APGENCO AE, 2017

Search on Telegram @apna_pdf

Ans. (c) : Closed coil spring subjected to axial force subjected to torque only.
Closed coil spring subjected to axial couple subjected to bending only.
Open coil helical spring always experience bending and torsion both irrespective of loading either axial force or axial couple.

1530. The energy stored per unit volume in coil spring as compared to leaf spring is
(a) Equal amount (b) Double the amount
(c) Four times higher (d) Six times higher
TNPSC AE 2017

Ans. (d) : The energy stored per unit volume in coil spring as compared to leaf spring is six times higher.

1531. Due to addition of extra full length leaves the deflection of a semi-elliptic spring
(a) increases (b) decreases
(c) does not change (d) is doubled
TNPSC AE 2017

Ans. (b) : Due to addition of extra full length leaves the deflection of a semi-elliptic spring decreases.

1532. The ratio of total load on the spring to the maximum deflection is called is
(a) Spring Tension (b) Spring life
(c) Spring efficiency (d) Spring rate
TNPSC AE 2017

Ans. (d) : The ratio of total load on the spring to the maximum deflection is called is Spring rate is denoted by k. Spring rate also known as stiffness of spring.

$$K = \frac{W}{\delta_{max.}}$$

1533. For a spring mass system, the frequency of vibration is 'N' what will be the frequency when one more similar spring is added in series
(a) N/2 (b) $N/\sqrt{2}$
(c) $\sqrt{2}/N$ (d) 2N
TNPSC AE 2017

Ans. (b) : We know that,

$$N = \frac{1}{2\pi}\sqrt{\frac{s}{m}}$$

$$N \propto \sqrt{s}$$

When two similar spring is added in series then

$$s_{equivalent} = \frac{s}{2}$$

then,

$$\frac{N_2}{N_1} = \frac{\sqrt{s/2}}{\sqrt{s}} \qquad (N_1 = N)$$

$$\boxed{N_2 = \frac{N}{\sqrt{2}}}$$

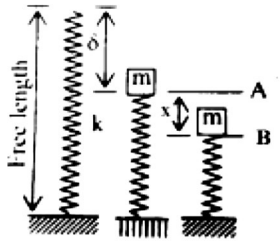
1534. The spring rate or stiffness (k) of the spring is given by:
(Where w load and δ deflection of spring)
(a) k = 2wδ (b) k = δ/w
(c) k = wδ (d) k = w/δ
CIL (MT) 2017 IInd Shift

Ans. (d) : Spring force w = kδ
So stiffness (k) = w/δ

1535. The device that permits variation in the distance between the spring eyes of leaf spring as the spring flexes is called :
(a) Spring shackle (b) Spring U bolt
(c) Spring hanger (d) Spring leaf
Kerala PSC Poly. Lect. (Auto) 05.05.2016

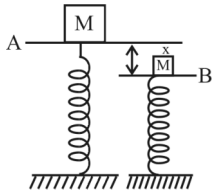
Ans. (a) The device that permits variation in the distance between the spring eyes of leaf spring as the spring flexes is called spring shackle.

1536. In the figure shown, the spring deflects by δ to position A (the equilibrium position) when a mass m is at a position B at some instant. The change in potential energy of the spring mass system from position A to position B is



(a) $\frac{1}{2}kx^2$ (b) $\frac{1}{2}kx^2 - mgx$
(c) $\frac{1}{2}k(x+\delta)^2$ (d) $\frac{1}{2}kx^2 + mgx$
RPSC ADE 2016

Ans. (b) :



$\frac{1}{2}kx^2 - mgx$

1537. The reason why a laminated spring is made up of a series of leaves is to:
(a) reduce the inter leaf friction
(b) soften the spring action and increase the maximum deflection
(c) allow the leave to slide during the bump movement
(d) overcome the weakness at the centre of a single leaf spring
RPSC VPITI 14.02.2016

Ans. (d) : As the laminated spring deflects the plates or leaves slide over each other causing inter-plate friction.
To overcome the weakness at the centre of a single leaf spring.

Search on Telegram @apna_pdf

1538. Shear stress in a closed coil helical spring (coil diameter 'D') of wire (diameter 'd') subjected to an axial load 'W' is

(a) $WD/\pi d^3$ (b) $(H_2 - H_1)/(H_3 - H_1)$

(c) $(H_3 + H_1)/(H_3 + H_2)$ (d) $(H_1 + H_2)/(H_1 + H_3)$

RPSC VPITI 14.02.2016

Ans. (*) : Note- No answer given by commission.

1539. The bending stress in full length leaves of a laminated spring is

(a) same as in graduated leaves

(b) 50% more than that in graduated leaves

(c) 50% less than that in graduated leaves

(d) 25% more than that in graduated leaves

RPSC AE (GWD) 06.05.2016

Ans. (b) : The bending stress in full length leaves of a laminated spring is 50% more than in graduated leaves.

1540. Which of the following types of energy is possessed by a tightly wound spring?

(a) Kinetic energy

(b) Magnetic energy

(c) Strain energy

(d) Electro-magnetic energy

KPCL AE 2016

Ans. (c) : When a tightly wound spring then energy is possessed in form strain energy. But a compressed spring has the potential energy in it due its compressed state when the compressed spring is released the potential energy changes to kinetic energy.

1541. When an open coiled helical spring (one end is fixed) in the vertical position is subjected to an axial tensile load and a couple, the strain energy stored will be due to .....

(a) bending moment only

(b) torsional moment only

(c) both bending moment and torsional moment

(d) shear force only

HPPSC Asstt. Prof. 29.10.2016

Ans. (c) : In this case both bending moment and torsional moment will apply.

■ Twisting in spring-

$$(\tau_s)_{max} = \frac{16T}{\pi d^3}$$

■ Bending in spring-

$$(\sigma_b)_{max} = \frac{32M}{\pi d^3}$$

1542. The reading of a spring balance is from 0 to 200 N and is 10 cm long. A body suspended from the spring balance is observed to oscillate vertically at 2 Hz. The mass of the body is nearly

(a) 22.5 kg (b) 12.5 kg

(c) 37 kg (d) 45 kg

ISRO Scientist/Engineer 03.07.2016

Ans. (b) : F = 200 N

Deflection = 10 cm

$(\delta) = 0.1$ m

Stiffness $k = \frac{F}{\delta}$

$$= \frac{200}{0.1} = 2000 \text{ N/m}$$

$$f = \frac{1}{2\pi}\sqrt{\frac{k}{m}} = \frac{1}{2\pi}\sqrt{\frac{2000}{m}}$$

$$4\pi = \sqrt{\frac{2000}{m}}$$

$$\frac{2000}{m} = 16\pi^2$$

$$m = \frac{2000}{16\pi^2}$$

$m = 12.66$ kg

$m \approx 12.5$ kg

1543. For a helical spring of mean diameter D. wire diameter d. number of coils n. modules of transverse elasticity C, when subjected to an axial load W the deflection would be

(a) $\frac{W_n D^3}{Cd^4}$ (b) $\frac{2Wnd^3}{CD^4}$

(c) $\frac{8Wn}{CD^4 d^3}$ (d) $\frac{8WnD^3}{Cd^4}$

Nagaland CTSE 2016-17 Ist Paper

Ans. (d) : In helical spring, when it is subjected to an axial load (W) the deflection (δ) would be,

$$\delta = \frac{8WD^3 n}{Cd^4}$$

Where,

D = mean diameter of spring

d = wire diameter

C = modules of transverse elasticity

W = axial load

n = no. of turn or coils

1544. A spring of stiffness 50 N/mm is mounted on top of second spring of stiffness 100 N/mm, what will be the deflection under the action of 500 N?

(a) 15 mm (b) 3.33 mm

(c) 5 mm (d) 10 mm

UPRVUNL AE 07.10.2016

Ans. (a) : Spring arrangement in series then,

$$\frac{1}{k_{eq}} = \frac{1}{100} + \frac{1}{50} = \frac{3}{100}$$

$$k_{eq} = \frac{100}{3} \text{ N/mm}$$

Then deflection (δ)

$$\delta = \frac{W}{k_{eq}} = \frac{500}{100} \times 3$$

$\delta = 15$ mm

Search on Telegram @apna_pdf

1545. When a closely coiled helical spring of mean diameter {D} is subjected to an axial load (W), the stiffness of the spring is given by

(a) Cd^4/D^3n (b) $Cd^4/2D^3n$
(c) $Cd^4/4D^3n$ (d) $Cd^4/8D^3n$

APPSC AEE MAINS 2016, PAPER-III

Ans. (d) : We know that deflection due to axial load (W) in a closely coiled helical spring is given as,

$$\delta = \frac{64WR^3n}{Cd^4}$$

$$\delta = \frac{8WD^3n}{Cd^4}$$

We know that, spring stiffness of spring.

$$K = \frac{W}{\delta}$$

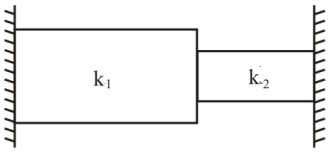
$$\boxed{K = \frac{Cd^4}{8D^3n}}$$

1546. A composite shaft consisting of two stepped portions having spring constant k_1 and k_2 is held between two rigid supports at the ends. Its equivalent spring constant is

(a) $(k_1 + k_2)/2$ (b) $(k_1 + k_2)/k_1k_2$
(c) $k_1k_2/(k_1+k_2)$ (d) $(k_1 + k_2)$

APPSC AEE MAINS 2016, PAPER-III

Ans. (d) :



$$k_{equivalent} = k_1 + k_2$$

1547. A closed coiled helical spring is subjected to axial load (W) and absorbs 100 Nm energy at 4cm compression. The value of axial load will be:

(a) 12.5 kN (b) 5.0 kN
(c) 10.0 kN (d) 2.5 kN

UPRVUNL AE 07.10.2016

Ans. (b) : Energy absorbs in spring = 100 N-m

Average load on spring $= \frac{(W+0)}{2} = \frac{W}{2}$

Deflection in spring = 4 cm = 0.04 m

Then

$$\frac{W}{2} \times 0.04 = 100$$

$$W = \frac{200}{0.04} = 5000N$$

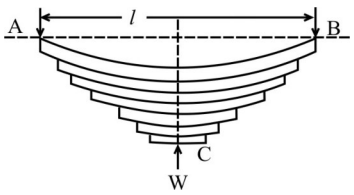
$\boxed{W = 5kN}$

1548. A laminated spring 1 m long carries a central point load of 2000 N. The spring is made of plates each 5 cm wide and 1 cm thick. The bending stress in the plates is limited to 100 N/mm^2. The number of plates required will be:

(a) 3 (b) 5
(c) 6 (d) 8

HPPSC W.S. Poly. 2016

Ans : (c)



Maximum bending stress (σ_{max}) $= \frac{3}{2}\frac{W\ell}{Nbt^2}$

l = spring length = 1m
W = central point load = 2000N
b = Width = 5 cm = 5×10^{-2}m
t = thickness = 1cm = 1×10^{-2}m
σ_{max} = maximum bending stress = 100N/mm^2

$$\sigma = \frac{3}{2}\frac{W\ell}{Nbt^2}$$

$$N = \frac{3}{2}\frac{W\ell}{\sigma bt^2}$$

$$N = \frac{3}{2} \times \frac{2000 \times 1}{100 \times 10^6 \times 5 \times 10^{-2} \times 1 \times 10^{-4}}$$

N = 6

1549. In a laminated spring the strips are provided in different lengths for

(a) Equal distribution of stress
(b) Equal distribution of strain energy
(c) Reduction in weight
(d) All are correct

MPPSC AE 2016

Ans : (a) In a laminated spring the strips are provided in distribution of bending stress.
Different length for equal distribution of bending stress therefore spring behave just like a uniform strength beam.

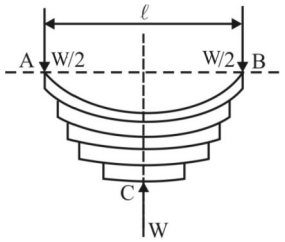
1550. In a leaf spring, the deflection at its centre is

(a) $\delta = Wl^3/8\,Enbt^3$ (b) $\delta = Wl^3/4\,Enbt^3$
(c) $\delta = 3Wl^3/8Enbt^3$ (d) $\delta = Wl^3/2Enbt^3$

TSPSC AEE 2015

(Where W = Max load on the pring
l - length of the spring
n = No. of plates
b - Width of the plates
t = thickness of the plates)

Ans : (c)



M = Maximum bending moment
I = Moment of Inerita.

Y = $\frac{t}{2}$ = half thickness of spring.

n = Number of leaf spring.

Search on Telegram @apna_pdf

Max bending moment = $\frac{W\ell}{4n}$

Maximum bending stress = $\frac{3}{2}\frac{W\ell}{nbt^2}$

maximum deflection = $\frac{3}{8}\frac{w\ell^3}{nEbt^3}$

1551. Type of spring used in door hinges is :

(a) Spiral spring
(b) Multi leaf spring
(c) Helical torsion spring
(d) Helical extension spring

GWSSB AAE, 27.12.2015

Ans. (c) : Helical torsion spring are particularly useful as door hinges from residential doors, garage doors, and automobile doors to large, industrial heavy duty overhead door used at loading docks and ware house.

1552. In a close-coiled helical spring subjected to an axial load and other quantities remaining the same, if the wire diameter is doubled, then the stiffness of the spring when compared to the original one will become

(a) two times (b) four times
(c) eight times (d) sixteen times

MPPSC AE 08.11.2015

Ans. (d) : Let, d = diameter of spring wire.
P = Axial load and K = stiffness of spring.
For the close - coiled helical spring, if all the quantities remaining same except diameter of spring wire.
$\therefore$ Stiffness of spring (K) $\propto d^4$.

$$\Rightarrow \frac{K_1}{K_2} = \left(\frac{d_1}{d_2}\right)^4 \qquad \because\ d_2 = 2d_1$$

$$\Rightarrow \frac{K_1}{K_2} = \left(\frac{d_1}{2d_1}\right)^4 = \left(\frac{1}{2}\right)^4 = \frac{1}{16}$$

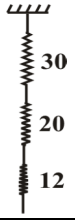
$\Rightarrow K_2 = 16\ K_1$
i.e., Sixteen times.

1553. When three springs are in series having stiffness 30 N/m, 20 N/m and 12 N/m, the equivalent stiffness will be

(a) 14 (b) 8
(c) 12 (d) 6
(e) 10

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Let stiffness of the composite spring be k_e
Given
$k_1 = 30$ N/m
$k_2 = 20$ N/m
$k_3 = 12$ N/m



Equivalent stiffness

$$\frac{1}{k_e} = \frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3}$$

$$\frac{1}{k_e} = \frac{1}{30} + \frac{1}{20} + \frac{1}{12}$$

$$\frac{1}{k_e} = \frac{2+3+5}{60}$$

$k_e = 6$ N/m

1554. A helical spring is made from a wire of 6 mm diameter and has outside diameter of 75 mm. If the permissible shear stress is 350 N/mm^2 and modulus of rigidity is 84 kN/mm^2, the axial load which the spring can carry without considering the effect of curvature.

(a) 422.5 N (b) 382.5 N
(c) 392.5 N (d) 412.5 N
(e) 402.5 N

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : Given,
$d = 6$ mm, $D_0 = 75$ mm, $\tau = 350$ MPa, $G = 84$ kN/mm^2
We know that
$D = D_0 - d = 75 - 6 = 69$ mm

$\therefore$ spring index, $C = \frac{D}{d} = \frac{69}{6} = 11.5$

Neglecting the effect of curvature–
We know that shear stress factor

$K_s = 1 + \frac{1}{2C} = 1 + \frac{1}{2\times 11.5} = 1.043$ and maximum shear stress induced in the wire (τ)

$$350 = K_s \times \frac{8WD}{\pi d^3} = 1.043 \times \frac{8W \times 69}{\pi \times 6^3}$$

$$W = \frac{350}{0.848} = 412.7\ \text{N}$$

1555. Which is not a type of ends for helical compression spring

(a) Plain ends
(b) square ends
(c) half hook ends
(d) plain and ground ends
(e) square and ground ends

CGPSC AE 26.04.2015 Shift-I

Ans. (c) : half hook ends

1556. Spring stiffness is :

(a) Load per unit deflection
(b) Load carrying capacity of the spring
(c) Ratio of mean coil diameter to wire diameter
(d) None

Kerala PSC Poly. Lect. 09.01.2014

Ans. (a) : Spring stiffness –

$$k = \frac{W}{\delta}$$

Where, $k \rightarrow$ Spring stiffness
$W \rightarrow$ Load
$\delta \rightarrow$ Deflection

Search on Telegram @apna_pdf

1557. A helical spring, having N number of coils, has spring-constant 2000 N/m. If there is another helical spring of the same material and same wire diameter and having N/2 number of coils, its spring constant will be

(a) 4000 N/m (b) 2000 N/m
(c) 1000 N/m (d) 500 N/m

Haryana PSC Civil Services Pre, 2014

Ans. (a) Given,
Number of Coils = N
Spring constant (k) = 2000 N/m
If no. of coils = N/2
then k = ?

$$k = \frac{Gd^4}{8D^3N}$$

$$\boxed{k \propto \frac{1}{N}}$$

$$\Rightarrow \quad 2000 \times N = \frac{k \times N}{2}$$

$$\boxed{k = 4000\,N/m}$$

1558. The work done in stretching a spring of spring constant k by a length Δ is

(a) $k\Delta$ (b) $k\Delta^2$
(c) $k\Delta/2$ (d) $k\Delta^2/2$

MPPSC State Forest Service Exam, 2014

Ans. (d) : The work done in stretching a spring is equal to the potential energy of stretched spring.
As we know,

P.E. in a stretched spring $U = \frac{1}{2}k\Delta^2$

Where, k = Stiffness, Δ = Deflection/elongation

1559. A body weighing 500 kg falls 8 cm and strikes a 500 kg/cm spring. The deformation of the spring will be _____cm.

(a) 8 (b) 2
(c) 20 (d) 4

MPSC Poly. Lect. 2014

Ans. (d) : m = 500 kg
h = 8 cm
k = 500 kg/cm
kinetic energy of body = Energy stored in spring.

$$\frac{1}{2}mv^2 = \frac{1}{2}kx^2 \qquad [k = 500\ kg/cm = 500 \times 9.81\frac{N}{cm}]$$

$$mv^2 = kx^2$$

$$500 \times (\sqrt{2 \times 9.81 \times 8})^2 = 500 \times x^2 \times 9.81$$

$$\boxed{x = 4\,cm}$$

1560. The Levy-von Mises equation is relation between the ratios of:

(a) The components of strain and stress increments
(b) The components of strain increment and deviatoric stress and shear stresses
(c) Plastic strain increments and deviatoric stress and shear stresses
(d) The stress increments and plastic strain increments

HPPSC Asstt. Prof. 2014

Ans. (b) : Levy-von Mises flow equation

$$\varepsilon_x = \frac{\sigma_x}{E} - V\left(\frac{\sigma_y}{E} + \frac{\sigma_z}{E}\right)$$

So, Levy von Mises equation is the relation between the ratios of the component of strain increment and deviatoric stress and shear stresses.

1561. A helical spring of wire diameter 6 mm and spring index 6 is acted by an initial load of 750 N. After compressing it further by 12 mm the stress in the wire is 500 MPa. Find the number of active coils. (given : G = 84000 MPa)

(a) 10 (b) 18
(c) 24 (d) 30

UPRVUNL AE 2014

Ans : (b) Given, C = 6, d = 6 mm, τ_{max} = 500 MPa
G = 84000 MPa
Initial load = 750 N
Compression, δ = 12 mm

$$D = C \times d = 36$$

$$k_w = \frac{4 \times 6 - 1}{4 \times 6 - 4} + \frac{0.615}{6} = 1.2525$$

$$\because \quad \tau_{max} = \frac{k_w \times 8 \times F \times D}{\pi d^3}$$

$$500 = \frac{1.2525 \times 8 \times F \times 36}{\pi \times 6^3}$$

$$F = 940.6\ N$$

$$k = \frac{F}{\delta} = \frac{940.6 - 750}{12}$$

$$k = 15.83$$

No. of active coil –

$$N = \frac{Gd^4}{8D^3k}$$

$$= \frac{84000 \times 6^4}{15.83 \times 8 \times (36)^3}$$

$$N = 18.42$$

$$\boxed{N \simeq 18}$$

1562. Load p_c and p_0 respectively acting axially upon close coiled and open coiled helical springs of same wire dia, coil dia, no of coils and material to cause same deflection

(a) p_c/p_0 is 1, < 1 or > 1 depending upon α
(b) $p_c/p_0 = 1$
(c) $p_c/p_0 > 1$
(d) $p_c/p_0 < 1$

(HPPSC AE 2014)

Ans : (d) Load P_c and P_o respectively acting axially upon close coiled and open coiled helical spring of same wire dia, coil dia, no of coils and material to case same deflection

$$P_c/P_o < 1$$

1563. The load required to produce and deflection in a spring is called

(a) stiffness constant (b) strain constant
(c) rigidity constant (d) torsional constant

Mizoram PSC AE/SDO 2014, Paper-II

Search on Telegram @apna_pdf

Ans. (a) : Stiffness : It is defined as the load required for unit deflection in spring.

$$k = \frac{W}{\delta}$$

$k \rightarrow$ Stiffness constant

$W \rightarrow$ Load

$\delta \rightarrow$ Deflection

1564. A closed coil helical spring having mean diameter of coil 'D' and wire diameter 'd' subjected to axial force 'P'. The strain energy stored in the spring is

(a) $\frac{8PC^3n}{Gd}$ (b) $\frac{8PD^3n}{Gd^4}$

(c) $\frac{4P^2D^3n}{Gd^4}$ (d) $\frac{8PD}{\pi d^2}$

GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : Strain energy $= \frac{1}{2}T.\theta$

$$= \frac{1}{2}T.\frac{TL}{GJ} = \frac{1}{2}\frac{T^2L}{GJ}$$

$$U = \frac{1}{2}\frac{\left(P\frac{D}{2}\right)^2 \times \pi Dn}{G.\frac{\pi}{32}.d^4}$$

$$\boxed{U = \frac{4P^2D^3n}{Gd^4}}$$

deflection of springs.

By castigliano's theorem

$$\delta = \frac{\partial U}{\partial P}$$

$$\boxed{\delta = \frac{8PD^3n}{Gd^4}}$$

1565. In a spring mass system if one spring of same stiffness is added in series, new frequency of vibration will be:-

(a) $\frac{\omega_n}{\sqrt{2}}$ (b) $\frac{2}{\omega_n}$

(c) $\frac{\omega_n}{2}$ (d) $\frac{\sqrt{2}}{\omega_n}$

UKPSC AE-2013, Paper-I

Ans. (a) : Case I -

$$\omega_n = \sqrt{\frac{K}{m}}$$

Case II - when spring is added in series.

$$K_{eq} = \frac{K}{2}$$

$$[\omega_n]_{II} = \sqrt{\frac{K}{2.m}}$$

$$[\omega_n]_{II} = \frac{\omega_n}{\sqrt{2}}$$

1566. Pick the correct statement about the maximum bending stress in the various leaf or laminated spring, assuming it has been designed ideally.

(a) It increases uniformly from the shortest leaf to the longest leaf.

(b) It is largest in the longest leaf.

(c) It is largest in the shortest leaf.

(d) It is same in all leafs.

RPSC AEN Pre-2013

Ans. (d) : Leaf springs (sometimes also known as laminated springs) are made up of beams of uniform strength and are normally used in automobiles to absorbs the shock and vibration produced by road bumps there by providing comfort to passengers.

1567. A closely coiled helical spring is cut into two equal parts. What will be the ratio of the deflection of any of the resulting spring to the deflection of the original spring for the same load?

(a) 2 (b) 1/2

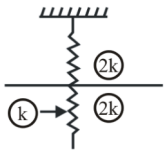
(c) 1 (d) 3/4

RPSC AEN Pre-2013

Ans. (b) : Deflection $(\delta) = \frac{8WD^3n}{Gd^4}$

If coil cut into two equal part –

Deflection $(\delta) = \frac{F}{k}$



$$\delta \propto \frac{1}{k}$$

$$\frac{\delta_1}{\delta} = \frac{\frac{F}{2k}}{F/k} \Rightarrow \boxed{\frac{\delta_1}{\delta} = \frac{1}{2}}$$

1568. A close-coiled helical spring absorbs 80 N mm of energy while extending by 4 mm. The stiffness of the spring is :

(a) 5 N/mm (b) 10 N/mm

(c) 16 N/mm (d) 20 N/mm

APPSC AE 04.12.2012

Ans. (b) : For a closed - Coiled helical spring -

Absorbe energy (U) $= \frac{1}{2}W.\delta$ … (i)

Given, δ = deflection of coil under the load W
= 4 mm

U = Absorbs energy
= 80 N-mm

$\therefore$ $W = \frac{2U}{\delta}$ [From eq. (i)]

$$W = \frac{2 \times 80N - mm}{4mm} = 40N$$

$\therefore$ Stiffness of spring (K) $= \frac{W}{\delta} = \frac{40N}{4mm} = 10N/mm$

Search on Telegram @apna_pdf

1569. Wahl suggested the correction in the stress factor to account for

(a) the additional transverse shear stress
(b) stress concentration
(c) fatigue stress
(d) none of these

TNPSC ACF 2012

Ans. (b) : Wahl suggested the correction in the stress factor to account for stress concentrations.

1570. A close coiled helical spring absorbs 500 Nmm of strain energy while extending by 10 mm. What is the stiffness of spring :

(a) 50 N/mm (b) 10 N/mm
(c) 5 N/mm (d) None of these

PSPCL AE, 2012

Ans. (b) : $U = \frac{1}{2}Kx^2$

$500 = \frac{1}{2} \times K \times 10^2$

K = 10 N/mm

1571. Match List – I with List – II and select the correct answer using the code given below the lists.

	List – I (Characteristic)		List – II (Member)
A.	Kernel of section	1.	Helical spring
B.	Tie and Strut	2.	Bending of beams
C.	Section modulus	3.	Eccentric loading of short column
D.	Stiffness	4.	Roof truss

Code :

	A	B	C	D
(a)	1	2	3	4
(b)	3	4	2	1
(c)	4	1	2	3
(d)	2	3	1	4

UKPSC AE 2012 Paper-I

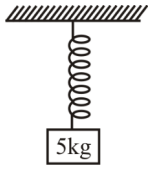
Ans. (b) :
Kernel of section - Eccentric loading of short column
Tie and Strut -Roof truss
Section modulus - Bending of beams
Stiffness - Helical spring

1572. A spring scale reads 20 N as it pulls a 5.0 kg mass across a table. what is the magnitude of the force exerted by the mass on the spring scale ?

(a) 4.0 N (b) 5.0 N
(c) 20.0 N (d) 49.0 N

UKPSC AE 2012 Paper-I

Ans. (c) :



- 5 kg mass is balance when 20 N applied then scale read 20 N.

1573. In a close-coiled helical spring

(a) plane of the coil and axis of the spring are closely attached
(b) angle of helix is large
(c) plane of the coil is normal to the axis of the spring
(d) deflection is small

BPSC AE 2012 Paper - VI

Ans : (c) : plane of the coil is normal to the axis of the spring.

1574. In a squared and ground helical spring, the effective number of turns is increased by

(a) one (b) two
(c) 15 (d) nil

TNPSC ACF 2012

Ans. (b) : In a squared and ground helical spring the effective number of turns is increased by-two.

1575. Stiffness of a spring can be increased by

(a) increasing the number of turns
(b) increasing the free length
(c) decreasing the number of turns
(d) decreasing the spring wire diameter

TNPSC ACF 2012

Ans. (c) : Stiffness of Spring $= \frac{W}{\delta} = \frac{Gd^4}{64R^3n}$

$\boxed{K \propto \frac{1}{n}}$

1576. Due to addition of extra full length leaves the deflection of a semi-elliptic spring

(a) increases (b) decreases
(c) does not change (d) is doubled

TNPSC ACF 2012

Ans. (b) : Addition of extra full length leaves the deflection of semi-elliptic spring decreases.

1577. A length of 10 mm diameter steel wire is coiled to a close coiled helical spring having 8 coils of 75 mm mean diameter and the spring has a stiffness K. If the same length of steel wire is coiled to 10 coils of 60 mm mean diameter, then the spring stiffness will be

(a) K (b) 1.95 K
(c) 1.56 K (d) 1.25 K

APPSC AEE 2012

Ans. (c) : wire diameter d = 10mm.
Mean diameter of first coil D_1 = 75mm
No. of Coils of first $N_1 = 8$
Mean diameter of second coil D_2 = 60 mm
No. of coils of second $N_2 = 10$

Then spring stiffness $k = \frac{Gd^4}{8D^3N}$

$$\frac{k_1}{k_2} = \frac{\frac{Gd^4}{8D_1^3N_1}}{\frac{Gd^4}{8D_2^3N_2}} = \frac{D_2^3N_2}{D_1^3 \times N_1} = \left(\frac{60}{75}\right)^3 \times \frac{10}{8}$$

$$\frac{k_1}{k_2} = 0.64 \Rightarrow \boxed{k_2 = 1.56k_1}$$

Search on Telegram @apna_pdf

1578. Cracks in helical springs used in railway carriages usually start on the inner side of the coil because of the fact that

(a) It has a lower curvature than the outer side
(b) It is subjected to higher stress than outer side
(c) It is subjected to higher cyclic loading than outer side
(d) It is more stretched than outer side during manufacturing

APPSC AEE 2012

Ans. (b) : Cracks in helical springs used in railway carriages usually start on the inner side of the coil because it is subjected to higher stress than outer side.

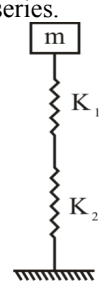
1579. If two springs with stiffness K_1 and K_2 are connected in series, then stiffness of the composite spring is given by

(a) $K_1 + K_2$ (b) $\frac{1}{K_1} + \frac{1}{K_2}$

(c) $\frac{1}{K_1} - \frac{1}{K_2}$ (d) $K_1 - K_2$

APPSC AEE 2012

Ans. (b) : If spring in series.



$$\frac{1}{K_{eq}} = \frac{1}{K_1} + \frac{1}{K_2}$$

or $$K_{eq} = \frac{K_1 . K_2}{K_1 + K_2}$$

$\Rightarrow$ If spring in parallel

$K_{eq} = K_1 + K_2$

1580. Two close-coil springs are made from a small diameter wire, one wound on 2.5 cm diameter core and the other on 1.25 cm diameter core. if each spring had 'n' coils, then the ratio of their spring constant would be

(a) 1/16 (b) 1/8
(c) 1/4 (d) 1/2

APPSC AEE 04.12.2012

Ans. (b) : $D_1 = 2.5$ cm, $D_2 = 1.25$ cm

No. of coils = n

$$\frac{K_1}{K_2} = ?$$

$$K = \frac{Gd^4}{8D^3 n}$$

$$K \propto \frac{1}{D^3}$$

$$\frac{K_1}{K_2} = \left(\frac{D_2}{D_1}\right)^3 = \left(\frac{1.25}{2.5}\right)^3 = \frac{1}{8}$$

1581. A mass is suspended at the bottom of two springs in series having stiffness 10 N/mm and 5N/mm. The equivalent spring stiffness of the two springs is nearly

(a) 0.3 N/mm (b) 3.3 N/mm
(c) 5 N/mm (d) 15 N/mm

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : Given,

k_1 = stiffness of spring 1st = 10 N/mm

k_2 = stiffness of spring 2nd = 5 N/mm

For series,

k_{eq} (equivalent stiffness) $\Rightarrow \frac{1}{k_{eq}} = \frac{1}{k_1} + \frac{1}{k_2}$

So, $k_{eq} = \frac{k_1 \times k_2}{k_1 + k_2} = \frac{10 \times 5}{15} = 3.3\,N/mm$

1582. A semi-spherical laminated leaf spring consisting of number of full length leaves say 'n_f' and number of graduated leaves say 'n_s' is subjected to a central load 'P'. The ratio of stress in full length leaves to the stress in graduated leaves will be:

(a) 1/1 (b) 2/1
(c) 3/2 (d) n_s/n_f

RPSC AE GWD, 2011

Ans. (d) : Maximum bending stress in full length leaves

$$(\sigma_b)_f = \frac{6F_f L}{n_f bt^2}$$

Maximum bending stress in Graduated leaves–

$$(\sigma_b)_s = \frac{6F_s L}{n_s bt^2}$$

Given, $F_f = F_s = F$

$\Rightarrow$ $$\boxed{\frac{(\sigma_b)_f}{(\sigma_b)_s} = \frac{n_s}{n_f}}$$

1583. Assertion (A) : In open-coiled helical springs, axial load causes normal stress and shearing stress in the spring wire.

Reason (R) : Helix angle is large in open-coiled helical springs.

Codes :

(a) Both A and R are individually true and R is the correct explanation of A
(b) Both A and R are individually true and R is not the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (b) : Pitch of helical springs is the axial distance between two similar points on the adjacent coils. Springs with helix angle larger than 10° is called open coil helical springs and helix angle less then 10° is called closed coil helical spring. Such spring have longer pitch.

Search on Telegram @apna_pdf

1584. The maximum shear stress induced in the wire of a circular section of a helical spring depends on

(a) material of the wire
(b) size of cross-section
(c) the ratio of d/D
(d) all of these

TNPSC AE, 2008

Ans. (b) : For closed coil helical spring under axial pull

$$\tau_{max} = \frac{8K_w FC}{\pi d^2}$$

where;
K_w = Wahl's factor
C = Spring index (D/d)
d = Spring wire diameter
F = Applied force
The maximum shear stress induced in the wire of a circular section of a helical spring depends on size of cross-section.

1585. Two spring of stiffness 'S_1' and 'S_2' are connected in parallel, what will be the stiffness of the composite spring?

(a) $S_2 + S_2$ (b) $S_2 \times S_2$
(c) $\frac{S_1}{S_1}$ (d) $\frac{(S_1\ S_2)}{(S_1 + S_2)}$

WBPSC AE 2008

Ans. (a) : For parallel –
equivalent stiffness (S_{eq}) = $S_1 + S_2$
For series –
equivalent stiffness $\frac{1}{S_{eq}} = \frac{1}{S_1} + \frac{1}{S_2}$

1586. Two concentric helical springs with spring constants 200 N/mm and 160 N/mm when subjected to a load of 1800 N will deflect by

(a) 5 mm (b) 10 mm
(c) 20.25 mm (d) 40.5 mm

DRDO Scientists 2008

Ans. (a) :

$$\frac{P_1}{P_2} = \frac{k_1}{k_2} = \frac{200}{160} = \frac{5}{4}$$

$$P_1 + P_2 = 1800$$

$$\left(1 + \frac{5}{4}\right) P_2 = 1800$$

$$P_2 = 800\ N$$

$$P_2 = k_2 x$$

$$800 = 160\ x$$

$$x = 5mm$$

1587. If *l* is the length of a leaf spring, t the thickness, of each leaf, then for the same stiffness, if *l* is doubled than t should be

(a) doubled (b) halved
(c) made four times (d) remain same

WBPSC AE, 2007

Ans. (a)

$$\delta_{spring}\ \alpha \frac{L^3}{t^3}$$

$$\Rightarrow K\ \alpha \frac{t^3}{L^3}$$

$$\text{or}\quad K = \frac{C \times t^3}{L^3}$$

where C = constant
for same stiffness

$$\frac{C \times t_1^3}{L_1^3} = \frac{C \times t_2^3}{L_2^3}$$

$$\frac{t_1^3}{L_1^3} = \frac{t_2^3}{(2L_1)^3}$$

$$t_1^3 = \frac{t_2^3}{8}$$

$$t_L^3 = 8t_1^3$$

$$\boxed{t_1 = 2t_1}$$

1588. In an open coiled helical spring an axial load on the spring produces which of the following stresses in the spring wire?

(a) normal (b) torsional shear
(c) direct shear (d) all of the above

UKPSC AE 2007 Paper -I

Ans. (d) : Under axial load spring will be under both bending and torsion. Thus is under complex stress therefore maximum principal stress and max. shear stress are found.

1589. When a helical coiled spring is compressed axially, it possesses

(a) potential energy (b) kinetic energy
(c) mechanical energy (d) none of the above

UKPSC AE 2007 Paper -I

Ans. (a) : Potential energy

1590. A closed coil helical spring of stiffness 'K' is cut to $\frac{2}{3}$ of its original length. The stiffness of this spring of reduced length is

(a) $\frac{3}{2}K$ (b) K
(c) $\frac{2}{3}K$ (d) $\frac{1}{3}K$

OPSC Civil Services Pre 2006

Ans. (a) : Stiffness (K) $= \frac{W}{\delta} = \frac{Gd^4}{64R^3 n}$ or $K \propto \frac{1}{n}$

where n = no of coils

the new stiffness of spring will be $\frac{3}{2}K$

Search on Telegram @apna_pdf

03.

THEORY OF MACHINES

1. Mechanisms and Machines

1. The relation between the no. of pairs (p) forming a kinematic chain and the no. of links (l) is

(a) $l = 2p - 2$ (b) $l = 2p - 3$
(c) $l = 2p - 4$ (d) $l = 2p - 5$

CGPSC AE 15.01.2021
Sikkim PSC (Under Secretary), 2017
Punjab PSC (Lect.) 06.08.2017
CGPSC ARTO & TSI 07.01.2017
Rajasthan Nagar Nigam AE 2016, Shift-II
GPSC Asstt. Prof. 28.08.2016
Assam PSC CCE Pre 2015
GPSC Lect. (Poly.) 07.12.2014
APPSC Poly. Lect. 2013
TNPSC ACF 2012
TNPSC AE, 2008
CSE Pre-2000

Ans. (c) : The relation between the number of pairs(p) forming a kinematic chain and the number of links(l) is

$$l = 2p - 4$$

2. If there are L number of links in a mechanism, then the number of possible inversions would be:

(a) L (b) L/2
(c) L + 1 (d) L + 2

Nagaland PSC (CTSE) 2018 Paper-I
WBPSC AE, 2017
RPSC AE 2016
HPPSC W.S. Poly. 2016
CGPSC Poly. Lect. 22.05.2016
RPSC ACF-2011
OPSC Civil Services Pre 2006
CSE Pre-1996

Ans. (a) : If number of link = L
$\therefore$ Number of possible inversion $\leq$ L

3. Oldham's coupling is used to connect two shafts which :

(a) have lateral misalignment
(b) have two axes intersecting
(c) have lateral movements during power transmission
(d) changes axes during power transmission

CGPSC AE 15.01.2021
CGPSC AE 16.10.2016
GPSC ARTO 01.05.2016
MPPSC AE 08.11.2015
Haryana PSC Civil Services Pre, 2014
Mizoram PSC AE/SDO 2014 Paper-II
RPSC ACF-2011

Ans. (a) : Oldham's couplings are three-piece flexible shaft coupling that are used to connect driving and driven shafts in mechanical power transmission assemblies. Flexible shaft couplings are used to counter the inevitable misalignment that occurs between connected shafts and in some cases, to absorb shock.

4. The driving and driven shafts connected by a Hook's joint will have equal speeds, if

(a) $\sin\alpha = \theta$ (b) $\tan\theta = \pm\sqrt{\cos\alpha}$
(c) $\tan\theta = \alpha$ (d) $\cot\alpha = \theta$

GPSC DEE, Class-2 (GWSSB) 04.07.2021
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021
Nagaland PSC (CTSE) 2018 Paper-I
GPSC Asstt. Director of Transport 05.03.2017
TSPSC Managers, 2015
ESE 2012

Ans. (b) : The driving and driven shafts connected by a Hooke's joint will have equal speed if.

$$\tan\theta = \pm\sqrt{\cos\alpha}$$

5. The mechanism used in a shaping machine is :

(a) a closed 4- bar chain having 4 revolute pairs
(b) a closed 6- bar chain having 6 revolute pairs
(c) a closed 4- bar chain having 2 revolute and 2 sliding pairs
(d) an inversion of the single slider-crank chain

OPSC AEE 2019 Paper-I
GPSC ARTO Pre 30.12.2018
HPPSC Asstt. Prof. 18.11.2016
UPRVUNL AE 21.08.2016
VIZAG Steel MT 10.06.2012
PSPCL AE, 2012
GATE 2003

Ans. (d) : The mechanism used in shaping machine is quick return motion mechanism having an inversion of single slider crank chain.
The depth of cut increment by moving the workpiece and the workpiece is fed by a pawl and ratchet mechanism.

Inversions of single slider crank chain

(i) Pendulum pump or bull engine.
(ii) Oscillating cylinder engine.
(iii) Rotary internal combustion engine
(iv) Crank and slotted lever quick return motion mechanism.
(v) Whitworth quick return motion mechanism.

6. The Grubler's criterion for obtaining the degree of freedom (F) of a planar mechanism with 'n' number of links and 'j' number of binary joints, is given by :

(a) $F = 3(n-1) - j$ (b) $F = 3(n-1) - 2j$
(c) $F = 2(n-1) - j$ (d) $F = 2(n-1) - 2j$

ISRO Scientist/Engineer 07.05.2017
HPPSC Asstt. Prof. 2014
TNPSC AE (Industries) 09.06.2013
TNPSC ACF 2012
OPSC Civil Services Pre. 2011
OPSC Civil Service Pre-2011
ESE 2003

Ans. (b) : The Grubler's criterion for obtaining the degree of freedom (F) of a planar mechanism with 'n' number of links and 'j' number of binary joints, is given by : $F = 3(n-1) - 2j$

Search on Telegram @apna_pdf

7. Which the following is an inversion of single slider crank chain?
(a) Beam engine
(b) Watt's indicator mechanism
(c) Elliptical trammel
(d) Whitworth quick return motion mechanism

SJVN ET 2019
MPPSC State Forest Service Exam, 2014
TNPSC ACF 2012
TRB Poly. Lect., 2012
ESE 2008
OPSC Civil Services Pre 2006

Ans. (d) : Inversions of single slider crank chain
First Inversion – cylinder is fixed
Example–
(1) Reciprocating engine
Second inversion – crank is fixed
Example–
(1) Whitworth quick return mechanism.
(2) Rotary engine.
Third inversion – connecting rod is fixed
Example–
(1) Oscillating cylinder engine.
(2) Crank and slotted lever mechanism.
Fourth inversion – Slider is fixed
Example– Hand pump

8. A planar mechanism has 8 links and 10 rotary joints. The number of degrees of freedom of the mechanism, using Grubler's criterion, is :
(a) 0 (b) 1
(c) 2 (d) 3

OPSC AEE 2019 Paper-I
GPSC ARTO Pre 30.12.2018
CGPSC AE 26.04.2015 Shift-I
Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2008

Ans : (b) : Degree of freedom (DOF) of a planer mechanism by Grubler's criterion,

$DOF = 3(\ell - 1) - 2j - h$

Where,
$\ell = 8$ (Number of links)
$j = 10$ (Number of binary joints)
$h = 0$ (Number of higher pairs)

$DoF = 3(8-1) - 2 \times 10 - 0$

$DOF = 1$

9. Which of the following is/are lower pair(s)?
(a) Ball and socket (b) Piston and cylinder
(c) Cam and follower (d) Both (A) and (B)

Assam PSC AE (PHED), 18.10.2020
Gujarat PSC AE 2019
WBPSC AE, 2017
UPPSC AE 12.04.2016 Paper-I
ISRO Scientist/Engineer 2008

Ans. (d) : Lower pair- A pair of links having surface or area contact between the member.
Example- Nut turning on a screw, shaft rotating in bearing, all pairs of slider crank mechanism, piston and cylinder, ball and socket etc.
Higher pair- When a pair has point or line contact between the links it is known as higher pair.
Example- Wheel rolling on a surface, cam and follower pair.

10. A ball and socket joint is example of _____ pair.
(a) Screw (b) Spherical
(c) Turning (d) Rolling

GPSC DEE, Class-2 (GWSSB) 04.07.2021
SJVN ET 2019
CIL MT 26.03.2017
HPPSC W.S. Poly. 2016
TNPSC AE (Industries) 09.06.2013

Ans. (b) : When the two elements of a pair are connected in such a way that one element (with spherical shape) turns or swivels about the other fixed element, the pair formed is called a spherical pair. The ball and socket joint, attachment of a car mirror, pen stand etc., are the examples of a spherical pair.

11. Mechanism is said to be converted to structure if the degree of freedom of mechanism reduced to :
(a) 3 (b) 1
(c) 0 (d) 2

Assam PSC AE (IWT) 14.03.2021
GPSC DEE, Class-2 (GWSSB) 04.07.2021
APPSC AEE SCREENING 17.02.2019
CIL MT 26.03.2017
Nagaland PSC CTSE 2017, Paper-I
GMB AAE 25.06.2017

Ans. (c) : When the degree of freedom of a kinematic chain is zero then it is called structure. A structure with negative degree of freedom is known as super structure.

12. If the elements of a kinematic pair make surface contact when in motion, then it is called a:
(a) Lower pair (b) Closed pair
(c) Higher pair (d) Surface pair

JPSC AE 10.04.2021, Paper-II
Rajasthan AE (Nagar Nigam) 2016 Shift-3
Haryana PSC Civil Services Pre, 2014
RPSC AEN Pre-2013

Ans. (a) : Lower pair- If the element of a kinematic pair make surface contact or area contact.
Example–Nut and screw, shaft rotating in bearing Universal joint etc.
Higher Pair–If the element of a kinematic pair make point contact or line contact.
Example–Cam and follower.

13. Inversion of a mechanism means
(a) turning it upside down
(b) fixing different links in a kinematic chain
(c) changing a higher pair to lower pair
(d) changing the input and output links

GPSC Executive Engineer 23.12.2018
Assam PSC CCE Pre 2015
MPPSC State Forest Service Exam, 2014
APPSC IOF, 2009
ESE 1992

Ans. (b) : Inversion of a mechanism means fixing different links in a kinematic chain to obtain various mechanisms.

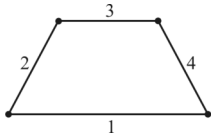
14. In a four-bar chain or quadratic cycle chain
(a) each of the four pairs is a turning pair
(b) one is a turning pair and three are sliding pairs

Search on Telegram @apna_pdf

(c) two are turning pairs and two are sliding pairs
(d) three are turning pairs and one is a sliding pair

GPSC DEE, Class-2 (GWSSB) 04.07.2021
UPRVUNL AE 05.07.2021
Maharashtra PSC AE Pre 2019
JPSC AE 2013, Paper-V

Ans : (a) : A four bar chain have all the links binary and all connection a turning pair or revolute pair as shown in figure below.



Link 1, 2, 3 and 4 are connected by turning pair.

15. In a 4– bar linkage, if the lengths of shortest, longest and the other two links are denoted by s, l, p and q, then it would result in Grasshof's linkage provided that:

(a) $\ell + p < s + q$ (b) $\ell + s < p + q$
(c) $\ell + p = s + q$ (d) None of these

GPSC DEE Class-2 (GWSSB) 04.07.2021
OPSC AEE 2019 Paper-I
Nagaland PSC CTSE 2017, Paper-I
GATE 2006

Ans. (b) : According to, Grasshof's law, for continuous relative motion in four bar mechanism, it require to satisfy the equation.

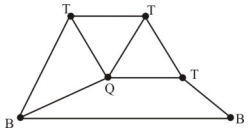
$$\ell + s < p + q$$

16. In kinematic chain, a quarternary joint is equivalent to

(a) one binary joint (b) two binary joints
(c) three binary joints (d) six binary joints

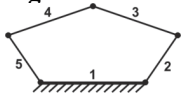
TSPSC Manager (Engg.) HMWSSB 12.11.2020
CGPSC AE 25.02.2018
UPRVUNL AE 07.10.2016
SJVN ET 2013
TNPSC ACF 2012
ESE 2005

Ans. (c) : Four links are connected at the same joint by a pin.



Q is Quaternary joint
A quaternary joint is equivalent to three binary joints.
A ternary joint is equivalent to two binary joints.

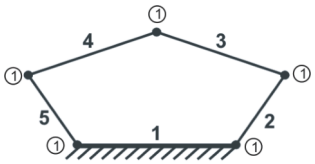
17. The number of degree of freedom of a five link place mechanism with five revolute pairs as shown in the figure is



(a) 3 (b) 4
(c) 1 (d) 2

MECON MT 2019
GPSC ARTO Pre 30.12.2018
ISRO Scientist/Engineer 2011
GATE 1993

Ans. (d) :



No. of link l = 5
No. of joint j = 5
No. of higher pair = h = 0

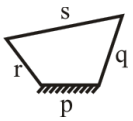
$$F = 3(l-1) - 2J - h$$
$$= 3(5-1) - 2\times5 - 0$$
$$= 3 \times 4 - 10$$
$$= 12 - 10 = \mathbf{2}$$

18. The lengths of the links of a 4 bar linkage with revolute pairs only are p, q, r and s units. Given that p<q<r<s. Which one of these links should be fixed, for obtaining a double crank mechanism?

(a) Link of length 'p' (b) Link of length 'q'
(c) Link of length 'r' (d) Link of length 's'

GPSC ARTO Pre 30.12.2018
Karnataka PSC Lect., 27.05.2017
RPSC ADE 2016
APGENCO AE 2012
GATE 2003

Ans (a) :



Shortest link is p and longest link is s, here q and r is intermediate link hence by fixing shortest link we will get double crank mechanism.

19. Which one of the following is a lower pair?

(a) cam and follower
(b) toothed gearing
(c) shaft in a bearing
(d) ball and race in bearing

RPSC AE (GWD) 06.05.2016
Kerala PSC AE 06.08.2015
Kerala PSC Poly. Lect. 09.01.2014
(KPSC AE 2015)

Ans. (c) : Kinematic Pairs According to the type of contact–
(a) Lower Pair- When the two elements of a pair have surface (area) contact while in motion the pair is called a lower pair All- sliding pair, turning pair and screw pair form lower pair.
e.g. – A nut turning on screws, a shaft rotating in a bearing, an universal joint pantograph etc.
(b) Higher Pair – When two elements have point or line contact while in motion.
e.g. – Belt rope and chain drives, gears, the cam and follower, ball and roller bearings etc.

20. Hooke's joint can be used for connecting two-

(a) Non-parallel and non-intersecting shafts
(b) Parallel and non-intersecting shafts
(c) Parallel and intersecting shafts

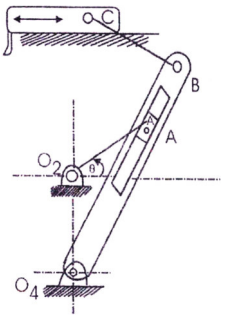
Search on Telegram @apna_pdf

(d) Non-parallel and intersecting shafts

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
HPPSC AE (PWD) 10.09.2016
ESE 2005

Ans. (d) : Hooke joint- Hooke joint is used to connect two non-parallel but intersecting shafts. It transmits power from the gear box of the engine to the rear axle. It has two U-shaped yokes and a centre block or cross-shaped piece. The angular velocity ratio is not uniform during the cycle of operation. The amount of fluctuation depends on the angle between the two shafts. For uniform transmission of motion, a pair of universal joint should be used.

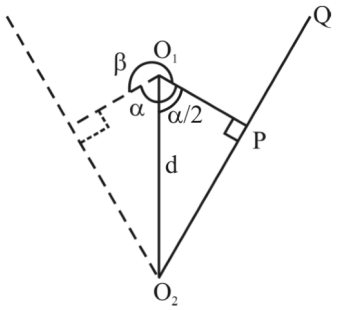
21. A simple quick return mechanism is shown in the figure. The forward to return ratio of quick return mechanism is 2 :1. If the radius of the crank O_2A is 125 mm, then the distance between the crank centre to lever centre point (O_2O_4) should be :



(a) 144.3 mm (b) 216.5 mm
(c) 240.0 mm (d) 250.0 mm

APGENCO AE, 2017
OPSC Civil Services Pre. 2011
GATE 2009

Ans. (d) :



$$\text{Quick return ratio} = \frac{\text{Time of cutting stroke}}{\text{Time of Return stroke}}$$

$$\frac{\beta}{\alpha} = \frac{2}{1}$$

$$\beta = 2\alpha$$

$$\therefore \alpha + \beta = 360^0$$

$$\alpha = 120^0$$

In triangle $\Delta O_1 O_2 P$

$$d = \frac{O_1P}{\cos\left(\frac{\alpha}{2}\right)} = \frac{125}{\cos 60^0} = 250 \text{ mm}$$

$\boxed{d = 250 \text{ mm}}$

22. A planar linkage having 8 links and 9 joints of single degree of freedom will have ..... degree of freedom.

(a) 1 (b) 2
(c) 3 (d) 4

RPSC AE 2018
AAI Jr. Executive 29.11.2018
GATE 2015

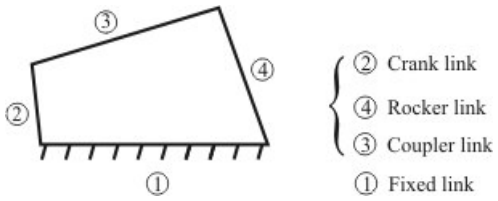
Ans. (c) : Data given:
No. of links (l) = 8
No. of joints (j) = 9
Then DOF = ?
DOF = 3(l -1) - 2j - h
DOF = 3 (8 - 1) - 2 × 9 - 0
= 3 × 7 - 18
$\boxed{\text{DOF} = 3}$

23. A mechanism is an assemblage of :

(a) three links
(b) four links or more than four links
(c) None of three mentioned here.
(d) two links

JPSC AE 10.04.2021, Paper-II
GWSSB DEE 07.07.2016
GWSSB AAE, 27.12.2015

Ans. (b) : A mechanism is an assemblage of four links or more than four links.



24. In a kinematic chain the minimum number of kinematic pairs required is

(a) one (b) two
(c) three (d) four

WBPSC AE, 2017
RPSC AE 2016
RPSC ACF-2011
GATE 2002

Ans. (c) : If there is all pairs are lower pair of a kinematic chain then 4 pair required to make a kinematic chain. But, if there is atleast one higher pair involved then minimum 3 pairs required to make a kinematic chain. Cam and follower is example of a 3 pair kinematic chain.

One higher pair = Two lower pair

25. A Universal joint is an example of

(a) lower pair (b) sliding pair
(c) rolling pair (d) higher pair

Rajasthan AE (Nagar Nigam) 2016 Shift-3
GWSSB DEE 07.07.2016
GWSSB AAE, 27.12.2015
UKPSC AE-2013, Paper-I

Ans. (a) : When the two element of a pair have surface contact when relatives motion take place and surface of one element slide over the surface of other the pair formed pair is known as lower pair.
Example – Turning pair, universal joint, shaft rotating in bearing automobile steering system

Search on Telegram @apna_pdf

26. The lead screw of a lathe with nut is a

(a) screw pair (b) sliding pair
(c) turning pair (d) rolling pair

Jharkhand Urja Vikas Nigam Ltd. AE 2017
NPCIL ET, 2015
TNPSC ACF 2012

Ans. (a) : When the nature of contact between the element of a pair is such that one element can turn about the other by screw threads, the pair is known as a screw pair. The lead screw of lathe with nut is an example of screw pair.

27. Which of the following is the inversion of double slider crank chain?

(a) Beam Engine
(b) Elliptical Trammel
(c) Watt's indicator mechanism
(d) Quick return mechanism

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
GPSC DEE, Class-2 (GWSSB) 04.07.2021
APPSC AEE 2012

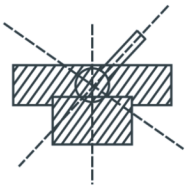
Ans. (b) : The inversion of a double slider crank chain are oldham's coupling, elliptical trammel & scotch yoke mechanism etc.

28. A spherical joint has _____ degree (s) of freedom.

(a) One (b) Two
(c) Three (d) Four

ISRO Scientist/Engineer 07.05.2017
APPSC AEE 2012
UKPSC AE 2007 Paper -I

Ans. (c) :



Linear moment x-axis or Δx not possible
Linear moment y-axis Δy, not possible
Linear moment z-axis Δz, not possible
Only three rotational motion is possible
DOF [Degree of freedom]
= 6 - Restraints
Restraints - No. of the motion which are not possible
DOF = 6 – 3 = 3

29. The following is not the inversion of slider crank mechanism

(a) Whit-worth quick return mechanism
(b) Scotch-yoke mechanism
(c) hand pump
(d) oscillating cylinder engine

GPSC Engineer, Class-II Pre-19.01.2020
GPSC ARTO 01.05.2016
Haryana PSC Civil Services Pre, 2014

Ans. (b) : Inversion single slider crank mechanism–
(i) Whit-worth quick return mechanism.
(ii) Oscillatory cylinder engine
(iii) Hand pump
Inversion of Double slider crank mechanism-
(i) Scotch yoke mechanism.
(ii) Elliptical trammel
(iii) Oldham's coupling

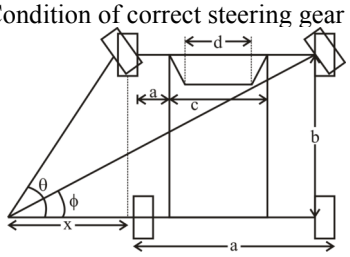
30. Condition for correct steering for a four-wheeler is

(a) $\cos\phi - \cos\theta = \frac{W}{H}$ (b) $\sin\phi - \sin\theta = \frac{W}{H}$
(c) $\tan\phi + \cot\theta = \frac{W}{H}$ (d) $\cot\phi - \cot\theta = \frac{W}{H}$
(e) none of these

Where W = Wheel base
H = Distance between the pivots of front axle, and
ϕ, θ are angles through which axis of outer and inner wheels turn, respectively.

RPSC IOF, 2020
CGPSC AE 16.10.2016
GPSC Lect. (Auto) 16.10.2016

Ans. (e) : Condition of correct steering gear –



$$\cot\phi = \frac{c+x}{b} = \frac{c}{b} + \frac{x}{b} = \frac{c}{b} + \cot\theta$$

So, $$\cot\phi - \cot\theta = \frac{c}{b} = \frac{H}{W}$$

$c \rightarrow$ Distance between the pivot centres = H
$b \rightarrow$ Wheel base of the vehicle = W

31. Automobile steering gear is an example of :

(a) Higher Pair (b) Lower Pair
(c) Sliding Pair (d) Turning Pair

Vizag Steel (MT) 2017
Assam PSC CCE Pre 2015
UPRVUNL AE 2014

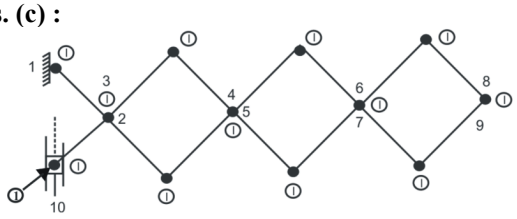
Ans. : (b) Automobile steering gear is an example of lower pair.
- Surface to surface contact is known as lower pair.
- Point to point contact is known as higher pair.

32. The kinematic planar chain shown in the given figure is a

(a) Structure
(b) Mechanism with 2 degree of freedom
(c) Mechanism with 1 degree of freedom
(d) Mechanism with more than 2 degree of freedom

OPSC Civil Services Pre. 2011
ISRO Scientist/Engineer 2009
ESE 2000

Ans. (c) :



Search on Telegram @apna_pdf

No. of Link = 10
No. of joint = 13
Degree of freedom
$F = 3(l-1) - 2j - h$
$= 3(10 - 1) - 2 \times 13$
$= 3 \times 9 - 26$
$= 27 - 26$
So $F = 1$

33. Scotch yoke mechanism is used to generate :
(a) Sine functions (b) Square roots
(c) Logarithms (d) Inversions

OPSC AEE 2019 Paper-I
UPRVUNL AE 21.08.2016
ESE 1992

Ans : (a) : Scotch yoke mechanism is an inversion of double slider crank mechanism. It is used to convert rotary motion into sliding motion. It generates (sin and cos) functions.

34. The number of inversions for a slider crank mechanism is :
(a) 6 (b) 5
(c) 4 (d) 3

GPSC ARTO Pre 30.12.2018
GPSC Lect. (Auto) 16.10.2016, GATE 2006

Ans. (c) : The number of inversions for a slider crank mechanism is 4.
(i) When crank is fixed – Rotary Engine, Whitworth quick return mechanism.
(ii) When connecting rod is fixed – Crank and slotted lever quick return mechanism, oscillating cylinder engine.
(iii) When slider is fixed – Pendulum pump or Bull engine.
(iv) When piston cylinder fixed – Reciprocating engine mechanism.

35. Which of the following statements is incorrect?
(a) Grashof's rule state that for a planar crank rocker four-bar mechanism, the sum of the shortest and longest link lengths cannot be less than the sum of the remaining two link lengths.
(b) Inversions of a mechanism are created by fixing different links one at a time
(c) Geneva mechanism is an intermittent motion device
(d) Gruebler's criterion assumes mobility of a planar mechanism to be one.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
GPSC ARTO Pre 30.12.2018, GATE 2010

Ans. (a) : (i) Grashof's rule states that the sum of shortest and longest link lengths less than or equal to sum of remaining two link lengths.
Grashof's law,
$S + l \le p + q$
(ii) Inversions of a mechanism are created by fixing different links one at a time.
(iii) Geneva mechanism is an intermittent motion device.
(iv) Gruebler's criterion assumes mobility of a planar mechanism to be one.

36. In slider crank mechanism, the maximum acceleration of slider is obtained when the crank is
(a) at the inner dead centre position
(b) at the outer dead centre position
(c) exactly midway position between the two dead centres
(d) slightly in advance of the midway position between the two dead centres.

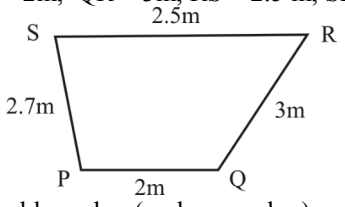
MPPSC AE 08.11.2015
ESE 2001

Ans. (a) : In slider crank mechanism, the maximum acceleration of slider is obtained when the crank is at the inner dead centre position.

37. A planar closed kinematic chain is formed with rigid links PQ = 2.0m, QR = 3.0m, RS = 2.5 m and SP = 2.7 m with all revolute joints. The links to be fixed to obtain a double rocker (rocker-rocker) mechanism is :
(a) PQ (b) QR
(c) RS (d) SP

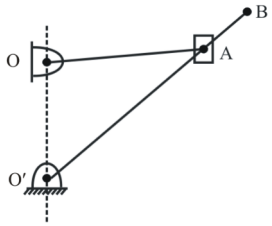
GPSC ARTO Pre 30.12.2018
GATE 2013

Ans. (c) : Given,
For a closed kinematic chain
PQ = 2m, QR = 3m, RS = 2.5 m, SP = 2.7m



To obtain double rocker (rocker - rocker) mechanism.
Opposite to shortest link should be fixed i.e. RS should be fixed.

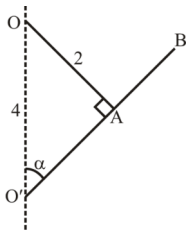
38. Figure shows a quick return mechanism. Crank OA rotates clockwise uniformly OA = 2 cm, OO' = 4 cm. The ratio of time for forward motion to that for return motion is



(a) 0.5 (b) 2.0
(c) $\sqrt{12}$ (d) 1

APGENCO AE 2012
GATE 1995

Ans. (b) : Given, $OO' = 4cm$
$OA = 2cm$



Search on Telegram @apna_pdf

$$\sin\alpha = \frac{2}{4}$$
$$\sin\alpha = 0.5$$
$$\boxed{\alpha = 30^\circ}$$

Ratio of time of forward motion to return motion

$$= \left(\frac{180+2\alpha}{180-2\alpha}\right) = \frac{180+60}{180-60}$$
$$= \frac{240}{120} = 2$$

39. Which one of the following is a higher pair ?

(a) Belt and Pulley (b) Turning Pair
(c) Screw Pair (d) Sliding Pair

Nagaland PSC (CTSE) 2018, Paper-I
OPSC Civil Services Pre. 2011

Ans. (a) :
■ Belt and pulley is higher pair.
■ One link is wrapped over another link.
■ A pair of two links having a rolling motion relative to each other is called rolling pair.

40. Ackerman steering gear consist of

(a) Lower pair (b) Turning pair
(c) Rolling pair (d) Cylindrical pair
(e) Sliding pair

CGPSC AE 26.04.2015 Shift-I
TNPSC AE, 2008

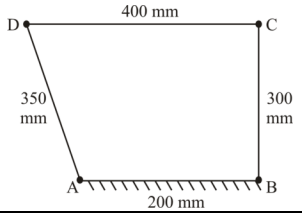
Ans. (b) : The Ackerman steering mechanism is a geometric arrangement of linkages in a steering of a vehicle to turn the inner and outer wheels at the appropriate angles. The Ackerman steering gear consists of turning pairs rather than sliding pair.

41. ABCD is a mechanism with link lengths AB = 200 mm; BC = 300 mm; CD = 400 mm and DA = 350 mm. Which one of the links should be fixed for the resulting mechanism to be a double crank mechanism?

(a) AB (b) BC
(c) CD (d) DA

TNPSC AE 2014
ESE 2004

Ans. (a) : AB = 200 mm, BC = 300 mm
CD = 400 mm, DA = 350 mm
If shortest link of the mechanism is fixed then the resulting mechanism become double crank mechanism so link AB is fixed because of AB is shortest link among them.



42. A link, which is free in space, has degree of freedom equal to

(a) 3 (b) 6
(c) 5 (d) 4

BPSC AE 2012 Paper - VI
UKPSC AE 2007 Paper -I

Ans : (b) : Degree of freedom of a pair is defined as the number of independent relative motions both translational and rotational, a pair can have Degree of freedom = 6

43. In a single slider four-bar linkage, when the slider is fixed, it forms a mechanism of :

(a) Hand pump
(b) Reciprocating engine
(c) Quick return
(d) Oscillating cylinder

OPSC AEE 2019 Paper-I
ESE 1999

Ans : (a) : The slider 4 is fixed and link-1 moves/slides through slider 4. The resulting mechanism is handpump.

44. Match the following :

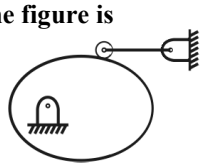
Column-I	Column-II
(P) Higher Kinematic pair	(i) Grubler's equation
(Q) Lower Kinematic pair	(ii) Line contact
(R) Quick return mechanism	(iii) Euler's equation
(S) Mobility of a linkage	(iv) Planer
	(v) Shaper
	(vi) Surfaces contact

(a) P–II, Q–VI, R–IV, S–III
(b) P–VI, Q–II, R–IV, S–I
(c) P–VI, Q–II, R–V, S–III
(d) P–II, Q–VI, R–V, S–I

OPSC AEE 2019 Paper-I
RPSC 2016

Ans : (d) :
■ Higher Kinematic Pair → Line contact
■ Lower Kinematic Pair → Surface contact
■ Quick return mechanism → Shaper
■ Mobility of a linkage → Grubler's equation

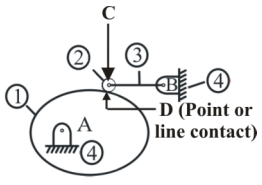
45. The degree of freedom of the mechanism shown in the figure is



(a) two (b) zero
(c) one (d) negative one

BPSC Poly. Lect. 2016
VIZAG MT 2015

Ans : (c)



link L = 4 (1, 2, 3, 4)
J = 3 (A, B, C)
h = 1 (D)
F_r = 1 (link 2 and link 3) (Redundant Motion)
DOF = 3 (L - 1) - 2J - h - F_r
DOF = 3 (4-1) - 2 × 3 - 1-1
$\boxed{\text{DOF} = 1}$

Search on Telegram @apna_pdf

46. The Scott Russell mechanism consist of
(a) Sliding pair only
(b) Sliding and rotary pair
(c) Turning and rotary pair
(d) Sliding and turning pair

Rajasthan Nagar Nigam AE 2016, Shift-II
RPSC AEN Pre-2013

Ans. (d) : Scott Russel mechanism has four link consists of turning pair and sliding pair.

47. The mechanism used in internal combustion engine is :
(a) crank mechanism
(b) slider mechanism
(c) slider crank mechanism
(d) circular mechanism

RPSC AE 2016
RPSC ACF-2011

Ans. (c) : Slider crank mechanism used in internal combustion engine. Internal combustion engine consists of a fixed cylinder, a reciprocating piston. The combustion gases pushes the piston which in turn rotates the crankshaft.

48. In an automobile the power is transmitted from gear box to differential through
(a) knuckle joint (b) universal joint
(c) Hooke's joint (d) bevel gears

RPSC AE 2016
RPSC ACF-2011

Ans : (b&c) In an automobile the power is transmitted from gear box to differential through universal joint.
Universal or hook's joint:- A hook's joint is used to connect two shaft which are intersecting at a small angle. The end of each shaft is forked to U-type and each fork provides to bearing for the arms of a cross. In case of automobiles, we use to hook's joint one at each end to the propeller shaft, connecting gear box on one and the differential on the other end.

49. Kinematic pairs are those which have
(a) two elements that do not permit relative motion
(b) two elements that permit relative motion
(c) elements of pair held together mechanically
(d) elements of pair not held together mechanically

RPSC VPITI 14.02.2016
TNPSC AE, 2008

Ans. (b) : Kinematic pairs are those which have two elements that permit relative motion.

50. The function of universal joint is to allow propeller shaft to :
(a) Change the length
(b) Change the inclination
(c) Transfer the torque at an angle
(d) None of these

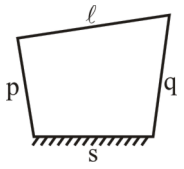
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021
GPSC Lect. (Auto) 16.10.2016

Ans. (c) : • A universal joint is a joint or coupling in a rigid rod that allows the rod to bend in any direction.
• The purpose of a universal joint is to transfer torque from one plane to another, retaining whatever rotational energy applied to the shaft.

51. The four bar mechanism in which the shortest link is fixed is termed as _____.
(a) double rocker mechanism
(b) compound mechanism
(c) Double crank mechanism
(d) crank rocker mechanism

VIZAG Steel MT 24.01.2021
Assam PSC AE (PHED), 18.10.2020

Ans. (c) :

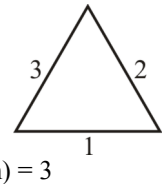


According Grashoff's Law–
$(s + \ell) \le (p + q)$
Short link (s)-fixed – Double crank mechanism

52. A framed structure of a triangular shape is _____.
(a) imperfect (b) redundant
(c) deficient (d) perfect

VIZAG Steel MT 24.01.2021 Shift-I
VIZAG MT, 14.12.2020

Ans. (d) :

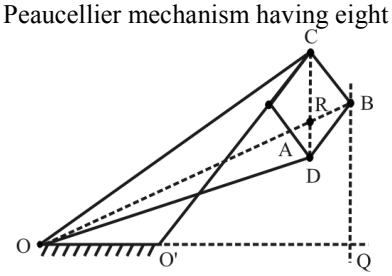


Member (m) = 3
Joint (j) = 3
For perfect frame,
$m = 2j - 3$
$3 = 2 \times 3 - 3$
$\boxed{3 = 3}$

53. Mechanism having eight links is :
(a) Porsch
(b) Backward quick return
(c) Peaucellier
(d) Short link show return

Kerala PSC AE (Irrigation) 05.04.2017
HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : Peaucellier mechanism having eight links.



Peaucellier mechanism was the first true planar straight line mechanism capable of transforming rotary motion into perfect straight line motion and vice-versa.
Peaucellier mechanism has eight link and all pair is turning pair.
• Hart's mechanism has six link and all turning pair.
• Scott-Russel mechanism has four link one sliding pair and three turning pair.

Search on Telegram @apna_pdf

• Watt's mechanism, modified Scott-Russel mechanism, Robert mechanism, grasshopper mechanism, Tchebicheff mechanism all mechanism has four link mechanism.

54. The pair is known as a higher pair, when the relative motion between the elements of a pair is

(a) turning only
(b) sliding only
(c) rolling only
(d) partly turning and partly sliding

Nagaland PSC (CTSE) 2018 Paper-I
Sikkim PSC (Under Secretary), 2017

Ans. (d) : Higher pair- When a pair has point or line contact between the links, it is known as higher pair the motion between two element is partly turning and partly sliding.
E.g.- Cam follower, tooth gearing, ball and Roller bearing.
Lower pair- A pair of links having surface or area contact between the member is known as lower pair.
Eg.- Shaft Rotating in bearing, all pairs of slider crank mechanism (sliding pair, turning pair).

55. There is a relation between number of joints and number of links, where L = number of links and J = number of joints which constitute a kinematic chain and this is given by the expression

(a) $L = \frac{3}{2}(J+2)$ (b) $L = \frac{2}{3}(J+2)$
(c) $L = \frac{3}{2}(J+1)$ (d) $L = \frac{2}{3}(J+3)$

Nagaland PSC (CTSE) 2018 Paper-I
Karnataka PSC AE, 10.09.2017

Ans. (b) : For kinematic chain–

$$J + \frac{h}{2} = \frac{3}{2}L - 2$$

$\therefore$ If no higher pair, h = 0

$$J + 0 = \frac{3}{2}L - 2$$

$$J = \frac{3}{2}L - 2$$

$$\frac{3}{2}L = (J+2)$$

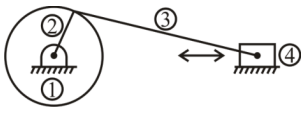
$$\boxed{L = \frac{2}{3}(J+2)}$$

56. In a single slider crank chain.

(a) each of the four pairs are a turning pair.
(b) one is turning pair and three are sliding pairs
(c) two are turning pairs and two are sliding pairs.
(d) three are turning pairs and one is a sliding pair.

Nagaland PSC (CTSE) 2018, Paper-I
MPSC Poly. Lect. 2014

Ans. (d) :



Single slider crank mechanism is 3R & 1P mechanism means.
3- Revolute or Turning pair.
1- Prismatic or sliding pair.
Double slider crank mechanism is 2R & 2P mechanism mean.
2- Revolute or Turning pair.
2 – Prismatic or sliding pair.

57. In a pantograph, all the pairs are

(a) Turning pairs (b) Sliding pairs
(c) Spherical pairs (d) Self closed pairs

GPSC DEE, Class-2 (GWSSB) 04.07.2021
GMB AAE 25.06.2017

Ans. (a) : In a pantograph, all the pairs are turning pairs.

58. Which of the following mechanism generates intermittent rotary motion from continuous rotary motion?

(a) Scotch yoke mechanism
(b) Geneva mechanism
(c) Elliptical mechanism
(d) Whitworth mechanism

ISRO Scientist/Engineer 12.01.2020
RPSC AE 2018
ESE 2008

Ans. (b) : Geneva mechanism—A Geneva mechanism is a commonly used mechanism for producing an intermittent rotary motion from a uniform input speed.
Scotch yoke mechanism—It is one of reciprocating motion mechanism, it should be convert an rotary motion into sliding of linear motion and vice-versa.
Elliptical trammel—The Elliptical trammel (also known as the trammel of Archimedes) is a simple mechanism which can trace an exact elliptical path.
Whitworth mechanism–The Whitworth quick return mechanism converts rotary motion into reciprocating motion, but unlike the crank and slider, the forward reciprocating motion is at a different rate than backward stroke.

59. Which of the following is an inversion of single slider - crank chain?

(a) Elliptical Trammel (b) Hand Pump
(c) Scotch Yoke (d) Oldham's Coupling

RPSC AE 2018
OPSC AEE 2015 Paper-I

Ans. (b) : Hand Pump is an inversion of single slider - crank chain whereas elliptical trammel, scotch yoke and oldham's coupling are inversion of double slider crank chain.

60. Any point on a link connecting double slider crank chain will trace a

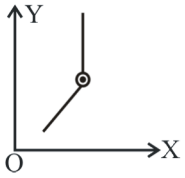
(a) Straight line (b) Circle
(c) Ellipse (d) Parabola

Gujarat PSC AE 2019
CGPSC AE 26.04.2015 Shift I
ESE 2000

Ans : (c) : At the centre the link will trace circle and it will trace ellipse on other points.

Search on Telegram @apna_pdf

61. The two-link system, shown in the given figure, is constrained to move with planar motion. It possesses:



(a) 2- degrees of freedom
(b) 3 - degrees of freedom
(c) 4 - degrees of freedom
(d) 6 - degrees of freedom

UJVNL AE 2016
ESE 2000

Ans : (c)
ℓ = No of links = 2
j = No of Joints = 1
DOF for open chain in 2D
DOF = 3l - 2j
DOF = 3 × 2 - 2 × 1 = 4

62. Which of the following is an open pair?
(a) ball and socket joint (b) journal bearing
(c) lead screw and nut (d) cam and follower

Sikkim PSC (Under Secretary), 2017
APPSC AEE 2012

Ans. (d) : Open pair- Open pair must be held either spring action or due to gravity force.
Eg.- cam and follower in I.C. engine,
Closed pair- Two links of pair held together mechanically.

63. When two elements have point or line contact motion, the pair so formed is known as
(a) higher pair (b) lower pair
(c) closed pair (d) screw pair

Mizoram PSC AE/SDO 2014, Paper-II
OPSC Civil Services Pre 2006

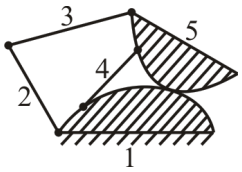
Ans. (a) : When the two elements of a pair have a line or point contact when relative motion take place between the two elements is partly turning and partly sliding, then the pair is known as higher pair. When two element have point or line contact motion, the pair is formed known as higher pair.

64. Two parallel shafts, the distance between whose axes is small and variable may be connected by:
(a) gear drive (b) universal joint
(c) knuckle joint (d) oldham's coupling

RPSC ACF-2011
CSE Pre-1998

Ans. (d) : Oldham's Coupling– It is used to connect two parallel shafts whose axes are at a small distance apart.

65. Number of degrees of freedom for the shown figure is:



(a) 0 (b) 1
(c) 2 (d) 4

AAI Jr. Executive 26.03.2021

Ans. (b) :
No. of links = 5
No. of joints = 5
No. of higher pair = 1
DOF = $3(\ell - 1) - 2j - h$
= 3(5 – 1) – 2 × 5 – 1
= 12 – 10 – 1
DOF = 1

66. The Davis steering gear fulfill the condition of correct gearing at
(a) two positions (b) three positions
(c) all positions (d) one position

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

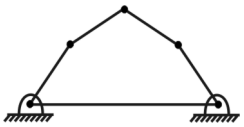
Ans. (c) : Davis steering are not commonly used, it can used in all positions due to front wheel arrangement on the other side, Ackermann steering fulfils the correct steering at only 3-positions.

67. The number of joints must be equal to _____ for a perfect frame with 5 members.
(a) 3 (b) 6
(c) 4 (d) 7

VIZAG Steel MT 24.01.2021

Ans. (c) : Member (m) = 5
For perfect frame,
m = 2j – 3
5 = 2j – 3
2j = 8
j = 4

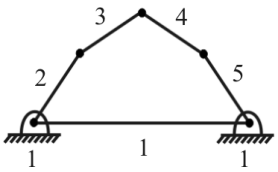
68. The degrees of freedom for the given planar mechanism will be :



(a) 1 (b) 2
(c) 3 (d) None of these

JPSC AE 10.04.2021, Paper-II

Ans. (b) :



L = 5
J = 5
Degree of Freedom
F = 3 (L – 1)– 2j – h
= 3 × (5 – 1) – 2 × 5
= 2

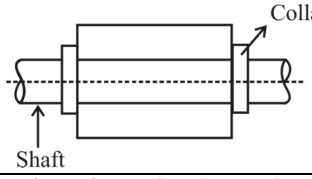
69. A combination of kinematic pairs, joined in such a way that the relative motion between the links is completely constrained, is called:
(a) mechanism (b) structure
(c) kinematic chain (d) inversion

UPRVUNL AE 05.07.2021

Search on Telegram @apna_pdf

Ans. (c) : Completely Constrained Motion–When the motion between two elements of a pair is in a definite direction irrespective of the force applied, it is known as completely constrained motion.

Example – Shaft with both end collar in a circular hole.



70. Which of the following is turning pair?

(a) Piston and cylinder of a reciprocating steam engine
(b) Shaft with collars at both ends fitted in a circular hole
(c) Lead screw of a lathe with nut
(d) Ball and socket joint

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : Shaft with collars at both ends fitted in a circular hole is a turning pair.

71. How may degrees of freedom a rigid body posses?

(a) 6 (b) 3
(c) 1 (d) 12

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (a) : Degree of freedom a rigid body = 6

$$= 3T + 3R \qquad \left[\because \begin{matrix} T = \text{Translational} \\ R = \text{Rotational} \end{matrix}\right]$$

72. In a four bar mechanism, the sum of the shortest and longest links should not be greater than that of the sum of the other two links. The above is called as _____.

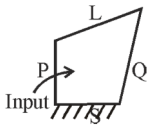
(a) Grubler Criterion (b) Hooke's Law
(c) Grashoff Law (d) Kutzbach Criterion

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) : Grashof's law states that four- bar mechanism, if the sum of the length of the largest and shortest links is less than or equal the sum of length of the other two links.

Grashof's law condition satisfied-

$$\boxed{S + L \le P + Q}$$



73. A mechanism converts into structure when the number of degrees of freedom is equal

(a) 0 (b) 1
(c) –1 (d) 2

UPRVUNL AE 05.07.2021

Ans. (a) : A mechanism converts into structure when the number of degrees of freedom is equal 0.

74. A linkage has 11 links and 4 loops. What is the degree of freedom if it has only single turning pairs?

(a) 0 (b) 1
(c) 2 (d) 3

ESE 18.07.2021

Ans. (c) : Given, No. of linkages (N) = 11
No. of loop (L) = 4
Degree of freedom (F) = N – (2 × L+1)
= 11 – (2× 4 +1) = 2

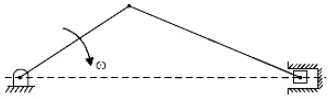
75. Which one of the following is the application of first inversion of single-slider-crank chain?

(a) Hand -pump
(b) Reciprocating engine
(c) Elliptical trammel
(d) Whitworth quick-return mechanism.

ESE 18.07.2021

Ans. (b) : First inversion of single slider crank chain

→ Reciprocating Engine
Cylinder is fixed



76. A quick-return mechanism is to be designed, where the outward stroke must consume 1.2s and the return stroke 0.8s. If the cycle time is 2.0 s/rev, what is the speed at which the mechanism should be driven?

(a) 10 rev/s (b) 30 rev/s
(c) 10 rev/min (d) 30 rev/min

ESE 18.07.2021

Ans. (d) :
Cycle time = 2 sec/rev.
So, basically, the mechanism will rotate one full relocation in 2 sec.

$$\therefore \text{speed} = \frac{60s}{2s} = 30\text{RPM}$$

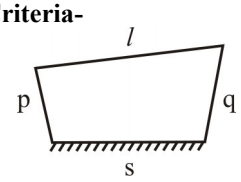
or, 30 rev/min.

77. The number of qualitatively distinct kinematic inversions possible for a Grashoff chain with four revolute pairs is_____

(a) 1 (b) 2
(c) 3 (d) 4

Assam Engg. College AP/Lect. 18.01.2021, GATE 2020

Ans. (c) : Kinematic inversions of Grashoff chain-
For Grashoff Criteria-



$s + l < p + q$
(1) Shortest link fixed- Doubled Crank
(2) Adjacent of shortest- Crank and Rocker
(3) Opposite the shortest- Double Rocker

78. In a slider-crank mechanism, there are

(a) three links (b) four links
(c) five links (d) None of the above

Assam PSC AE (IWT) 14.03.2021

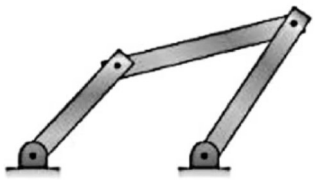
Ans. (b) : A slider-crank linkage is a four-link mechanism with three revolute joints and one prismatic or sliding joint. The rotation of the crank drives the linear movement the slider or the expansion of gases against a sliding piston in a cylinder can drive the rotation of the crank.

Search on Telegram @apna_pdf

79. Which of the following is a lower pair ?
(a) Tooth gears in mesh (b) Cam and follower
(c) Roller bearing (d) All of the above
CGPSC AE 15.01.2021

Ans. (*) : All of the above are higher pair.

80. The degree of freedom for the following mechanism is :



(a) 1 (b) 0
(c) 2 (d) Infinite
APPSC Poly Lect. 13.03.2020

Ans. (a) : Number of links (l) = 4
Number of joints (j) = 4
Higher pair (h) = 0
Degree of freedom (DOF) = 3 (l–1) – 2j – h
= 3 (4–1) – 2 × 4
DOF = 9 – 8 = 1

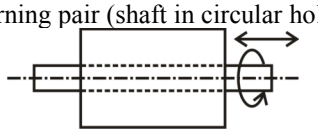
81. For a Whitworth quick return motion mechanism, $\alpha = 200^{o}$, Find the ratio of time of cutting stroke to the time of return stroke.
(a) 1.25 (b) 1.35
(c) 1.30 (d) 1.40
Assam PSC AE (PHED), 18.10.2020

Ans. (a) : Ratio of time of cutting stroke to time of return stroke for a whitworth quick return motion mechanism.

$$QRR = \frac{\alpha}{360-\alpha}$$
$$= \frac{200}{360-200}$$
$$\frac{t_C}{t_R} = 1.25$$

82. Motion of shaft in circular hole forms;
(a) Incompletely constrained motion
(b) Completely constrained motion
(c) Successfully constrained motion
(d) None of the above
GPSC Engineer, Class-II Pre-19.01.2020

Ans. (a) : Incompletely Constrained Motion–When the motion between two elements of a pair in more than one direction and depends upon the direction of force applied, it is known as incompletely constrained motion.
Example–Turning pair (shaft in circular hole).



83. Ackermann steering gear mechanism is inversion of :
(a) Slider crank chain
(b) four bar chain
(c) Double slider chain
(d) Crossed slider crank chain
GPSC Engineer, Class-II Pre-19.01.2020

Ans. (b) : Ackermann steering gear mechanism is inversion of four bar chain.

84. Shaft with tapper key is an example
(a) incompletely constrained motion
(b) completely constrained motion
(c) successfully constrained motion
(d) All of the above
GPSC Engineer, Class-II Pre-19.01.2020

Ans. (c) : Shaft with tapper key is an example successfully constrained motion.

85. Why is double Hooks' joint used?
(a) to obtain uniform velocity ratio
(b) to obtain variable velocity ratio
(c) Both (a) and (b)
(d) None of the above
GPSC Engineer, Class-II Pre-19.01.2020

Ans. (a) : Double Hook's joint is used to obtain uniform velocity ratio.

86. Reciprocating motion of the cutting tool in shaping machines is accomplished by
(a) rack pinion mechanism
(b) crank and connecting rod mechanism
(c) cam and cam follower mechanism
(d) oscillating lever mechanism
ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (b) : Shaping Machines–
Mechanism–Crank and slotted lever quick return motion mechanism (which is the inversion of single slider crank mechanism known as crank and connecting rod mechanism).
Note-In the shaper mechanism, tool feed is given by 'Ratched and pawl' mechanism.

87. In an IC engine, the reciprocatory motion is converted into a rotary motion by the combination of _____.
(a) rack and pinion
(b) cam and follower
(c) ratchet and pawl
(d) crankshaft and connecting rod
VIZAG MT, 14.12.2020

Ans. (d) : In an IC engine, the reciprocatory motion is converted into a rotary motion by the combination of crankshaft and connecting rod.

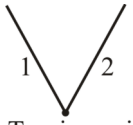
88. Which one of the following is not an inversion of a four bar chain?
(a) bull engine
(b) beam engine
(c) coupling rod of a locomotive
(d) watt's indicator mechanism
VIZAG MT, 14.12.2020

Ans. (a) : Bull engine is an inversion of single slider crank chain mechanism.
Beam engine, coupling rod of locomotive and watt's indicator is an example of inversion of a four bar chain.

89. A turning pair has
(a) Zero degree of freedom
(b) One degree of freedom
(c) Two degree of freedom
(d) Six degree of freedom
Haryana PSC AE (PHED) 05.09.2020, Paper-II

Search on Telegram @apna_pdf

Ans. (b) : When relative motion between two elements of a pair takes place in the form of pure turning only then the pair is called turning pair.
Turning pair has one degree of freedom.



Turning pair
I_{12}

90. The degree of freedom for a planar mechanism is obtained using
(a) Kutzbach criterion
(b) Grashoff's criterion
(c) Kennedy theorem
(d) Chebyshev theorem

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Kutzbach Criterion – Degree of freedom
Grashoff's criterion – Inversion of quadratic chain
Kennedy theorem – Velocity and acceleration of machine mechanism.
Chebyshev theorem – It estimates the proportion of the measurement that lie must within one , two and three standard deviation of the mean.

91. In the process of inversion in a kinematic chain,
(a) The absolute motion of links does not change
(b) The relative motion of the links does change
(c) The link dimensions change
(d) The relative motion between the links do not change

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (b) : In inversion, the relative motion of the links does changes.
If no. of link is ℓ
Then no. of inversion $\leq \ell$

92. When the nature of contact between the elements of a pair is such that it can only slide relative to the other, the pair is known as
(a) Screw pair (b) Spherical pair
(c) Turning pair (d) Sliding pair

RPSC IOF, 2020

Ans. (d) : When the two elements of a pair are connected in such a way that one can only slide relative to the other. The pair is known as a sliding pair.
Ex.- Piston and cylinder, cross-head and guides of reciprocating steam engine.
Ram and its guide in shaper tail stock on lathe bed.

93. Which of the mechanisms uses two identical mechanisms?
(a) Hart (b) Watt
(c) Peaucellier (d) Kempe

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : Kempe mechanisms uses two identical mechanisms.

94. In a four-bar linkage if 'S' is the length of the shortest link, 'L' is the length of longest link and 'P' & 'Q' are length of other links, then the criteria for getting a triple rocker mechanism in which no links will fully rotate is
(a) $S + Q > P + L$ (b) $S + L < P + Q$
(c) $S + L = P + Q$ (d) $S + L > P + Q$

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : All three links i.e. input, output and coupler will be rocker, when Grashoff's law will not be satisfied, i.e, we will not be getting continuous relative motion in 4-bar mechanism i.e, $S + L > P + Q$

95. When two elements of a pair have surface contact while in motion and the relative motion is purely turning or sliding, then the pair is called a _____pair.
(a) Higher (b) Lower
(c) Turning (d) Sliding

MECON MT 2019

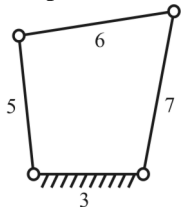
Ans. (b) : When two elements of a pair have surface contact while in motion and the relative motion is purely turning or sliding, then the pair is called a lower pair.

96. Which of the following is an inversion of four bar chain?
(a) Watts indicator mechanism
(b) Oscillating cylinder engine
(c) Whitworth quick return motion mechanism
(d) Scotch yoke mechanism

MECON MT 2019

Ans. (a) : Watts indicator mechanism

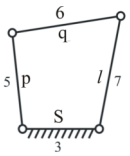
97. For the four link mechanism with the dimension of the links indicated in standard units of length, choose the type of mechanism from the given options.



(a) crank rocker (b) double crank
(c) double rocker (d) rocker

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (b) :



S + L	<	P + Q
3 + 7	<	5 + 6
10	<	11

(S + L < P + Q) means Grasshof mechanism and shortest link is fixed so it will be **Double Crank** mechanism.

Search on Telegram @apna_pdf

98. Match the approaches given below to perform stated kinematics/dynamics analysis of machine.

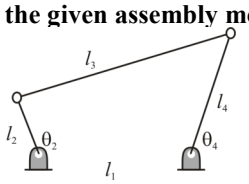
	Analysis		Approach
P.	Continuous relative rotation	1.	D' Alembert's principle
Q.	Velocity and acceleration	2.	Grubler's criterion
R.	Mobility	3.	Grashoff's law
S.	Dynamic-static analysis	4.	Kennedy's theorem

(a) P- 1, Q- 2, R- 3, S- 4;
(b) P- 3, Q- 4, R- 2, S- 1
(c) P- 2, Q- 3, R- 4, S-1;
(d) P- 4, Q- 2, R- 1, S- 3

HPPSC ADF 05.03.2019

Ans. (b) : Continuous relative rotation- Grasshoff's law
Velocity and acceleration – Kennedy's theorem
Mobility- Grubler's criterion
Dynamic-static-analysis- D' Alembert's principle

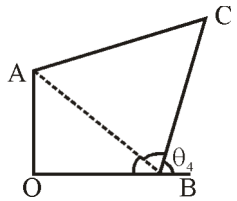
99. The figure shown below has the following details:
$l_1 = 3$ cm, $l_2 = 1.5$ cm, $l_3 = 3.5$ cm, $l_4 = 4$ cm, The value for θ_4 (in degrees) when the input link (l_2) becomes perpendicular to the fixed link for the given assembly mode will be:



(a) 45 (b) 97.44
(c) 65.34 (d) 79.44

BHEL ET 2019

Ans. (b) : When the link ℓ_2 becomes perpendicular to fixed link,



Given, OB = 3 cm, AC = 3.5 cm, BC = 4 cm, OA = 1.5 cm
In ΔAOB,

$$(AB)^2 = (OA)^2 + (OB)^2$$

$$(AB)^2 = (1.5)^2 + (3)^2$$

$$\boxed{AB = 3.354 \text{ cm}}$$

In ΔABC,

$$\cos C = \frac{(AC)^2 + (BC)^2 - (AB)^2}{2(AC)(BC)}$$

$$= \frac{(3.5)^2 + (4)^2 - (3.354)^2}{2(3.5)(4)}$$

$\cos C = 0.607$
$C = 52.615^\circ$
In ΔAOB,

$$\tan x = \frac{OA}{OB} = \frac{1.5}{3} = 0.5$$

$$\boxed{x = 26.56^\circ}$$

In ΔABC,

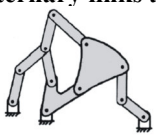
$$\cos\alpha = \frac{(AB)^2 + (BC)^2 - (AC)^2}{2(AB)(BC)}$$

$$\cos\alpha = \frac{(3.354)^2 + (4)^2 - (3.5)^2}{2(3.354)(4)}$$

$\cos\alpha = 0.559$
$\alpha = 56.012$
$\theta_4 = 180 - (x + \alpha)$
$= 180 - (26.56 + 56.012)$

$$\boxed{\theta_4 = 97.428^\circ}$$

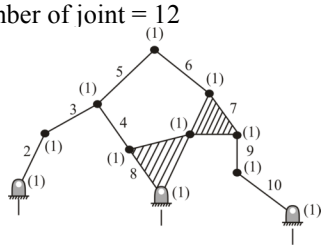
100. A mechanism is shown below. The number of ternary links and the DOF, respectively, are :



(a) 2 ; 3 (b) 2 ; 2
(c) 3 ; 2 (d) 3 ; 3

BHEL ET 2019

Ans. (d) : Number of ternary links = 3
Number of links = 10
Number of joint = 12



DOF = 3 (l – 1) – 2J – h
l = 10 , J = 12, h = 0
DOF = 3 (10 – 1) – 2 × 12
= 3 × 9 – 24 = 27 – 24

$$\boxed{DOF = 3}$$

101. DOF of an over constrained structure has _____ value.

(a) zero (b) positive or negative
(c) negative (d) positive

BHEL ET 2019

Ans. (c) : If degree of freedom is negative
i.e., F < 0, its called in determinant structure or super structure because no relative motion in between links.

102. The input parameters of inverse kinematics are

(a) Links length, wrist position
(b) Links length, joint angles
(c) Wrist position, joint angles
(d) Only links length

TNPSC AE 2019

Ans. (a) : The input parameters of inverse kinematics are links length, wrist position.

Search on Telegram @apna_pdf

103. Which of the following is a statically indeterminate structure?
(a) Load supported on composite member
(b) Load supported on two members
(c) Load supported on three members
(d) Thermal load supported on two members

TNPSC AE 2019

Ans. (c) : Load supported on three members is a statically indeterminate structure.

104. The number of links in a planer mechanism with only revolute joints having 21 instantaneous centers is:
(a) 5 (b) 6
(c) 7 (d) 8

HPPSC ADF 05.03.2019

Ans. (c) : $^{n}C_2 = \frac{n(n-1)}{2} = 21$

$n^2 - n - 42 = 0$

$n - 7n + 6n - 42 = 0$

$n(n-7) + 6(n-7) = 0$

$n = -6, 7$

So, no. of links = 7

105. Assertion (A) : The Ackermann steering gear is commonly used in all automobiles.
Reason (R) : It has correct inner turning angle for all positions.
(a) Both (A) and (R) are individually true and (R) is not the correct explanation of (A)
(b) Both (A) and (R) are individually true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

OPSC AEE 2019 Paper-I

Ans : (c) : An Ackerman steering gear has only turning pairs and thus is preferred, Its drawback is that it fulfills the fundamental equation of correct gearing at the middle and the two gearing at the middle and the two extreme positions and not in all positions.

106. Which of the following statements are correct with respect to inversion of mechanisms?
1. It is a method of obtaining different mechanisms by fixing different links of the same kinematic chain.
2. It is method of obtaining different mechanisms by fixing the same links of different kinematic chains.
3. In the process of inversion, the relative motions of the links of the mechanisms produced remain unchanged.
4. In the process of inversion, the relative motions of the links of the mechanisms produced will change accordingly.

Select the correct answer using the code given below.
(a) 1 and 3 (b) 1 and 4
(c) 2 and 3 (d) 2 and 4

ESE 2019

Ans. (a) : Inversion is the process of alternately fixing each link of a kinematic chain to get different type of mechanism where the relative motion between links remain unchanged but the absolute motion between then gets inverted i.e. the sense of their motion changes from clockwise to counter clock wise rotation or from rightward movement to leftward.

107. In a mechanism having 1 degree of freedom, if one pair is higher pair, what is the minimum number of links required :
(a) 3 (b) 4
(c) 6 (d) 8

Vadodara Muncipal Corp. DEE, 2018

Ans. (a) : In a mechanism having 1 degree of freedom, if one pair is higher pair, then the minimum number of links required 3.
For example– Cam follower mechanism.

108. Which one of the following is an exact straight-line mechanism using lower pairs?
(a) Watt's mechanism
(b) Grasshopper mechanism
(c) Robert's mechanism
(d) Peaucellier's mechanism

RPSC Vice Principal ITI 2018

Ans. (d) :
■ **Exact straight-Line motion Mechanism**
(i) Peaucellier's Mechanism
(ii) Hart's mechanism
(iii) Scott Rusell's Mechanism
■ **Approximate straight line motion Mechanism**
(i) Watt's Mechanism
(ii) Modified Scott-Russell Mechanism
(iii) Grasshopper mechanism
(iv) Techebicheff's Mechanism
(v) Roberts Mechanism

109. Which of the following does not represents the higher pair?
(a) Wheel rolling on a surface
(b) Sphere rolling on a surface
(c) Ball bearing
(d) Turning out on screw
(e) Cylinder rolling on a surface

CGPSC AE 25.02.2018

Ans. (d) : Wheel rolling on a surface, sphere rolling on a surface, ball bearing and cylinder rolling on a surface are example of higher pair where as turning nut on screw is the example of lower pair [Screw and nut pair].

110. Which of the following mechanism is made up of turning pairs?
(a) Scott-Russel mechanism
(b) Peaucellier mechanism
(c) Watt mechanism
(d) Pantograph

TNPSC AE 2018

Ans. (b) : Peaucellier mechanism- The first planar linkage capable of transforming rotary motion into perfect straight - line motion and vice versa.
Number of links is 8.

111. Which type of mechanism is used in shaper machine?
(a) Indexing mechanism
(b) Slider-crank mechanism
(c) Quick return mechanism
(d) None of the above

Vadodara Muncipal Corp. DEE, 2018

Search on Telegram @apna_pdf

Ans. (c) : Quick return mechanism is used in shaper machine.

112. According to linear law of Machine, when P is the effort and W is the load then

(a) P = m.W + C (b) W = P.m + C
(c) W = P.m – C (d) P = m.W – C

WBPSC AE, 2017

Ans. (a) :

113. Which of the following statements is/are true for mechanisms?

(a) A slider crank mechanism is formed if one link in slider crank chain is fixed.
(b) Three, kinematic links joined together form a mechanism
(c) Kinematic chain is a part of kinematic pair
(d) All of above

Karnataka PSC Lect., 27.05.2017

Ans (a) : If a number of bodies are assembled in such a way that the motion of one link causes constrained and predictable motions to the other links is known as a mechanism.

- Mechanism is neither a source of energy nor a producer of work but helps in proper utilization of the energy.
- A slider crank chain is a mechanism that converts reciprocating motion into rotary motion of the crank or vice-versa. But when it is used in an automobile by adding valve mechanism, cam mechanism etc. It becomes a machine.

114. Which of the following are the third inversions of slider crank mechanism?

A. Oscillating cylinder engine
B. Hand pump
C. Rotary engine
D. Crank and slotted lever
Select the code for the correct answer from the options given below:

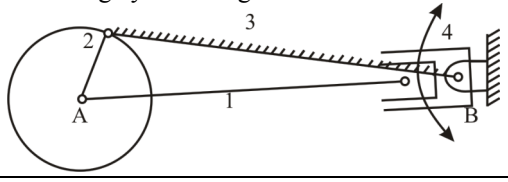
(a) A and B only (b) A and D only
(c) A, B and D only (d) All of the above

Karnataka PSC AE, 10.09.2017

Ans. (b) : 3rd inversion of single slider crank chain obtained by fixing connecting rod are

(1) Crank and slotted lever mechanism.

(2) Oscillating cylinder engine.



115. If a planner mechanism with six links and seven lower pairs, each lower pair is having one degree of freedom, then the degrees of freedom of the mechanism is

(a) 1 (b) 2
(c) 3 (d) 0

APGENCO AE, 2017

Ans. (a) : DOF = 3 (n–1) – 2j – h
3 (6–1) – 7 × 2 – 0 = 1

116. Which of the following are the inversions of a double slider crank chain?

1. Whitworth quick return motion
2. Scotch Yoke
3. Oldham's Coupling
4. Rotary Engine
Select the correct answer using the codes given below :
Codes :

(a) 1 and 2 (b) 2 and 3
(c) 1, 3 and 4 (d) 2, 3 and 4

Punjab PSC (Lect.) 06.08.2017, ESE 1993

Ans. (b) : Inversions of double slider crank chain
(i) Elliptical Trammel
(ii) Scotch Yoke
(iii) Oldham Coupling

117. Degree of freedom of a rectangular block resting on a plane table is

(a) 0 (b) 2
(c) 3 (d) 6

Punjab PSC (Lect.) 06.08.2017

Ans. (c) : Degree of freedom of a rectangular block resting on a plane table is 3 (2T + 1R) = 3

118. Universal coupling is used to connect the shaft:

(a) Whose axes intersect as small angle
(b) Which are perfectly aligned
(c) Which are not aligned
(d) Have lateral misalignment

Punjab PSC SDE 12.02.2017

Ans. (a) : Hooke's Joint or Universal Joint– It is used to connect two non-parallel and intersecting shafts.

- It is also used for shafts with angular misalignment.
- Driving shaft runs at a uniform angular speed whereas the drivens shaft rotates at a continuously varying angular speed.
- It is used in steering mechanism and also used in transmitting power from gear box to rear axle.

119. In order to obtain the maximum mechanical advantage and consequently in order to obtain maximum mechanical efficiency we must use the machine at

(a) Minimum load (b) Maximum load
(c) No load (d) Mean load

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (b) : Mechanical advantage = $\frac{W}{P}$

W = load lifted
P = applied effort

For max mechanical efficiency, $\eta = \frac{W}{P} \times \frac{y}{x}$

$\frac{x}{y}$ is the velocity ratio.

For this formula $\eta = \frac{\text{Mechanical advantage}}{\text{Velocity ratio}}$

to obtain maximum M.A. in order to mechanical η_{max} used maximum load.

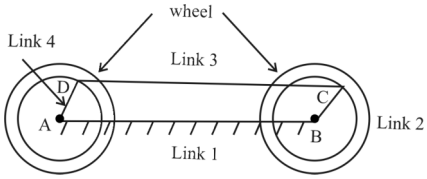
Search on Telegram @apna_pdf

120. Inversions of four-bar chain are obtained depending upon the use of various links as lever or crank. Coupled wheel of a locomotive is an inversion of

(a) Double lever mechanism
(b) Reciprocating engine mechanism
(c) Double crank mechanism
(d) Crank and lever mechanism

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (c) :



The mechanism of a coupling rod of locomotive which consists 4 link.
In the mechanism the link AD and BC act as cranks and are connected to the respective wheels.
The link CD acts as coupling rod and link AB is fixed.
It is inversion of double crank mechanism.

121. In a crank and slotted lever quick return motion mechanism, the distance between the fixed centers is 160 mm and the driving crank is 80mm long. The ratio of time taken by cutting and return strokes is

(a) 0.5 (b) 1
(c) 1.5 (d) 2

GPSC Asstt. Director of Transport 05.03.2017
ESE 2012

Ans. (d) : Given, OA = 160 mm, AB = 80 mm
We know that,

$$\sin(90-\alpha/2)=\frac{AB}{OA}=\frac{80}{160}$$

$$\cos\frac{\alpha}{2}=\frac{1}{2}=\cos 60°$$

Therefore, $\alpha = 120°$

$$\beta = 360 - 120° = 240°$$

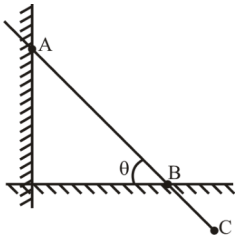
$$\text{Quick return ratio} = \frac{\beta}{\alpha}=\frac{240}{120}=2$$

122. In an elliptical trammel, the length of the link connecting the two sliders is 100mm. The tracing pen is placed on 150mm extension of this link. The major and minor axes of the ellipse traced by the mechanism would be

(a) 250 mm and 150 mm
(b) 250 mm and 100 mm
(c) 500mm and 300 mm
(d) 500 mm and 200 mm

GPSC Asstt. Director of Transport 05.03.2017, ESE 2012

Ans. (c) :



Given,

AB = 100 mm, BC = 150 mm
$x_c = BC\cos\theta = 150\cos\theta$

$$\cos\theta=\frac{x_c}{150}$$

$y_c = AC\sin\theta = 250\sin\theta$

$$\sin\theta=\frac{y_c}{250}$$

We know, ($\because \cos^2\theta + \sin^2\theta = 1$)

$$\left(\frac{x_c}{150}\right)^2+\left(\frac{y_c}{250}\right)^2=1$$

Major axis = 250 × 2 = 500 mm
Minor axis = 150 × 2 = 300 mm

123. The Ackerman steering gear mechanism is preferred to Davis steering mechanism because

(a) Whole of the mechanism in the Ackerman steering gear is on the back of the front wheels
(b) The Ackerman steering gear consists of sliding pairs
(c) The Ackerman steering gear is most economical
(d) Davis steering gear consists of turning pairs

ISRO Scientist/Engineer (RAC) 07.05.2017

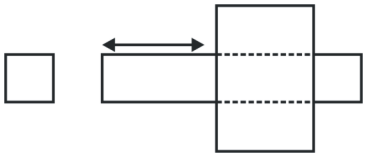
Ans. (a) : The Ackerman steering gear consists of turning pairs and Davis steering gear consist of sliding and turning pairs. The whole of the mechanism in the Ackerman steering gear is on the back of the front wheels, where as in Davis steering mechanism, it is in front of the front wheel.
The Ackerman steering gear is most economical than Davis because less wear follow exact gearing in three stage, two extreme and one is mid where as Davis steering gear satisfy exact gearing at all stage but have more wear.

124. The motion of a square bar in a square hole is example of _____.

(a) Completely constrained motion
(b) Incompletely constrained motion
(c) Successfully constrained motion
(d) Machine
(e) Structure

(CGPSC Polytechnic Lecturer 2017)

Ans. (a) : Completely Constrained Motion –
Completely constrained motion is a type of constrained motion in which relative motion between the links of a kinematic pair occurs in a definite direction by itself, irrespective of external forces applied.
Example– Square bar in a square hole undergoes completely constrained motion.



Incompletely Constrained Motion– Incompletely constrained motion, the relative motion between the links depend on the direction of external forces acting

Search on Telegram @apna_pdf

on them. A good example of incompletely constrained motion is the motion of a shaft inside a circular hole.
Partially or Successfully Constrained Motion–A kinematic pair is said to be partially or successfully constrained if the relative motion between the links occurs in a definite direction, not by itself, but by some other means. A good example of successfully constrained motion is piston reciprocating inside a cylinder in an internal combustion engine.

125. Grubler's criterion is applicable for mechanisms with:
(a) Zero degree of freedom
(b) Single degree of freedom
(c) Two degree of freedom
(d) Three degree of freedom
(e) More than three degree of freedom

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : Kutzbach Criteria–Kutzbach criteria is for determining degree of freedom of body in planar mechanism (2D)

$$DOF = 3[\ell - 1] - 2j - h \quad .....(1)$$

Here, ℓ = Number of links
j = Number of lower pair
h = Number of higher pair
If h = 0, DOF = 1 putting in equation (1)
Then we get

$$1 = 3(\ell - 1) - 2j$$

$$1 = 3\ell - 3 - 2j$$

$$\boxed{3\ell - 2j = 4}$$

This equation is known as Grubler's criteria.

126. A wheel rotating around its axle forms a _____ pair.
(a) sliding (b) turning
(c) rolling (d) screw
(e) spherical

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : A wheel rotating around its axle forms a turning pair.

127. _____permits one shaft to drive two other shafts with equal efforts at three different shafts speeds.
(a) Universal joint (b) Stub axles
(c) Differential (d) Axle housing

TNPSC AE 2017

Ans. (c) : Differential permits one shaft to drive two other shafts with equal efforts at three different shafts speeds.

128. Consider the following degrees of freedom
(i) Pitch
(ii) Roll
(iii) Yaw
DOF which is not included in half car model is
(a) (i) and (ii) (b) (i) and (iii)
(c) (ii) and (iii) (d) (i), (ii), (iii)

TNPSC AE 2017

Ans. (a) :

129. For a Kinematic chain to be considered as mechanism
(a) Two links should be fixed
(b) One link should be fixed
(c) None of the links should be fixed
(d) There is no such criterion

Vizag Steel (MT) 2017
WBPSC AE, 2017
Mizoram PSC AE/SDO 2014, Paper-II

Ans. (b) : for a kinematic chain to be considered as mechanism one link should be fixed.

130. A planer mechanism has 10 links and 12 rotary joints. Using Grubler's criterion, the number of degrees of freedom of the mechanism is
(a) 1 (b) 3
(c) 2 (d) 4

ESE 2017

Ans. (b) : Given,
n = 10
$j_1 = 12$
$j_2 = 0$
Degree of freedom (DOF) $= 3(n - 1) - 2j_1 - j_2$
$= 3(10 - 1) - 2 \times 12 - 0$
$= 3$

131. Which of the following mechanisms are examples of forced closed kinematic pairs?
1. Cam and roller mechanism
2. Door – closing mechanism
3. Slider – crank mechanism
Select the correct answer using the code given below.
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Ans. (a) : Force closed kinematic pair– Contact between the links forming the pair is maintained by an external force/torque but not due to the geometry of surface in contact.
In general, cam and follower will be in contact either due to force of gravity or force of the spring on the follower. Door closing mechanism, has a torsion spring loaded follower in contact with door.
Note- The answer given by UPSC is option (c).

132. How many links must be there in "compound mechanism"?
(a) 1 (b) 2
(c) 3 (d) 4
(e) More than 4

CGPSC ARTO & TSI 07.01.2017

Ans. (e) : Simple and compound mechanism :-
A mechanism with four links is known as simple mechanism and mechanism with more than four link is known as compound mechanism.

133. Transmission of power from the engine to the rear axle of an automobile is by means of
(a) worm and wheel method
(b) Hooke's joint
(c) crown gear
(d) compound gears

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (b) : Transmission of power from the engine to the rear axel of an automobile is by means of Hook's joint.

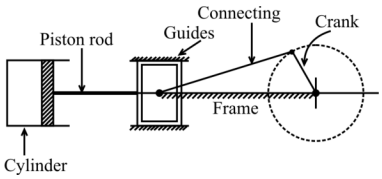
Search on Telegram @apna_pdf

134. The no. of inversions for a slider crank mechanism is.....

(a) 4 (b) 8
(c) 6 (d) 0

(HPPSC LECT. 2016)

Ans : (a)



A single slider crank chain is a modification of the basis four bar chain. It consist of one sliding pair and three turning pair.

The method of obtaining different mechanism by fixing different links in kinematic chain, is known as inversion of the mechanism

(i) If number of links are N then no. of inversion is N

(ii) The no. of inversion for a slider crank mechanism is 4.

135. Watt mechanism is a ..... bar mechanism.

(a) 3 (b) 4
(c) 5 (d) 8

(HPPSC LECT. 2016)

Ans : (b) Watt mechanism is a four bar mechanism.

Watt mechanism:- It is a crossed four bar chain mechanism and was used by Watt for his early steam engine to guide the piston rod a cylinder to have an approximate straight line motion.

136. Mechanism having zero d.o.f. is known as:

(a) Machine (b) structure
(c) Kinematic chain (d) Link

(HPPSC LECT. 2016)

Ans : (b) Mechanism having zero degree of freedom is known as structure.

structure:- If one of the link of redundant chain is fixed. It is known as structure or a locked system.

(i) No relative motion
(ii) Capable of transmitting force only
(iii) Power energy cannot be transmitted
(iv) Degree of freedom of structure is zero
(v) Degree of freedom of super structure is less than zero.

137. Match list-I with list-II select the correct Answer using the codes given below the list:

List -I	List -II
(a) Cam and follower	1. Grubler's rule
(b) Screw pair	2. Grashof's linkage
(c) 4-bar mechanism	3. Pressure angle
(d) Degree of freedom of Planar mechanism	4. Single degree of freedom

Code

	A	B	C	D
(a)	3	4	2	1
(b)	1	2	4	3
(c)	1	4	2	3
(d)	3	2	4	1

UJVNL AE 2016, ESE 2001

Ans : (a) List -I	**List -II**
i) Cam and follower	i. Pressure angle
ii) Screw pair	ii. Single degree of freedom
iii) 4-bar mechanism	iii. Grashof's linkage
iv) Degree of freedom of Planar mechanism	iv. Grubler's rule

138. Differential gear is used in an automobile to

(a) Transmit power from the engine to driving wheels.
(b) Multiply the available engine torque.
(c) Enable the vehicle negotiate curves properly.
(d) Serves all the three functions as mentioned in (a), (b) and (c) above.

UPPSC AE 12.04.2016 Paper-I

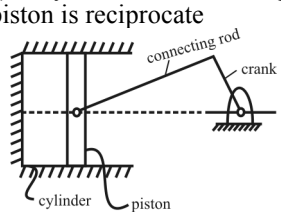
Ans : (d)
Differential gear is used in an automobile to:-
(i) Transmit power from the engine to driving wheels.
(ii) Multiply the available engine torque.
(iii) Enable the vehicle negotiate curves properly.

139. Cylinder of an I.C. engine is a :

(a) Elasto-fluid link
(b) Elasto-rigid link
(c) Translatory rotating link
(d) Fixed link

HPPSC Lect. (Auto) 23.04.2016

Ans. (d) : Cylinder of an I.C. engine is a fixed lines in which piston is reciprocate



140. In order to make a mechanism with one degree of freedom, how many minimum number of links needed? The mechanisms has one higher pair

(a) 2 (b) 3
(c) 4 (d) 6

GPSC ARTO 01.05.2016

Ans. (b) : Cam and follower has 3 links where 2 are lower pair and 1 higher pair, it has DOF = 1.

141. The analysis of mechanism deals with

(a) the determination of displacement, velocity and acceleration of the links in a mechanism
(b) the determination of input and output angles of the mechanism
(c) the determination of dimensions of the link in a mechanism
(d) none of the above

GPSC ARTO 01.05.2016

Ans. (a) : The analysis of mechanism deals with the determination of displacement, velocity and acceleration of the link in a mechanism.

142. The part of an overhead valve mechanism arranged between the valve tappet and rocker arm is :

(a) Cam follower (b) Push rod
(c) Rocker shaft (d) Cam shaft

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Search on Telegram @apna_pdf

Ans. (b) The part of an overhead valve mechanism arranged between the valve tappet and rocker arm is push rod.

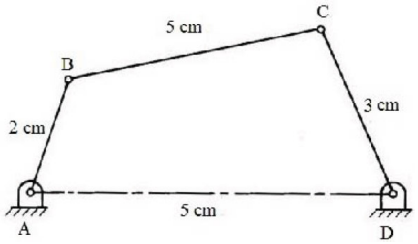
143. If the number of members (m) are more than that required by the equation m = 2j–3 (j is number of joints) such frames are called

(a) Redundant frame (b) Weak frame
(c) Perfect frame (d) Ideal frame

APPSC AEE Mains 2016 (Civil Mechanical)

Ans. (c) : We know, In general (m = member)
→ If m = 2j – 3, then the frame is perfect
→ If m < 2j – 3, then the frame is deficient frame.
→ If m > 2j – 3, then the frame is redundant frame.

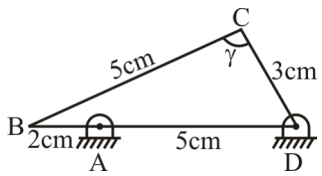
144. What will be the maximum transmission angle for the mechanism shown in the figure below?



(a) 90° (b) 110°
(c) 120° (d) 135°
(e) 150°

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) :



Transmission angle = γ

$$\cos\gamma = \frac{5^2+3^2-7^2}{2\times5\times3} = -\frac{1}{2}$$

$\gamma = 120°$

145. A Thompson indicator employs :

(a) Pantograph mechanism
(b) Grass-hopper mechanism
(c) Kemtpe's mechanism
(d) Tchebicheff mechanism

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) : A Thompson indicator employs grass-hopper mechanism.
In this indicator the piston rod is hollow and serves only as a guide for a piston. The pencil mechanism is connected to the piston be a very light rod that passes through the piston rod and is attached to the piston with a swivel joint. This permits the use of a very simple and light parallel motion.

146. A wedge used to raise loads consists of.....pairs.

(a) One sliding (b) Two sliding
(c) Three sliding (d) Revolving

HPPSC AE (PWD) 10.09.2016

Ans. (c) : A wedge used to raise loads consists of three turning pairs.

147. Degrees of freedom (d.o.f.) of a pair is the number of independent relative motions, both translational and rotational and thus a kinematic pair can have:

(a) d.o.f. = 3 – no. of restraints
(b) d.o.f. = 6 – no. of restraints
(c) d.o.f. = 12 – no. of restraints
(d) d.o.f. = no. of restraints

HPPSC AE (PWD) 10.09.2016

Ans. (b) : The number of restraints can never be zero (Joint is disconnected) or six (joint becomes solid). Degree of freedom of a pair is defined as the number of independent relative motion's both translational and rotational a pair can have.

Degree of freedom = 6-no. of restraints.

148. Which one is a lower pair ?

(a) Roller bearing
(b) Tooth gears in mesh
(c) Cam and follower
(d) All of the above
(e) None of the above

CGPSC AE 16.10.2016

Ans. (e) : Lower pair, when two elements of a pair joined together with the surface contact between them, the joint is referred to as lower pair e.g. revolute, prismatic, screw, cylindrical, spherical & planar.
Roller bearing, Tooth gears in mesh, Cam and follower are higher pair.

149. A bolt and nut form

(a) Turning pair (b) Rolling pair
(c) Screw pair (d) Sliding pair
(e) None of these

CGPSC AE 16.10.2016

Ans. (c) : The combination of sliding and turning, is an example of nuts bolt, this pair is known as screw pairs eg. Screw Nut, Screw of lathe with a nut etc.

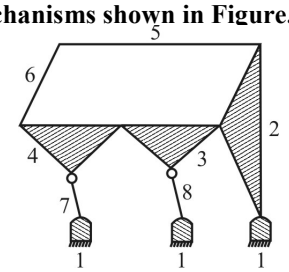
150. Consider the following pairs of parts:
1. Pair of gear in mesh
2. Belt and pulley
3. Roller Bearing
4. Cam and follower
Among these the higher pairs are:

(a) 1, 3 and 4 (b) 1, 2 and 3
(c) 2 and 4 (d) 1 and 4

UPRVUNL AE 21.08.2016

Ans. : (*) Higher pairs are
(i) Pair of gear in mesh
(ii) Belt and pulley
(iii) Roller bearing
(iv) Cam and follower.
Note-Official answer is (a).

151. Determine the number of degrees of freedom of the mechanisms shown in Figure.

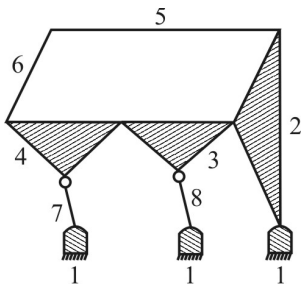


Search on Telegram @apna_pdf

(a) 2 (b) 3
(c) 4 (d) 1

UPRVUNL AE 21.08.2016

Ans. : (d)



L = 8

Number of binary point (T) = 10

h (higher pair) = 0

DOF = 3 (l–1) –2J – h

= 3 (8–1) – 2 × 10 – 0

DOF = 1

152. Which of the following has sliding motion?

(a) crank (b) connecting rod
(c) cross head (d) cross head guide

GPSC Lect. 23.10.2016

Ans. (c) : Sliding is a type of frictional motion between two surfaces in contact e.g. cross head.

153. A slider crank chain consists of following numbers of sliding and turning pairs

(a) 1, 3 (b) 3, 1
(c) 2, 2 (d) 4, 0

GPSC Lect. 23.10.2016

Ans. (a) : Slider crank is a four bar mechanism, have one sliding pairs and three turning pairs.

154. Which of the following disciplines provides study of relative motion between the parts of a machine

(a) applied mechanics (b) mechanisms
(c) kinematics (d) kinetics

Nagaland PSC CTSE 2016 Paper-I

Ans. (c) : The study of inertia forces arising from the combined effect of the mass and motion of the parts is called kinetics while, the study of relative motion between the parts of a machine is called kinematics.

155. A circular shaft is revolving inside the bearing is an example of

(a) Sliding pair (b) Turning pair
(c) Rolling pair (d) Spherical pair

RPSC LECTURER 16.01.2016

Ans. (b) : A circular shaft is revolving inside the bearing is an example of turning pair.

156. The relation between number of links and number of lower pairs is given as n = 2p – 4. If L.H.S is less than R.H.S of this equation then the chain is

(a) constrained (b) locked
(c) structure (d) unconstrained

APPSC AEE MAINS 2016, PAPER-III

Ans. (d) : n = 2p – 4

If, L.H.S < R.H.S

Then, it become an unconstrained

157. When the motion between a pair takes place in a definite direction irrespective of direction of force applied, then it is said to be which among the following?

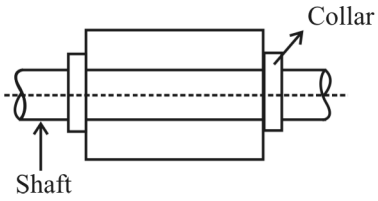
(a) Incompletely constrained motion
(b) Successfully constrained motion
(c) Completely constrained motion
(d) Partially successful constrained motion

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : There are three types of constrained motion

(i) Completely Constrained Motion–When the motion between two elements of a pair is in a definite direction irrespective of the force applied, it is known as completely constrained motion.

Example – Shaft with both end collar in a circular hole.

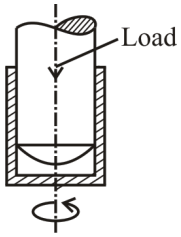


(ii) Incompletely Constrained Motion–When the motion between two elements of a pair in more than one direction and depends upon the direction of force applied, it is known as incompletely constrained motion.

Example–Turning pair (shaft in circular hole).

(iii) Successfully Constrained Motion–When the motion between two elements of a pair is possible in more than-one direction but it made to have motion only in one direction by using some external means. It is a successfully constrained motion.

Example–Foot step bearing.



In completely constrained motion, the motion between a pair takes place in a definite direction irrespective of direction of force applied.

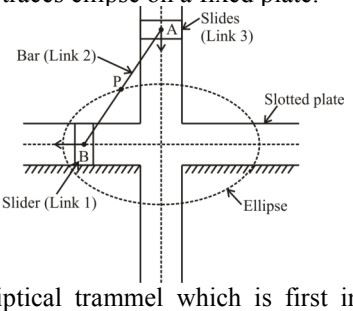
158. A point on a link connecting double slider crank chain traces a

(a) Circle on fixed plate
(b) Ellipse on fixed plate
(c) Straight line on fixed plate
(d) Parabola on fixed plate

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Search on Telegram @apna_pdf

Ans. (b) : A point on a link connecting double slider crank chain traces ellipse on a fixed plate.



It is an elliptical trammel which is first inversion of double slider-crank chain. In elliptical trammel there are two turning pair & two sliding pair.

159. An inversion of four bar chain in which one link can make complete rotation while the output link oscillates is obtained when
(a) If the link adjacent to the shortest link is fixed
(b) If the shortest line is fixed
(c) If the link opposite to the shortest link is fixed
(d) None of these

RPSC AE (GWD) 06.05.2016

Ans. (a) : An inversion of four bar chain in which one link can make complete rotation while the output link oscillation is obtained when if the link adjacent to the shortest link is fixed.
e.g. Crank-rocker

160. By fixing the connecting rod of a slider crank chain, the inversion obtained is called
(a) Whitworth quick return mechanism
(b) Rotary cylinder engine
(c) Crank and slotted lever quick return mechanism
(d) None of these

RPSC AE (GWD) 06.05.2016

Ans. (c) : By fixing the connecting rod of a slider crank chain, the inversion is called crank and slotted lever quick return mechanism.

161. The only service that a steering linkage normally requires is :
(a) Piston-rod adjustment
(b) Lubrication
(c) Cam grinding
(d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : Lubrication is the only service that is required in steering linkage.

162. A shaft rotating in bearing forms ….. pair.
(a) Helical (b) Sliding
(c) Turning (d) Revolving

HPPSC Lect. (Auto) 23.04.2016

Ans. (d) : A shaft rotating in bearing forms turning or revolving pair.
• **Turning or revolving pair-** When one link of paired elements rotating inside other elements form turning pair.
• **Sliding pair-** When one elements slides with respect to other elements form sliding pair.
Note-Official answer is (d).

163. A truss having 4 joints and 7 members is termed as…… truss.
(a) Perfect
(b) Imperfect or deficient
(c) Redundant
(d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) :
For Perfect Truss or Statically Determinate

$$\boxed{m = 2j - 3}$$

Under Rigid or Collapsible Truss or Deficient truss

$$\boxed{m < 2j - 3}$$

Over Rigid or Redundant Truss or Statically Indeterminate

$$\boxed{m > 2j - 3}$$

$J = 4, \quad m = 7$
$m = 2j - 3$
$= 2 \times 4 - 3 = 5$
$m > 5 \Rightarrow 7 > 5$
Hence, the truss is redundant or over rigid.
Note-Option (b) given by commission.

164. The other name for Hooke's joint is ……
(a) Oldham coupling (b) Universal coupling
(c) Rigid coupling (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : The hooks joint is also known universal coupling. Hooke's joint is a Joint coupling connecting rigid rods whose axes are inclined to each other and is commonly used in shaft that transmit rotary motion.

165. The number of centers in a crank driven slider crank mechanism are
(a) 2 (b) 1
(c) 5 (d) 4

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (a) : 2 load centers is in a crank driven slider crank mechanism.

166. The degrees of freedom of a simple pendulum is given by :
(a) 2 (b) 6
(c) 0 (d) 1

TSPSC Managers, 2015

Ans. (d) : The degree of freedom of a simple pendulum = 1 because it has one input (i.e. one mass system).

167. Which one is NOT the inversion of four bar mechanism?
(a) Watt's mechanism
(b) Beam engine
(c) Pantograph
(d) Oscillating cylinder engine

NPCIL ET, 2015

Ans. (d) : Inversion's of four bar chain mechanism-
There three inversions-
(1) Beam engine or crank and lever mechanism
(2) Coupling rod of locomotive or double crank mechanism
(3) Watt's straight line mechanism or double lever mechanism
(4) Pantograph

Search on Telegram @apna_pdf

168. A planer mechanism has 6 links with 6 lower pairs and 2 higher pairs. Then the degree of freedom of mechanism as per Gruebler's Criterion is

(a) 1 (b) 2
(c) 3 (d) 0

TSPSC AEE 2015

Ans. (a) : Data given as,

$l = 6, \quad h = 2, \quad j = 6$

Then,

$N = 3(l - 1) - 2j - h$

$N = 3(6 - 1) - 2 \times 6 - 2$

$\boxed{N = 1}$

169. Which one of the following is not a inversion of double slider crank mechanism

(a) Elliptical trammel
(b) Oldham's coupling
(c) Scotch yoke mechanism
(d) Beam engine Mechanism

TSPSC AEE 2015

Ans. (d) : Elliptical trammel, oldham's coupling and scotch yoke mechanism are the example of double slider crank mechanism where as beam engine mechanism is the example of four bar mechanism.

170. Typewriter constitutes

(a) Structure (b) Machine
(c) Inversion (d) mechanism

(KPSC AE 2015)

Ans : (d) Typewriter constitutes mechanism.

171. Where is the Hooke's joint used in an automobile?

(a) between gearbox and propeller shaft
(b) between flywheel and clutch
(c) between differential gear and wheel
(d) between clutch and gear box

(KPSC AE 2015)

Ans : (a) Hooke's joint:- A Hooke's joint is used to connect two shaft which are Intersecting at a small angle. The end to each shaft is forked to U-type and each fork provides two bearing for the arms of a cross. The arms of the cross are perpendicular to each other. The motion is transmitted from the driving shaft to driven shaft through a cross.

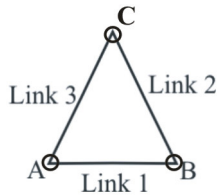
172. Locked chain satisfy equation

(i) $n = 2p - 4$, (ii) $j = \frac{3}{2}n - 2$:

(a) Only Equation (i)
(b) Only Equation (ii)
(c) Satisfy both the Equations
(d) Doesn't satisfy both the Equations

OPSC AEE 2015 Paper-I

Ans : (d)



Number of link (l) = 3

Number of pair (p) = 3

Number of Joints (J) = 3

Equation (i)

$n = 2p - 4$

$3 = 2 \times 3 - 4$

LHS > RHS

Equation (ii)

$= 3 = \frac{3}{2} \times 2 - 2$

LHS > RHS

Since the arrangement of three link, does not satisfy the equation (i) and (ii) and the left hand side is greater than the right hand side therefore it is not a kinematic chain and hence no relative motion is possible. Such type of chain is called locked chain and forms a rigid frame or structure which is used in bridges and trusses :

173. Roller bearing is a :

(a) Spherical pair (b) Higher pair
(c) Lower pair (d) Cylindrical pair

OPSC AEE 2015 Paper-I

Ans : (b) Roller bearing is a Higher pair.

Higher pair : When the two elements of a pair have a line or point contact or when relative motion takes place and the motion between the two elements is partly turning and partly sliding, then the pair is known as higher pair. A pair of friction discs, toothed gearing belt and rope drives, ball and roller bearing and cam and follower are the examples of higher pair.

174. One of the following mechanism is not exact straight line mechanism:

(a) Grasshopper Mechanism
(b) Hart Mechanism
(c) Scott Russel Mechanism
(d) Peaucellier Mechanism

OPSC AEE 2015 Paper-I

Ans : (a) Grasshopper Mechanism is not exact straight line mechanism.

Approximate straight line motion mechanism :
(1) Watt's mechanism
(2) Modified Scott-Russel mechanism
(3) Grasshopper mechanism
(4) Tchebicheff's mechanism
(5) Roberts mechanism

Exact straight line motion mechanism :
(i) Peaucellier mechanism
(ii) Hart's mechanism
(iii) Scott Russell's mechanism

175. Knee joint of a human being has ____degree(s) of freedom.

(a) One (b) Two
(c) Three (d) Zero

OPSC AEE 2015 Paper-I

Ans : (a) Knee joint of a human being has one degree of freedom.

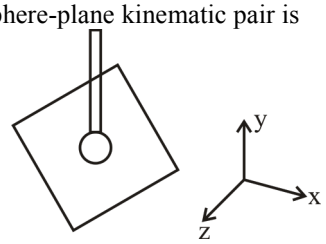
176. The number of degrees of freedom for sphere-plane kinematic pair is :

(a) one (b) three
(c) five (d) six

MPPSC State Forest Service Exam, 2014

Search on Telegram @apna_pdf

Ans. (c) : Sphere-plane kinematic pair is



Translation → x & z direct
Rotation → x, y & z direct
So have total five degree of freedom.

177. A framed structure is imperfect, if the number of member are _____ (2j – 3), where j is the number of joints.
(a) equal to (b) less than
(c) greater than (d) either (2) or (3)

MPSC Poly. Lect. 2014

Ans. (d) : For perfect truss m = 2j – 3
If m < 2j – 3 Deficient truss
m > 2j – 3 Redundant truss
Note-Official answer is (a).

178. If the number of nodes in a perfect frame is n, then the number of members is
(a) 2n-1 (b) 2n
(c) 2n-3 (d) n-1

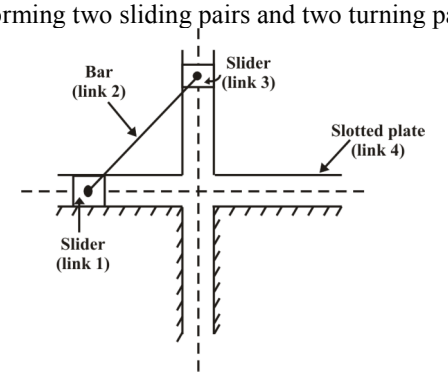
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (c)
m = 2n – 3 for perfect frame
If m < 2n – 3 It means that the truss contain more members than required to be just rigid and is over rigid and statically indeterminate.
If m > 2n – 3 It means that the truss contains less members than required to be just rigid and is collapsible or under rigid.
Where,
m = Number of members in the truss
n = Number of node

179. In elliptical trammels
(a) All four pairs are sliding
(b) All four pairs are turning
(c) Two pairs are turning and other two sliding
(d) One pair turning and three sliding
(e) One pair sliding and three turning

CGPSC AE 26.04.2015 Shift-I

Ans. (c) : • Elliptical Trammel is an inversion of double crank chain mechanism.
• A double slider crank chain consist of four links forming two sliding pairs and two turning pairs.



180. The joint in valve mechanism of reciprocating engine is
(a) knuckle joint (b) universal joint
(c) cotter joint (d) key joint
(e) pin joint

CGPSC AE 26.04.2015 Shift-I

Ans. (a) : Applications of Knuckle joints-
(i) Joints between the tie bars in a root trusses.
(ii) Between the links of suspension bridge.
(iii)In valve mechanism of a reciprocating engine.
(iv) Fulcrum for the levers.

181. In an offset slider-crank mechanism with length of connecting rod l, crank radius r and offset e, the crank will revolve only when
(a) $l \geq (r + e)$ (b) $l \leq (r - e)$
(c) $l > (r - e)$ (d) $l < (r + e)$

TNPSC AE 2014

Ans. (a) : In an offset slider-crank mechanism with length of connecting rod l, crank radius r and offset e, the crank will revolve only when length of connecting rod l should be equal or greater than the sum of crank radius and offset e.

$$\ell \geq (r + e)$$

182. Which of the following systems has 8 links?
(a) Hart mechanism
(b) Peaucellier mechanism
(c) Whitworth Quick return mechanism
(d) Scotch yoke mechanism

TNPSC AE 2014

Ans. (b) : Mechanism	**Number of links**
Hart mechanism	6
Peaucellier mechanism	8
Whithworth quick return Mechanism	4
Scotch yoke mechanics	4

183. Theory of machine which deals with the inertia force due to combined effect of the mass and motion of the various links of the machines is known as
(a) kinetic (b) kinematics
(c) dynamics (d) statics

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (a) : Dynamics– It is that branch of theory of machines which deal with the forces and their effects while acting upon the machine parts in motion.
• **Kinetics**–It deals with inertia forces which occur due to combined effect of mass and motion of machine element.

184. A shaft with collars both ends fitted into a circular hole is a popular example of
(a) rolling pair (b) turning pair
(c) sliding pair (d) spherical pair

Mizoram PSC AE/SDO 2014, Paper-II

Ans. (b) : When the two element of a pair are connected in a such a way that one can only turn on revolve about a fixed axis of another links, the pair is known as turning pair. A shaft with collar at both ends fitted into a circular hole, the crankshaft in a journal bearing in an engine, lathe spindle support in head stock are the example of turning pair.

Search on Telegram @apna_pdf

185. If n links are connected at the same joint, the joint is equivalent to :

(a) (n – 1) binary joints
(b) (n – 2) binary joints
(c) (n – 3) binary joints
(d) (2n – 1) binary joints

J&K PSC Civil Services Pre, 2013

Ans. (a) : (n – 1) binary joints

186. If a constant velocity ratio of driving and driven shafts is required then the mechanism used is :

(a) Ackermann gearing
(b) Hooke's joint
(c) Double Hooke's joint
(d) Grass-Hopper mechanism

J&K PSC Civil Services Pre, 2013

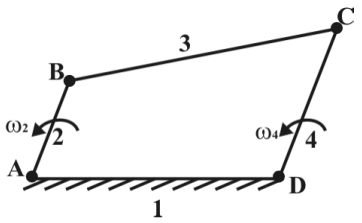
Ans. (c) : The velocity of driven shaft is not constant it varies from maximum to minimum values. In order to have constant velocity ratio of driving and driven shaft, an intermediate shaft with a hooks joint at each end is used. This is double Hooke's joint.
Ackermann gearing is used in steering and Grass hopper mechanism is used in straight line mechanism.

187. For a four-linkage in toggle position, the value of mechanical advantage is-

(a) 0.0 (b) 0.5
(c) 1.0 (d) ∞

APGENCO AE, 2017
TSPSC AEE 2017
RPSC 2016
CGPSC AE 26.04.2015 Shift-I
GATE 2006

Ans : (d)



The extreme positions of a linkage are known as "toggle position"

When, Mechanical Advantage $= \frac{\omega_2}{\omega_4} = \frac{\omega_{input}}{\omega_{output}}$

At extreme position the angular velocity of link (4) becomes 0 (i.e. $\omega_4 = 0$) and hence mechanical advantage becomes infinity.

Mechanical Advantage (M.A.) $= \frac{\omega_2}{\omega_4} = \frac{\omega_2}{0} = \infty$

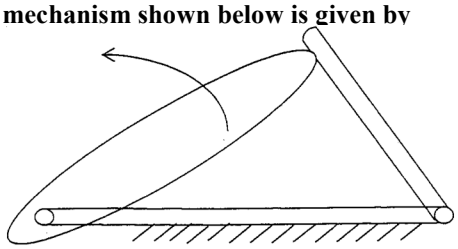
188. Capacity of accumulator indicates amount of.

(a) Work done in lifting the ram
(b) Lift of ram
(c) Work done by accumulator per second
(d) power supplied by accumulator

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : Capacity of accumulator indicates amount of work done in lifting the ram.

189. The number of degrees of freedom in the 3 link mechanism shown below is given by



(a) 1 (b) 2
(c) 3 (d) 0

ISRO Scientist/Engineer 12.05.2013

Ans. (a) : Applying Kutzback equation

$$F = 3(\ell - 1) - 2J - h$$

Number of link $\ell = 3$
No. of turning pair or joint J = 2
No. of higher pair h = 1

$F = 3(3 - 1) - 2 \times 2 - 1$
$F = 3 \times 2 - 4 - 1 = 1$

190. Which of the following is an approx. straight line motion mechanism?

(a) Watt's mechanism
(b) Grasshopper mechanism
(c) Robert's mechanism
(d) All of these

SJVN ET 2013

Ans. (d) : Approximate straight line motion mechanism-
(i) Watt's mechanism.
(ii) Modified Scott-Russel mechanism
(iii) Grosshopper mechanism
(iv) Tchebicheff's mechanism
(v) Robert's mechanism

191. A completely constrained motion can be transmitted with:

(a) 1 link with pin joints
(b) 2 link with pin joints
(c) 3 link with pin joints
(d) 4 link with pin joints

SJVN ET 2013

Ans. (d) : A completely constrained motion can be transmitted with 4 link with pin joints.

192. The motion of a piston in the cylinder of a steam engine is an example of

(a) Forced constrained motion
(b) Successfully constrained motion
(c) Incompletely constrained motion
(d) Completely constrained motion

TNPSC AE 2013

Ans. (b) : Successfully constrained motion– When the motion between two elements of a pair possible in more than one direction but is made to have motion only in one direction by using some external means.
Example– Foot step bearing, A piston in a cylinder of an IC engine is made to have only reciprocating motion and no rotary motion due to constraints of the piston pin.

Search on Telegram @apna_pdf

193. The maximum force which acts on the connecting rod is

(a) Force due to gas pressure
(b) Force due to inertia of piston
(c) Force due to friction of connecting rod
(d) Force due to crank pin

TNPSC AE 2013

Ans. (a) : Force due to gas pressure is the maximum force acts on the connecting rod.

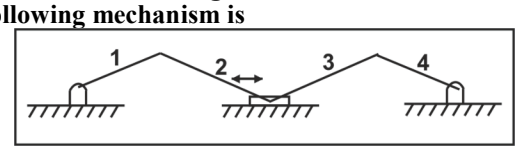
194. Which of the following mechanism is used to enlarge or reduce the size of a drawing ?

(a) Pantograph (b) Bentograph
(c) Watt mechanism (d) Four bar chain

TNPSC AE (Industries) 09.06.2013

Ans. (a) :

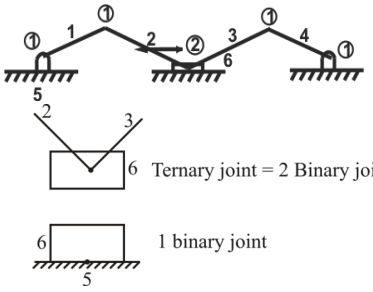
195. The number of degrees of freedom for the following mechanism is



(a) 0 (b) 1
(c) 2 (d) 4

ISRO Scientist/Engineer 2012

Ans. (b) :



No. of links $\ell = 6$

No. of joint j = 7

According to Kutzback Equations

$DOF = 3(\ell - 1) - 2j - h$

$= 3(6-1) - 2 \times 7$

$= 15 - 14 = 1$

196. In a slotted lever and crank quick return mechanism used in shapers, the beginning and end of cutting stroke occurs when

(a) cranked lever are in line with each other
(b) crank is perpendicular to lever
(c) crank is horizontal
(d) lever is horizontal

UKPSC AE 2012 Paper-I

Ans. (b) : crank is perpendicular to lever

197. Identify the wrong statement :

(a) A mechanism is an assemblage of four or more links.
(b) A slider crank chain consists of two sliding pairs and two turning pairs.
(c) A kinematic chain requires at least four links and four turning pairs.
(d) Open pairs are those whose elements are not held together mechanically.

UKPSC AE 2012 Paper-I

Ans. (b) : A slider crank chain consists of one sliding pairs and three turning pairs.

198. Which one of the following is not an example of higher pair ?

(a) Disc Cam and roller follower
(b) Spur Gear meshing teeth
(c) Ball Bearing
(d) Bush Bearing

UKPSC AE 2012 Paper-I

Ans. (d) : Bush Bearing is not an example of higher pair.

199. A framed structure is perfect, if the number of members is ..... (2j – 3), where 'j' is the number of joints.

(a) equal to (b) less than
(c) greater than (d) either (b) and (c)

TNPSC ACF 2012

Ans. (a) : m = 2J – 3 perfect
m > 2J – 3 redundant

200. Match List-I correctly with List II and select your answer using the codes given below

List I	List II
(A) Quick return mechanism	1. Lathe
(B) Apron mechanism	2. Milling machine
(C) Index mechanism	3. Shaper
(D) Regulating wheel grinding	4. Centreless

Codes

	a	b	c	d
(a)	3	2	1	4
(b)	2	3	4	1
(c)	4	2	3	1
(d)	3	1	2	4

TNPSC ACF 2012

Ans. (d) : Quick return mechanism – Shaper
Apron mechanism – Lathe
Indexing mechanism – Milling machine
Regulatory Wheel – Centre less guiding

201. When a cylinder is located in a Vee-block, the number of degrees of freedom which are arrested is

(a) 2 (b) 4
(c) 7 (d) 8

OPSC AEE 2019 Paper-I
GATE 2003

Ans. (b) :

202. Oldham's coupling and elliptical trammels are the inversion of :

(a) Crossed Slider Crank Chain
(b) Four Bar Chain
(c) Single Slider Crank Chain
(d) Double Slider Crank Chain

OPSC Civil Services Pre. 2011

Ans. (d) : Oldham's coupling scotch yoke and elliptical trammels are the inversion of double slider crank chain mechanism.

Search on Telegram @apna_pdf

203. A negative degree of freedom for a mechanism means :

(a) Constrained motion mechanism
(b) Unconstrained motion mechanism
(c) Any motion
(d) Statically indeterminate structure

OPSC Civil Services Pre. 2011

Ans. (d) : Statically indeterminate structure we know that mobility or degree of freedom of a statically indeterminate structure (means super structure) is always negative.

204. Which of the following is an example of sliding pair?

(a) Piston and cylinder of a reciprocating steam engine
(b) Shaft with collars at both ends fitted into a circular hole
(c) Lead screw of a lathe with nut
(d) Ball and a socket joint

VIZAG Steel MT 2011

Ans. (a) : Piston and cylinder of a reciprocating steam engine

205. What is the mechanism consisting of four links called as?

(a) Simple mechanism
(b) Complex mechanism
(c) Compound mechanism
(d) Convenient mechanism

VIZAG Steel MT 2011

Ans. (a) : Mechanism consisting of four links called as simple mechanism.

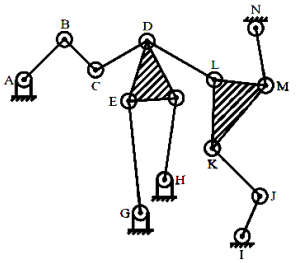
206. Unconstrained rigid link in a plane has

(a) No degree of freedom
(b) One degree of freedom
(c) Two degree of freedom
(d) Three degrees of freedom

UPSC JWM Advt. No.-52/2010

Ans. (d) : Unconstrained rigid link or body in plane has three degree of freedom. They are 2-Translational (about x, y -axis) and one-Rotational (about z-axis).

207.



The mechanism shown in the figure has

(a) One degree of freedom
(b) Two degrees of freedom
(c) Three degrees of freedom
(d) Four degrees of freedom

UPSC JWM Advt. No.-50/2010

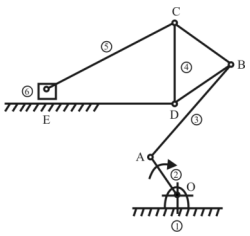
Ans. (c) : From fig. (question), $\ell = 12$, j = 15, h = 0

We know that,

Degree of freedom, $F = 3(\ell - 1) - 2j - h$

$= 3 \times 11 - 2 \times 15$ $\boxed{F = 3}$

208.

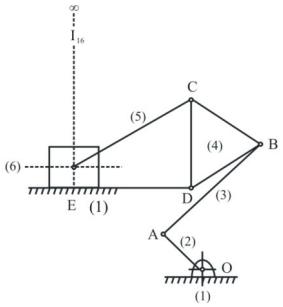


What is the location of I_{16} of the mechanism in the above figure?

(a) At E
(b) At ∞ along the line DE
(c) At ∞ along the perpendicular to DE
(d) At ∞ along the perpendicular to CE

UPSC JWM Adv. No-16/2009

Ans. (c) :



The location of I- Centre (I_{16}) of the mechanism in the figure is at ∞ perpendicular to DE when piston/object sliding on a plane surface along DE.

209. It is planned to construct a four-bar mechanism ABCD with length AB = 60 mm, BC = 100 mm, CD = 70 mm and fixed link AD = 200 mm. If at least one link is required to have a complete rotation, this mechanism is

(a) of crank-rocker type
(b) of double-crank type
(c) of double rocker type
(d) impossible to construct

DRDO Scientists 2009

Ans. (c) : S+L = 60+200 = 260 mm

P+Q = 100+70 = 170 mm

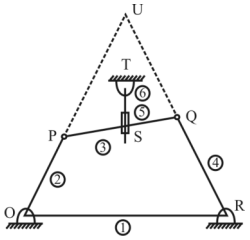
According to Grashoff's law

$S+L \le P+Q$

Here, $S + L > P + Q$ $\Downarrow$ (Double - Rocker) is not satisfied Grashoff's law

Class II mechanism, so always double rocker.

210.



A 6 –link mechanism is shown in the above figure, with a swivel trunnion at 5. What is the location of the instantaneous centre which is at ∞?

Search on Telegram @apna_pdf

(a) I_{35}, on a line perpendicular to TS
(b) I_{56}, on a line perpendicular to PQ
(c) I_{56}, on a line perpendicular to TS
(d) I_{15}, on a line perpendicular to TS

UPSC JWM Adv. No-16/2009

Ans. (c) : The location of the instantaneous centre I_{56} is at infinite (∞), which is on a line perpendicular to TS because slider link slide along the link TS or link 6.

211. In which of the following machine "quick return motion" incorporated?
(a) Lathe machine
(b) Broaching machine
(c) Slotting machine
(d) Milling machine

WBPSC AE 2008

Ans. (c) :

212. A pantograph is a device that reproduces a displacement
(a) On the same scale (b) On any scale
(c) On reduced scale (d) On enlarged scale

ISRO Scientist/Engineer 2008

Ans. (b) : **Pantograph**—A Pantograph is a mechanical linkage connected in a manner based on parallelograms so that the movement of one pin, in tracing an images produces identical movements in a second pin. If a line drawing is traced by the first point, an identical, enlarged or miniaturized copy with be drawn by a pen fixed to the other.

213. In ideal machines
(a) mechanical advantage is greater than velocity ratio
(b) mechanical advantage is equal to velocity ratio
(c) mechanical advantage is less than velocity ratio
(d) mechanical advantage is unity

TNPSC AE, 2008

Ans. (b) : In ideal machines, mechanical advantage is equal to velocity ratio.

$$\eta = \frac{\text{M.A.}}{\text{V.R.}}$$

Where, M.A. = Mechanical advantage
V.R. = Velocity ratio
For ideal machine $\eta = 100\%$
Then, M.A. = V.R.

214. A kinematic chain requires at least
(a) 2 links and 3 turning pairs
(b) 3 links and 4 turning pairs
(c) 4 links and 4 turning pairs
(d) 5 links and 4 turning pairs

TNPSC AE, 2008

Ans. (c) : A kinematic chain requires at least 4 links and 4 turning pairs.

215. The indicator using Watt mechanism is known as
(a) Thomson indicator (b) Richard indicator
(c) Simplex indicator (d) None of these

TNPSC AE, 2008

Ans. (b) : The indicator using Watt mechanism is called as Richard indicator.

216. A football is rolling on ground, the motion of any point on its surface is
(a) elliptical plane motion (b) helical
(c) spherical (d) plane rotation

UKPSC AE 2007 Paper -I

Ans. (b) :

217. Which of the following is not an inversion of single slider crank mechanism?
(a) Quick return mechanism
(b) Oscillating cylinder engine mechanism
(c) Pendulum pump mechanism
(d) Oldham's coupling

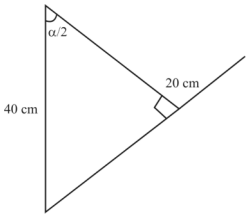
UKPSC AE 2007 Paper -I

Ans. (d) : Oldham's coupling – It is the inversion of double slider crank mechanism.

218. In a slotted lever quick return mechanism, the crank length is 20 cm while the distance between centres of crank and slotted lever rotation is 40 cm. What is the ratio of cutting stroke time to return stroke time?
(a) 2 (b) 3
(c) 4 (d) 5

UKPSC AE 2007 Paper -I

Ans. (a) :



$$\cos\frac{\alpha}{2} = \frac{20}{40} = \frac{1}{2}$$

$$\frac{\alpha}{2} = 60^\circ$$

$$\alpha = 120^\circ$$

$$\text{QRR} = \frac{360 - 120}{120} = \frac{240}{120}$$

$$\text{QRR} = 2$$

219. The number of links in a pantograph is :
(a) 3 (b) 4
(c) 5 (d) 6

J & K PSC Screening, 2006

Ans. (b) : The pantograph is a four bar mechanism used to enlarge or reduce drawings.

220. Shaft rotating inside bearing is an example of :
(a) Higher pair (b) Lower pair
(c) Unclosed pair (d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : Shaft rotating inside bearing is an example of lower pair.

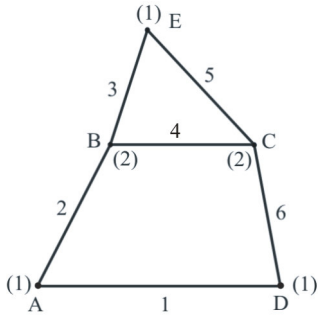
221. A six-link mechanism is required to have mobility or degree of freedom equal to one. All the pairs in the mechanism are single degree of freedom pairs. Pick the correct statement about the mechanism:

Search on Telegram @apna_pdf

(a) It will have six pairs.
(b) It will have 7 pairs and all the links will be binary links
(c) It will have 7 pairs and two of the six links will be ternary links.
(d) It is not possible to have a mechanism with six links.

RPSC AEN Pre-2013

Ans. (c) :



link = 6, joint = 7 = (1) + (1) + (1) + (2) + (2)

Degree of freedom (F) = 3 (l – 1) – 2j – h

= 3 (6 – 1) – 2 × 7 – 0

[∵ h = higher pair = 0]

= 3 × 5 – 2 × 7

= 15 – 14

= 1

2. Velocity and Acceleration Analysis

222. The Coriolis component of acceleration is considered in

(a) Four-bar chain mechanism
(b) Quick return motion mechanism
(c) Slider-crank mechanism
(d) All of the above
(e) None of these

RPSC ACF & FRO, 26.02.2021
PPSC Asstt. Municipal Engineer 15.06.2021
CIL MT 27.02. 2020, TSPSC AEE 2017
HPPSC Asstt. Prof. 18.09.2017
CIL MT 26.03.2017
UJVNL AE 2016, RPSC AE 2016
GMB AAE 25.06.2017, CGPSC AE 16.10.2016
TANGEDCO AE 2015
TNPSC AE 2013, TSPSC AEE 2015
UKPSC AE 2012 Paper-I, HPPSC Asstt. Prof. 2014
Mizoram PSC AE/SDO 2014 Paper-II
RPSC ACF 2011

Ans. (b) : Coriolis component of acceleration exists when there is sliding motion of a slider which is sliding on a link which itself is rotating. In quick return motion mechanism and crank and slotted liver mechanism coriolis component of acceleration will exist.

Coriolis component of acceleration (a_c) = $2V\omega$.

223. If a mechanism has n links, then the number of instantaneous centers would be equal to :

(a) n (b) n(n – 1)/2
(c) n/2 (d) (n – 1)

GPSC DEE Class-2 (GWSSB) 04.07.2021
APGCL AM, 2021
ESE 2020
WBPSC AE, 2017
CGPSC Polytechnic Lecturer 2017
Nagaland PSC CTSE 2017, Paper-I
GPSC Asstt. Prof. 28.08.2016

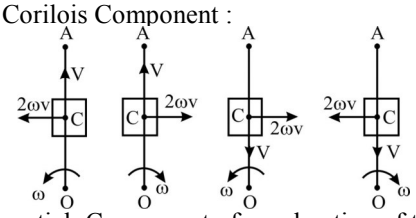
226. Coriolis component of acceleration is present exists whenever a point moves along a path that has :

(a) tangential acceleration
(b) centripetal acceleration
(c) linear motion
(d) rotational motion

MECON MT 2019
APPSC AEE Mains 2016, Paper-III
(KPSC AE 2015)
Kerala PSC AE 06.08.2015
UKPSC AE-2013, Paper-I
WBPSC AE 2008

Ans : (d) Coriolis Component of acceleration is present exists whenever a point moves along a path that has rotational motion.

Corilois Component :



This tangential Component of acceleration of the Slider B with respect to the coincident point C on the link is known as coriolis Component of acceleration and is always perpendicular to the link

∴ Coriolis Component of the acceleration of B with reference of C .

$$a_{BC}^{C} = a_{BC}^{t} = 2\omega V$$

ω = Angular velocity of the link oA .

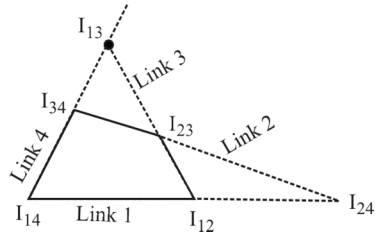
V = Velocity of Slider B with respect of Coincident Pont C .

227. The number of instantaneous centres in a four bar mechanism is

(a) 5 (b) 7
(c) 6 (d) 4

JPSC AE 10.04.2021, Paper-II
Jharkhand Urja Vikas Nigam Ltd. AE 2017
GPSC Lect. (Auto) 16.10.2016
TNPSC AE (Industries) 09.06.2013

Ans. (c) :



Number of instantaneous centres (N) in a four bar mechanism

$$N = \frac{n(n-1)}{2} = \frac{4(4-1)}{2} = 6$$

N = 6

228. The coriolis component of acceleration acts:

(a) along the sliding surface
(b) perpendicular to the sliding surface
(c) at 45° to the sliding surface
(d) parallel to the sliding surface

Punjab PSC SDE 12.02.2017
Karnataka PSC AE, 10.09.2017
TSPSC Managers, 2015
UKPSC AE-2013, Paper-I

Ans. (b) : The component 2ωV is known as the coriolis acceleration component. It comes into pircture when a body has its motion relative to a moving body, for example motion of a slider on a rotating link.

• The direction of the coriolis acceleration component is obtained by rotating the radial velocity vector 'v' through 90° in the direction of rotation of the link.

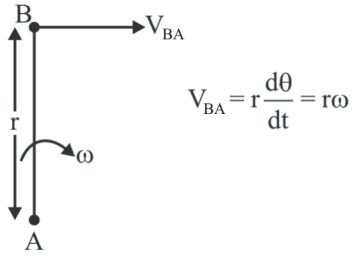
Coriolis component is always perpendicular to the sliding link and in the direction of rotation of the link.

229. The relative velocity of end B with respect to other end A in a rigid link AB is:

(a) perpendicular to AB (b) parallel to AB
(c) along AB (d) inclined to AB

CIL MT 27.02.2020
GPSC ARTO Pre 30.12.2018
HPPSC Asstt. Prof. 20.11.2017
PTCUL AE 25.06.2017

Ans. (a) : The relative velocity of any point with respect to any other point on a moving link is perpendicular to the line joining the point.

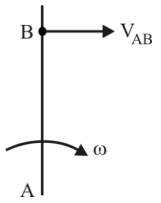


230. The linear velocity of a point B on a link rotating at an angular velocity ω relative to another point A on the same link is :

(a) $\omega^2 \times AB$ (b) $\omega \times AB$
(c) $\omega \times (AB)^2$ (d) $\frac{\omega}{AB}$

Assam PSC CCE Pre 2015
MPSC HOD (Govt. Poly. Colleges) 04.10.2014
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
TNPSC ACF 2012

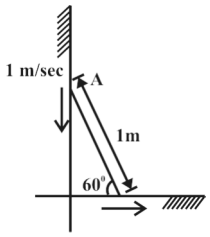
Ans. (b) : Relative velocity



$V_{AB} = \omega \times AB$

231. A rod of length 1 meter is sliding in a corner as shown in the figure. At an instant the velocity of point 'A' on the rod is 1m/sec when the rod makes an angle of 60^0 with the horizontal plane. The angular velocity of rod at that instant is:

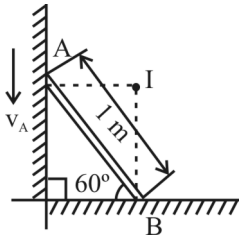
Search on Telegram @apna_pdf



(a) 2 rad/sec (b) 1.5 rad/sec
(c) 0.5 rad/sec (d) 0.75 rad/sec

UPPSC AE 12.04.2016 Paper-I
OPSC Civil Services Pre. 2011
ESE 2009, GATE 1996

Ans. (a) :



Length of rod = 1m
velocity of point A,
$(v_A) = 1m/s$
Let the angular velocity of rod AB about I at that instant be ω

$$v_A = I_A \times \omega$$
$$v_A = (AB \cos 60^0) \times \omega$$
$$= (AB \cos 60^0) \times \omega$$
$$= 1 \times \frac{1}{2}\omega$$
$$\Rightarrow v_A = \frac{\omega}{2}$$
$$\omega = 1 \times 2 = 2 rad/s$$
$$\boxed{\omega = 2 rad/sec}$$

232. When a slider moves with a velocity 'V' on a link rotating at an angular velocity 'ω' then the magnitude of Corioli's component of acceleration is given by

(a) $\sqrt{2}\,V\omega$ (b) $V\omega$
(c) $\frac{V\omega}{2}$ (d) $2\,V\omega$

MPPSC AE 2016
TSPSC AEE 20015
UKPSC AE 2007 Paper -I

Ans. (d) : $a_c = 2\,V\omega$

233. The direction of linear velocity of any point on a link with respect to another point on the same link is

(a) Perpendicular to the link joining the points
(b) At 45^0 to the link joining the points
(c) Parallel to the link joining the points
(d) At 90^0 to the link joining the points

GPSC DEE, Class-2 (GWSSB) 04.07.2021
RPSC Vice Principal ITI 2018
Rajasthan Nagar Nigam AE 2016, Shift-I
TNPSC AE Industries 09.06.2013

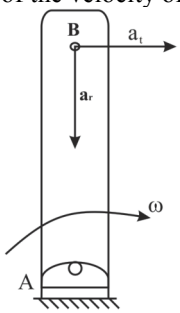
Ans. (a) : The direction of linear velocity of any point on a link with respect to another point on the same link is perpendicular to the link joining the points.

234. A point B on a rigid link AB moves with respect to A with angular velocity ω rad/s. The total acceleration of B with respect to A will be equal to

(a) vector sum of radial component and cariolis component
(b) vector sum of tangential component and cariolis component
(c) vector sum of radial component and tangential component
(d) vector difference of radial component and tangential component

Rajasthan Nagar Nigam AE 2016, Shift-II
NPCIL ET, 2015
TNPSC AE 2013

Ans. (c) : Where-
$a_t \rightarrow$ Tangential component of acceleration [due to change in angular acceleration]
$a_r \rightarrow$ Radial component of acceleration due to change in direction of the velocity of the link.



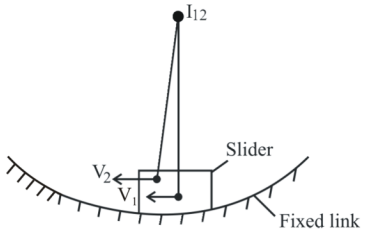
$$a = a_t + a_r$$
$$= AB \times \alpha + AB\,\omega^2$$
$$= AB\,[\alpha + \omega^2]$$

235. When a slider moves on a fixed link having curved surface, their instantaneous centre lies

(a) At the centre of circle
(b) At the pin joint
(c) On their point of contact
(d) At the centre of curvature

RPSC AE 2018
Rajasthan AE (Nagar Nigam) 2016 Shift-3
GATE 1992

Ans. (d) : When slider moves on fixed link having curved surface their instantaneous centre lies on centre of curvature of the curvilinear path in the configuration at that instant.



If n is the no. of links then,
Instantaneous centre $(I) = \frac{n(n-1)}{2}$

Search on Telegram @apna_pdf

236. The component of the acceleration, parallel to the velocity of the particle, at the given instant is called

(a) radial component
(b) tangential component
(c) Coriolis component
(d) axial component

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Punjab PSC SDE 12.02.2017
Rajasthan Nagar Nigam AE 2016 Shift-II

Ans. (b) : tangential component

$$\boxed{a_t = r \times \alpha}$$

237. Kliens construction can be used when

(a) crank has uniform angular velocity
(b) crank has non-uniform velocity
(c) crank has uniform angular acceleration
(d) crank has a uniform angular velocity and angular acceleration

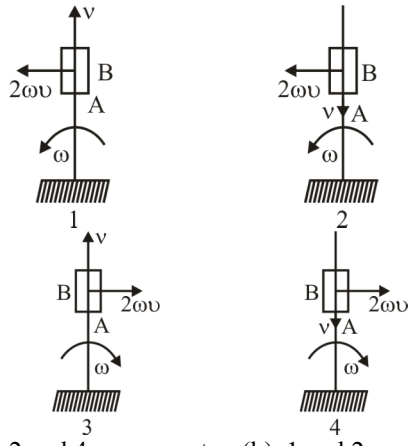
HPPSC Asstt. Prof. 18.09.2017
TNPSC AE 2014

Ans. (a) : Klein's Construction–This construction is applied only in basic single-slider crank mechanism.
When, uniform angular velocity, ω = Constant

$$\frac{d\omega}{dt} = 0$$

$$\boxed{\alpha_{crank} = 0}$$

238. The direction of Coriolis component of acceleration, 2ωv, of the slider A with respect to the coincident point B is shown in the figure below :



(a) 2 and 4 are correct (b) 1 and 2 are correct
(c) 1 and 3 are correct (d) 2 and 3 are correct

OPSC Civil Services Pre. 2011
ESE 1995

Ans. (c) : As far as direction of Coriolis acceleration is concerned,

- If velocity of Slider is away from center of rotations of link, the coriolis acceleration will be in direction of ω.
- If direction of slider velocity in toward the centre of rotation, the coriolis acceleration will be opposite to rotation ω.

So the figure 1 and 3 are correct.

239. The two links OA and OB are connected by a pin joint at O. The link OA turns with angular velocity ω_1 rad/s in the clockwise direction and the link OB turns with angular velocity ω_2 rad/s in the anticlockwise direction. The rubbing velocity at the pin joint O is given by (where r = radius of the pin at O) :

(a) $(\omega_1 + \omega_2)r$ (b) $(\omega_1 - \omega_2)r$
(c) $\omega_1 \cdot \omega_2 . r$ (d) $(\omega_1 - \omega_2)2r$

CGPSC AE 15.01.2021
ESE 1998

Ans. (a) : $\boxed{\text{Sliding Velocity } (v_s) = (\omega_1 + \omega_2)\, r}$

240. The number of Instantaneous Centers in a 6 link mechanism are

(a) 6 (b) 15
(c) 10 (d) 20

TSPSC Managers, 2015
UKPSC AE 2007, 2012 Paper-I

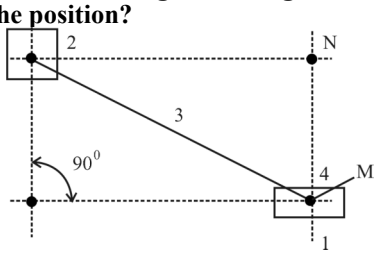
Ans. (b) : link (l) = 6

No. of Instantaneous centre $= \frac{n(n-1)}{2}$

$$= \frac{6(6-1)}{2}$$

$$= \frac{6 \times 5}{2} = 15$$

241. The figure below shows a planar mechanism with single degree of freedom. The instant centre I_{24} for the given configuration is located at the position?



(a) L (b) M
(c) N (d) ∞

RPSC ADE 2016
GATE 2004

Ans. (d) : Total instantaneous context

12 13 14
23 24
34

$I_{14} \rightarrow$ at infinite
$I_{12} \rightarrow$ at infinite
$I_{23} \rightarrow$ at L
$I_{34} \rightarrow$ at M

I_{24} will be at intersection point of line $I_{12} - I_{14}$ and I_{23}-I_{34}. These two line will intersect each other at infinity, So
I_{24} will be at infinity.
I_{13}will be at N.

242. Instantaneous center of a body rolling with sliding on a stationary curved surface lies

(a) At point of contact
(b) On the common tangent at the point of contact
(c) On the common normal at the point of contact
(d) None of these are correct

MPPSC AE 2016, GATE 1992

Search on Telegram @apna_pdf

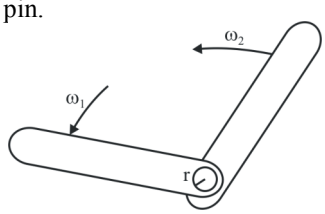
Ans : (c) Instantaneous centre of a body rolling with sliding on a stationary curved surface lies on the common normal at the point of contact.

243. If ω_1 and ω_2 are the angular velocities of the two links which are connected by a pin joint where radius of the pin is r, the rubbing velocity at the pin joint when the links are moving in same direction is given by:

(a) $(\omega_1 - \omega_2)r$ (b) $(\omega_1 + \omega_2)r$
(c) $2(\omega_1 - \omega_2)r$ (d) $2(\omega_1 + \omega_2)r$
(e) $3(\omega_1 - \omega_2)r$

CGPSC Polytechnic Lecturer 2017
APPSC AEE Mains 2016, Paper-III

Ans. (a) Rubbing Velocity– It is defined as the algebraic sum between the angular velocities of the two links which are connected by pin joints, multiplied by the radius of pin.



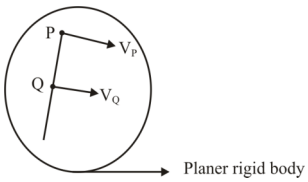
Rubbing velocity, when two links have same direction
$= (\omega_1 - \omega_2) \times r$
Rubbing velocity, when two links have opposite direction of rotation.
$= (\omega_1 + \omega_2) \times r$

244. For two points A and B located on a planar rigid body, the relative velocity between the two points:

(a) should always be perpendicular to AB
(b) should always be perpendicular to AB when the body undergoes pure translation
(c) should always be along AB
(d) can be oriented along any direction

UPRVUNL AE 2014
GATE 2010

Ans : (a)



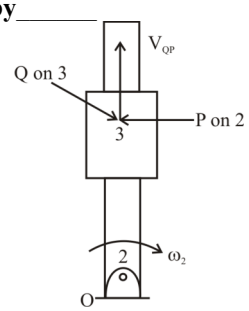
V_{PQ} = Relative velocity between P and Q
$V_{PQ} = V_p - V_Q$ Always perpendicular to PQ
Considering two points P and Q on a rigid body. The relative position of point P with respect to Q is r_{PQ}. The relative velocity of P with respect to Q is $V_{PQ} = \dot{r}_{PQ}$. If the relative distance between the P and Q does not change then V_{PQ}

$V_{PQ} = \dot{r}_{P/Q} = \omega \times \dot{r}_{P/Q}$

ω is the angular velocity of the rigid body.

Since V_{PQ} is the cross product of ω and $\dot{r}_{P/Q}$ the relative velocity of P with respect to Q will be perpendicular to PQ.
Note :– The commission has given answer option (d).

245. Link 2 rotates with constant angular velocity ω_2. Slider link 3 moves with a constant relative velocity $V_{Q/P}$, where Q is a point on slider 3 and P is a point on link 2. The magnitude and direction of Coriolis component of acceleration is given by_____



(a) $2\omega_2 V_{Q/P}$; direction of $V_{Q/P}$ rotated by 90º in the direction ω_2
(b) $\omega_2 V_{Q/P}$; direction of $V_{Q/P}$ rotated by 90º in the direction ω_2
(c) $2\omega_2 V_{Q/P}$; direction of $V_{Q/P}$ rotated by 90º opposite to the direction of ω_2
(d) $\omega_2 V_{Q/P}$; direction of $V_{Q/P}$ rotated by 90º opposite to the direction ω_2

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

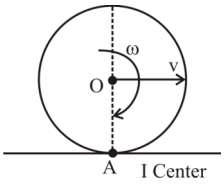
Ans. (a) : Coriolis component of acceleration
$= 2\omega_2 \times V_{Q/P}$
Direction of acceleration (Coriolis) perpendicular to slider and in direction of ω_2.

246. A circular object of radius r rolls without slipping on a horizontal level floor with the center having velocity V. The velocity at the point of contact between the object and the floor is___.

(a) V opposite to the direction of motion
(b) V in the direction of motion
(c) Zero
(d) V vertically upward from the floor

Assam Engg. College AP/Lect. 18.01.2021
GATE 2014

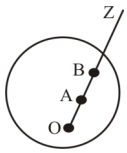
Ans. (c) :



Velocity of point 0 = $\omega \times OA$
$= \omega \times r$
Velocity at point of contact (A)
$= \omega \times AA$
$= \omega \times 0$
$V_A = 0$

Common data for questions 130 and 131
The circular disc shown in its plane view in the figure rotates in a plane parallel to the horizontal plane about the point O at a uniform angular velocity ω. The other points A and B are located on the line OZ at a distance r_A and r_B from O respectively.

Search on Telegram @apna_pdf



247. The velocity of point B with respect to A is a vector of magnitude

(a) 0

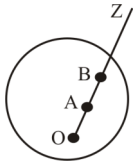
(b) $\omega(r_B - r_A)$ and direction opposite to the direction of motion of point B.

(c) $\omega(r_B - r_A)$ and direction same as the direction of motion of point B.

(d) $\omega(r_B - r_A)$ and direction being from O to Z.

TSPSC AEE 2017
GATE 2003

Ans. (c) :



$\rightarrow$ B has the linear velocity $\omega_B r_B$

$\rightarrow$ A has linear velocity $\omega_A r_A$

Obviously $\omega_B r_B > \omega_A r_A$, because, $\omega_A = \omega_B = \omega$

$r_B > r_A$

So, relative velocity = $\omega(r_B - r_A)$ in the direction of motion of point B.

248. The acceleration of point B with respect to point A is a vector of magnitude

(a) 0

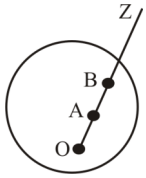
(b) $\omega(r_B - r_A)$ and direction opposite to the direction of motion of point B.

(c) $\omega(r_B - r_A)$ and direction same as the direction of motion of point B.

(d) $\omega^2(r_B - r_A)$ and direction being from Z to O.

TSPSC AEE 2017
GATE 2003

Ans. (d) :



Acceleration of point B with respect to point A

$$\alpha_{B/A} = \bar{\omega} \times v_{B/A} = \omega \times \omega(r_B - r_A) = \omega^2 (r_B - r_A)$$

and direction from Z to O

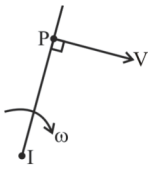
249. The velocity of any point 'P' on a body rotating with angular velocity 'ω' and with instantaneous centre of rotation 'I' is equal to:

(a) $P/\omega I$ (b) $IP\omega$

(c) $I/P\omega^2$ (d) $I^2P\omega^2/2$

HPPSC Lect. (Auto) 23.04.2016
(HPPSC LECT. 2016)

Ans. (b) :



Tangential velocity of point P with respect to I

V = radial distance × angular velocity.

$V = IP\omega$

250. The instantaneous center of rotation is a point of zero

(a) Angular velocity (b) Linear velocity

(c) Displacement (d) Acceleration

(e) Acceleration and Displacement

HPPSC Lect. (Auto) 23.04.2016
CGPSC AE 26.04.2015 Shift-I

Ans. (b) : Instantaneous center of velocity—
Any point on a rigid body or on its extension that has zero velocity is called the instantaneous center of velocity of the body.

251. A mechanism has 7 links with all binary pairs except one which is ternary pair. The number of instantaneous centres of this mechanism are:

(a) 14 (b) 21

(c) 28 (d) 42

TSGENCO AE 14.11.2015
OPSC Civil Services Pre. 2011

Ans. (c) : Number of links = 6 binary + 1 ternary

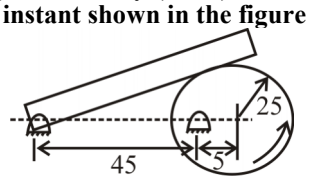
= 6 binary + 2 binary ($\because$ 2B = 1T)

= 8 binary

$$\text{Instantaneous centers of the Mechanism} = \frac{n(n-1)}{2}$$

$$= \frac{8(8-1)}{2} = 28$$

252. In the mechanism given below, if the angular velocity of the eccentric circular disc is 1 rad/s, the angular velocity (rad/s) of the follower link for the instant shown in the figure is_____



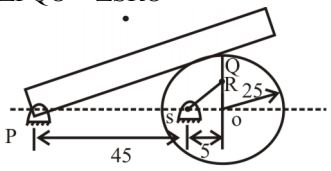
Note: All dimensions are in mm.

(a) 0.1 (b) 0.05

(c) 5.0 (d) 10.0

Assam Engg. College AP/Lect. 18.01.2021
GATE 2012

Ans. (a) : $\Delta PQO \sim \Delta SRO$



(Velocity will be some on Q & R because they are on same link)

$$\therefore \quad \frac{PQ}{RS} = \frac{PO}{OS}$$

$$PQ = \sqrt{(45+5)^2 - 25^2}$$

= 43.3 mm

Then,

Search on Telegram @apna_pdf

$$\frac{43.3}{RS} = \frac{50}{5}$$

$RS = 4.33$ mm

$VR = VQ = RS \times \omega$

$= 4.33 \times 1$

$VQ = 4.33$

$$\omega_{PQ} = \frac{VQ}{PQ} = \frac{4.33}{43.3} = 0.1 \text{ rad/sec.}$$

Velocity will be some on Q & R because they are on same link.

253. The component of acceleration parallel to the link is called

(a) radial (b) tangential
(c) Coriolis (d) absolute

Assam PSC AE (IWT) 14.03.2021

Ans. (a) : The radial component also known as the normal component is parallel to the link and always exists as long as there is angular velocity.
The acceleration of a particle whose velocity changes both in magnitude and in a direction at any instant has the radial component and the tangential component.

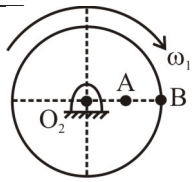
254. The velocity of an intermediate point on any of the links can be found by dividing the corresponding.....vector in the same ratio as the point divides the link.

(a) Position (b) Direction
(c) Acceleration (d) Velocity

HPPSC AE (PWD) 10.09.2016

Ans. (d) : The velocity of an intermediate point on any of the links can be found by dividing the corresponding velocity vector in the same ratio as the point divides the link.

255. Figure shows a wheel rotating about O_2. Two points A and B located along the radius of wheel have speeds of 80 m/s and 140 m/s respectively. The distance between the point A and B is 300 mm. The radius of the wheel (in mm) is_____



(a) 1400 (b) 400
(c) 700 (d) 800

Assam Engg. College AP/Lect. 18.01.2021

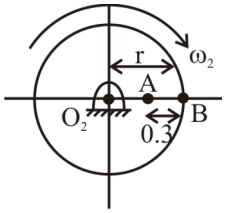
Ans. (c) : Given,

$AB = 300$ mm

$= 0.3$ m

$V_A = 80$ m/s

$V_B = 140$ m/s



Assume radius = r(m)

$$\frac{V_A}{r - 0.3} = \frac{V_B}{r}$$

$$\frac{80}{r - 0.3} = \frac{140}{r}$$

$80r = 140r - 42$

$$r = \frac{42}{60}$$

$r = 0.7$ m

or $r = 700$ mm

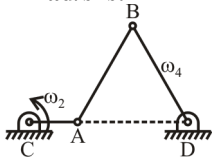
256. If three bodies have planer motion, their instantaneous centres lie on :

(a) two parallel lines
(b) two perpendicular lines
(c) two intersecting non-perpendicular lines
(d) on same straight line

JPSC AE 10.04.2021, Paper-II

Ans. (d) : According to kennedy's theorem-
If three bodies have planer motion their instantaneous centre lies on same straight line.

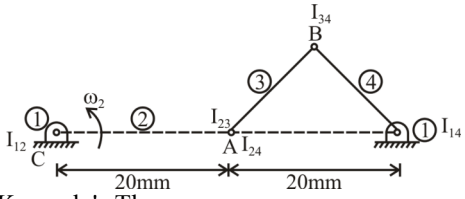
257. In the mechanism shown here, points C, A and D are in same straight line. If CA = 20 mm, CD = 40 mm and ω_2 = 4rad/s (CCW), then the value of ω_4 in rad/s is:



(a) 3.5 (CCW) (b) 4.0 (CCW)
(c) 4.0 (CW) (d) 3.5 (CW)

AAI Jr. Executive 26.03.2021

Ans. (c) : Given, $\omega_2 = 4$ rad/sec (CCW)
CA = 20 mm
CD = 40 mm



From Kennedy's Theorem,

$\omega_2(I_{12}I_{24}) = \omega_4(I_{14}I_{24})$

$4(20) = \omega_4(20)$

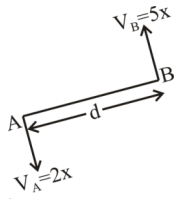
$\omega_4 = 4$rad/s (CW)

258. Two points on a link are moving with velocities of 5x and 2x perpendicular to the link in the same direction, separated by a distance d. What is the angular velocity of the link?

(a) 7x/d (b) 10x/d
(c) 3x/d (d) 2.5x/d

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (c) :



$V_{AB} = 5x - 2x$

Search on Telegram @apna_pdf

$= 3x$

We know that,

$$V_{AB} = d \times \omega_{AB}$$

$$\boxed{\omega_{AB} = \frac{3x}{d}}$$

259. Under which of the following conditions is Coriolis component encountered in the relative acceleration of two points?

1. The two points are coincident, but on different links.
2. The point on one link traces a path on the other link.
3. The link that contains the path rotates.

Select the correct answer using the code given below:

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 18.07.2021

Ans. (d) : Coriolis component encountered in the relative acceleration of two points when-

- The two points are coincident, but on different links.
- The point on one link traces a path on the other link.
- The link that contains the path rotates.

260. Coriolis component of the acceleration is experienced:

(a) by a point on one link that is subjected to both dynamic and static forces.
(b) by a rotating link with varying angular velocity
(c) by a rotating link with varying angular displacement.
(d) by a point on one link that is sliding along another rotating link

NLCIL GET 17.11.2020, Shift-II

Ans. (d) : Coriolis component of the acceleration is experienced by a point on link that is sliding along another rotating link. The component $2v\omega$ is known as coriolis acceleration component.

$$a_{coriolis} = 2v\omega$$

A crank and slotted lever mechanism has coriolis component $2\omega v_{slide.}$

261. The Coriolis component of acceleration depends on

(a) velocity and acceleration of the slider
(b) angular velocity and angular acceleration of the link
(c) velocity of the slider and angular velocity of the link
(d) acceleration of slider and angular velocity of the link

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : The Coriolis component of acceleration depends on-

Coriolis acceleration, $(a_c) = 2\omega v$

v = velocity of slider

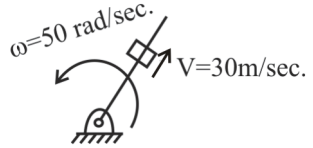
ω = Angular velocity of the link

262. If a block slides outward on a link at a uniform rate of 30 m/s, while the link is rotating at a constant angular velocity of 50 rad/s counter clockwise, the Coriolis component of acceleration is_____m/s^2.

(a) 1000 (b) 1500
(c) 3000 (d) 4500

ISRO Scientist/Engineer 12.01.2020

Ans. (c) :



Coriolis component of acceleration,

$a_c = 2\omega V = 2 \times 30 \times 50$

$a_c = 3000\ m/sec^2$

263. The magnitude of the velocity of any point on the kinematic link relative to the other point on the same kinematic link is the product of

(a) A square root of an angular velocity of the link and the distance between the two points under consideration
(b) An angular velocity of the link and the square of distance between the two points under consideration
(c) A square of an angular velocity of the link and the distance between the two points under consideration
(d) An angular velocity of the link and the distance between the two points under consideration

ESE 2020

Ans. (d) : An angular velocity of the link and the distance between the two points under consideration.

264. Where will be the instantaneous centre of rotation of a point A having linear velocity v equal to zero?

(a) Instantaneous centre of rotation will be at infinity of a point A
(b) Instantaneous centre of rotation will be at itself of a point A
(c) Instantaneous centre of rotation will be at distance r from point A
(d) Instantaneous centre of rotation will not exist for a point A

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : $v = r\omega$

$\because \quad r = 0$

$\therefore \quad v = 0$

265. Which of the graphical methods is NOT used for determining the velocity and acceleration of the reciprocating parts in an engine?

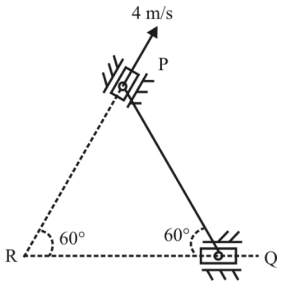
(a) Klien's construction
(b) Ritterhaus' construction
(c) Bennett's construction
(d) Mohr's circle diagram

APPSC Poly Lect. Automobile Engg., 2020

Search on Telegram @apna_pdf

Ans. (d) : Following graphical methods is used for determining the velocity and acceleration of the reciprocating parts in an engine –
(a) Klien's construction
(b) Ritterhaus' construction
(c) Bennett's construction

266. A rigid rod PQ shown in Figure is connected to two sliders at each end through pins. The sliders can slide along PR and QR. If the velocity of the slider at P is 4m/s, the velocity of the midpoint of the rod PQ at this instant is :



(a) 4 m/s (b) 3 m/s
(c) 2 m/s (d) 1 m/s

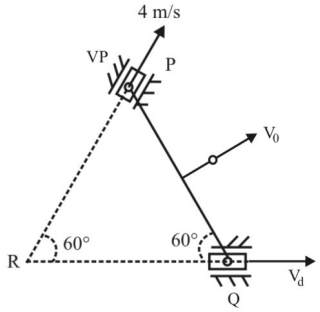
ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (c) : $\frac{v_P}{PQ} = \frac{v_0}{OQ}$

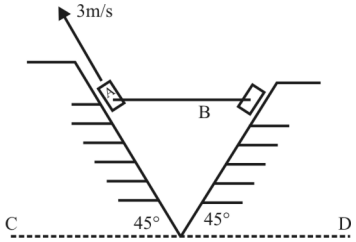
$\frac{4}{PQ} = \frac{v_0}{\frac{PQ}{2}}$

$4 = 2v_0$

$\boxed{v_0 = 2m/s}$



267. For the position of the mechanism shown in Figure, find the velocity of the slider B for the given configuration if the velocity of the slider A is 3m/s. Consider AB as a rigid link and is parallel to CD at this instant.



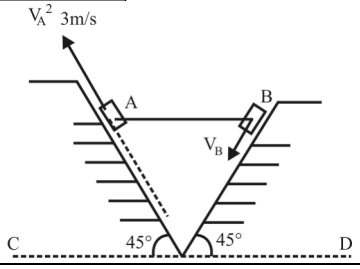
(a) 3m/s (b) $3\sqrt{2}m/s$
(c) $3/\sqrt{2}m/s$ (d) $1.5m/s$

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) : $V_A \cos 45° = V_B \sin 45°$

$3 \times \frac{1}{\sqrt{2}} = V_B \times \frac{1}{\sqrt{2}}$

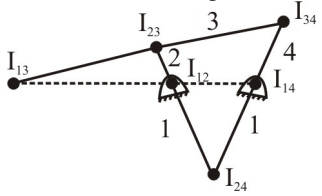
$\boxed{V_B = 3m/\sec.}$



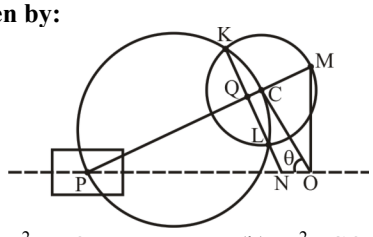
268. _____ is not associated with the vector calculus.
(a) Stokes's theorem (b) Gauess Theorem
(c) Kennedy's Theorem (d) Greens Theorem

Oil India Limited Sr. Engg. (Production) 30.11.2019

Ans. (c) : Kennedy's theorem- It is a three centre in-line theorem. Which states that if three links have relative motion with respect to each other, their relative instantaneous centre lies on straight line.



269. In the below figure, PC is the connecting rod and OC is the crank making an angle θ with the line of stroke PO and rotates with uniform angular velocity at ω rad/s. The Klein's acceleration diagram for determining the acceleration of the piston P is shown by quadrilateral CQNO. The acceleration of the piston P with respect to the crankpin C is given by:



(a) ω^2x NO (b) ω^2x CO
(c) ω^2x CN (d) ω^2x QN

Vadodara Muncipal Corp. DEE, 2018

Ans. (a) The Klein's acceleration diagram is drawn as discussed below–
(1) First of all draw a circle with 'C' as centre as 'CM' as radius.
(2) Draw another circle with PC as diameter.
Let this circle intersect the previous circle at K and L.
(3) Join KL and produce it to intersect PO at N. Let KL intersect PC at Q.
This forms the quadrilateral CQNO, which is known as Klein's acceleration diagram.

$\boxed{\text{Hence, Acceleration of piston}\left(a_p\right) = \omega^2 \times NO}$

Search on Telegram @apna_pdf

270. If the rotational speed of a crank of radius 50 cm is 100 RPM and the angular acceleration is 50 rad/s^2, then the tangential acceleration of the crank will be:

(a) 50 m/s^2 (b) 25 m/s^2
(c) 0.25 m/s^2 (d) 2.5 m/s^2

AAI Jr. Executive 29.11.2018

Ans. (b) : Given, $(\alpha) = 50$ rad/sec^2

$r = 50$ cm $= 50 \times 10^{-2}$ m

Tangential acceleration $(a_t) = r\,\alpha$

$= 50 \times 10^{-2} \times 50$

$= 2500 \times 10^{-2}$

$a_t = 25$ m/sec^2

271. A slider moving at 150 mm/s on a link rotating at 60 rpm will have ..... Coriolis acceleration.

(a) 600 π mm/s^2 (b) 400 π mm/s^2
(c) 700 π mm/s^2 (d) 300 π mm/s^2

RPSC AE 2018

Ans. (a) : Data given-

$N = 60$ rpm

$V = 150$ mm/s

We know that,

Coriolis acceleration

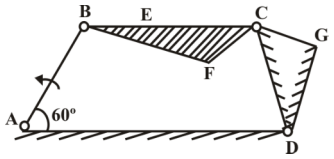
$a_c = 2\,V \times \omega$

$= \dfrac{2 \times 150 \times 2\pi \times N}{60}$

$= \dfrac{2 \times 150 \times 2\pi \times 60}{60}$

$\boxed{a_c = 600\pi \text{ mm/s}^2}$

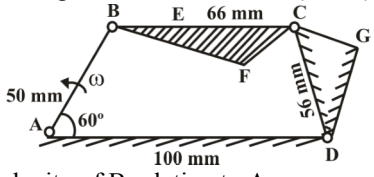
272. A four link mechanism shown in the figure has link lengths as AB = 50 mm, BC = 66 mm, CD = 56 mm and AD = 100 mm. If at an instant when $\angle DAB = 60^\circ$ and the link AB has an angular velocity of 10.5 rad/s in the counter - clockwise direction, the velocity of B relative to A (vector v_{ba}) (in m/s) of the point C is .....



(a) 0.131 (b) 0.262
(c) 0.393 (d) 0.525

RPSC AE 2018

Ans. (d) : Data given : $\omega = 10.5$ rad/s (CCW)

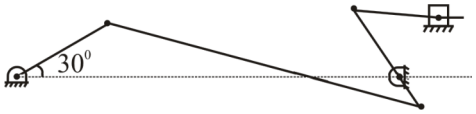


Then the velocity of B relative to A.

$V_{ba} = \omega \times AB = 10.5 \times 0.05$

$V_{ba} = 0.525$ m/s

273. Number of instantaneous centre for the mechanism will be



(a) 6 (b) 12
(c) 14 (d) 15

TNPSC AE 2018

Ans. (d) : Number of links in this mechanism (n) = 6

Number of I-centre

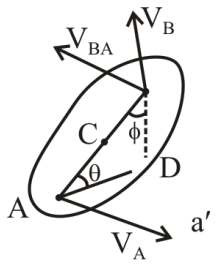
$= \dfrac{n(n-1)}{2} = \dfrac{6 \times (6-1)}{2} = 15$

274. A point B on a rigid link AB moves with respect to A with angular velocity ω rad/s. The radial component of the acceleration of B with respect to A, is

(a) $v_{BA} \times AB$ (b) v_{BA}/AB
(c) $v_{BA}^2 \times AB$ (d) v_{BA}^2 / AB

Nagaland PSC (CTSE) 2018, Paper-I

Ans. (d) :



$\omega_{AB} = \dfrac{v_{BA}}{AB} = \dfrac{ab}{AB}$

Vector $a'x = a_{BA}^r$

$= \dfrac{v_{BA}^2}{AB}$

v_{BA} = Velocity of B with respect to A.

275. A wheel accelerates uniformly from rest to 1200 rpm in 20 seconds. Its angular acceleration will be _____ rad/s^2.

(a) 1π (b) 2π
(c) 3π (d) 4π
(e) 5π

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : $N_1 = 0$ $N_2 = 1200$ rpm

$\omega_1 = 0$ $\omega_2 = \dfrac{2\pi N_2}{60} = \dfrac{2 \times \pi \times 1200}{60}$

$t = 20$ sec. $\omega_2 = 40\pi$ rad/sec.

Then angular acceleration (α)

$\alpha = \dfrac{\omega_2 - \omega_1}{t} = \dfrac{40\pi - 0}{20}$

$\boxed{\alpha = 2\pi \text{ rad/sec}^2}$

276. In a slider crank mechanism if the crank rotates at uniform speed of 200 rpm and has a length of 0.2 m, its linear velocity is:

(a) 4.19 m/s (b) 20.9 m/s
(c) 5.2 m/s (d) 41.9 m/s

TRB Polytechnic Lecturer 2017

Search on Telegram @apna_pdf

Ans. (a) : Data given as,

$N = 200$ rpm

$\ell = 0.2$ m

$V = ?$

We know that

$$V = r\omega = r \cdot \left[\frac{2\pi N}{60}\right]$$

$$V = \frac{0.2 \times 2 \times 3.14 \times 200}{60}$$

$$V = 4.186\,m/s \simeq 4.19\ m/s$$

277. In Klein's construction for reciprocating engine mechanism, the scale of acceleration diagram will be

(a) linear scale of configuration diagram

(b) Linear scale of configuration diagram multiplied by square of angular velocity of crank

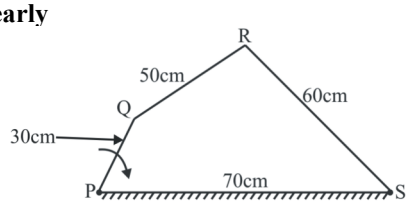
(c) square of the linear scale of configuration diagram

(d) square of the linear scale of configuration diagram multiplied by square of angular velocity of crank

BPSC AE Mains 2017 Paper - VI

Ans : (b) : Linear scale of configuration diagram multiplied by square of angular velocity of crank.

278. In the 4-bar mechanism as shown, the link PQ measures 30 cm and rotates uniformly at 100 rev/min. The velocity of point Q on link PQ is nearly



(a) 2.54 m/s (b) 3.14 m/s

(c) 4.60 m/s (d) 5.80 m/s

ESE 2017

Ans. (b) : $r_{PQ} = 30$ cm

$N = 100$ rpm

$$V_{PQ} = r_{PQ} \times \omega$$

$$= 0.3 \times \left(\frac{2\pi \times 100}{60}\right)$$

$= 3.14$ m/s

279. If two rigid bodies A and B are moving in the same plane relative to a third rigid body C, then the instantaneous centres of A relative to C, of B relative to C and B relative to A all lies.

(a) In a straight line (b) On a same point

(c) On a circle (d) None of these

PTCUL AE 25.06.2017

Ans. (a) : In a straight line

280. In the transmission system, the provision of slip joints allows a change in the :

(a) Angle of gear (b) Length of shaft

(c) Turning angle (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : In the transmission system, the provision of slip joints allow a change in the length of shaft.

281. If a point moves along a straight line which is rotating then the longitudinal component of acceleration is

(a) $\frac{V^2}{r}$ (b) $\frac{dv}{dt} - \omega^2 r$

(c) $\frac{dv}{dt}$ (d) $2v\omega + r \times \alpha$

(e) none of these

Where v = velocity of point along the straight line

ω = angular velocity of line

α = angular acceleration of the line

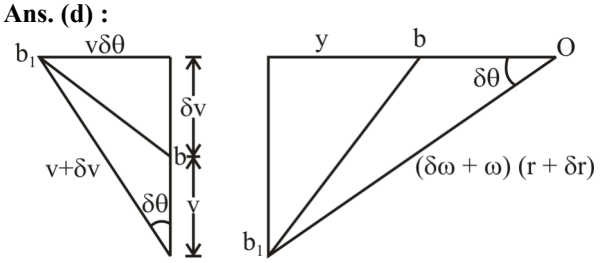
r = radius of the point

V = tangential velocity of the line

$= \omega \times r$

CGPSC AE 16.10.2016

Ans. (d) :



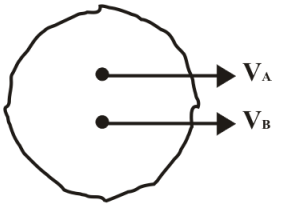
From these, we get,

$$a_{Bo} = \frac{vd\theta}{dt} + \frac{\omega dr}{dt} + \frac{rd\omega}{dt}$$

$= v \cdot \omega + \omega \cdot v + r\alpha$

$= 2v\omega + r\alpha$

282. If the direction of velocity at two different points (A and B) on a rigid body are parallel and equal in magnitude ($V_A = V_B$) as shown in figure. Then its instantaneous center will be:



(a) Outside the body but not at infinity

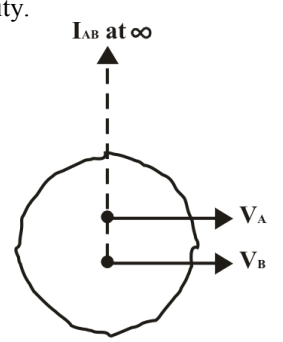
(b) At infinity

(c) On the surface of the body

(d) At centroid of the body

UPRVUNL AE 07.10.2016

Ans. (b) : If the direction of velocity at two different points (A and B) on a rigid body are parallel and equal in magnitude ($V_A = V_B$) then its instantaneous center will be at infinity.



Search on Telegram @apna_pdf

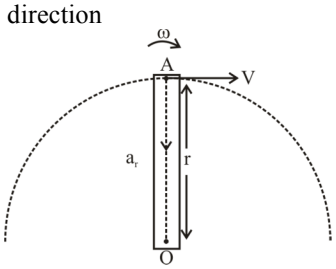
283. A link (OA) of length 'r' with centre 'O', rotates in a circular path in clockwise direction with constant angular velocity (ω). The tangential and radial acceleration of point (A) relative to center is respectively given by:

(a) $\omega^2 r$, 0 (b) $\omega^2 r$, $\omega^2 r$

(c) 0, 0 (d) 0, $\omega^2 r$

UPRVUNL AE 07.10.2016

Ans. (d) : For link OA which rotates in a circular path in clockwise direction



with constant angular velocity (ω = constant) so tangential acceleration will be zero, whereas radial or normal acceleration will be equal to $r\omega^2$

$$a_r = r\omega^2$$

284. In a general plane motion, if a body is rolling without slipping on stationary surface then the point of contact with stationary surface is the.....

(a) Axial of rotation

(b) Instantaneous centre of rotation

(c) Centroidal axis of rotation

(d) Point of inflexion

HPPSC AE (PWD) 10.09.2016

Ans. (b) : The instantaneous centre of rotation is the point fixed to a body under going planer movement that has zero velocity at a particular instant of time. At this instant the velocity vectors of the other points in the body generate a circular field around this point which is identical to what is generated by a pure rotation.

The number of instantaneous centre (N) in four bar mechanism.

$$N = \frac{n(n-1)}{2}$$

$$n = 4$$

$$N = \frac{(4-1)4}{2} = 6$$

285. Which one of the following is false for instantaneous center of rotation?

(a) At the instantaneous center of rotation, one rigid link rotates instantaneously relative to another for configuration of the mechanism concerned

(b) At the instantaneous centre of rotation, the two rigid links have no linear velocities relative to each other

(c) both (1) and (2) are true

(d) both (1) and (2) are false

TSGENCO AE 14.11.2015

Ans. (c) : Properties of instantaneous centre –

- At the instantaneous centre of rotation, one rigid link rotates instantaneously relative to another, for configuration of the mechanism concerned.
- The two rigid links have no relative velocity to each other at the instantaneous centre.
- The two rigid link have the same linear velocity relative to the third link or any other link.

286. In a link AB, the part B moves relative to A. If ω is the angular velocity and α_{AB} is the angular acceleration, the total acceleration of B relative to A will be

(a) $\omega_{AB}^2 \times AB + \alpha \times AB$

(b) $\omega_{AB} \times AB + \alpha \times AB$

(c) $\sqrt{\left(\omega_{AB}^2 \times AB\right)} + \alpha \times AB$

(d) $\sqrt{\omega_{AB}^2 \times AB + \alpha \times AB}$

TSGENCO AE 14.11.2015

Ans. (d) : ω = Angular velocity

α = Angular acceleration

link = AB

Radial Acceleration (centripetal acceleration) – Towards centre

$a_r = \omega^2 \times AB$

Tangential Acceleration – Change in magnitude of velocity

$$a_T = \alpha \times AB$$

Resultant, $a_R = \sqrt{(a_R)^2 + (a_T)^2}$

$$a_R = \sqrt{\omega^2 \times AB + \alpha \times AB}$$

287. The space Centrode of a Circular disc on a straight line path is :

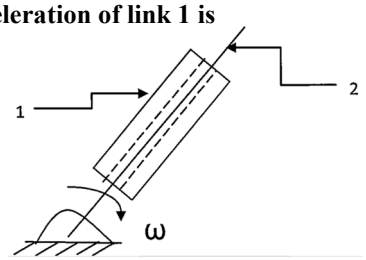
(a) A Circle (b) A parabola

(c) A straight line (d) A hyperbola

TSPSC Managers, 2015

Ans. (c) : The space centrode of a circular disc on a straight line path is straight line.

288. In the figure shown below, the relative velocity of link 1 with respect to link 2 is 15 m/s. The link 2 rotates at a constant speed of 150 rpm. The magnitude of Coriolis component of acceleration of link 1 is

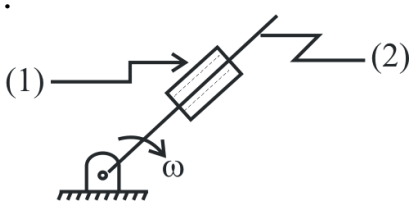


(a) 201 m/s^2 (b) 239 m/s^2

(c) 418 m/s^2 (d) 471 m/s^2

ISRO Scientist/Engineer 24.05.2014

Ans. (d) :



Search on Telegram @apna_pdf

$v = 15 m/s$

$\omega = \frac{2\pi n}{60}$

$N = 150 rpm$

$\omega = \frac{2\pi \times 150}{60}$

Coriolis Component of Acceleration

Coriolis Acceleration $\boxed{a_c = 2v\omega}$

$a_c = 2 \times 15 \times \frac{2\pi N}{60}$

$= 2 \times 15 \times \frac{2 \times \pi \times 150}{60}$

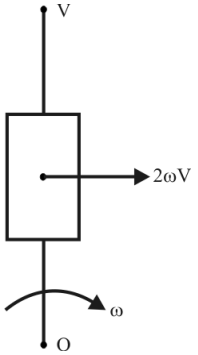
$a_c = 471 m/s^2$

289. A slider moves with uniform velocity V on a revolving link of length r with angular velocity ω. The Coriolis acceleration component of a point on the slider relative to a coincident point on the link is equal to :

(a) 2rω parallel to the link.
(b) 2ωV perpendicular to the link
(c) 2ωr perpendicular to the link
(d) 2ωV parallel to the link

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : Coriolis acceleration = 2ωV



The component 2Vω is known as Coriolis acceleration component.

The direction of the Coriolis acceleration component is obtained by rotating the radial velocity vector 'V' through 90° in the direction of rotation of the link.

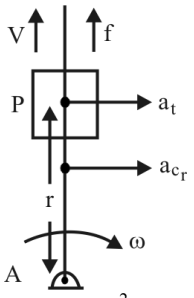
290. The component of the acceleration directed towards the centre of rotation of a revolving body is known as _____ component.

(a) tangential
(b) centripetal
(c) coriolis
(d) none of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : The component of the acceleration directed towards the centre of rotation of a revolving body is known as centripetal component.

Tangential acceleration $(a_t) = r\alpha$



Acceleration along AP = $f - \omega^2 r$

Centripetal acceleration $a_c = \omega^2 r$

Coriolis acceleration $a_{c_r} = 2V\omega$

291. The Coriolis component of acceleration is present in:

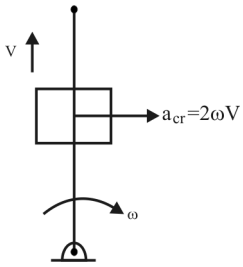
(a) four bar mechanism
(b) scotch yoke mechanism
(c) slider crank mechanism
(d) none of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (d) : The coriolis component of acceleration is present in mechanism which have rotation & translation on same link.

It exist in –

(a) Whitworth quick return mechanism
(b) Crank & slotter lever mechanism.



292. A slider sliding at 10 cm/s on a link, which is rotating at 60 rpm. The Coriolis acceleration of the slider is

(a) 40 cm/s^2 (b) 0.4π c cm/s^2
(c) 40π cm/s^2 (d) 20 cm/s^2

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (c) : Given

Sliding Velocity (V) = 10 cm/sec.

Link rotating (N) = 60 rpm

$\omega = \frac{2\pi N}{60}$

$\omega = \frac{2 \times \pi \times 60}{60}$

$\omega = 2\pi$ rad/sec

Coriolis Acceleration $(a^c) = 2v\omega$

$= 2 \times 10 \times 2\pi$

$= 40\pi$ cm/sec^2

293. Klein's diagram is used to find

(a) Angular velocity of various parts
(b) Velocity of various parts
(c) Acceleration of various parts
(d) Displacements of the various parts
(e) Velocity and acceleration of various parts

CGPSC AE 26.04.2015 Shift-I

Search on Telegram @apna_pdf

Ans. (e) : Klein's diagram is used to find velocity and acceleration of various parts of single slider crank mechanism.

294. A crank of radius 12 cm is rotating at 60 rpm with an angular acceleration of 50 rad/sec^2. The tangential acceleration of the crank is

(a) 4.75 m/s^2 (b) 5.2 m/s^2
(c) 6 m/s^2 (d) 7.4 m/s^2

TNPSC AE 2014

Ans. (c) : Given, r = 12 cm, N = 60 rpm

$\alpha = 50$ rad/sec^2

$a_t = ?$

We know that the tangential acceleration of the crank is given as

$a_t = r\alpha = 0.12 \times 50$

$a_t = 6$ m/s^2

295. In which of the following mechanism, the Coriolis acceleration exists ?

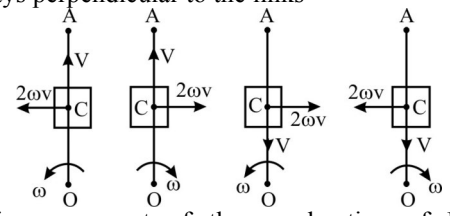
(a) Whitworth quick return mechanism
(b) Tangent cam mechanism
(c) Both (A) and (B)
(d) One of these

(HPPSC AE 2014)

Ans : (a) The Coriolis acceleration exists.

(i) Whitworth quick return mechanism

Coriolis component is on component of acceleration of the slider B with respect to the coincident point C on the link is known as coriolis component of acceleration and is always perpendicular to the links



Coriolis component of the acceleration of B with respect of C

$$a^C_{BC} = a^t_{BC} = 2\omega v$$

ω = Angular velocity of the link OA.

V = Velocity of slider respect to coincident point C.

296. The mechanical advantage for a rigid link AB, whose driving end is A whereas driven end is B (neglecting friction effect), is given by :

(a) V_A/V_B (b) V_B/V_A
(c) $V_B.V_A$ (d) None of the above

J&K PSC Civil Services Pre, 2013

Ans. (a) : Mechanical advantage is the ratio of the force produced by a machine to the force applied to it, used in a reserving the performance of a machine.

For no friction

Power input = Power output

$$\frac{F_{output}}{F_{input}} = \frac{V_{input}}{V_{output}} = \text{M.A.}$$

$$MA = \frac{V_A}{V_B} = \frac{V_{driver}}{V_{driven}}$$

297. A straight link has a straight slot along the length of the link in which a sliding block is free to slide. The slotted link is rotating at uniform angular velocity of 10 rad/s about one of its ends. The sliding block in the link is also moving outwards at a uniform speed of 5m/s relative to the slotted link. What is the magnitude of acceleration of the slider in a direction perpendicular to the link?

(a) 100 m/s^2 (b) 50 m/s^2
(c) 200 m/s^2 (d) Zero

RPSC AEN Pre-2013

Ans. (a) : Given- angular velocity (ω) = 1 rad/sec.

velocity (v) = 5 m/sec.

$\because$ magnitude of acceleration of the slider in a direction perpendicular to the link coriolis acceleration

$(a_c) = 2v\omega = 2 \times 5 \times 10$

$\boxed{a_c = 100 \text{ m/s}^2}$

298. A link is rotating about O Velocity of point P on link w.r.t. point Q on link will be perpendicular to

(a) OP
(b) OQ
(c) PQ
(d) Line in between OP and OQ

SJVN ET 2013

Ans. (c) : A link is rotating about O velocity of point P on link with respect to point Q on link will be perpendicular to PQ.

299. When a particle moves along a straight path, then the particle has

(a) normal component of acceleration only
(b) tangential acceleration only
(c) centripetal acceleration only
(d) both tangential and centripetal acceleration

TNPSC AE 2013

Ans. (b) When a particle moves along a straight path, then the particle has Radial/centripetal or normal component of $a_r = 0$

[because there is no change in the direction of the velocity (straight path)]

therefore the partial has only tangential acceleration

$a_t \neq 0$

Note : When a partial moves along a straight line or path with uniform velocity, there will be no radial as well as tangential acceleration.

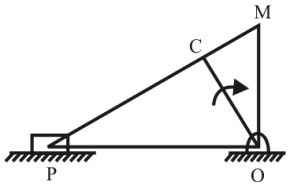
300. When two links are connected by a pin joint, their instantaneous centre lies

(a) on their point of contact
(b) at the centre of curvature
(c) at the centre of circle
(d) at the pin joint

JPSC AE 2013, Paper-V

Ans : (d) : At the pin joint.

301.



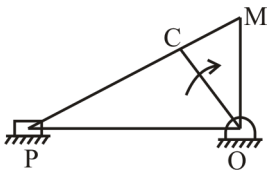
Search on Telegram @apna_pdf

A slider crank mechanism is shown in the above figure. OC is the crank, CP is the connecting rod, PC extended cuts the vertical line from O at M. Given OC =100 mm, OM = 15 mm, CP = 220 mm, CM = 17 mm ω of cranks = 10 rad/s. Find the velocity of the piston in mm/s?

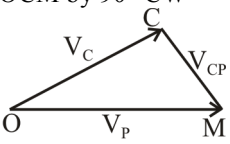
(a) 150 (b) 170
(c) 200 (d) 1000

UPSC JWM Adv. No-16/2009

Ans. (a) :



Rotating triangle OCM by 90° CW

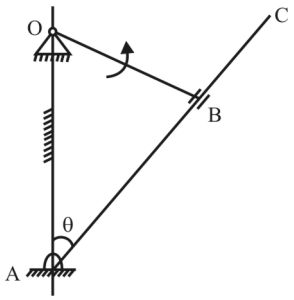


$$\frac{V_C}{OC}=\frac{V_{CP}}{CM}=\frac{V_P}{OM}=\omega$$

$$\frac{V_P}{OM}=10$$

$V_P = 10 \times 15 = 150$ mm/s

302.



A quick return mechanism is shown in the above figure. The crank OB = 100 mm running at 10 rad/s, fixed link OA = 200 mm. Which of the following statements is/are correct regarding coriolis component?

1. It is never zero
2. It is zero when θ = 0°
3. It is zero when θ = 30°
4. It is zero when $\tan\theta=\frac{1}{2}$

(a) 1 only (b) 2 and 3
(c) 2 and 4 (d) 3 and 4

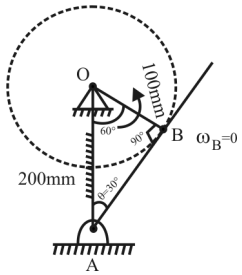
UPSC JWM Adv. No-16/2009

Ans. (b) : Coriolis Component (a_c) = 2Vω
V = Velocity of slider
ω = Angular velocity of the Crank

Case-I : When $\angle B = 90°$ (At extreme position)

i.e. $\sin\theta=\frac{OB}{OA}=\frac{100}{200}=0.5 \Rightarrow \theta=30°$

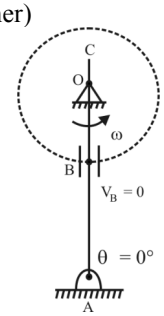
$\because \angle B = 90°$



At extreme position B:
i.e. ω = 0 (Angular Velocity)
∴ **Coriolis Component :**

$a_c = 2V\omega$
$= 2V \times 0$
$\boxed{a_c = 0}$

Case-II : When θ = 0° (i.e. fixed link and Crank Overlap on each other)



∴ $a_c = 2V\omega = 2 \times 0 \times w$
⇒ $\boxed{a_c = 0}$

303. In a single link robotic arm, the end effector slides upward along the link with a velocity of 0.5 m/s while the link rotates about revolute joint with an angular speed of 1 rad/s. When the endeffector is at a distance of 1 m from the joint, the acceleration experienced by the endeffector will be

(a) 1 m/s^2 (b) 1.41 m/s^2
(c) 1.71 m/s^2 (d) 2 m/s^2

DRDO Scientists 2009

Ans. (a) : Corolis acceleration given by
$a_c = 2\omega V = 2\times1\times0.5 = 1$ m/s^2

304. The number of links in a planar mechanism with revolute joints having 10 instantaneous centres is

(a) 3 (b) 4
(c) 5 (d) 6

DRDO Scientists 2009

Ans. (c) : Instantaneous centres $=\frac{n(n-1)}{2}=10$

$n(n-1) = 20$
$n = 5$

305. The motion of pulley (Figure) is controlled by cable C which has a constant acceleration of 0.225 m/s^2. The magnitude of angular acceleration of the pulley is

(a) 3 rad/s^2 (b) 4 rad/s^2
(c) 225 rad/s^2 (d) 6 rad/s^2

DRDO Scientists 2008

Search on Telegram @apna_pdf

Ans. (a) : Angular acceleration given by

$$a = r\alpha$$

$$\alpha = \frac{a}{r} = \frac{0.225}{0.075} = 3 \text{ rad/s}^2$$

306. In a reciprocating engine mechanism, the no. of links and instantaneous centres are

(a) 3, 3 (b) 4, 5
(c) 4, 6 (d) 5, 5

WBPSC AE 2008

Ans. (c) : Reciprocating engine mechanism is a single slider crank mechanism which has 4 links.

No. of instantaneous centre $= \frac{n(n-1)}{2}$

$$= \frac{4 \times 3}{2} = 6$$

307. In a mechanism, the fixed instantaneous centres are those centres which-

(a) Remain in the same place for all configurations of the mechanism
(b) Vary with the configuration of the mechanism
(c) Move as the mechanism moves, but joints are of permanent nature
(d) None of these

NPCIL ET, 2015

Ans. (a) : Fixed instantaneous centres remain in the same place for all configuration of the mechanism. The permanent instantaneous centre more when the mechanism moves, but the joints are the permanent nature.

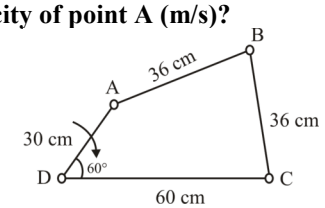
308. A body of mass 100 kg is rotating at a speed of 20 rad/s. The radius of rotation is about 20 m. The linear velocity of the body is _____ .

(a) 200 m/s (b) 800 m/s
(c) 400 m/s (d) 100 m/s

VIZAG MT, 14.12.2020

Ans. (c) : Given, M = 100 kg, ω = 20 rad/s, r = 20 m
Linear velocity (v) = $r\omega = 20 \times 20 = 400$ m/s

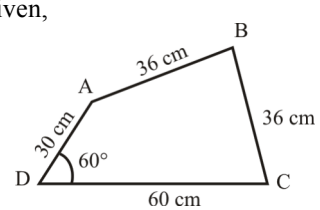
309. Consider a four bar mechanism shown in the given figure. The driving link DA is rotating uniformly at a speed of 100 rpm clockwise. Velocity of point A (m/s)?



(a) 3.00 (b) 3.14
(c) 3.25 (d) 4.00

GPSC ARTO Pre 30.12.2018, ESE 1999

Ans. (b) : Given,



N_{DA} = 100 rpm (clockwise)
r_{DA} = 30 cm = 0.3 m
$v_{DA} = r\,\omega_{DA}$

$$= r \times \frac{2\pi N_{DA}}{60}$$

$$= \frac{0.3 \times 2\pi \times 100}{60}$$

v_{DA} = 3.14 m/s

310. In a four bar mechanism the following instantaneous centre of rotation is not present:

(a) Fixed
(b) Permanent
(c) Neither fixed nor permanent
(d) Perpendicular to the line joining centre of rotations of crank and lever at infinity

UKPSC AE 2007 Paper -I

Ans. (d) : Perpendicular to the line joining centre of rotations of crank and lever at infinity

311. In a slider crank mechanism, piston velocity becomes maximum for the following configuration when crank is

(a) at inner dead centre
(b) at outer dead centre
(c) perpendicular to line of stroke
(d) perpendicular to connecting rod

UKPSC AE 2007 Paper -I

Ans. (c) : Perpendicular to line of stroke.

312. The link EF in a slider crank mechanism has a length of 0.4 m. The velocity of end E with respect to F is 4.9 m/s. The angular velocity of the link is :

(a) 0.01225 rad/s (b) 1.225 rad/s
(c) 12.25 rad/s (d) 1225.5 rad/s

TRB Polytechnic Lecturer 2017

Ans. (c) : Given,

ℓ = 0.4 m

V_{EF} = 4.9 m/s

Angular velocity $(\omega) = \frac{V_{EF}}{\ell} = \frac{4.9}{0.4}$

ω = 12.25 rad/s

313. The coriolis component of acceleration is taken into account for :

(a) Slider crank mechanism
(b) Quick return motion mechanism
(c) Four bar chain mechanism
(d) Double slider crank mechanism

TNPSC AE (Industries) 09.06.2013

Ans. (b) :

314. The angular Velocity in rad/s of a body rotating at N rpm is

(a) π N/60 (b) 2π N/60
(c) πN/120 (d) π N/180

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : 2π N/60

Search on Telegram @apna_pdf

3. Cams and Follower

315. For high speed engines, the cam follower should move with

(a) Uniform velocity
(b) Simple harmonic motion
(c) Uniform acceleration and retardation
(d) Cycloidal motion

GPSC DEE Class-2 (GWSSB) 04.07.2021
JPSC AE PRE 2019
Vizag Steel (MT) 2017
UPPSC AE 12.04.2016 Paper-I
MPPSC AE 2016
Nagaland PSC CTSE 2016 Paper-I
TSPSC AEE 2015
CGPSC AE 26.04.2015 Shift-I / ESE 2002

Ans : (d) For high speed engines, the cam follower should move with cycloidal motion.
Cycloidal motion:- There are no instantaneous changes in acceleration at any point during motion. This would in turn mean that there would be no jerks and the cam follower system would show smooth operation. this makes the cam suitable for high speed application.

316. Cam size depends on

(a) Pitch circle (b) Base circle
(c) Prime circle (d) Outer circle

Karnataka PSC AE (WRD) 31.07.2021
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
TNPSC AE 2019
GMB AAE 25.06.2017
Rajasthan Nagar Nigam AE 2016, Shift-II
GWSSB DEE 07.07.2016
RPSC AE. 2016
GWSSB AAE, 27.12.2015
CGPSC AE 26.04.2015 Shift-I
RPSC ACF-2011

Ans. (b) : Base circle decides the size of cam base circle is the smallest circle tangent to the cam profile drawn from the centre of rotation of radial cam.
Pitch circle – It is the circle passing through the pitch point and concentric with the base circle.
Prime circle – It is the smallest circle drawn tangent to the pitch curve is known as prime circle.

317. Pitch point on cam is

(a) Any point on pitch curve
(b) The point on cam pitch curve having maximum pressure angle
(c) Any point on pitch circle
(d) The point on cam pitch curve having minimum pressure angle

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
CGPSC AE 15.01.2021
APPSC Poly Lect. Automobile Engg., 2020
GPSC Executive Engineer 23.12.2018
RPSC VPITI 14.02.2016
GPSC Lect. 23.10.2016
TSPSC AEE 2015
UKPSC AE 2012 Paper-I

Ans. (b) : It is the point on the pitch curve at which the pressure angle is maximum.
A high value of maximum pressure angle is not as it might jam the follower in the bearings. Maximum pressure angle
For oscillating follower = 45º
For translating follower = 30º

318. The cam and follower without a spring is an example of

(a) Sliding pair (b) Self closed pair
(c) Force closed pair (d) Lower pair

UPRVUNL AE 05.07.2021
GMB AEE 25.06.2017
CGPSC ARTO & TSI 07.01.2017
Rajasthan AE (Nagar Nigam) 2016 Shift-3
APPSC AEE Mains 2016, Paper-III

Ans. (b) : According to the type of closed kinematic pair, are of two types.
(1) Self Closed Pair–When two elements of a pair are connected together mechanically in such a way that only required kind of relative motion occurs, it is then known as self closed pair.
Note-Lower pair are self closed pair.
(2) Force-Closed Pair–When two elements of a pair are not connected mechanically but are kept in contact by the action of external forces, the pair is said to be a force-closed pair.
The cam and follower is an example of force closed pair, as it is kept in contact by the force exerted by spring and gravity.
So, cam and follower without a spring is an example of self closed pair.

319. In a cam follower mechanism, the follower needs to rise through 20 mm during 60º of cam rotation, the first 30º with a constant acceleration and then with a deceleration of the same magnitude. The initial and final speeds of the follower are zero. The cam rotates at uniform, speed of 300 rpm. The maximum speed of follower is

(a) 0.60 m/s (b) 1.20 m/s
(c) 1.68 m/s (d) 8.40 m/s

TSPSC AEE 2017
HPPSC Asstt. Prof. 18.11.2016
VIZAG Steel MT (Re-Exam) 24.11.2013
GATE 2005

Ans. (b) : Given, h = 20 mm

$$\phi = \text{Total rise} = \frac{\pi}{3} = 60°$$

$$v_{max} = \frac{2h\omega}{\phi} = \frac{2 \times 0.02 \times \left(\frac{2\pi \times 300}{60}\right)}{\pi/3}$$

v_{max} = 1.2 m/sec

320. The cam follower extensively used in air-craft engine is

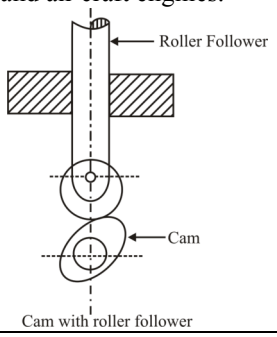
(a) knife edge follower (b) flat faced follower
(c) spherical face follower (d) roller follower

APPSC AEE Mains 2016, Paper-III
TSPSC Managers, 2015
TNPS AE (Industries) 09.06.2013

Search on Telegram @apna_pdf

Ans. (d) : Roller follower–

- When the contacting end of the follower is a roller, it is called a roller follower.
- Since the rolling motion take place between the contacting surface therefore the rate of wear is greatly reduced.
- In roller followers also the side thurst exists between the follower and the guide.
- The roller followers are extensively used where more space is available such as in stationary gas and oil engines and air craft engines.



Cam with roller follower

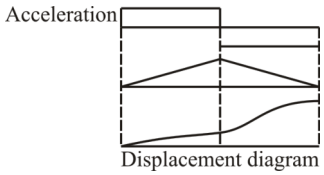
321. In the plate cam mechanism with reciprocating follower, in ……. motion the follower has a constant acceleration.

(a) Parabolic (b) MHS
(c) Sino-cycloidal (d) None of these

HPPSC Lect. (Auto) 23.04.2016
MPPSC State Forest Service Exam, 2014
ESE 2004

Ans. (a) : For constant or uniform acceleration, the velocity of the follower must change at a constant rate. The velocity diagram of the follower consists of slopping straight line. The velocity diagram represents everywhere the slope of the displacement diagram. The later must be a curve, whose slope changes at a constant rate.

Hence, the displacement diagram consists of double parabola.



Displacement diagram

322. When cam moves, the period during which the follower of cam remains at rest is known as

(a) constant period (b) fixed period
(c) dwell period (d) idle period

TSPSC AEE 2015
GPSC Lect. Poly. 07.12.2014
UKPSC AE-2013, Paper-I

Ans : (c) When cam moves, the period during which the follower of cam remains at rest is known as dwell period.

Application of dwell period:-

Cam-follower dwell mechanisms are used in pairs in sewing machines to operate the four motion feed dogs, with one cam moving the dog up and down, and the other cam moving the dog forwards and backwards. The cams in this application are usually phased 90 degrees apart allowing a pause in the up/down movement of the dog while it is being moved forwards/backwards. A separate adjustable sliding block or link is used to control the amount of forwards/ backwards movement of the dog.

323. In a cam drive, it is essential to off set the axis of follower to:

(a) Decrease the side thrust between follower and guide
(b) Decrease wear between follower and guide
(c) Take care of speed limitations
(d) Reduce cost

GPSC Asstt. Prof. 28.08.2016
MPPSC AE 08.11.2015, ESE 1998

Ans. (a) : Offsets are required in cam and followers to reduce wear and side thrust. Less stroke length means follower movement will be less. Due to less movement of follower, spring will also be compressed less. So decrease in wear between follower and guide.

324. In cycloidal motion of cam follower. The maximum acceleration of follower motion f_{mn} at $\theta = \frac{\phi}{4}$, where h = maximum follower displacement
ω = angular velocity of cam
ϕ = angle for the maximum follower displacement

(a) $\frac{h\pi\omega^2}{2\phi^2}$ (b) $\frac{3h\pi\omega^2}{2\phi^2}$
(c) $\frac{2h\pi\omega^2}{\phi^2}$ (d) $\frac{3h\pi\omega^2}{\phi^2}$

APGCL AM, 2021
ESE 2020

Ans. (c) :

For cycloidal motion, Acceleration $= \frac{2\pi\omega^2 h}{(\phi)^2} \sin\left(\frac{2\pi\phi}{\phi}\right)$

for maximum acceleration $= \theta = \phi/4$

so maximum acceleration $= \frac{2\pi\omega^2 h}{\phi^2}$

325. Let R is flank radius, r is minimum radius of the cam and θ is angle turned through by the cam. If a flat-faced follower is in contact with the flank of a circular arc cam, its lift of displacement is equal to-

(a) (R + r) (1+ cosθ) (b) (R – r) (1+ cosθ)
(c) (R – r) (1– cosθ) (d) (R + r) (1– cosθ)

TNPSC AE (Industries) 09.06.2013
WBPSC AE 2003

Ans. (c) : Displacement of flat faced follower when contact with the flank of a circular arc.

Displacement- $x = (R - r)(1 - \cos\theta)$

Velocity - $V = \omega(R - r)\sin\theta$

acceleration - $a = \omega^2(R - r)\cos\theta$

Search on Telegram @apna_pdf

326. A radial follower is one which-
(a) reciprocates in the guides
(b) oscillates
(c) translates along an axis passing through the cam centre of rotation
(d) None of these

OPSC AEE 2019 Paper-I
Nagaland PSC CTSE 2017, Paper-I

Ans. (c) : In radial follower, the line of motion of follower is passing through cam centre of rotation.

327. A cam mechanism imparts
(a) rotating motion
(b) oscillating motion
(c) reciprocating motion
(d) All of the above

Karnataka PSC AE (WRD) 31.07.2021
Assam PSC AE (IWT) 14.03.2021

Ans. (d) : A cam may be defined as a rotating or a reciprocating element of a mechanism which transmit reciprocating or oscillating motion to other element known as follower by direct contact.
Any complicated output motions which are otherwise difficult to produce can easily be produced with the help of cam.

328. A circle drawn with centre as the cam centre and radius equal to the distance between the cam centre and the point on the pitch curve at which the pressure angle is maximum, is called–
(a) Base circle (b) Pitch circle
(c) Prime circle (d) None of these

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Nagaland PSC CTSE 2017, Paper-I

Ans. (b) : It is pitch circle, at which the pressure angle will be maximum (when this point pass through the pitch curve).
Base circle- It is the smallest circle tangent to the cam profile drawn from the centre of rotation of a radial cam.
Pressure angle- The pressure angle representing the steepness of the cam profile, is the angle between normal to the pitch curve at a point and the direction of the follower motion.
Prime circle- Smallest circle drawn tangent to the pitch curve is known as prime circle.
Pitch circle- It is a point on pitch curve at which the pressure angle is maximum.

329. In a radial cam. The follower moves:
(a) along the cam axis
(b) in a direction parallel to the cam axis
(c) in a direction perpendicular to the cam axis
(d) at an angle of 30º to the cam axis
(e) at an angle of 75º to the cam axis

CGPSC ARTO & TSI 07.01.2017
VIZAG Steel MT 2011

Ans. (c) : In radial cams, the follower reciprocates or oscillates in a direction perpendicular to the cam axis.
When the motion of the follower is along an axis passing through the centre of the cam it is know as radial follower.

330. The maximum value of the pressure angle in case of cam is kept as
(a) 20 deg (b) 25 deg
(c) 30 deg (d) 15 deg

TNPSC AE 2020
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (c) : The maximum value of the pressure angle in case of cam is kept as 30^0.

331. The throw of a Cam is the maximum distance of the follower from
(a) Root circle (b) Base circle
(c) Pitch circle (d) Staring to finish

Gujarat PSC AE 2019
APPSC AEE Screening Test 2016

Ans. (b) : The stroke/throw, the greatest distance or angle through which the follower moves or rotates. It is the maximum distance of followers from the base circle. Base circle is a smallest circle of a cam profile drawn from the center of rotation of the cam.

332. The pressure angle and the base circle in a cam should be
(a) both as big as possible
(b) both as small as possible
(c) as big as possible and as low as possible respectively
(d) as small as possible and as big as possible respectively

BPSC Poly. Lect. 2016
VIZAG MT 2015

Ans : (d) The pressure angle and the base circle in a cam should be as small as possible and as big as possible respectively.
Base circle :- It is the smallest circle that can be drawn to the cam profile
pressure angle:- It is the angle between the direction of the follower motion and a normal to the pitch curve. This angle is very important in designing a cam profile. If the pressure angle is too large, a reciprocating follower will jam in its bearings.

333. The smallest circle that can be drawn from the centre of the cam and tangent to the pitch curve is known as :
(a) Base circle (b) Pitch circle
(c) Prime circle (d) Profile circle

RPSC ACF & FRO, 26.02.2021

Ans. (c) : Prime circle- It is the smallest circle that can be drawn from the centre of cam and tangent to the pitch curve.
Pitch circle – It is the circle passing through the pitch and concentric with base circle.
Base circle – It is the smallest circle that can be drawn tangential to cam profiles from the centre of rotation of a radial cam.
Profile–The shape of the contoured cam surface by means of which motion is communicated to the follower.

334. In case of simple harmonic motion of a follower (rise – 90°, fall –90°, rest –90°) the maximum velocity of the follower will be :
(a) $\frac{\pi\omega s}{2\theta}$ (b) $\frac{\pi^2\omega^2 s}{2\theta}$
(c) $\frac{4\omega^2 s}{\theta}$ (d) $\frac{4\omega^2 s}{\theta^2}$

where, s – stoke of the follower
θ – cam angle
ω – angular velocity.

JPSC AE 10.04.2021, Paper-II

Search on Telegram @apna_pdf

Ans. (a) : In case of simple harmonic motion

$$\text{Maximum velocity } (V_{max}) = \frac{\pi}{2}\frac{\omega s}{\theta}$$

$$\text{Maximum acceleration } (a_{max}) = \frac{s}{2}\left(\frac{\pi\omega}{\theta}\right)^2$$

335. If there is constant acceleration in the first half of the follower motion and constant deceleration in the later

(a) circular (b) straight line
(c) parabolic (d) elliptical

HPPSC Workshop Suptd. 08.07.02021

Ans. (c) :

336. Consider the following statements regarding cams:

1. **A cam in which the follower moves radially from the centre of rotation of the cam is known as a disc cam.**
2. **A globoidal cam is a double-disc cam, the two discs being keyed together and are in constant touch with the two rollers of a follower.**
3. **A conjugate cam can have two types of surfaces, convex or concave.**
4. **In a spherical cam, the follower oscillates about an axis perpendicular to the axis of rotation of the cam.**

Which of the above statements are correct?

(a) 1 and 4 only (b) 2 and 4 only
(c) 2 and 3 only (d) 1, 2, 3 and 4

ESE 18.07.2021

Ans. (a) : Given, statements 2 and 3 are wrong because-

- Conjugate can is a double disc can, the two discs being keyed together and are in constant touch with the two rollers of followers.
- Globoidal cam have two type of surfaces, convex or concave.

337. In a radial cam translating follower mechanism, the offset is provided to

(a) Decrease the pressure angle during descent of the follower
(b) Decrease the pressure angle during ascent of the follower
(c) Increase the pressure angle during ascent of the follower
(d) Avoid any obstruction due to other machine parts

UPPSC AE 13.12.2020, Paper-I, ESE 2009

Ans. (b) : An offset provided in the radial cam translating follower mechanism, the offset is provided to decrease the pressure angle during the ascent of the because the high value of pressure angle is not desirable as it increases side thrust and performance will not be smooth.

338. Acceleration of flat faced follower, when it is in contact with flank of circular arc cam is:

(a) $\omega^2(R-r)\sin\theta$ (b) $\omega^2(R+r)\sin\theta$
(c) $\omega^2(R-r)\cos\theta$ (d) $\omega^2(R+r)\cos\theta$

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (c) :

339. When contacting end of follower is a perfectly circular flat face, it is called

(a) Mushroom follower
(b) Knife edge of follower
(c) Roller follower
(d) Spherical faced follower

Oil India Senior Officer 23.12.2020

Ans. (a) : In mushroom follower contacting end of follower is a perfectly circular flat face.

340. Path described by the trace point as referred to cams is known as

(a) Base circle (b) Prime circle
(c) Pitch circle (d) Pitch curve

RPSC IOF, 2020

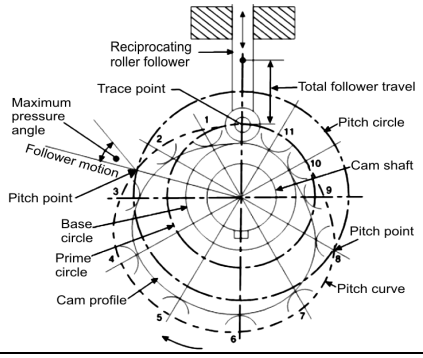
Ans. (d) : Pitch Curve– It is a path described by the trace point as referred to cams
For knife edge follower the pitch curve and the cam profile are same where as for a roller follower, they are separated by the radius of the roller.

341. The smallest circle in the cam profile is :

(a) prime circle (b) pitch circle
(c) base circle (d) pitch curve

APPSC Poly Lect. 13.03.2020

Ans. (c) : 'Base Circle' is the smallest circle in the cam profile.



342. For favorable dynamics of a high-speed cam, the acceleration curve should be necessarily made

(a) Zero (b) Continuous
(c) Positive (d) Negative

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (b) : For favorable dynamics of a high speed cam the acceleration curve should be necessarily made continuous. Any variation in acceleration will cause jerk, which is unfavorable.

343. On the displacement diagram of a cam, the dwell portion of the cycle represents the condition of

(a) No movement of the follower as the cam continuous to rotate
(b) Movement of the follower with maximum velocity as the cam continuous to rotate
(c) Movement of the follower with maximum acceleration as the cam continuous of rotate
(d) Movement of the follower with minimum velocity as the cam continuous to rotate

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : Dwell is the motion during which the follower is at rest but cam rotate continuously.

Search on Telegram @apna_pdf

344. The locus of the trace point if the follower is moved around the cam is known as

(a) prime circle (b) cam circle
(c) pitch (d) base circle

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : The locus of the trace point if the follower is moved around the cam is known as pitch curve.

345. The cam and follower having a line contact between them, is known as :

(a) line pair (b) higher pair
(c) lower pair (d) reciprocating pair

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : Higher Pair– When the two elements of a pair have a line or point contact when relative motion takes place and the motion between the two elements is partly turning and partly sliding then the pair is known as higher pair. A pair of friction disc toothed gearing belt and rope drive, ball and roller bearing and cam and follower are the example of higher pair.

346. Which of the following is not related to the cam profile?

(a) Prime circle (b) Trace point
(c) Addendum (d) Base circle

SJVN ET 2019

Ans. (c): Addendum- Addendum is Radial distance between pitch circle and addendum circle and it is equal to 1 module.

Addendum = 1 module

347. For a given lift of the follower in a given angular motion of the cam, the acceleration /retardation of the follower will be least when the profile of the cam during the rise portion is:

(a) Such that the follower motion is simple harmonic
(b) Such that the follower motion has a constant velocity from start to end
(c) A straight line, the being a tangent cam
(d) Such that the follower velocity increases linearly for half the rise portion and then decreases linearly for the remaining half of the rise portion

OPSC AEE 2019 Paper-I, ESE 1999

Ans : (d) : Acceleration of follower in various situations

(i) SHM, $a = \left(\frac{\pi\omega}{\phi}\right)^2 \frac{h}{2}$

(ii) Constant velocity Acceleration very high at start end the rise but zero during whole motion, so overall very high

(iii) In tangent cam also, the maximum acceleration is very high.

(iv) Velocity increases linearly i.e. parabolic motion, the acceleration.

$= \frac{4\omega^2}{\phi^2}.h$

So out of given all, the least acceleration will be in which Velocity varies linearly.

348. The retardation of a flat faced follower when it has contact at the apex of the nose of a circular arm cam, is given by :

(a) $\omega^2 \times OQ$ (b) $\omega^2 \times OQ\sin\theta$
(c) $\omega^2 \times OQ\cos\theta$ (d) $\omega^2 \times OQ\tan\theta$

Where OQ = Distance between the centre of circular flank and centre of nose.

OPSC AEE 2019 Paper-I

Ans : (a) : The retardation of a flat faced follower when it has contact at the apex of the nose of a circular cam is given by $\omega^2 \times OQ$.

349. In cam and follower geometry, pitch circle is

(a) The circle passing through pitch point and concentric with the base circle
(b) The circle passing through pitch point and not-concentric with the base circle
(c) The smallest circle drawn tangent to the pitch curve
(d) None of the above

MPSC Lect. (Prod.) 2018

Ans. (a) : In cam and follower, geometry, pitch circle is the circle passing through pitch point and concentric with the base circle.

350. Which of the following is not the shape of Cam?

(a) Spiral (b) Knife-edge
(c) Globoidal (d) Conjugate
(e) Spherical

CGPSC AE 25.02.2018

Ans. (b) : Spiral, globoidal, conjugate and spherical are shape of cam whereas knife-edge is the shape of follower in cam-follower mechanism.

351. The angle between the direction of follower motion and a normal to pitch curve is called :

(a) Pitch angle (b) Prime angle
(c) Base angle (d) Pressure angle

Kerala PSC Poly. Lect., 2017

Ans. (d) : Pressure Angle (ϕ)–It represents the steepness of cam profile, is the angle between normal to the pitch curve at a point and the direction of follower motion. A high value of maximum pressure angle is not desired. Its magnitude varies at all instant of followed motion.

352. A cam in which the follower reciprocates or oscillates in a plane parallel to the axis of the cam is known as

(a) Cylindrical Cam (b) Circular cam
(c) Reciprocating cam (d) Tangent cam

Vizag Steel (MT) 2017

Ans. (a) : Cylindrical cam– A cam in which the follower reciprocates or oscillates in a plane parallel to the axis of the cam is known as cylindrical cam.

353. A cam-and-follower system with the follower having a constant velocity is not suitable in practice because

1. The cam rotates with a uniform angular velocity
2. The follower moves with constant velocity
3. Inertial forces are large at the beginning as well as at the end of follower motion

Which of the above statements is/are correct?

(a) 1 only (b) 2 only

Search on Telegram @apna_pdf

(c) 3 only (d) 1, 2 and 3

UPSC JWM 2017

Ans. (c) : The follower with a constant velocity is not suitable for practical use because the inertial forces are large at the beginning as well as at the end of follower motion.

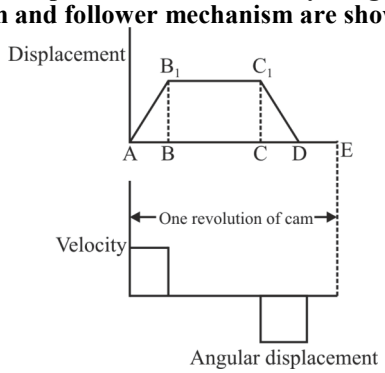
354. Statement (I): Cams used in high-speed application should have displacement, velocity and acceleration curves of the follower in continuity.

Statement (II): Abrupt changes in these curves will cause high contact stresses at the bearings and make the operation noisy.

ESE 2017

Ans. (a) : Acceleration curve with abrupt changes (such as parabolic/simple harmonic motion of follower) will exert abruptly changing contact stresses at the bearings and an the cam surface and lead to noise, surface wear and eventual failure.

355. The displacement and velocity diagrams of a cam and follower mechanism are shown:



Which of the following statements is / are correct?

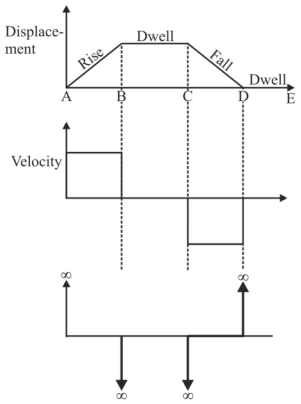
1. The acceleration of the follower at the beginning and at the end of each stroke will be zero.
2. The follower remains at rest in the dwell period.
3. During period DE, the motion of the follower is retarding.

Select the correct answer using the code given below.

(a) 1, 2 and 3 (b) 1 only
(c) 2 only (d) 3 only

ESE 2017

Ans. (c) :



Given- Profile is corresponding to uniform velocity motion of follower during rise and fall.

AB – Rise
BC – Dwell
CD – Fall
DE – Dwell

At start and end of rise and fall, velocity suddenly changes, which makes acceleration at these locations tend to ∞.

During dwell period followers does not move.

356. What is the reference point on the follower to lay the cam profile known as?

(a) Cam center (b) Pitch point
(c) Trace point (d) Prime point
(e) Flat point

CGPSC ARTO & TSI 07.01.2017

Ans. (c) : Trace Point :- It is a reference point on the follower and is used to generate the pitch curve.

Pitch Point :- The point of contact of the pitch lines of two gears or of a rack and pinion when in mesh.

Cam Profile :- It is the actual working surface contour of the cam base circle.

It is the smallest circle drawn to the cam profile from the centre of rotation of the cam.

357. .....velocity of the following implies that the displacement of the follower is proportional to the cam displacement and the slope of the displacement curve is constant.

(a) Constant
(b) Uniformly increasing
(c) Uniformly decreasing
(d) Non-uniform

HPPSC Asstt. Prof. 29.10.2016

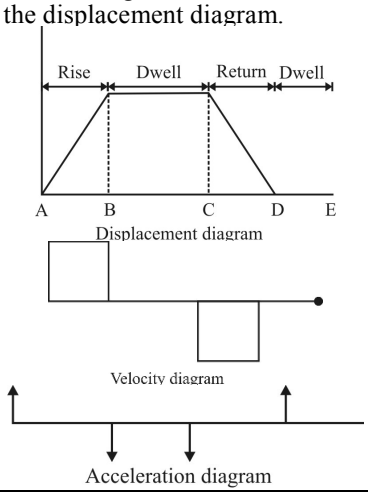
Ans. (a) : Follower motion with uniform velocity– Constant velocity of the follower implies that the displacement of the follower is proportional to the cam displacement and the slope of the displacement curve is constant.

358. What type of follower motion is represented as a straight line with arcs at the beginning and end in the displacement diagram?

(a) Harmonic (b) Uniform
(c) Combination (d) Uniformly accelerated

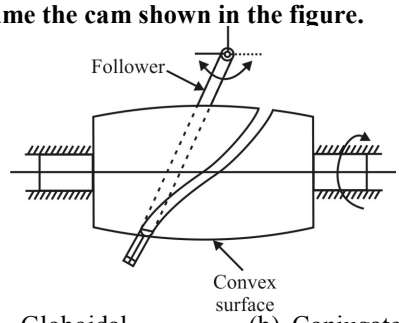
UPRVUNL AE 21.08.2016

Ans. : (b) Uniform tube of follower motion is represented as a straight line with arcs at the beining and end in the displacement diagram.



Search on Telegram @apna_pdf

359. Name the cam shown in the figure.



(a) Globoidal (b) Conjugate
(c) Spherical (d) Cylindrical

UPRVUNL AE 21.08.2016

Ans. : (a) Globoidal cam

360. For a Roller Follower the trace point is at _____

(a) At the centre point of cam
(b) At the cam axis
(c) At the roller diameter
(d) At the centre point of roller

Nagaland PSC CTSE 2016 Paper-I

Ans. (d) : For a roller follower the trace point is at the roller centre.
Ex. Used in Aircraft engine & Gas engines.

361. The circle passing through the pitch point and concentric with the base circle of Cam profile is known as:

(a) Pitch circle (b) Prime circle
(c) Trace circle (d) Base circle

UPRVUNL AE 07.10.2016

Ans. (a) : The circle passing through the pitch point and concentric with the base circle of Cam profile is known as pitch circle.

362. The pressure angle in a cam depends on

(a) The angle of ascent
(b) The lift of the follower
(c) offset between centre lines of cam and follower
(d) All of the above

UPPSC AE 12.04.2016 Paper-I

Ans : (d) The pressure angle in a cam depends on
(i) The angle of ascent
(ii) The lift of the follower
(iii) Offset between centre lines of cam and follower.

363. If the line of movement of the follower passes through the centre of rotation of the cam, then it is called :

(a) Axial follower (b) Radial follower
(c) Offset follower (d) None of these

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (b) : If the line of movement of the follower passes through centre of rotation of the cam, then it is called Radial follower.

364. The follower of a cam has :

(a) uniform acceleration and retardation
(b) cycloidal motion
(c) simple harmonic motion
(d) any one of the above

Kerala PSC IOF 19.04.2016

Ans. (d) The follower of a cam has–
- Uniform acceleration and retardation
- Cycloidal motion
- Simple harmonic motion

365. A cam is to be designed for a knife edge follower with following data; cam lift 40 mm during 90º of cam rotation with SHM, dwell for the next 30º, during the next 60º of cam rotation the follower returns to its original position with SHM, : dwell during the remaining 180º. The radius of base circle of the cam is 40 mm. If cam rotates at 240 rpm then acceleration of the follower during its accent and descent will be

(a) 20.6, 11.8 m/s^2 (b) 20.6, 118 m/s^2
(c) 50.6, 11.8 m/s^2 (d) 50.6, 113 m/s^2

MPPSC AE 08.11.2015

Ans. (d) : Given, S = 40 mm = 0.04 m

$$\theta_0 = 90° = \frac{\pi}{2}\text{rad} = 1.571\text{rad}$$

$$\theta_R = 60° = \frac{\pi}{3}\text{rad} = 1.047\text{rad}$$

$$N = 240 \text{ rpm}$$

$$\omega = \frac{2\pi \times 240}{60} = 25.14\,\text{rad/sec}$$

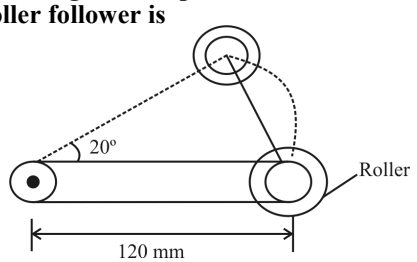
Maximum acceleration of the follower during its ascent

$$a_0 = \frac{\pi^2\omega^2 S}{2(\theta_0)^2} = \frac{\pi^2(25.14)^2 \times 0.04}{2\times(1.571)^2} = 50.6\,\text{m/s}^2$$

Maximum acceleration of follower during it's descent,

$$a_R = \frac{\pi^2\omega^2 S}{2(\theta_R)^2} = \frac{\pi^2(25.14)^2 \times 0.04}{2\times(1.047)^2} = 113.8\,\text{m/s}^2$$

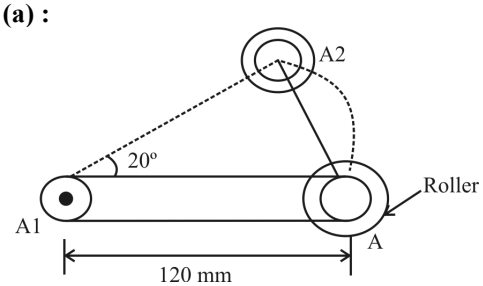
366. The angular displacement of the following roller follower is



(a) π/9 (b) 2π/9
(c) π/18 (d) 2π/18

APPSC Poly. Lect. 2013

Ans. (a) :



The angular displacement of the follower = 20º

$$= 20 \times \frac{\pi}{180} = \pi/9\,\text{rad}$$

Search on Telegram @apna_pdf

367. For low and moderate speed engines, the cam follower should move with
(a) simple harmonic motion
(b) uniform velocity
(c) uniform acceleration and retardation
(d) cycloidal motion

JPSC AE 2013, Paper-V

Ans : (a) : For low and moderate speed engines, the cam follower should move with simple harmonic motion.

368. Kinematic pair constituted by cam and follower mechanism is:-
(a) Higher and open type
(b) Lower and open type
(c) Lower and closed type
(d) Higher and closed type

UKPSC AE-2013, Paper-I

Ans. (a) : Kinematic pair constituted by cam and follower mechanism is higher and open type.

369. The profile of a cam in a particular zone is given by $x = \sqrt{3}\cos\theta$ and $y = \sin\theta$. The normal to the cam profile at $\theta = \frac{\pi}{4}$ is at an angle (with respect to x axis) :
(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$
(c) $\frac{\pi}{3}$ (d) 0

APGENCO AE 2012

Ans. (c) : $\frac{\pi}{3}$

370. Angle of dwell of cam is defined as the angle
(a) during which the follower returns to its initial position
(b) of rotation of the cam for definite displacement of the follower
(c) through which the cam rotates during the period in which the follower remains in the highest position
(d) moved by the cam from the instant the follower begins to rise, till it reaches its highest position

ISRO Scientist/Engineer 2008

Ans. (c) : Angle of dwell of cam is defined as the angle through which the cam rotates during the period in which the follower remains in the highest position.

371. For a roller follower, pitch curve and cam surface are
(a) identical
(b) separated by the radius of the roller
(c) separated by the diameter of the roller
(d) separated by one and half times the radius of the roller

UKPSC AE 2007 Paper -I

Ans. (b) : Separated by the radius of the roller

372. The pressure angle of a flat footed follower in contact with a circular arc cam is
(a) 5° (b) 3°
(c) 0° (d) –1°

UKPSC AE 2007 Paper -I

Ans. (c) : 0°

373. The linear velocity of the reciprocating roller follower when it has contact with the straight flank of the tangent cam, is given by
(a) $\omega(r_1 - r_2)\sin\theta$
(b) $\omega(r_1 - r_2)\cos\theta$
(c) $\omega(r_1 + r_2)\sin\theta\sec^2\theta$
(d) $\omega(r_1 + r_2)\cos\theta\ \mathrm{cosec}^2\theta$

TNPSC AE 2013

Ans. (c) : $V = \omega(r_1 + r_2)\sin\theta.\sec^2\theta$

4. Gears and Gear Trains

374. In a reverted gear train
(a) The axes of first and the last gear are parallel
(b) The axes of the first and last gear are co-axial
(c) One gear is always fixed
(d) Speed of last gear must be higher than speed of the first gear

HPPSC Workshop Suptd. 08.07.2021
APGCL AM, 2021
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

GATE-1994

Ans. (c) : Circular Pitch–It is a distance measured on the circumference of the pitch circle from a point of one tooth to the corresponding point on the next tooth

$$P_c = \frac{\pi D}{T}$$

Diametral Pitch–It is the ratio of number of teeth to the pitch circle diameter in millimetres.

$$P_d = \frac{\pi}{P_c} = \frac{T}{D}$$

So, product of dimetral pitch and circular pitch is

$$P_d \times P_c = \frac{\pi D}{T} \times \frac{T}{D}$$

$$\boxed{P_d \cdot P_c = \pi}$$

377. _____ is a gear train that is useful for transmitting high velocity ratios with gears of moderate size in a comparatively lesser space.

(a) Hypocyclic gear train
(b) Reverted gear train
(c) Compact gear train
(d) Epicyclic gear train

RPSC ACF & FRO, 26.02.2021
NLCIL GET, Shift-II 17.11.2020
RPSC AE 2018

RPSC AE 2016 / Assam PSC CCE Pre 2015
OPSC AEE 2015 Paper-I
UPRVUNL AE 2014

Ans. (c) Circular pitch-

- It is a distance along a pitch circle from one point on a tooth to the corresponding point on the next tooth.

$$\boxed{P_c = \frac{\pi D}{T} = \pi m}$$

m = Module
D = Pitch circle diameter
T = Number of teeth

- **Diametral Pitch–** It is the ratio of number of teeth to the pitch circle diameter but diameter should be in inches.

$$\boxed{P_d = \frac{T}{D}}$$

Relation between circular pitch (P_c) diametral pitch (P_d)

Circular pitch × Diametral Pitch = π

$$\boxed{P_c \times P_d = \pi}$$

- **Pressure Angle–** It is the angle between the pressure line and the common tangent to the pitch circles. Its standard values are 14.5^0, 20^0 and 25^0.

379. A fixed gear having 200 teeth in mesh with another gear having 50 teeth. The two gears are connected by an arm. The number of turns made by the smaller gear for one revolution of arm about the centre of the bigger gear is

(a) 2 (b) 3
(c) 4 (d) 5

Nagaland PSC (CTSE) 2018 Paper-I

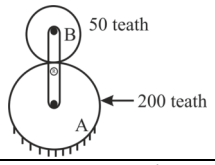
ISRO Scientist/Engineer 2006

Ans : (d)



Condition of Motion	Revolutions of elements		
Work	Arm R	Gear A	Gear B
Multiply by x	0	x	$-x \times \frac{200}{50}$
Add y	y	x+y	$-x \times \frac{200}{50} + y$

Search on Telegram @apna_pdf

$\because x + y = 0$ (A is fixed)

$y = 1$ (Given Data)

$x = -1$

Revolution of Gear B

$$= -x \times \frac{200}{50} + y$$

Revolution of gear B = 5

380. An epicyclic gear have .....degrees of freedom has been utilized in the differential gear of an automobile-

(a) one (b) two

(c) three (d) four

APPSC Poly Lect. 13.03.2020
Assam PSC AE (PHED), 18.10.2020
Oil India Ltd. Sr. Engineer (Production) 30.11.2019
CSE Pre-2008
HPPSC Asstt. Prof. 29.10.2016 / ESE-2011
TNPSC AE 2008

Ans. (b) : Epicyclic Gear Train– When there exists a relative motion of axes in a gear train it is called an epicyclic gear train. Thus in an epicyclic train, the axis of at least one of the gears also move relative to the frame. An epicyclic gear have two degree of freedom.

381. The helix angle for single helical gears ranges from

(a) 10 to 15° (b) 15 to 20°

(c) 20 to 35° (d) 35 to 50°

GPSC DEE Class-2 (GWSSB) 04.07.2021
GPSC EE Pre, 28.01.2017
ISRO Scientist/Engineer (RAC) 07.05.2017
TNPSC AE 2013, 2008

Ans. (c) : The helix angle for single helical gears ranges from 20° to 35°.

382. Herringbone gears are used

(a) For power transmission between shafts with axes at 90^0 to each other

(b) For stronger gear tooth

(c) For a higher velocity ratio

(d) To ensure zero axial thrust

Haryana PSC AE (PHED) 05.09.2020, Paper-II
VIZAG MT 2015
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
TNPSC AE 2014
DRDO Scientist 2009

Ans. (d)

- Spur gear does not produce axial thrust where as for high speed and smooth application helical gears are used in car but helical gears produce axial thrust but the axial thrust can be eliminated by using axial thrust bearing of specific load capacity or by using double helical gear (Herringbone gears) which reduces noise and axial thrust.

383. In a spur gear, the circle on which the involute is generated is called

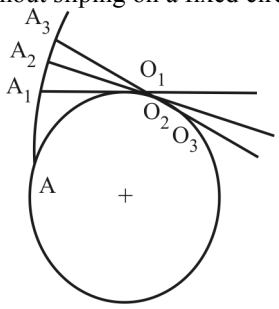
(a) pitch circle (b) clearance circle

(c) base circle (d) addendum circle

OPSC AEE 2019 Paper-I
MPPSC AE 2016
HPPSC Lect. (Auto) 23.04.2016
Mizoram PSC AE/SDO 2014 Paper-II
TRB Asstt. Prof., 2012

Ans. (c) : In a spur gear, on base circle involute profile is generated.

Involute profile– It is the locus of the point on a line, which rolls without sliping on a fixed circle.



Normal Drawn any point on the involute profile will become tangent to base circle automatically and vice-versa.

384. The train value of a gear train is

(a) equal to velocity ratio

(b) reciprocal of velocity ratio

(c) always greater than unity

(d) always equal to unity

GPSC DEE Class-II (GWSSB) 04.07.2021
GPSC Engg. Class-II Pre-19.01.2020
Nagaland PSC CTSE 2017, Paper-I
TNPSC AE 2018, 2013
J&K PSC Civil Services Pre, 2013

Ans. (b) : The train value of a gear train is reciprocal of velocity ratio

$$\text{velocity ratio} = \frac{\omega_{driver}}{\omega_{driven}} = \frac{N_1}{N_2} = \frac{T_2}{T_1}$$

$$\text{Train value} = \frac{\omega_{driven}}{\omega_{driver}} = \frac{N_2}{N_1} = \frac{T_1}{T_2}$$

$$\text{Train value} = \frac{1}{\text{velocity ratio}}$$

385. An automobile gear box has

(a) simple gear train

(b) compound gear train

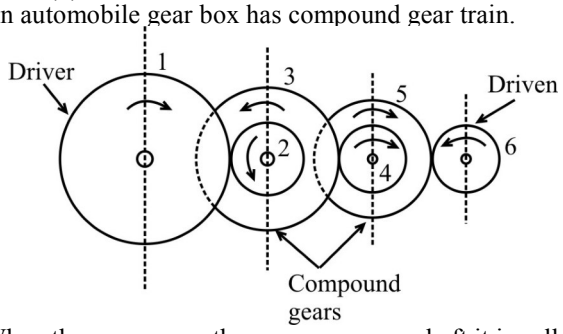
(c) epicyclic gear train

(d) compound epicyclic gear train

Nagaland PSC CTSE 2017, Paper-I
RPSC AE 2016
GWSSB DEE 07.07.2016
RPSC ACF-2011
UKPSC AE 2007 Paper-I

Ans : (b)

An automobile gear box has compound gear train.



When there are more than one gear on a shaft it is called a compound train of gear.

Search on Telegram @apna_pdf

386. Lewis equation in gears is used to evaluate

(a) tensile stress in bending
(b) compressive stress in bending
(c) creep stress
(d) shear stress on flank

Nagaland PSC (CTSE) 2018 Paper-I
RPSC AE 2016
RPSC VPITI 14.02.2016
UKPSC AE-2013, Paper-I
RPSC ACF-2011

Ans : (b) Lewis equation in gear is used to evaluate compressive Stress in bending.

$$W_T = \sigma_W . b . P_C . y = \sigma_W . b . \pi m . y$$

The quantity y is know as Lewis form factor or tooth form factor and W_T is called the beam strength of the tooth.

$$y = 0.124 - \frac{0.684}{T}$$

$$[\text{for} 14\frac{1}{2}^\circ \text{composite and full depth involut}]$$

$$y = 0.154 - \frac{0.912}{T} [\text{for} 20^\circ \text{ full depth involute system}]$$

387. The type of gear used for speed reduction of 50 : 1 will be

(a) Herringbone (b) Spur
(c) Bevel (d) Worm Wheel

Punjab PSC (Lect.) 06.08.2017
SJVN ET 2013
UKPSC AE-2013, Paper-I
UPPSC JWM Adv. No. 16/2009
TNPSC AE, 2008

Ans. (d) : Worm wheel type of gear used for speed reduction of 50 : 1.

388. Two mating spur gears have 40 and 120 teeth respectively. The pinion rotates at 1200 rpm and transmits a torque of 20 Nm. The torque transmitted by the gear is

(a) 10 N – m (b) 20 N – m
(c) 40 N – m (d) 60 N – m

ISRO Scientist/Engineer (RAC) 22.04.2018
TSPSC AEE 2017
APPSC AEE Mains 2016, Paper-III
Vizag Steel MT (Re-Exam) 24.11.2013
ISRO Scientist/Engineer 2012

Ans. (d) : Data given,

$Z_P = 40$ $Z_G = 120$

$N_P = 1200$ rpm $T_P = 20$ N–m

We assume that

Power transmitted by pinion = Power transmited by gear

$P_P = P_G$

$$\frac{2\pi N_P \times T_P}{60} = \frac{2\pi N_G T_G}{60}$$

$$T_G = T_P \times \frac{N_P}{N_G} \quad \left[\frac{N_P}{N_G} = \frac{Z_G}{Z_P}\right]$$

$$T_G = 20 \times \frac{120}{40}$$

$T_G = 60$ N–m

389. The motion transmitted between the teeth of gears in mesh is

(a) sliding
(b) rolling
(c) rotary
(d) partly sliding and partly rolling

UPRVUNL AE 05.07.2021
TNPSC AE 2017
GPSC Lect. 23.10.2016
Assam PSC CCE Pre 2015
Kerala PSC Poly. Lect. 09.01.2014
ESE-2007

Ans. (d) : The motion transmitted between the teeth of gears in mesh is partly sliding due to presence of sliding velocity and partly rolling due to rotation.

390. Module of spur gear is define as ratio of :

(a) the pitch circle diameter to number of teeth
(b) the number of teeth to pitch circle diameter
(c) the circular pitch to diameteral pitch.
(d) None of the above

Haryana PSC AE (PHED) 05.09.2020, Paper-II

Search on Telegram @apna_pdf

Ans. (b) : Worm gear– To transmit power from one rotating shaft to another whose axes are neither parallel nor intersecting known as worm gear.
Spur gear– spur gears are cylindrical and have straight teeth and are mounted on parallel shafts.
Bevel gear– Teeth are formed on a conical surface, used to transfer motion between non-parallel and intersecting shafts.
Spiral gear– Spiral gears are also known as crossed helical gears. They have high helix angle and transmit power between two non-intersecting non parallel shafts. Worm gear and hypoid gear is the type of spiral gear.

393. The number of teeth per unit length of the pitch circle diameter is called
(a) diametral pitch (b) module
(c) clearance (d) gear ratio

Assam PSC AE (PHED), 18.10.2020
GPSC Lect. 23.10.2016
KPSC ADF 2015
RPSC ACF-2011
TNPSC AE, 2008

Ans. (a) : Diametrical pitch is the number of teeth per unit length of the pitch circle diameter.
Module- It is defined as the ratio of pitch circle diameter in mm to the number of teeth.

$$M = \frac{D}{T}$$

Clearance- It is the radial distance from the top of the tooth to the bottom of the tooth, in a meshing gear. A circle passing through the top of the meshing gear is known as clearance circle.
Gear ratio- It is the ratio of number of teeth of gear to the number of teeth of pinion.

$$G = \frac{T}{t}$$

394. In a pair of spur gear with external involute profile, the interference of tooth can be minimize by:
(a) Decreasing center distance between gear pair
(b) Increasing number of gear teeth
(c) Decreasing module
(d) Decreasing pressure angle

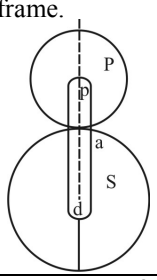
CIL MT 27.02.2020
Kernataka PSC Lect. 27.05.2017
TSPSC AEE 2017
HPPSC Asstt. Prof. 18.11.2016
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE-2000

Ans. (b) : Minimize interference in spur gear with involute profile.
(1) Increasing number of teeth
(2) Increasing center distance
(3) Increasing pressure angle

395. The gear train used in an automobile differential is
(a) simple gear train (b) compound gear train
(c) reverted gear train (d) epicyclic gear train

TSPSC AEE 2015
OPSC AEE 2015 Paper-I
(KPSC AE 2015)
TNPSC AE (Industries) 09.06.2013

Ans : (d) The gear train used in an automobile differential is epicyclic gear train.
Differential gear of an automobile: The differential gear used in the rear drive of an automobile, its functions is.
(i) To transmit motion from the engine shaft to the rear driving wheels.
(ii) To rotate the rear wheels at different speed while the automobile is taking a turn.
Epicyclic gear train:-
when there exists a relative motion of axes in a gear train, it is called an epicyclic gear train. Thus in an epicyclic train, the axis of at least one of the gears also move relative to the frame.



396. The minimum number of teeth which can be cut for standard tooth, for given pressure angle ϕ is equal to
(a) $\frac{\sin 2\phi}{2}$ (b) $2\sin^2\phi$
(c) $\frac{2}{\sin 2\phi}$ (d) $\frac{2}{\sin^2\phi}$
(e) $\frac{1}{\sin^2\phi}$

RPSC AE (GWD) 06.05.2016
CGPSC AE 26.04.2015 Shift-I
UKPSC AE 2012 Paper-I
J & K PSC Screening, 2006

Ans. (d) : Undercutting occurs if you cut deeper than the interfering point. Undercutting is a phenomenon that occurs when some part of tooth dedendum is unexpectedly cut by the edge of the generating tool. The condition for no undercutting in a standard spur gear is given by the expression.
Maximum addendum

$$m \le \frac{mZ}{2}\sin^2\phi$$

and minimum number of teeth (Z) is

$$Z = \frac{2}{\sin^2\phi}$$

397. When two bevel gears having equal teeth and equal pitch angle are used to transmit power between shafts that are intersecting at right angle, they are called
(a) Spiral bevel gears (b) Mitre gears
(c) Straight bevel gears (d) Hypoid gears

APPSC Poly Lect. Automobile Engg., 2020
VIZAG MT, 14.12.2020
GPSC Lect. 23.10.2016
TNPSC AE (Industries) 09.06.2013
ESE-2011
WBPSC AE, 2007

Search on Telegram @apna_pdf

Ans. (b) : Mitre gears are a special class of bevel gears. Where the shafts intersect at 90º and the gear ratio is 1:1. They are available in two types, spiral and straight tooth.

398. In involute gears the pressure angle is :

(a) Dependent on the size of teeth
(b) Dependent on the size of gears
(c) Always constant
(d) Always variable

OPSC AEE 2019 Paper-I
WBPSC AE, 2017
GPSC EE Pre, 28.01.2017
HPPSC Asstt. Prof. 18.09.2017
DRDO Scientists 2009

Ans : (c) : In involute tooth profiles, the line of action is fixed or from fundamental law of gearing, the line of action passes through a fixed point i.e. pitch point and inclined with perpendicular to the line joining centre of gears at a fixed angle. Hence pressure angle is constant throughout the teeth engagement.

399. The Minimum number of teeth in a rack and pinion for a 20° pressure angle teeth is :

(a) 20 (b) 18
(c) 22 (d) 24

VIZAG Steel MT 24.01.2021
AAI Jr. Executive 29.11.2018
TSPSC Managers, 2015
MPPSC State Forest Service Exam, 2014
UKPSC AE-2013, Paper-I
UKPSC AE 2007 Paper -I
CSE Pre-2001

Ans. (b) : $T_{min} = \frac{2A}{\sin^2 \phi}$

For minimum no. of teeth

$A = 1$

$T_{min} = \frac{2 \times 1}{(\sin^2 20)}$

$T_{min} \approx 18$

Minimum No. of teeth = 18 (If $\phi = 20°$)

400. The surface of the gear tooth below the pitch circle is called the

(a) flank (b) face
(c) undercut (d) bottom land

Assam PSC AE (IWT) 14.03.2021
Punjab PSC (Lect.) 06.08.2017
CGPSC AE 26.04.2015 Shift-I

Ans. (a) : The surface of the gear tooth above the pitch circle is called the face.
The surface of the gear tooth below the pitch circle is called the flank.

401. The tooth profile most commonly used in gear drive for power transmission is :

(a) A cycloid (b) An involutes
(c) An ellipse (d) A parabola

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I
TRB Poly. Lect., 2012
J&K PSC Civil Services Pre, 2010
CSE Pre-1996

Ans. (b) : For power transmission gears, the tooth form most commonly used today is the involutes profile. In involutes profile gear can be manufactured easily and the gearing has a feature that enables smooth meshing despite the misalignment of centre distance to some degree.

402. The locus of a point on the circumference of a circle which rolls without slipping on a fixed straight line is known as

(a) Cycloid (b) involute
(c) Hypocycloid (d) Epicycloid

GPSC DEE, Class-2 (GWSSB) 04.07.2021
VIZAG Steel MT 24.01.2021, Shift-I
APPSC AEE Mains 2016, Paper-III
Kerala PSC AOF 19.04.2016
GPSC Lect. (Auto), 16.10.2016

Ans. (a) : Cycloid– A cycloid is the curve traced by a point on the rim of a circle wheel as the wheel rolls along a straight line without slipping.
Involute profile– It is defined as the locus of the point on the line which roll without slipping on the fixed circle.

403. An imaginary circle on a gear which gives a rolling action, as same as the motion as the actual gear, is called:

(a) Dedendum circle (b) Pitch circle
(c) Clearance circle (d) Addendum circle

CIL MT 27.02.2020
CSE Pre-2000
UPPSC AE 12.04.2016 Paper-I
Mizoram PSC (Insp. of Factories) 2019 Paper-III

Ans. (b) : Pitch Circle– It is an imaginary circle made in such a way that a pure rolling motion on this circle gives the motion which is exactly similar to the gear motion.
Dedendum Circle– A circle drawn from bottom of the teeth and concentric with the pitch circle.
Addendum Circle– A circle drawn from top of tooth and concentric to pitch circle.
Clearance Circle– A circle passing through the top of the meshing gear.

404. Law of gearing is satisfied, if

(a) two surface slides correctly
(b) common normal at the point of contact passes through the pitch point
(c) common tangent at the point of contact passes through the pitch point.
(d) Addendum > dedendum

TNPSC AE 2018
HPPSC Asstt. Prof. 20.11.2017
APPSC AEE Mains 2016, Paper-III

Ans. (b) : Law of gearing is satisfied, if common normal at the point of contact passes through the pitch point.

405. The backlash for spur gear depends upon

(a) module (b) pitch line velocity
(c) tooth profile (d) Both (a) and (b)

Punjab PSC (Lect.) 06.08.2017
Nagaland PSC CTSE 2016 Paper-I
JPSC AE 2013, Paper-V

Ans : (d) : The backlash for spur gear depends upon module and pitch line velocity.

Search on Telegram @apna_pdf

406. In a single reduction, a large velocity ratio is required. The best transmission is

(a) Spur gear drive (b) Helical gear drive
(c) Worm gear drive (d) Bevel gear drive

UJVNL AE 2016
RPSC Lect. (Tech. Edu. Dept.) 2011
ISRO Scientist/Engineer 2007

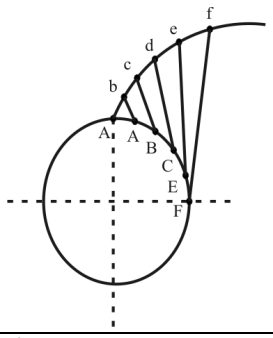
Ans. (c) : Worm gears and worm wheel have very large velocity ratio as compared to others. so worm gear drive is best in all condition.

407. When two spur gear having involute profiles on their tooth engage the line of action is tangential to :

(a) pitch circle (b) dedendum circle
(c) addendum circle (d) base circle

RPSC AE 2018
Kerala PSC AE 06.08.2015
(KPSC AE 2015
Kerala PSC Poly. Lect. 09.01.2014

Ans. (d) : Involute tooth profile is a cause made by a base circle. The definition of an involute is the spiraling curve traced by the end of an inaginary circle called the base circle



408. Gear box is used

(a) to produce torque
(b) for speed reduction
(c) to obtain variable speeds
(d) to increase efficiency of system

Vizag Steel (MT) 2017
RPSC AE 2016
RPSC ACF-2011

Ans : (c) Gear box used to obtained variable speeds.

409. If 'r' is the pitch circle radius of pinion. 'R' is pitch circle radius of driver and 'ϕ' is pressure angle, the maximum length of arc of contact for two matting gears, in order to avoid interference will be

(a) $(r + R) \sin \phi$ (b) $(r + R) \cos \phi$
(c) $(r + R) \tan \phi$ (d) $(r + R) \cot \phi$

Karnataka PSC Lect., 27.05.2017
TNPSC AE 2013
TNPSC AE, 2008

Ans. (c) : Path of contact $= (r + R) \sin \phi$

$$\text{Arc of contact} = \frac{\text{Path of contact}}{\cos\phi}$$

$$= \frac{(r+R)\sin\phi}{\cos\phi}$$

$$\boxed{\text{Arc of contact} = (r+R)\tan\phi}$$

410. Internal gears are manufactured by

(a) Hobbing
(b) Shaping with pinion cutters
(c) Shaping with rack cutter
(d) Milling

PPSC Asstt. Municipal Engg. 15.06.2021
Gujarat PSC AE 2019
GWSSB AAE, 27.12.2015
GPSC ARTO 01.05.2016

Ans : (b) : Internal gear cutting operation can be performed by shaping with pinion cutter in the case of rotating pinion type cutter indexing is not required, therefore, this type is more productive and so common.

411. The product of diametral pitch and module is equal to

(a) zero (b) infinity
(c) unity (d) two

Gujarat PSC AE 2019
Nagaland PSC (CTSE) 2018, Paper-I
Kerala PSC IOF 19.04.2016

Ans : (c) : Module $(m) = \frac{D}{T}$

$$\text{Diametral pitch } (D) = \frac{1}{\text{Module}(m)}$$

Product of diametral pitch and module is

$$= \frac{D}{T} \times \frac{T}{D} = 1$$

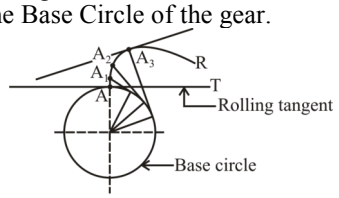
412. In a gear having involute teeth, the normal to the involute is a tangent to the

(a) pitch circle (b) base circle
(c) addendum circle (d) dedendum circle

Sikkim PSC (Under Secretary), 2017
CGPSC AE 26.04.2015 Shift-I
UPSC JWM Adv. No-16/2009

Ans. (b) : Involute Profile–Involute is a curve generated by point on a tangent which rolls on a circle without slipping. The involute profile on a gear will be generated through a generating circle and this generating circle will be known as base circle. It is a fundamental property of a gear its radius will not change in any condition for a gear.

In an involute gear, the normal to the involute is the tangent to the Base Circle of the gear.



Involute Profile

413. A fixed gear having 100 teeth meshes with another gear having 25 teeth, the centre lines of both the gears being joined by an arm so as to form an epicyclic gear train. The number of rotations made by the smaller gear for one rotation of arm is.

(a) 3 (b) 4
(c) 5 (d) 6

MPPSC AE 08.11.2015
MPPSC State Forest Service Exam, 2014
APPSC AEE 2012
CSE Pre-1995 / ESE-2009

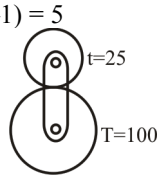
Search on Telegram @apna_pdf

Ans. (c) :

Arm	$T_P(100)$	t(25)
0	+x	–4x
+1	1+x	1–4x

$N_P = 0,\ x = -1$

$N_t = 1 - 4(-1) = 5$



414. An involute pinion and gear are in mesh. If both have the same size of addendum, then there will be an interference between the :
(a) Tip of the gear tooth and flank of pinion
(b) Tip of the pinion and flank of gear
(c) Flanks of both gear and pinion
(d) Tip of both gear and pinion

RPSC ACF & FRO, 26.02.2021
APPSC IOF, 2009
ESE 1996

Ans. (a) : An involute pinion and gear are in mesh. If both have the same size of addendum, then there will be an interference between the tip of the gear tooth and flank of pinion.

415. For 20° pressure angle, minimum number of teeth will be:
(a) 6 (b) 12
(c) 17 (d) 20

SJVN ET 2013
J & K PSC Screening, 2006

Ans. (c) : $t \geq \dfrac{2a_r}{\sin^2\phi}$ ($a_r = 1$ for standard addendum)

$$\therefore t_{min} = \frac{2}{\sin^2 20^o} = 17.1 \text{ or } 18$$

416. The interference in cycloidal teeth
(a) is absent completely
(b) depends on number of teeth
(c) depends on condition of meshing
(d) depends on pressure angle
(e) is maximum

Nagaland PSC CTSE 2017, Paper-I
CGPSC AE 26.04.2015 Shift-I

Ans. (a) : In cycloidal gears, no interference exists provided the centre distance is properly maintained, unlike in involute gears.

417. Backlash is
(a) Sum of the clearances of pinion and gear teeth
(b) The amount by which the width of a tooth space exceeds the thickness of meshing tooth on pitch circle
(c) Difference between dedendum and addendum of gear tooth
(d) Difference between the pitch circles of meshing gears

APPSC AEE Mains 2016, Paper-III
TNPSC AE, 2008

Ans. (b) : Backlash– Backlash is defined as the amount by which a tooth space exceeds the thickness of an engaging tooth. The general purpose of backlash is to present gears from jamming together and making contact on both sides of their teeth simultaneously. Lack of backlash may cause noise.

418. The minimum number of teeth on the pinion, in order to avoid interference for $14\frac{1}{2}$ full depth system is
(a) 12 (b) 14
(c) 18 (d) 32

TNPSC AE 2013
UKPSC AE 2007 Paper-I

Ans. (d) : In the design of gears, it is required to decide the number of teeth on the pinion and gear. There is a limiting value of the minimum number of teeth on the pinion.

So, the minimum number of teeth to avoid interference is given by,

$$Z_{min} = \frac{2}{\sin^2\alpha}$$

So, for $\alpha = 14\frac{1}{2}$ (full depth system)

$Z_{min} = 32$

419. A high pressure angle for spur gear leads to
(a) minimum axial thrust
(b) greater backlash
(c) more interference
(d) wide base and stronger teeth

TSPSC Manager (Engg.) HMWSSB 12.11.2020
Kerala PSC Poly. Lect. 09.01.2014

Ans. (d) : A high pressure angle for spur gear leads to wide base and stronger teeth because if pressure angle increases, strength of tooth increases.

420. Purpose of using differential gear in automobile is to
(a) control speed
(b) avoid jerks
(c) help in turning
(d) improve speed performance

HPPSC Asstt. Prof. 20.11.2017
GPSC Lect. 23.10.2016

Ans. (c) : Differential gear, in automotive mechanism, gear arrangement that permits power from the engine to be transmitted to a pair of driving wheel, as when turning a corner or transverse an uneven road.

421. The path of the point of contact between the involute teeth profile gears is :
(a) Circle (b) Straight line
(c) Complex curve (d) Parabola

HPPSC W.S. Poly. 2016
RPSC AE (GWD) 06.05.2016

Ans : (b) The path of the point of contact between the involute teeth profile gear is straight line.
In actual practice following are the two types of teeth commonly used – 1. Cycloidal teeth, 2. Involute teeth
An involute of a circle is a plane curve generated by a point on a tangent, which rolls on the circle without slipping which in unwrapped from a reel as.

Search on Telegram @apna_pdf

422. If t and T are the number of teeth on pinion and gear, G is gear ratio, A_p is the fraction by which the standard addendum of one module is multiplied and ϕ is the pressure angle, the expression minimum number of teeth on pinion to avoid interference when pinion and gear have equal number of teeth is given as

(a) $t = 2\,A_p / (1-3\sin^2\phi + 1)^{1/2}$
(b) $t = 2\,A_p / (1+3\sin^2\phi + 1)^{1/2}$
(c) $t = 2\,A_p / (1-3\sin^2\phi - 1)^{1/2}$
(d) $t = 2\,A_p / [(1+3\sin^2\phi)^{1/2} - 1]$

BPSC Poly. Lect. 2016
VIZAG MT 2015

Ans : (d)
Minimum number of teeth on the pinion in order to avoid interference.

$$t = \frac{2Ap}{\sqrt{\left[1+\frac{T}{t}\left(\frac{T}{t}+2\right)\sin^2\phi\right]-1}}$$

t = Number of teeth on the pinion
T = Number of teeth on the wheel
m = Module of the teeth

r = pitch circle radius of pinion = $\frac{mt}{2}$

G = Gear ratio = $\frac{T}{t} = R/r$

ϕ = pressure angle.
if the pinion and wheel have equal teeth, then G=1 therefore the above equation reduces to

$$t = \frac{2A_p}{\sqrt{(1+3\sin^2\phi)}-1}$$

423. In a simple gear train, there is odd number of idlers. The direction of rotation of the driver and the driven gears will be

(a) same
(b) opposite
(c) depends upon the number of teeth of the gears
(d) depends upon the diameter of idlers used

MPPSC AE 2016
UKPSC AE 2012 Paper-I

Ans. (a) : In a simple gear train, there is odd number of idlers. The direction of rotation of the driver and the driven gears will be same.

424. The working surface above the pitch surface of a gear tooth is termed as

(a) addendum (b) dedendum
(c) flank (d) face

GPSC Executive Engg. 23.12.2018
UKPSC AE 2007 Paper -I
ESE-1998

Ans. (d) : • **Face-** The working surface above the pitch surface of the gear tooth is termed as face.
• **Flank-** The portion of tooth profile below the pitch surface.
• **Addendum-** It is the radial height of the teeth above the pitch circle. Its standard value is one module.
• **Dedendum-** It is the radial depth of the tooth below the pitch circle. Its standard value is 1.157 module.

425. For full depth involute spur gears, minimum number of teeth on the pinion to avoid interference depends on :

(a) Pressure angle (b) Speed ratio
(c) Circular pitch (d) Pitch diameter

GPSC Executive Engineer 23.12.2018
Kerala PSC Asstt. Prof. 27.09.2016

Ans. (a) : Interference- When two gears are mesh at one instant there is a chance to mate involute portion with non-involute portion of mating gear. This phenomenon is known as interference.
• Minimum number of teeth on the pinion to avoid interference depends on pressure angle.
• When we increase the pressure angle then base radius decrease but we cannot increase the pressure angle beyond the 20°.

426. For a helical gear, if θ is helix angle, and Z is number of teeth on pinion, then what is virtual number of teeth:

(a) $Z/\cos\theta$ (b) $Z/\cos^2\theta$
(c) $Z/\cos^3\theta$ (d) None of these

TNPSC AE 2018
PSPCL AE, 2012

Ans. (c) :
Vertical number of teeth of helical gear = $\frac{z}{\cos^3\theta}$
Where θ = helix angle

427. The normal circular pitch in helical gear is given by :

(a) $p\sin\psi$ (b) $\frac{p}{\sin\Psi}$
(c) $p\cos\psi$ (d) $\frac{p}{\cos\Psi}$

KPSC ADF 2015
OPSC AEE 2015 Paper-I

Ans. (c) : The normal circular pitch (P_n) for helical gear is :

$$\boxed{P_n = P\cos\Psi}$$

Where, P_n = Normal circular pitch
P = Transfer circular pitch

428. Tumbler gears are used to:

(a) give the desired direction of movement to the lathe carriage
(b) give the desired angle to the tapper turning
(c) give a varying speed to the headstock
(d) give a varying speed to tailstock, when needed

NLCIL GET 17.11.2020, Shift-II
WBPSC AE, 2017

Ans. (a) : Tumbler gear mechanism is used to change the direction of lead screw and feed rod in lathe machines by engaging tumbler gear the carriage can be moved automatically from tailstock end to head stock end or moved from headstock end to tail stock end.
So, tumbler gear is used to give the desired direction of movement to the lathe carriage.

429. Spur gears used for connecting……..

(a) Shafts intersecting at 45 degrees
(b) Parallel shafts

Search on Telegram @apna_pdf

(c) Non-parallel, non intersecting shafts
(d) Shafts intersecting at 90 degrees.

HPPSC Lect. (Auto) 23.04.2016
DRDO Scientist 2008

Ans. (b) : Spur gears used for connecting.
- Parallel shafts.
- Tooth are parallel to shaft axis.
- Sudden engagement and disengagement.
- High impact stresses comes on profile and no axial thrust.

430. If T is the number of teeth on a helical gear and ϕ is the helix angle for the teeth, the formative number of teeth is written as

(a) $T \sec^3 \phi$ (b) $T \sec^2 \phi$
(c) $T/\sec^3 \phi$ (d) $T \operatorname{cosec} \phi$

APPSC Poly. Lect. 2013
TNPSC AE (Industries) 09.06.2013

Ans. (a) : T - Actual no. of teeth on a helical gear
ϕ - is the helix angle for the teeth
then, Formative number of teeth is written as, = $T\sec^3 \phi$
Formative or equivalent no. of teeth for a helical gear may be defined as the number of teeth that can be generated on the surface of a cylinder having a radius equal to the radius of curvature at the tip of the minor axis of an ellipse obtaining by taking a section of the gear in the normal plane.

431. For a speed ratio of 100, smallest gear box is obtained by using

(a) A pair of spur gears
(b) A pair of helical and pair of spur gear compounded
(c) A pair of bevel and a pair of spur gear compounded
(d) A pair of helical and a pair of worm gear compounded

RPSC IOF, 2020
APPSC Poly. Lect. 2013

Ans. (d) : For a speed ratio of 100, smallest gear box is obtained by using a pair of helical and a pair of worm gear compounded.

432. Two parallel and coplanar shafts are connected by :

(a) Spur gears (b) Bevel gears
(c) Spiral gears (d) Double helical gears

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Rajasthan Nagar Nigam AE 2016, Shift-I
TSPSC Managers, 2015

Ans. (a) : Spur Gears– Two parallel and coplanar shafts are connected by spur gears.
Bevel Gears–Bevel gears connect two shafts above axes intersect at an angle after than a right angle, uses – to change the axis of rotational motion.
Spiral Gears–It is used to connect known parallel shaft are commonly called spiral gear or helical gears or crossed axis helical gear. If the shaft angle is 90 degrees, the gears will be of the same hand and the sum of the helix angles will be equal to the shaft angle.
Double Helical Gears–A double helical gear incorporates two opposites oriented helical gears of the same helix angle together such that the two opposing thrust forces annihilates one another.

433. In spiral bevel gears, the axes are

(a) non-parallel and non-intersecting and the teeth are curved
(b) non-parallel and non-intersecting and the teeth are straight
(c) intersecting, the teeth are curved and oblique
(d) intersecting, the teeth are curved and can be ground

TNPSC AE 2019
TNPSC AE, 2008

Ans. (c) : A spiral bevel gear is a bevel gear with helical teeth formed along spiral lines an the gear face. Spiral bevel gear are most often used in vehicle differentials automotive, marine and aerospace.
Non-parallel and non-intersecting and the teeth are curved and are called skew bevel gear.

434. The axial thrust on the worm (W_A) is given by

(a) $W_A = W_T \cdot \tan \phi$ (b) $W_A = W_T / \tan \phi$
(c) $W_A = W_T \cdot \tan \lambda$ (d) $W_A = W_T / \tan \lambda$

TNPSC AE 2014
TNPSC AE, 2008
TNPSC AE (Industries) 09.06.2013

Ans. (d) : The axial thrust on the worm (W_A) is given by

$$W_A = \frac{W_T}{\tan \lambda}$$

Where; W_T = Tangential force on the worm.

435. In a 20^0 pressure angle involutes gear, how can interference be avoided?

(a) Using more than 8 teeth
(b) Cutting involutes profile accurately
(c) Using more than 20 teeth
(d) Using as small number of teeth as possible

APGENCO AE, 2017
GPSC DEE, Class-2 (GWSSB) 04.07.2021
TNPSC ACF 2012

Ans. (c) : Interference in gear can be avoided by –
(i) Increasing centre distance
(ii) Increasing no. of teeth on pinion
(iii) Increasing pressure angle
(iv) Stubbing or cutting some portion of addendum

436. The locus of a point on a thread unwound from a cylinder will be

(a) an involute (b) a helix
(c) a straight line (d) a cycloid

JPSC AE 10.04.2021, Paper-II
Punjab PSC (Lect.) 06.08.2017

Ans. (a) : The locus of a point on a thread unwound from a cylinder will be an involute.

437. In gears, the contact ratio is the ratio of

(a) length of path of contact to the circular pitch
(b) length of arc of contact to the circular pitch
(c) length of arc of approach to the circular pitch
(d) length of arc of recess to the circular pitch

CGPSC AE 15.01.2021
JPSC AE 2013, Paper-V

Ans : (b) :

$$\text{Contact ratio} = \frac{\text{length of arc of contact}}{\text{circular pitch}}$$

Search on Telegram @apna_pdf

438. Gears used for non-intersecting perpendicular shafts are :

(a) spur gears
(b) helical gears
(c) double helical gears
(d) hypoid gears

RPSC AE 2016
RPSC ACF-2011

Ans. (d) : Gears used for non-intersecting and perpendicular shafts are hypoid gears.

Spur gear is used to connect two parallel and coplanar shaft.

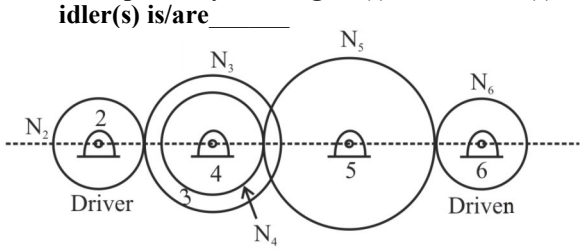
439. When both pinion and gear are made of the same material, then from the design point of view :

(a) pinion is the determining factor
(b) gear is the determining factor
(c) any one of the two may be taken as determining factor
(d) criteria is strength of any one of the teeth

RPSC AE 2016
RPSC ACF-2011

Ans. (a) : When both pinion and gear are made of the same material, then from the design point of view based on pinion. Pinion weaker than gear because a pinion tooth is loaded and unloaded more number of times than the gear tooth you can verify this by putting a mark on one pinion tooth and count how many times it meshes. Pinion has less material in the blank to sustain the same radial as well as thermal load.

440. A gear train is made up of five spur gears as shown in the figure. Gear 2 is driver and Gear 6 is driven member. N_2, N_3, N_4, N_5 and N_6 represent number of teeth on gears 2, 3, 5 and 6 respectively. The gear(s) which act(s) as idler(s) is/are_____



(a) Only 5
(b) Only 3
(c) Only 4
(d) Both 3 and 5

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (a) : $\frac{\omega_2}{\omega_6} = \frac{T_3 \times T_5 \times T_6}{T_2 \times T_4 \times T_5}$

$$\boxed{\frac{\omega_2}{\omega_6} = \frac{T_3 \times T_6}{T_2 \times T_4}}$$

So, Gear 5 act as a idler gear.

441. In which one of the following tooth profiles, does the pressure angle remain constant throughout the engagement of teeth?

(a) Cycloidal
(b) Involute
(c) Conjugate
(d) Epicycloid

ESE 2020
Haryana PSC Civil Services Pre, 2014

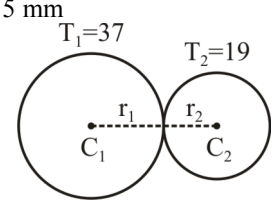
Ans. (b) : In involute profile tooth, because of the involute property to be satisfied, pressure angle does not change with point of contact position.

442. 20° full depth involute profile 19 tooth pinion and 37 teeth gear are in mesh. If the module is 5 mm, then the centre distance between the gear pair is

(a) 140 mm
(b) 150 mm
(c) 280 mm
(d) 300 mm

UPPSC AE 13.12.2020, Paper-I
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 2006

Ans. (a) : m = 5 mm



Pitch circle radius of gear $(r_1) = \frac{mT_1}{2}$

Pitch circle radius of pinion $(r_2) = \frac{mT_2}{2}$

Centre distance $(C_1C_2) = r_1 + r_2$

$$= \frac{m}{2}(T_1 + T_2)$$

$$= \frac{5}{2}(37 + 19)$$

$$= 140 \text{ mm}$$

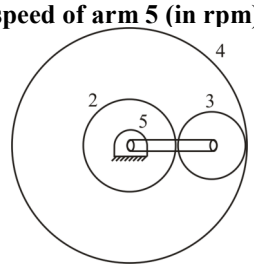
443. From the start of engagement to the end of engagement, the pressure angle of gear, having involutes profile, is :

(a) zero
(b) varies linearly
(c) varies exponentially
(d) constant

APPSC Poly Lect. 13.03.2020
ESE 2020

Ans. (d) : From the start of engagement to the end of engagement, pressure angle (ϕ) of gear of Involute profile should be constant.

444. In the gear train shown, gear 3 is carried on arm 5, Gear 3 meshes with gear 2 and gear 4. The number of teeth on gear 2, 3 and 4 are 60, 20 and 100 respectively. If gear 2 is fixed and gear 4 rotates with an angular velocity of 100 rpm in the counterclockwise direction, the angular speed of arm 5 (in rpm) is



(a) 100 rpm
(b) 62.5 rpm
(c) 125.5 rpm
(d) 500 rpm

Gujarat PSC AE 2019 / GATE 2016

Search on Telegram @apna_pdf

Ans : (b) : The table for calculation

Action	Arm 5	Gear 2	Gear 3	Gear 4
1. Fix Arm to Gear 2	0	x	$=-\frac{60}{20}x$ $=-3x$	$=\frac{20}{100}\times(-3x)$ $=-0.6\,x$
2. Add 'y' to each	y + 0	y + x	y – 3x	y – 0.6x

Conditions-

1. Gear - 2 is fixed

$\therefore$ x + y = 0

x = – y

2. Gear - 4 rotates with 100 rpm (ccw)

$\therefore$ y – 0.6 x = 100

y + 0.6 y = 100

$$y=\frac{100}{1.6}=62.5=62.5 \text{ rpm (ccw)}$$

445. Match list I with list II and select the correct answer from the codes given below:

List I (Gear type)	List II (Application)
A. Worm gears	1. Parallel shafts
B. Cross helical gears	2. Non parallel intersecting shafts
C. Bevel gears	3. Non-parallel, non-intersecting shafts
D. Spur gears	4. Large speed ratio

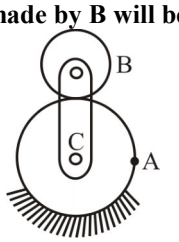
Code:

	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	4	1	2
(d)	4	3	2	1

PTCUL AE 25.06.2017
GATE 1995

Ans. (d) :

446. In the Epicyclic gear train shown below, A is fixed, A has 100 teeth and B has 20 teeth. If the arm C makes three revolutions, the number of revolutions made by B will be



(a) 12 (b) 15
(c) 18 (d) 24

TSPSC AEE 2017
ESE 1997

Ans. (c) : From figure

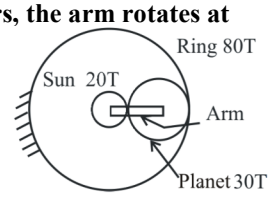
For 1 revolution of C,

$$N_B=1+\frac{T_A}{T_B}=6$$

For 3 revolution

$N_B = 6 \times 3 = 18$

447. The sun gear given in the figure is driven clockwise at 100 rpm. The ring gear is held stationary. For the number of teeth shown on the gears, the arm rotates at ____.



(a) 0 rpm (b) 20 rpm
(c) 33.33 rpm (d) 66.67 rpm

RPSC ADE 2016
GATE 2001

Ans. (b) :

Action	Rotation			
	arm	sun (T_s)	planet (T_P)	ring (T_R)
Arm to fixed sun gear 'S' rotate x revolution CCW	0	+x	$-\frac{T_s}{T_P}x$	$-\frac{T_s}{T_R}x$
Add + y' revolution in all member	+y	+y	$+y-\frac{T_s}{T_P}x$	$y-\frac{T_s}{T_R}x$
Total revolution	y	x+y	$-\frac{T_s}{T_P}x+y$	$-\frac{T_s}{T_R}x+y$

x+ y = – 100 ..... (1)

$-\frac{20}{80}x+y=0$ ..... (2) ring is fixed

x = – 80, y = –20

rotation of arm = y = – 20 rpm

i.e. = 20 rpm clockwise.

448. Which one of the following is used to convert a rotational motion into a translational motion?

(a) Bevel gears
(b) Double helical gears
(c) Worm gears
(d) Rack and pinion gears
(e) None of the above

GPSC Executive Engineer 23.12.2018
CGPSC Poly. Lect. 22.05.2016

Ans. (d) : Rack and pinion gears

- Rack and pinion gear system are used to transfer rotational motion into translational motion.
- The flat tooth part is the rack and the gear is pinion.
- The rack has teeth cut into it and they mesh with the teeth of the pinion gear.

449. The maximum efficiency for spiral gears is

(a) $\frac{\cos(\theta+\Phi)+1}{\cos(\theta-\Phi)+1}$ (b) $\frac{\cos(\theta-\Phi)+1}{\cos(\theta+\Phi)+1}$

(c) $\frac{\sin(\theta+\Phi)+1}{\cos(\theta+\Phi)+1}$ (d) $\frac{\cos(\theta-\Phi)+1}{\sin(\theta+\Phi)+1}$

Nagaland PSC CTSE 2016 Paper-I
CSE Pre-1998

Ans. (a) : The maximum efficiency of spiral gears is given by, $\eta_{max}=\frac{\cos(\theta+\Phi)+1}{\cos(\theta-\Phi)+1}$

Search on Telegram @apna_pdf

450. Match the item in Column I and II

Column-I	Column-II
p. Addendum	**1.** Cam
q. Instantaneous center of velocity	**2.** Beam
r. Section modulus	**3.** Linkage
s. Prime Circle	**4.** Gear

Select the correct answer using the codes given below-

(a) p-4, q-3, r-2, s-1 **(b) p-4, q-2, r-3, s-1**
(c) p-3, q-2, r-1, s-4 **(d) p-3, q-4, r-1, s-2**

RPSC 2016
GATE 2006

Ans : (a) p-4, q-3, r-2, s-1

451. An external gear with 60 teeth meshes with a pinion of 20 teeth, module being 6 mm. What is the centre distance in mm?

(a) 120 (b) 180
(c) 240 (d) 300

Assam PSC CCE Pre 2015
ESE 2009

Ans. (c) : Centre distance,

$$d = \frac{m}{2}(T_1 + T_2)$$

$$= \frac{6}{2}(60 + 20) = \frac{6}{2} \times 80$$

$$= 240 \text{ mm}$$

452. Match List I with List II :

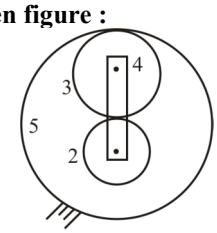
List I	List II
A. Helical gear	(i) Non-interchangeable
B. Herring bones gear	(ii) Zero axial thrust
C. Worm gears	(iii) Quiet motion
D. Hypoid gears	(iv) High speed reduction

	A	B	C	D
(a)	(i)	(ii)	(iii)	(iv)
(b)	(iii)	(ii)	(i)	(iv)
(c)	(iii)	(i)	(iv)	(ii)
(d)	(iii)	(ii)	(iv)	(i)

MPSC Poly. Lect. 2014
CSE Pre-2009

Ans. (d) : Helical gear – Quiet motion.
Herring bones gear – zero axial thrust
Worm gears – High speed reduction
Hypoid gears – Non- interchangeable.

453. An epicyclic gear train is shown schematically in the given figure :

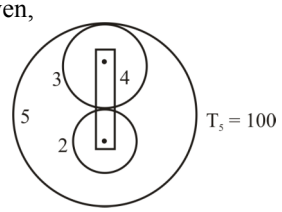


The sun gear 2 on the input shaft is a 20 teeth external gear. The planet gear 3 is a 40 teeth external gear. The ring gear 5 is a 100 teeth internal gear. The ring gear 5 is fixed and gear 2 is rotating at 60 rpm ccw. The arm 4 attached to the output shaft will rotate at :

(a) 10 rpm ccw (b) 10 rpm cw
(c) 12 rpm ccw (d) 12 rpm cw
(ccw = counter clockwise and cw = clock wise)

OPSC Civil Services Pre. 2011
GATE 2009

Ans. (a) : Given,



clockwise direction taken as positive

Condition of motion	Arm	Gear-2 $T_2 = 20$	Gear-3 $T_3 = 40$	Gear-5 $T_5 = 100$
(1) Arm is fixed	0	x	$-\frac{20x}{40}$	$-\frac{20x}{100}$
(2) Arm is free	y	x+y	$y - \frac{x}{2}$	$y - \frac{x}{5}$

$$\therefore \quad y - \frac{x}{5} = N_5 = 0$$

$$x = 5y$$

$$x + y = -60$$

$$\therefore \quad 6y = -60$$

$$y = -10 \text{ rpm}$$

$$\boxed{N_{arm} = 10 \text{ rpm}(ccw)}$$

454. The type of gear used to keep noise minimum should be

(a) Cyclical (b) Involute
(c) Bevel (d) Helical

APGCL AM, 2021

Ans. (d) : Helical gears are gradually engaged and disengaged, that's why this type of gears are used to keep noise minimum.

455. An automobile generally employs _____ gear train.

(a) simple (b) reverted
(c) compound (d) epicyclic

UPRVUNL AE 05.07.2021

Ans. (c) : An automobile generally employs compound gear train.

456. Consider the following statements regarding gears:

1. The ratio of number of teeth on the gear to that on the pinion is known as gear ratio.
2. The circle passing through the tips of teeth is called dedendum circle.
3. The circle passing through the roots of teeth is called addendum circle.
4. Backlash is the difference between the space width and the tooth thickness along the pitch circle.

Which of the above statements are correct?

(a) 1, 2 and 3 only (b) 1 and 4 only
(c) 2 and 3 only (d) 1, 2, 3 and 4

ESE 18.07.2021

Ans. (b) : Statements 2 and 3 are wrong because-

- The circle passing through the tips of teeth is called addendum circle.
- The circle passing through the roots of teeth is called dedendum circle.

Search on Telegram @apna_pdf

457. The number of teeth of a spur gear is 30 and it rotates at 200 rpm. What is the pitch line velocity if it has a module of 2 mm?

(a) 341.7 mm/s (b) 497.2 mm/s
(c) 628.3 mm/s (d) 758.5 mm/s

ESE 18.07.2021
HPPSC Asstt. Prof. 29.10.2016

Ans. (c) : Given:
Number of teeth, T = 30
Module,m = 2mm
Rotational speed, N = 200 rpm
Pitch line velocity, $v = \omega \times r$

$$= \frac{2\pi N}{60} \times \frac{mT}{2}$$

$$\therefore v = \left(\frac{2\pi \times 200}{60} \times \frac{2 \times 30}{2}\right) mm/s.$$

v = 628.32 mm/s

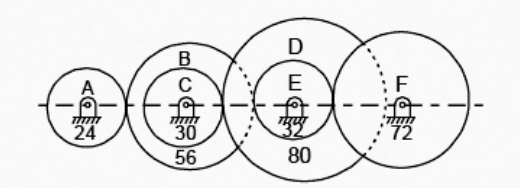
458. The difference between the tooth space and tooth the thickness as measured on the pitch circle is called.

(a) working depth (b) clearance
(c) face width (d) backlash

GPSC AE 26.07.2015
MPSC Poly. Lect. 2014

Ans. (d) : The difference between the tooth space and tooth thickness is called backlash.

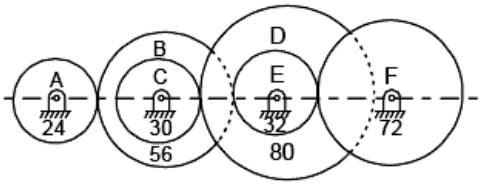
459. The compound gear train shown in the figure below consists of compound gear B-C and DE. All gears are mounted on parallel shafts. The motor shaft rotating at 800 rpm is connected to the gear A and the output shaft to the gear F. The number of teeth on gears A, B, C, D, E and F are 24, 56, 30, 80, 32 and 72 respectively. What is the speed of the gear F?



(a) 57.14 rpm (b) 32.51 rpm
(c) 74.63 rpm (d) 69.72 rpm

ESE 18.07.2021

Ans. (a) :



$$\frac{N_F}{N_A} = \frac{\text{Product of teeth on driving gear}}{\text{Product of teeth on driven gear}}$$

$$\frac{N_F}{800} = \frac{24 \times 30 \times 32}{56 \times 80 \times 72}$$

$N_F = 0.07142 \times 800$

$\boxed{N_F = 57.14 \text{ rpm}}$

460. Which of the following factors can cause misalignment of the teeth on the pinion relative to those on the gear?

1. Inaccurate gear teeth
2. Misalignment of the axes of shafts carrying gears
3. Thermal distortions during operation

Select the correct answer using the code given below:

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 18.07.2021

Ans. (d) : factors responsible for misalignment of the teeth on the pinion-

- Inaccurate gear teeth.
- Misalignment of the axes of shafts carrying gears.
- Thermal distortions during operation.

461. Two parallel shafts are connected by spur gearing. The approximate distance between the shafts is 600 mm. One shaft rotates at 120 rpm and the other rotates at 360 rpm. The module is 8 mm. Number of teeth on the wheels are _____.

(a) 114.38 (b) 120.40
(c) 132.44 (d) 108.36

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (a) : Given,
Centre distance, x = 600 mm
N_1 = 120 rpm
N_2 = 360 rpm
module, m = 8 mm
zed, D_1 = diameter of the first gear
D_2 = diameter of second gear
We know that,

$$\frac{N_1}{N_2} = \frac{D_2}{D_1} = \frac{120}{360} = \frac{1}{3}$$

$D_1 = 3D_2$ ———(I)

$$\therefore \text{ centre distance, } \quad 600 = \frac{1}{2}(D_1 + D_2)$$

$D_1 + D_2 = 1200$ ———(II)
From equation (I) and (II) –
$3D_2 + D_2 = 1200$
$4D_2 = 1200$
D_2 = 300 mm
and $D_1 = 3 \times 300 = 900$ mm
$\therefore$ Number of teeth on the first gear

$$\boxed{\text{module} = \frac{D_1}{T_1}}$$

$$T_1 = \frac{D_1}{m} = \frac{900}{8} = 112.5$$

and Number of teeth on the second gear,

$$T_2 = \frac{D_2}{m} = \frac{300}{8}$$

$T_2 = 37.5$
$T_2 = 38$

Search on Telegram @apna_pdf

462. In order to have smooth operation, the minimum number of teeth on the smaller sprocket, for moderate speeds, should be
(a) 15 (b) 17
(c) 21 (d) 25
GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : 17

463. Gears used in drive to the differential of an automobile are
(a) straight bevel gears.
(b) spiral bevel gears.
(c) zero bevel gears.
(d) All of the above
PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : The spiral bevel gear is a bevel gear with helical feat. The main application of this gear is in vehicle differential where the direction of drive from the driven shaft must be turned 90º.

464. A spur gear is designed to transmit the power 10 kW at a pitch line velocity of 10 m/s. Diameter of driving gear is 1 m. The tangential force between the driver and the follower and the transmitted torque, respectively, are:
(a) 1 kN and 0.5 kNm
(b) 0.5 kN and 0.5 kNm
(c) 1 kN and 1 kNm
(d) 0.5 kN and 1 kNm
AAI Jr. Executive 26.03.2021

Ans. (a) : Given, Power = 10 kW, dia = 1 m
Pitch line velocity = 10 m/s

$$P = F \times v$$

$$F = \frac{P}{v}$$

$$F = \frac{10}{10} = 1\,kN \quad \text{(Tangential force)}$$

Transmitted torque,

$$T = F \times r$$

$$T = 1 \times 0.5$$

$$T = 0.5\ kNm$$

465. Hypoid gears are approximations of _____ through they look like spiral gears.
(a) epicycloids (b) pinion
(c) cycloids (d) hyperboloids
HPPSC Workshop Suptd. 08.07.02021

Ans. (d) : Hypoid gears are approximations of hyperboloids through they look like spiral gears.

466. Spur and helical gears can be planed using _____ process.
(a) Whitworth (b) Markovian
(c) Sunderland (d) Taylor's
HPPSC Workshop Suptd. 08.07.02021

Ans. (c) : Spur and helical gears can be planed using Sunderland process.

467. The locus of all such points on the coupler which have stationary curvature at the instant is known as _____.
(a) circling curve
(b) spherical stationary curvature
(c) centre of curvature
(d) None of the above
HPPSC Workshop Suptd. 08.07.02021

Ans. (a) : The locus of all such points on the coupler which have stationary curvature at the instant is known as circling curve.

468. The control gear to epicylic gear unit is called
(a) sun gear (b) ring gear
(c) planet gear (d) internal gear
HPPSC Poly. Lect. 05.07.2021

Ans. (a) : sun gear

469. Addendum circle for a spur gear has a diameter equal to :
(a) pitch circle diameter
(b) pitch circle diameter – 2m
(c) pitch circle diameter + 2m
(d) None of the above
JPSC AE 10.04.2021, Paper-II

Ans. (c) : Diameter of addendum Circle = D + 2m
Diameter of dendum Circle = D – 2 × 1.157m
where,
D = Pitch circle dia of gear
m = module of gear.

470. If two gears A with m_A = 2mm and t_A = 50 and B with m_B = 4mm and t_B = 30 teeth are in mesh with each other such that A rotates with 100 rpm, then revolution of gear B is approximately near to :
(a) 60 rpm (b) 100 rpm
(c) 92 rpm (d) 83 rpm
JPSC AE 10.04.2021, Paper-II

Ans. (d) : Given,

$m_A = 2mm$

$t_A = 50$

$m_B = 4mm$

$t_B = 30$

$N_A = 100$ rpm

$N_B = ?$ $\qquad m = \frac{D}{T}$

$$\frac{N_B}{N_A} = \frac{D_A}{D_B}$$

$$\frac{N_B}{100} = \frac{50 \times 2}{30 \times 4} \Rightarrow \boxed{N_B = 83\,rpm}$$

471. A pinion and gear are in mesh with a gear ratio of 2. The moment of inertias of the pinion and gear are 3 kg m^2 and 5kg m^2 respectively. For the pinion to have an angular acceleration of 4 rad/s^2, the torque to be applied to the pinion shaft is :
(a) 5 N-m (b) 10 N-m
(c) 14 N-m (d) 17 N-m
RPSC ACF & FRO, 26.02.2021

Ans. (b) : Given,

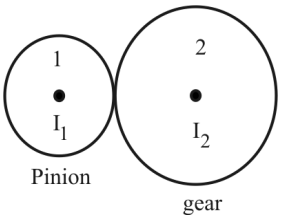
$$\text{Gear ratio}\left(\frac{Z_2}{Z_1}\right) = 2$$

$$I_{pinion}(I_1) = 3\,kg\,m^2$$

$$I_{gear}(I_2) = 5\,kg\,m^2$$

$$\frac{Z_2}{Z_1} = \frac{D_2}{D_1} = \frac{\omega_1}{\omega_2} = 2$$

Search on Telegram @apna_pdf



In meshing power transmission is same.

$$P_1 = P_2$$

$$T_1\omega_1 = T_2\omega_2$$

$$T_1 = T_2 \times \frac{\omega_2}{\omega_1} = I_2\alpha\frac{\omega_2}{\omega_1} = 5 \times 4 \times \frac{1}{2}$$

$$\boxed{T_1 = 10}$$

472. In comparison to reverse gear, the torque obtained and speed ratio of top gear are

(a) less, less (b) more, less
(c) equal, more (d) less, more

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021

Ans. (d) : less, more

473. The adjustment for backlash in a differential is provided between :

(a) Crown wheel and sun gear
(b) Crown wheel and the planet gear
(c) Sun gear and the planet gear
(d) Crown wheel and drive pinion

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

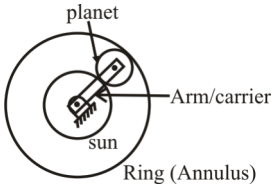
Ans. (b) : The adjustment for backlash in a differential is provided between crown wheel and the planet gear.

474. In a simple epicyclic gear-set, the output member to increase torque in reverse is always the :

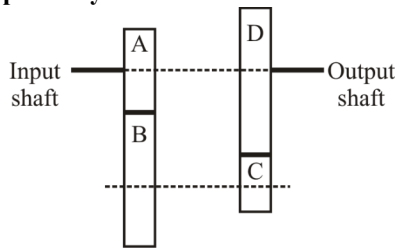
(a) Ring gear (b) Sun gear
(c) Planet carrier (d) None of these

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) :



475. In compound gear train as shown in fig., what will be the speed of output shaft if input shaft runs at 2700 rpm? The number of teeth on gears A, B, C, D are 16, 24, 12 & 36 respectively



(a) 5400 rpm (b) 2700 rpm
(c) 600 rpm (d) 1350 rpm

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) :

$$\frac{N_D}{N_A} = \frac{T_A \times T_C}{T_B \times T_D}$$

$$\frac{N_D}{2700} = \frac{16 \times 12}{24 \times 36}$$

$$\boxed{N_D = 600\text{rpm}}$$

476. A pair of Spur gears consists of a 20 teeth pinion meshing with a 120 teeth gear. The module is 4 mm, what will be the center distance?

(a) 560 mm (b) 140 mm
(c) 700 mm (d) 280 mm

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (d) : As we know,

Centre distance $(a) = \frac{D_p + D_g}{2}$

D_p = Diameter of pinion
D_g = Diameter of gear
$D = mZ \Rightarrow m$ = module, Z = No. of teeth.

$$a = \frac{m\left[Z_p + Z_g\right]}{2} = \frac{4\left[20 + 120\right]}{2}$$

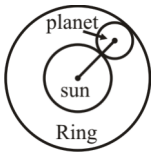
$$a = 280 \text{ mm}$$

477. If the annular wheel of an epicyclic gear train has 200 teeth and the planet wheel has 40 teeth, the number of teeth on the sun wheel is

(a) 160 (b) 120
(c) 80 (d) 40

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021, Paper-I

Ans. (b) :



As we know,

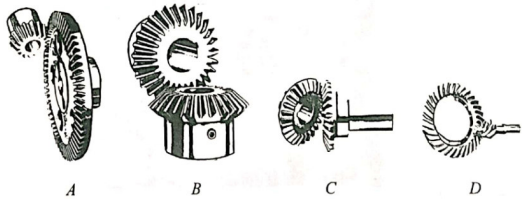
$$R_{ring} = 2\,R_{planet} + R_{sun}$$

$$R \propto T, \quad m = \frac{2R}{T} = \text{const.}$$

So, $T_R = 2 \times T_P + T_s$

$200 = 2 \times 40 + T_s \Rightarrow T_s = 120$ teeth

478. The figure below shows some of the gears used in engineering practices. Which combination of gearing is correct in order of A, B, C, D?



(a) Bevel gears (A), Miter gears (B), Angular bevel gears (C), Hypoid gears (D)
(b) Miter gears (B), Angular bevel gears (C), Hypoid gears (D), Bevel gears (A)
(c) Angular bevel gears (C), Hypoid gears (D), Bevel gear (A), Miter gear (B)
(d) Hypoid gears (D), Angular bevel gears (C), Miter gears (B), Bevel gears (A).

CGPSC AE 15.01.2021

Search on Telegram @apna_pdf

Ans. (a) : Bevel gears (A), Miter gears (B), Angular bevel gears (C), Hypoid gears (D).

179. The gears are termed as medium velocity gears, if their peripheral velocity is :

(a) $1-3\,m/s$ (b) $30-50\,m/s$

(c) $15-30\,m/s$ (d) $3-15\,m/s$

CGPSC AE 15.01.2021

Ans. (d) : The gears are termed as medium velocity gears, if their peripheral velocity is 3-15 m/s.

480. The following data is given, module of the gear is 4 mm, number of teeth in gear and pinion is 24 and 12 respectively, what is the centre distance?

(a) 144 mm (b) 72 mm

(c) 18 mm (d) 36 mm

VIZAG Steel MT 24.01.2021

Ans. (b) : Given,

$m = 4$ mm

$T_g = 24$

$T_p = 12$

Centre distance $(R) = R_g + R_p$

$$= \frac{mT_g}{2} + \frac{mT_p}{2}$$

$$= m\left[\frac{24}{2} + \frac{12}{2}\right]$$

$$= 4[12 + 6] = 4 \times 18$$

$$= 72 \text{ mm}$$

481. For the given statements:

I. Mating spur gear teeth is an example of higher pair.

II. A revolute joint is an example of lower pair.

Indicate the correct answer.

(a) Both I and II are false

(b) Both I and II are true

(c) I is false and II is true

(d) I is true and II is false

Assam Engg. College AP/Lect. 18.01.2021, GATE 2014

Ans. (b) : Mating gear teeth is an example of higher pair because their is a point of contact.

Revolute joint is an example of lower pair because their is surface or area contact.

482. A spur gear with 20° full depth teeth is transmitting 20 kW at 200 rad/s. The pitch circle diameter of the gear is 100 mm. The magnitude of the force applied on the gear in the radial direction is_____.

(a) 1.39 kN (b) 2.78 kN

(c) 0.73 kN (d) 0.36 kN

Assam Engg. College AP/Lect. 18.01.2021

Ans. (c) : Given,

Power (P) = 20 kW

$\omega = 200$ rad/sec

D = 100 mm

Power (P) = 20 kW

$T \times \omega = 20 \times 10^3$

$T \times 200 = 20 \times 10^3$

$T = 100$ Nm

$$F_t \times \frac{D}{2} = 100$$

$$F_t = \frac{100 \times 2}{0.1} = 2000\,N$$

Tangential force

$F_t = F_n \cos\phi = 2000$ N

$$F_n = \frac{2000}{\cos 20^\circ} = 2128.35\,N$$

Radial force

$F_r = F_n \sin 20^\circ = 2128.35 \times \sin 20^\circ = 727.94$ N

$= 0.73$ kN

483. In a gear drive, the ratio of teeth of meshing gears is:

(a) inversely proportional to the product of their pitch diameters.

(b) directly proportional to the product of their pitch diameters.

(c) inversely proportional to the ratio of their pitch diameters.

(d) directly proportional to the ratio of their pitch diameters.

NLCIL GET 17.11.2020, Shift-II

Ans. (d) : In a gear drive, the ratio of teeth of meshing gear is directly proportional to the ratio of their pitch diameters.

484. A compound gear train has pinions of 25 and 40 teeth and gears of 75 teeth and 80 teeth. The overall gear ratio is

(a) 6 (b) 3.2

(c) 1.75 (d) 1.5

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : Overall gear ratio $= \frac{80}{40} \times \frac{75}{25} = 6$

485. When the bevel gears connect two shafts whose axes intersect at an angle greater than a right angle and one of the bevel gears has a pitch angle as right angle, then it is known as _____.

(a) mitre gear (b) crown bevel gear

(c) internal bevel gear (d) angular bevel gears

VIZAG MT, 14.12.2020

Ans. (b) : Crown Bevel Gear–When the bevel gears connect two shaft whose axes intersect at an angle greater than a right angle and one of the bevel gears has a pitch angle as right angle, then it is known as crown bevel gear.

486. The radial dimension between the pitch circle and the bottom of a tooth space is known as -

(a) Dedendum (b) Diametral pitch

(c) Addendum (d) Circular pitch

MECON MT 2019

Ans. (a) : The radial dimension between the pitch circle and the bottom of a tooth space is known as dedendum.

487. Two parallel shafts at a distance D apart are to be connected by spur gears (gear and pinion). Which equation represents the correct relationship between centre distance D, diameters of gear (d_1) and pinion (d_2)?

(a) $D = d_1 + d_2$ (b) $D = 2(d_1 + d_2)$

(c) $D = (d_1 + d_2)/2$ (d) $D = d_1 - d_2$

APPSC Poly Lect. Automobile Engg., 2020

Search on Telegram @apna_pdf

Ans. (c) : Center Distance–It is the distance between the center of rotation of the gears in mesh,

$$C = R_1 + R_2 = \frac{D_1 + D_2}{2} = m\left(\frac{T_1 + T_2}{2}\right)$$

488. Which of the following system is able to take heavy loads?
(a) $14\frac{1}{2}°$ full depth involute system
(b) 18° stub involute system
(c) $14\frac{1}{2}°$ composite system
(d) 20° stub involute system

Oil India Senior Officer 23.12.2020

Ans. (d) :

489. The velocity of sliding _____ the distance of the point of contact from the pitch point.
(a) is directly proportional to
(b) is inversely proportional to
(c) is equal to cosθ multiplied by
(d) does not depend upon

TNCSC AE 2020

Ans. (a) : The velocity is directly proportional to the distance of the point of contact from the pitch point.

$\boxed{V_{sliding} = (\omega_1 + \omega_2)QP}$

Where, ω_1 = angular velocity of gear
ω_2 = angular velocity of pinion
QP = distance of the point of contact from the pitch point.

490. The circular pitch of spur gears is defined as the ratio of
(a) The circumference of the pitch circle to the number of teeth
(b) The circumference of the pitch circle to the diameter of the pitch circle
(c) The diameter of pitch circle to the number of teeth
(d) The number of the teeth to the diameter of pitch circle

GPSC Engineer, Class-II Pre-19.01.2020
RPSC IOF, 2020

Ans. (a) : The circular pitch of spur gears is defined as the ratio of the circumference of the pitch circle to the number of teeth.

491. In case of cycloidal tooth profile gears in mesh
(a) The pressure angle is always constant throughout the contact of mating teeth
(b) The path of contact is a straight line
(c) The variation in centre distance affects the angular velocity ratio
(d) There is interference in these gears.

RPSC IOF, 2020

Ans. (c) : A cycloid is the locus of a point on the circumference of a circle that rolls without slipping on the flat surface in case of cycloidal teeth the pressure angle varies from the maximum at the beginning of engagement to zero when the point of contact coincides with pitch point P and then again increases to maximum in the reverse direction.

492. A spur gear has a module of 3.5 mm, length of path of contact of $11\sqrt{3}$ mm and pressure angle 30^0. The contact ratio of the gear will be :
(a) 1.7 (b) 3.0
(c) 2.0 (d) 1.0

APPSC Poly Lect. 13.03.2020

Ans. (c) : Given data : Module (m) = 3.5 mm
Length of path of contact = $11\sqrt{3}$ mm
Pressure angle (ϕ) = 30^0
Contact Ratio (C.R.) = ?

$$\text{Contact ratio (C.R.)} = \frac{\text{Arc of contact}}{\text{Circular pitch}}$$

$\because$ Circular Pitch = $\frac{\pi D}{T} = \pi m$ {Where; m = module}
$= 3.5\ \pi$

$\because$ Arc of contact = $\frac{\text{Path of contact}}{\cos\phi} = \frac{11\sqrt{3}}{\cos 30^0} = 22$ mm

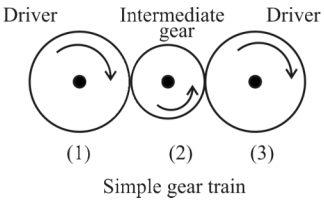
$\therefore$ C.R. = $\frac{22}{3.5\pi} = \frac{22}{3.5 \times 22/7} = \frac{7}{3.5} = \frac{10}{5} = 2$

$\Rightarrow$ $\boxed{\text{C.R.} = 2.0}$

493. In a simple gear train, 1st gear (Driver) has 40 number of teeth, 2nd gear gas has 20 number of teeth and last gear has 80 number of teeth. The train value of the gear train is
(a) 0.5 (b) 1
(c) 2 (d) 1.2

APPSC Poly Lect. 13.03.2020

Ans. (a) :



Simple gear train

Given,
Teeth, $T_1 = 40$, $T_2 = 20$, $T_3 = 80$

$\therefore$ Train value = $\frac{T_1}{T_2} \times \frac{T_2}{T_3} = \frac{T_1}{T_3} = \frac{40}{80}$

Train value = $\frac{1}{2} = 0.5$

494. In gears, angle of obliquity is the angle :
(a) between the direction of the force applied by the driving gear and the direction of the resultant reaction by driven gear.
(b) between the common normal to two gear teeth at the point of contact and the common tangent at the pitch point.
(c) between two shafts on which meshing gears are mounted.
(d) between the direction of the force applied by the driving gear and the direction of the friction force.

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : In gears, angle of obliquity is the angle between the common normal to two gear teeth at the point of contact and the common tangent at the pitch point. It is usually denoted by □ .

The standard pressure angles are $14\frac{1}{2}°$ and 20°

Search on Telegram @apna_pdf

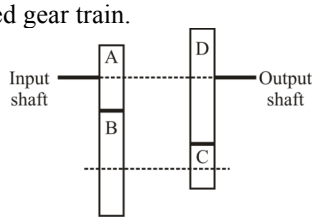
495. In lathe back gears, the following gear train is used :

(a) compound gear train
(b) reverted gear train
(c) simple gear train
(d) epicyclic gear train

NLCIL GET 17.11.2020, Shift-II

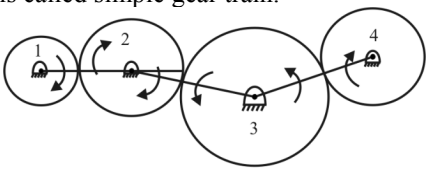
Ans. (b) : Back gear is a gear mounted at the back of the headstock that allows the chuck to rotate slowly with greatly increased turning power. By engaging back gear and so reducing rpm but increasing torque even the largest face plate mounted jobs can be turned successfully.

Reverted gear- It is such a arrangement is used in clock and in simple lathe where back gear is used to given slow speed to the chuck in this gear train if the axis of the first and last wheels of a compound gear coincide is called reverted gear train.



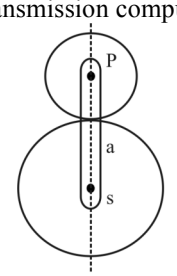
Reverted gear

Simple gear train- A series of gears capable of receiving and transmitting motion form one gear to another is called simple gear train.



Simple gear train

Epicyclic gear train- Important application of epicyclic gear train are in transmission computing devices.



Epicyclic gear train

496. A single reduction gear of 100 kW with a pinion 200 mm pitch circle diameter and angular speed 50 rad/s is supported in bearings on either side. The tangential load on the pinion is _____.

(a) 15 kN (b) 20 kN
(c) 5 kN (d) 10 kN

VIZAG MT, 14.12.2020

Ans. (b) : P = 100 kW
d = 200 mm
ω = 50 rad/sec
$P = T \times \omega$
$100 \times 10^3 = T \times 50$
$\boxed{T = 2000\,N}$
$T = F_t \times r$
$F_t \times r = 2000$
$F_t \times \left[\frac{d}{2}\right] = 2000$
$F_t \times \frac{0.2}{2} = 2000$
$F_t = 20{,}000$ N
$\boxed{F_t = 20\,kN}$

497. The number of teeth on each of the two spur gears in mesh are 40. The teeth have 20° profile and the module is 6 mm. If the arc of contact is 1.5 times the circular pitch, then its value is _____.

(a) 28.26 mm (b) 42.39 mm
(c) 56.52 mm (d) 14.13 mm

VIZAG MT, 14.12.2020

Ans. (a) : No. of teeth (T) = 40
$\phi = 20°$
m = 6 mm
$\text{Arc of contact} = \frac{\text{Path of contact}}{\cos\phi}$
Circular pitch $P_c = m\pi = 6 \times \pi = 6\pi$
Arc of contact = $1.5\,P_c = 1.5 \times 6\pi$
= 28.26 mm

498. The minimum number of teeth on a pinion in order to avoid interference for a 20 degree stub involute system is _____.

(a) 12 (b) 14
(c) 18 (d) 32

VIZAG MT, 14.12.2020

Ans. (b) : The minimum number of teeth on a pinion in order to avoid interference for a 20° stub involute system.

$$T_P = \frac{2A_P}{\left[\sqrt{1+G(G+2)\sin^2\phi} - 1\right]}$$

$$T_P = \frac{2}{\sqrt{1+1\times 3\sin^2 20° - 1}}$$

$\boxed{T_P = 12.32}$ ≈ next higher value 13

So answer will be 14.

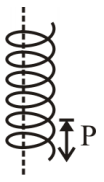
499. The distance between the corresponding points on adjacent teeth measured on the pitch circle is called

(a) helical pitch (b) normal pitch
(c) gear pitch (d) circular pitch

Assam PSC AE (PHED), 18.10.2020

Ans. (d) : Circular pitch- The distance between the corresponding point on adjacent teeth measured on the pitch circle is called circular pitch.

Helical Pitch- The pitch of a helix is the height of one complete helix turn measured parallel to the axis of helix.



Search on Telegram @apna_pdf

Normal pitch- It is the distance between point of intersection of the line of action of gear teeth with the working faces of two adjacent.
Gear pitch- The pitch of gear is defined as the distance between two identical points on two adjacent gear teeth.

500. The angle at which teeth of the gear are inclined to the axis of a gear is called as
(a) pitch angle (b) normal angle
(c) helix angle (d) gear angle
Assam PSC AE (PHED), 18.10.2020

Ans. (c) : Helix angle- The angle at which teeth of the gear are inclined to the axis of a gear is called as helix angle.
Pitch angle- Pitch angle is the angle between an element of a pitch cone and its axis.

501. The manufacturing of gear tooth with generating process leads to
(a) Undercutting of gear tooth
(b) Interface of gear tooth
(c) Non-conjugate tooth profiles
(d) None of the above
Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : Generating process (combination of straight moment of tool and rotation of work piece by spindle) is method by gear cutting.

502. For spur gears with involute profile teeth, when the centre distance between the gear centres is increased
(a) Pressure angle decrease
(b) Pitch circle diameter remains unchanged
(c) Pressure angle increase
(d) None of the above
Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (c) : As the centre distance increases, the radius of pitch circle increases and pressure angle increases.

503. The spiral bevel gears can be considered as
(a) Bevel counterparts of helical gear
(b) Spur counterparts of helical gear
(c) Bevel counterparts of worm gear
(d) Spur counterparts of worm
Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (a) : The spiral bevel gears can be considered as bevel counterparts of helical gear.

504. The Lewis equation for gear design is (w_t– tangential) forces, P_c-circular pitch, p_d-diametral pitch, F-face width and Y-Lewis form factor, A - face area)
(a) $\sigma_b = \frac{FY}{w_t p_d}$ (b) $\sigma_b = \frac{w_t}{AY}$
(c) $\sigma_b = \frac{w_t P_c}{FY}$ (d) $\sigma_b = \frac{w_t P_d}{F.Y}$
Haryana PSC AE (PHED) 05.09.2020, Paper-II

Ans. (d) : $w_t = F.m.Y.\sigma_b$
Where, m = module $= \frac{D}{T}$
Diametrical pitch $p_d = \frac{T}{D}$
$w_t = \frac{F.Y.\sigma_b}{p_d}$ $\boxed{\sigma_b = \frac{w_t.p_d}{F.Y}}$

505. Tooth profile of gear which can accommodate slight variation in center distance is
(a) cycloid (b) epi-cycloid
(c) involute (d) circular
TSPSC Manager (Engg.) HMWSSB 12.11.2020

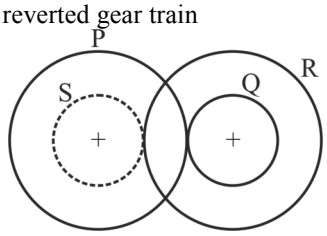
Ans. (c) : In involute profile center distance can be slightly varied but in cycloidal profile exact center distance are required.

506. A pinion rotates at 1200 rpm and transmits a torque of 20 Nm. This pinion of 40 teeth mesh with the other spur gear having 60 teeth. The torque transmitted by the gear is:
(a) 15 Nm (b) 20 Nm
(c) 40 Nm (d) 30 Nm
CIL MT 27.02.2020

Ans. (d) : In gear transmission power is always constant. If we neglect friction on teeth and bearing
Power P = Torque × Angular velocity
$T_1\omega_1 = T_2\omega_2$
$T_1N_1 = T_2N_2$ $\frac{N_2}{N_1} = \frac{\text{Teeth on pinion}}{\text{Teeth on gear}}$
$T_2 = \frac{20\times1200}{800}$ $N_2 = \frac{1200\times40}{60}$
$T_2 = 30$ Nm $N_2 = 800$ rpm

507. In a reverted gear train with four gears, two gears P and Q are meshing, Q – R is a compound gear, while R and S are meshing. The modules of P and R are 6 mm and 5 mm respectively. The numbers of teeth in P, Q and R are 24, 36 and 40 respectively. The number of teeth in gear S is:
(a) 42 (b) 28
(c) 38 (d) 32
CIL MT 27.02.2020

Ans. (d) : A reverted gear train



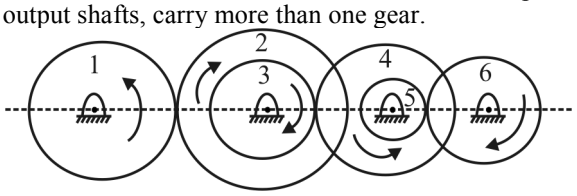
Formula,
$m(T_1 + T_2) = m'(T_3 + T_4)$
$6(24 + 36) = 5(40 + T_4)$
$160 = 5T_4$
$T_4 = 32$ Teeth

508. A gear train in which each shaft carries more than one gear except input and output shafts is known as:
(a) Compound (b) Reverted
(c) Planetary (d) Simple
Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (a) : A gear train is combination of gears used to transmit motion from one shaft to another. It becomes necessary when it is required to obtain large speed reduction within a small space.
Types of gear train are :
1. Simple gear train
2. Compounded gear train

Search on Telegram @apna_pdf

3. Reverted gear train
4. Planetary gear train.
In compounded gear train a series of gear are connected in such a way that two or more gears rotates about an axis with the same angular velocity. It also carries some of the intermediate shafts i.e. other than the input and output shafts, carry more than one gear.



$$\text{Train value}\left(\frac{N_6}{N_1}\right)=\frac{\text{Product of Number of teeth on driving gears}\,(T_1\times T_3\times T_5)}{\text{Product of Number of teeth on driven gears}\,(T_2\times T_4\times T_6)}$$

509. Which of the following is the correct relation for gear?
(a) Circular pitch = π × Module
(b) Circular pitch = 2 × Module
(c) Circular pitch = 2π × Module
(d) Circular pitch = Module

SJVN ET 2019

Ans. (a) : Circular pitch = $\frac{\pi D}{T}$

Module = $\frac{D}{T}$

Circular pitch = π × Module

510. Face of a tooth in spur gear is :
(a) The surface between pitch circle and top land
(b) The surface between top land and bottom land
(c) The surface between pitch circle and bottom land
(d) The surface of the top of the tooth

SJVN ET 2019

Ans. (a) : The surface between pitch circle and top land is known as face of a tooth in spur gear.

511. In meshing gears with involute gears teeth, the contact begins at the intersection of the :
(a) Line of action and the addendum circle of the driven gear
(b) Line of action and the pitch circle of the driven gear
(c) Dedendum circle of the driver gear and the addendum circle of the driven gear
(d) Addendum circle of the driver gear and the pitch circle of the driven gear

OPSC AEE 2019 Paper-I, ESE 2007

Ans : (a) : In meshing gear with involute gear teeth, the contact begins at the intersection of the line of action and the addendum circle of the driven gear. The contact point moves along the line of action throughout the engagement.

512. Match the following :

Type of gears	**Arrangement of Shafts**
(P) Bevel gears	(i) Non-parallel offset shafts
(Q) Worm gears	(ii) Non-parallel intersecting shafts
(R) Herringbone gears	(iii) None-parallel non-intersecting shafts
(S) Hypoid gear	(iv) offset of the shaft

(a) P–IV,Q–II, R-I, S–II
(b) P–II,Q–III, R-IV, S–I
(c) P–III,Q–II, R-I, S–IV
(d) P–I,Q–III, R-IV, S–II

OPSC AEE 2019 Paper-I, GATE 2004

Ans : (b) :
(P) Bevel gears – Non-parallel intersecting shafts
(Q) Worm gears- Non-parallel non-intersecting
(R) Herringbone- Herringbone gear are used to transmit power between two parallel shafts.
(S) Hypoid gear- Advantage of hypoid gear is that the offset of the shaft is so great that the shafts may continue past each other. Therefore, multiple power take-offs from a single shaft with several pinion is possible.

513. Match the type of gears with their most appropriate description :

Type of gear	**Description**
(P) Helical	**(i) Axes non-parallel and intersecting**
(Q) Spiral	**(ii) Axes parallel and teeth are inclined to the axis**
(R) Hypoid	**(iii) Axes parallel and teeth are parallel to the axis**
(S) Rack and pinion	**(iv) Axes are perpendicular and intersecting and teeth are inclined to the axis**
	(v) Axes are perpendicular and used for large speed reduction
	(vi) Axes parallel and one of the gears has infinite radius

(a) P– ii, Q–iv, R-i, S–vi
(b) P– ii, Q–vi, R-iv, S–ii
(c) P– i, Q–iv, R-v, S–vi
(d) P– vi, Q–iii, R-i, S–v

OPSC AEE 2019 Paper-I, GATE 2008

Ans : (a) : Helical- Axes parallel and teeth are inclined to the axis.
Spiral- Axes are perpendicular and intersecting and teeth are inclined to the axis.
Hypoid- Axes non parallel and non-intersecting.
Rack and pinion- Axes parallel and one of the gears has infinite radius.

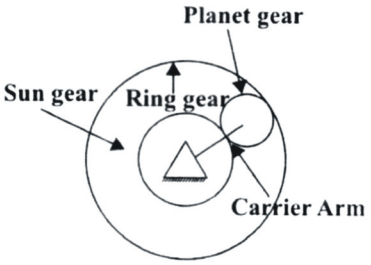
514. Automatic transmission in automobile is based on
(a) Epicyclic gear train
(b) Compound gear train
(c) Simple gear train
(d) Inverted gear train

Gujarat PSC AE 2019

Ans : (a) : Automatic transmission in automobile is based on epicyclic gear train.

Search on Telegram @apna_pdf

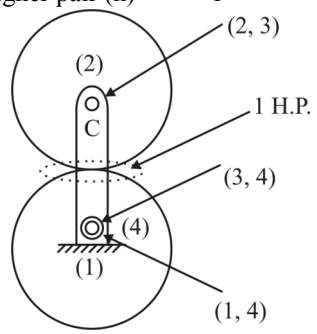
515. The number of degrees of freedom of the planetary gear train shown in the figure is



(a) -1 (b) 0
(c) 1 (d) 2

Gujarat PSC AE 2019

Ans : (d) : Number of links (l) = 4
Number of binary joints (j) = 3
Number of higher pair (h) = 1



Now, from Grubler's equation, Degree of freedom is given by

$$F = 3(l-1) - 2j - h$$
$$= 3(4-1) - 2 \times 3 - 1$$
$$= 2$$

516. Law of Gearing is about

(a) Constant torque between meshed gears
(b) Constant force between meshed gears
(c) Constant moment between meshed gears
(d) Constant velocity between meshed gears

Gujarat PSC AE 2019

Ans : (d) : Law of gearing- According to the law of gearing, the common normal at the point of contact between a pair of teeth must always pass through the pitch point.

517. Automobile gears are generally manufactured by

(a) Hobbing (b) Stamping
(c) Punching (d) Rolling

Gujarat PSC AE 2019

Ans : (a) : Gear hobbing- It is a machining process in which gear teeth are progressively generated by a series of cuts with a helical cutting tool. Gear hobbing is generative type of process in gear manufacturing.

518. For the two gears meshing in velocity ratio equal to 1/3, module = 4 mm; centre distance = 200 mm. The number of teeth on the gear wheel are

(a) 150 (b) 125
(c) 100 (d) 75

Gujarat PSC AE 2019

Ans : (d) : Velocity ratio $= \frac{1}{3} = \frac{T_1}{T_2}$

$$T_2 = 3T_1$$

Module (m) = 4 mm

$$\text{Centre distance } (C) = m\left(\frac{T_1 + T_2}{2}\right) = 200$$

$$T_2 = 3T_1$$

$$4\left(\frac{T_1 + 3T_1}{2}\right) = 200$$

$$4T_1 = 100$$

$$T_1 = 25$$

$$T_2 = 3 \times 25$$

$$\boxed{T_2 = 75}$$

519. The centre distance C between two gears, in terms of base circle radii R_1, R_2 and the pressure angle ϕ, is

(a) $\frac{\cos\phi}{R_1 + R_2}$ (b) $\frac{R_1 + R_2}{\cos\phi}$
(c) $\left(\frac{R_1}{R_2}\right)\cdot\cos\phi$ (d) $\left(\frac{R_2}{R_1}\right)\cdot\cos\phi$

ESE 2019

Ans. (b) : The centre distance between two gears
C = sum of pitch circle radii
$= r_1 + r_2$

$$= \frac{R_1}{\cos\phi} + \frac{R_2}{\cos\phi} = \frac{R_1 + R_2}{\cos\phi}$$

where r_1 and r_2 are pitch circle radius.

520. Which one of the following is not the correct statement with respect to the involute profile toothed gears in mesh?

(a) Pressure angle remains constant from the start till the end of the engagement.
(b) The base circle diameter and the pitch circle diameter of the two mating involutes are proportional.
(c) When two involutes are in mesh, the angular velocity ratio is proportional to the size of the base circles.
(d) The shape of the involute profile depends only on the dimensions of the base circle.

ESE 2019

Ans. (c) : Important points for involute profile toothed Gears in mesh.

(i) The pressure angle, from the start of the engagement of the teeth to the end of the engagement, remains constant in involute gears.
(ii) The base circle diameters and pitch diameters of two mating involutes are directly proportional.
(iii) When two involute are in mesh, the angular velocity ratio is inversely proportional to the size of the base circles.
(iv) The shape of the involute profile depends only on the dimensions of the base circle.

Search on Telegram @apna_pdf

521. For the follower with stroke S, following the cycloidal motion, the radius of the rolling circle will be

(a) $S \times 2\pi$ (b) $\frac{S}{2\pi}$

(c) $\frac{2\pi}{S}$ (d) $S + 2\pi$

ESE 2019

Ans. (b) : For cycloidal motion the circumference of the rolling circle is equal to stroke i.e. follower displacement.

Hence $2\pi r = s$

Radius of rolling circle

$$r = \frac{s}{2\pi}$$

522. The number of teeth of a spur gear is 30 and it rotates at 200 rpm. What will be its pitch line velocity if it has a module of (6/π) mm?

(a) 600 mm/s (b) 300 mm/s

(c) 191 mm/s (d) 164 mm/s

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) : Given, No of teeth (T) = 30

N = 200 rpm

Module (m) = $6/\pi$ mm $= \frac{6}{\pi}$ mm

$$m = \frac{D}{T} = \frac{6}{\pi}$$

$$D = \frac{6}{\pi} \times T = \frac{6}{\pi} \times 30 = 57.29mm$$

Pitch line velocity $v = \frac{\pi DN}{60} = \frac{\pi \times 57.20 \times 200}{60}$

= 600 mm/sec.

523. Operating pressure angle for involute gear teeth is :

(a) Maximum at engagement of teeth

(b) Minimum at engagement of teeth

(c) Same at all points of contact

(d) Vary uniformaly at all points of contact

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (c) : Same at all points of contact.–

In involute profile gear tooth pressure angle remains constant.

524. A simple gear train consists of gear A and B, having module 2 mm and centre distance of shafts equal to 115 mm. If the pitch circle diameter of driver (gear A) is 46 mm, the train value of the gear train is:

(a) 1/2 (b) 1/3

(c) 1/4 (d) 1/2.5

HPPSC ADF 05.03.2019

Ans. (c) : Given,

m = 2

Centre of distance, $R_A + R_B = 115$ mm

$D_A = 46$

$m\,T_A = 46$

$$\boxed{T_A = \frac{46}{2} = 23}$$

Centre of distance, $R_A + R_B = 115$ mm

$$\frac{m}{2}(T_A + T_B) = 115$$

$$\frac{2}{2}(23 + T_B) = 115$$

$$\boxed{T_B = 92}$$

Train value $\frac{T_A}{T_B} = \frac{23}{92}$

$$\boxed{\text{Train value} = \frac{1}{4}}$$

525. Which of the following gears are used between parallel shafts?

(a) Straight Bevel gears (b) Spiral Bevel gears

(c) Worm & worm gears (d) Herringbone gears

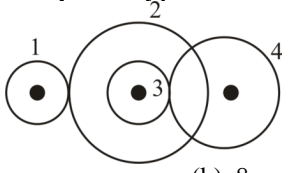
(e) Hypoid gears

CGPSC AE 25.02.2018

Ans. (d) : Herringbone Gear– Herringbone gears, also called double helical gears, are gear sets designed to transmit power through parallel shafts.

Herringbone gear are mostly used on heavy machinery. These gears overcome the problem of axial thrust presented by single helical gear, by having two sets of teeth that are set in 'V' shape. So axial thrust in case of these gear is zero. Double helical gear most difficult to manufacture.

526. A compound gear train is shown in figure. The power is transmitted from the shaft of gear 1 to the shaft of gear 4 with intermediate shaft having gear 2 and gear 3. The speed ratio will be: [Number of teeth on gears 1, 2, 3, 4 are 10, 80, 30, 60 respectively].



(a) 4 (b) 8

(c) 12 (d) 16

(e) 20

CGPSC AE 25.02.2018

Ans. (d) : Speed ratio of compound train

$$\frac{N_1}{N_4} = \frac{T_2 \times T_4}{T_1 \times T_3} = \frac{80 \times 60}{10 \times 30} = 16$$

527. Circular pitch is equal to [D = pitch diameter, T = number of teeth]

(a) Addendum + dedendum

(b) Addendum – dedendum

(c) Tooth thickness × width of space

(d) Tooth thickness – width of space

(e) None of these

CGPSC AE 25.02.2018

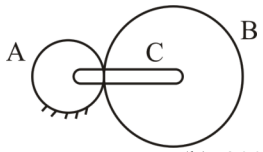
Ans. (e) : Circular pitch of gear- The distance between corresponding points of consecutive gear teeth measured along the pitch circle.

It is denoted by P.

$$P = \frac{\pi D}{T}$$

Search on Telegram @apna_pdf

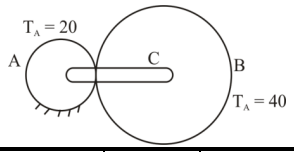
528. Ref. the figure gear B rotates at 150 rpm about its own axis. The arm C will rotate by $T_A = 20$; $T_B = 40$.



(a) 150 rpm (b) 200 rpm
(c) 100 rpm (d) 250 rpm

TNPSC AE 2018

Ans. (c) :



Motion	Arm	A	B
Arm fixed let A rotated + x rpm [Clock wise]	0	+ x	$-x \times \frac{20}{40}$
Arm free	y	y + x	$y - \frac{x}{2}$

Then
Gear A is fixed

$$y + x = 0$$
$$y = -x \quad ...(1)$$

Gear B rotates at 150 rpm

$$y - \frac{x}{2} = 150$$
$$y + \frac{y}{2} = 150$$
$$\frac{3y}{2} = 150$$
$$\boxed{y = 100 \text{ rpm}}$$

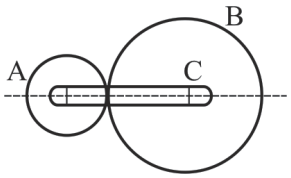
529. The interference between a given pinion tooth and a gear tooth can be avoided by using
1. smaller pressure angle
2. larger pressure angle
3. less number of teeth on the gear for a pinion with predefined number of teeth
4. more number of teeth on the gear for a pinion with predefined number of teeth

Which of the above statements are correct?
(a) 1 and 4 (b) 1 and 3
(c) 2 and 4 (d) 2 and 3

ESE 2018

Ans. (c) : (i) To avoid interference pressure angle should be large as it results in large centre distance.
(ii) During meshing interference takes place when addendum of gear digs into portion between base and root circle of pinion. To avoid it we define the minimum number of teeth on pinion. Number of teeth on gear should be more as it results in reduction of size of gear teeth.

530. A gear train is as shown in the figure below, in which gears A and B have 20 and 40 teeth, respectively. If arm C is fixed and gear A rotates at 100 rpm, the speed of gear B will be



(a) 90 rpm (b) 75 rpm
(c) 50 rpm (d) 20 rpm

ESE 2018

Ans. (c) : $\frac{N_B}{N_A} = \frac{T_A}{T_B}$

$$\frac{N_B}{100} = \frac{20}{40}$$
$$N_B = 50 \text{ rpm}$$

531. Consider the following statements:
1. In spur gears, the contact occurs abruptly on a line parallel to the axis, and the disengagement too is abrupt.
2. In helical gears, both loading and unloading are gradual, and therefore, these happen more smoothly and less noisily.
3. When two gears mesh, any arbitrary shape of the tooth can be chosen for the profile of the teeth of any one of the two gears, and the profile for the other shall be obtained by applying the law of gearing.

Which of the above statements are correct?
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) :
(i) In spur gears, the contact takes place on a line parallel to the axis abruptly and disengagement is also abrupt.
(ii) In helical gears, the loading and unloading is gradual and therefore, the action is more smooth and less noisy.
(iii) It has been proved that any arbitrary shape of the tooth can be chosen for profile of teeth of one of the two gears in mesh and the profile for the other may be determined to satisfy the law of gearing.

532. Large speed reductions (greater than 20) in one stage of a gear train are possible through
(a) Helical gearing (b) Bevel gearing
(c) Spur gearing (d) Worm gearing

GPSC Executive Engineer 23.12.2018, GATE 2002

Ans. (d) : Worm gears- It is a special case of a spiral gear in which the larger wheel usually has a hollow or concave shape.
- The smaller of the two wheels is called the worm which also has a large spiral angle.
- The sliding velocity of a worm gear is higher as compared to other types of gears. Velocity ratio is very high (50 : 1 to 100 : 1).

533. A gear box using epicyclic gear train is used to supply 100 kW power to a machine. The input speed of supply gear shaft is 100 rad/s. The speed of output shaft of a gear box is 10 rad/s in opposite sense of supply speed. The holding torque on the fixed gear of the train is:

Search on Telegram @apna_pdf

(a) 5 kNm (b) 25 kNm
(c) 9 kNm (d) 18 kNm

AAI Jr. Executive 29.11.2018

Ans. (c) : Holding torque,

$$T_3 = T_1\left[\frac{\omega_1}{\omega_2} - 1\right]$$

$$P = T_1 \times \omega$$

$$100 \times 10^3 = T_1 \times 100$$

$$T_1 = 1000 \text{ N-m}$$

$$T_3 = 1000\left[\frac{100}{10} - 1\right]$$

$$= 1000 \times 9 = 9 \text{ kN-m}$$

$$T_3 = 9 \text{ kN-m}$$

534. The velocity ratio in the case of compound train of wheels is equal to-

(a) $\frac{\text{Number of teeth on first driver}}{\text{Number of teeth on last follower}}$

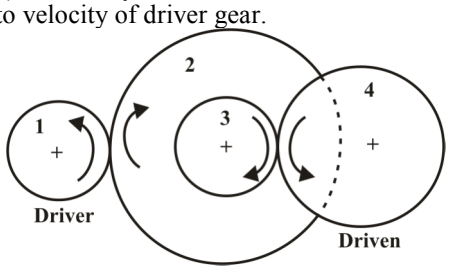
(b) $\frac{\text{Number of teeth on last follower}}{\text{Number of teeth on first driver}}$

(c) $\frac{\text{Product of teeth on the driver}}{\text{Product of teeth on the followers}}$

(d) $\frac{\text{Product of teeth on the followers}}{\text{Product of teeth on the driver}}$

RPSC AE 2018
ESE-2000

Ans. (d) : Velocity Ratio—It is the ratio of velocity of driver to velocity of driver gear.



$$\frac{N_1}{N_4} = \frac{T_2 \times T_4}{T_1 \times T_3}$$

535. The maximum efficiency of worm and worm wheel is : [Coefficient of friction = μ]

(a) $\frac{1}{1+\sin\left(\tan^{-1}\mu\right)}$ (b) $\frac{1-\sin\left(\tan^{-1}\mu\right)}{1+\sin\left(\tan^{-1}\mu\right)}$

(c) $\frac{1}{1+\tan\left(\sin^{-1}\mu\right)}$ (d) $\frac{1}{1+\mu}$

(e) $1-\sin\left(\tan^{-1}\mu\right)$

CGPSC AE 25.02.2018

Ans. (b) : Maximum efficiency of worm and worm wheel is given as

$$[\eta_{max}]_{WW} = \frac{1-\sin\phi}{1+\sin\phi} = \frac{1-\sin\left(\tan^{-1}\mu\right)}{1+\sin\left(\tan^{-}\mu\right)}$$

$$\theta = \tan^{-1}\mu$$

536. If the number of teeth on the wheel rotating at 300 r.p.m. is 90, then the number of teeth on the mating pinion rotating at 1500 r.p.m. is

(a) 15 (b) 18
(c) 20 (d) 60

RPSC Vice Principal ITI 2018

Ans. (b) :

$$\frac{T_A}{T_B} = \frac{N_B}{N_A}$$

$$\frac{90}{T_B} = \frac{1500}{300}$$

$$\boxed{T_B = 18}$$

537. The circle passing through the top of the teeth of a gear is known as

(a) Pitch circle (b) Addendum circle
(c) Dedendum circle (d) Base circle

HPPSC AE 2018

Ans. (b) : The circle passing through the top of the teeth of a gear is known as Addendum circle.

538. In a simple gear train the wheel has 150 teeth and the pinion has 50 teeth. What is the speed of pinion if the wheel rotates at 120 rpm?

(a) 300 rpm (b) 330 rpm
(c) 360 rpm (d) 375 rpm
(e) 4 00 rpm

CGPSC ARTO & TSI 07.01.2017

Ans. (c) : Given,

$Z_1 = 150$, $N_1 = 120$ rpm

$Z_2 = 50$ $N_2 = ?$

From Gear Ratio

$$\frac{Z_1}{Z_2} = \frac{N_2}{N_1}$$

$$\frac{\cancel{150}}{\cancel{50}} = \frac{N_2}{120}$$

$$N_2 = 360\text{rpm}$$

539. A gear has 40 teeth of module 5 mm. Find the pitch circle diameter.

(a) 40 mm (b) 100 mm
(c) 140 mm (d) 200 mm
(e) 240 mm

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : Given,

Teeth $(\tau) = 40$

Module (M) = 5

$$\text{Module} = \frac{D}{T}$$

$D = 5 \times 40$

$D = 200$ mm

540. Which is the correct relationship of gears?

(a) Module = pitch circle diameter/number of teeth
(b) root circle diameter = pitch circle diameter × module
(c) pitch circle diameter = number of teeth/ module
(d) circular pitch × π = diametral pitch

Search on Telegram @apna_pdf

(e) Circular pitch = pitch circle diameter × number of teeth

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : $\text{Module} = \frac{D}{T}$

$$\text{Module} = \frac{\text{Pitch circle Diameter (D)}}{\text{Number of Teeth (T)}}$$

541. It is required to drive a shaft at 720 rpm by means of a belt from a parallel shaft with a pulley of 300 mm diameter on it and running at 240 rpm. What is the diameter of the pulley required on the driven shaft?

(a) 100 mm (b) 120 mm
(c) 130 mm (d) 145 mm
(e) 150 mm

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Form the Relation

$$\boxed{\frac{D_1}{D_2} = \frac{N_2}{N_1}} \text{ ____(i)}$$

Given, $N_1 = 720$ rpm ; $D_1 = ?$
$N_2 = 240$ rpm ; $D_2 = 300$ mm

From eq^{h} (i)

$$\frac{D_1}{300} = \frac{240}{720}$$

$$\boxed{D_1 = 100\text{mm}}$$

542. When the gear ratio through the transmission is 0.8 : 1, the transmission is in :

(a) overdrive (b) underdrive
(c) direct drive (d) neutral
(e) deep drive

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Overdrive :-It is a transmission gearing that lowers the engine's per minute (RPM) at select time to bring on humorous beneficial effect.
The point of overdrive is fuel efficiency. If the car can move faster while relaxing the engine. The car's efficiency improve additionally, with engine's reduction in workload, the car is consequently less noisy and ride comfort improves.
In overdrive the gearing makes it so that the input shaft is rotating slower than the output shaft and the car is over driving beyond its peak power point.

543. Steering ratio for cars is approximately:

(a) 2-5 (b) 10-20
(c) 30-40 (d) 50-60
(e) 70-80

CGPSC ARTO & TSI 07.01.2017

Ans. (b) :

544. The smallest gears inside the differential casing are:

(a) pinion gears (b) sun gears
(c) side gears (d) ring gears
(e) both, sun gears and side gears

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : The smallest gear inside the differential casing are pinion gears. Differential gear, in automotive mechanics, gear arrangement that transmit power from the engine to be transmitted to a pair of driving wheels, dividing the force equally between them but permitting them to follow path of different lengths as when turning a corner or traversing an uneven read.

545. For small cars, suitable steering gear box is:

(a) rack and pinion (b) worm and wheel
(c) cam and roller (d) worm and nut
(e) cam and worm

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Most car- based vehicles use rack and pinion steering in which the steering wheel turns a pinion gear that moves on a rack to turn the front wheel. others use recalculating ball systems in which ball bearing are mounted on a worm type steering gear.

546. The part of the vehicle by which outer wheel of a vehicle runs faster than inner wheel while taking turn is known as:

(a) Differential (b) Brake
(c) Clutch (d) Engine
(e) Chassis

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Differential Gear :- It is a system that transmits an engine's torque to the wheels. The differential takes the power from the engine and splits it, allowing the wheels to spin at different speed-turn it around a corner and you will have no issues as each wheel is able to turn independently from the other.
Brake :- A brake is a mechanical device that inhibits motion by absorbing energy from a moving system. it is used for slowing or stopping vehicle wheel axle , or to prevent its motion, most often accomplished by means of friction.
Chassis :- It is the main support structure of the vehicle which is also known as frame. It bears all the stresses on the vehicle in both static and dynamic condition.

547. How can interference in involute gears be avoided?

(a) Varying the centre distance by changing the pressure angle only
(b) Using modified involute composite system only
(c) Increasing the addendum of small wheel and reducing it for the larger wheel only
(d) Any of the above

HPPSC Asstt. Prof. 18.09.2017

Ans. (d) : Any of the above

548. The circle passing through the bottom of the teeth of gear is known as:

(a) dedendum circle (b) prime circle
(c) addendum circle (d) base circle

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (a) : Dedendum circle–The circle, passing through the bottom of the teeth of gear.
or
It is a radial distance of a tooth from the pitch circle to the bottom of the tooth.
Addendum circle–It is the circle drawn through the top of teeth and is concentric with the pitch circle.

Search on Telegram @apna_pdf

Pitch circle–It is an imaginary circle which by pure rolling action, would give the same motion of the actual gear.
Prime circle–It is smallest circle which can be drawn tangent to the locus of the centerline of the follower.
Base circle–Base circle of gear is the base circle for the involute curve. An involute curve is the trace of a point at the end of taut string that unwinds from a cylinder, this cylinder is called base circle.

549. According to law gearing:
(a) dedendum should be equal to 1.157 m
(b) teeth should of cycloidal type
(c) teeth should be of involute type
(d) none of these

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (d) : Law of gearing–The law of gearings fulfilled by the goal, tooth profiles to maintain a constant angular velocity ratio between two gears.
2. For constant angular velocity ratio of the two gears the common normal at the point of contact of the two mating teeth must pass through the pitch point.
3. Velocity of sliding = $(w_1 + w_2) \times$ distance between the pitch point and point of contact.
So, answer is none of these.

550. Match list I with list II and select the correct answer from the codes given below:

List I	List II
A. Gears	1. Sprocket
B. Belts	2. Friction
C. Chains	3. Slip
D. Clutch	4. Flank

Code:

	A	B	C	D
(a)	4	3	1	2
(b)	1	2	3	4
(c)	2	3	4	1
(d)	3	4	1	2

PTCUL AE 25.06.2017

Ans. (a) :

551. What is the preferred order of sequence for the following drives from high speed to low speed?
(a) Rack and pinion, spur gears, worm and worm wheel
(b) Worm and worm wheel, spur gears, rack and pinion
(c) Worm and worm wheel, rack and pinion, spur gears
(d) Spur gears, worm and worm wheel, rack and pinion

UPSC JWM 2017

Ans. (c) : The preferred order of sequence for the high speed to low speed drives as following-
Worm and worm wheel
Rack and pinion
Spur gears

552. Design load factor for (i) a helical gear is smaller than that for (ii) a straight tooth spur gear because
(a) Load concentration factor may be same in both but dynamic load factor is smaller in (i)
(b) Both load concentration factor and dynamic load factor are smaller in (i)
(c) Load concentration factor is smaller even though dynamic load factor may be higher in (i)
(d) Load concentration factor is smaller in (i) even as the dynamic load factor is the same for both

UPSC JWM 2017

Ans. (a) :

553. The minimum recommended top land for hardened gears in terms of module m is
(a) 0 m (b) 0.4 m
(c) 1 m (d) 1.2 m

BPSC AE Mains 2017 Paper - VI

Ans : (c) : The minimum recommended top land for hardened gears in terms of module m is 1 m.

554. Pressure angles more than 25° are not used in involute profiles because
1. The gears are difficult to manufacture
2. Minimum number of teeth for under cutting increases enormously
3. Bearing radial load from normal reaction between gears will be very high
(a) 1 only (b) 2 only
(c) 3 only (d) 1, 2 and 3

UPSC JWM 2017

Ans. (c) : Pressure angles more than 25^o are not used in involute profiles because bearing radial load from normal reaction between gears will be very high.

555. Gears with involute profile have become popular in comparison to those with cycloidal profiles because:
1. They are interchangeable
2. They are insensitive to centre-distance variation
3. Involute rack cutter is straight-sided
4. They occupy lesser space

Which of the above statements are correct?
(a) 1 and 2 only (b) 2 and 3 only
(c) 3 and 4 only (d) 1 and 4 only

UPSC JWM 2017

Ans. (b) : Gear with involute profile have become popular because of
• They are insensitive to centre-distance variation.
• Involutes rack cutter is straight sided.

556. In case of two meshing gears both with involute tooth profiles, contact is made when the tip of the:
(a) Driven wheel touches the flank of a tooth of the driving wheel
(b) Driven wheel touches the face of a tooth of the driving wheel
(c) Driving wheel touches the face of a tooth of the driven wheel
(d) Driving wheel touches the flank of a tooth of the driven wheel

UPSC JWM 2017

Ans. (a) : In case of two meshing gears both with involute tooth profiles, contact is made when the tip of the Driven wheel touches the flank of a tooth of the driving wheel.

Search on Telegram @apna_pdf

557. The direction of motion of the driven gear of a simple gear train having an odd number of idler gears will be

(a) Same as that of the driving gear
(b) Opposite to that of the driving gear
(c) Dependent upon the number of teeth on the driving gear
(d) Dependent upon the number of teeth on the driven gear

UPSC JWM 2017

Ans. (a) : The direction of motion of the driven gear of a simple gear train having an odd number of idler gears will be same as that of the driving gear.
Note : Even number of gears, driver and follower turn in opposite direction.

558. A spur gear with 32 teeth and module 4 mm is rotating at 400 rpm. The circular pitch is:

(a) 7π mm (b) 6π mm
(c) 5π mm (d) 4π mm

UPSC JWM 2017

Ans. (d) : Circular pitch for spur gear,

$$P_c = \pi m = \pi \frac{D}{T}$$

Module, m = 4 mm

$$P_c = 4\pi$$

559. In a simple epicyclic gear train for transmission of torque. The following component must be held stationary

(a) Sun gear (b) Annular gear
(c) The carrier unit (d) Any one of the above

TNPSC AE 2017

Ans. (d) : In a simple epicyclic gear train for transmission of torque any one, sun gear or annular gear or the carries unit [arm] may be fixed.

560. The problem of interference in an involute pinion, which has to come in external mesh with a gear, can be avoided by

(a) increasing the pressure angle
(b) positive profile correction on pinion and corresponding negative profile correction on gear
(c) machining the pinion teeth through hobbing so that the interfering portion gets undercut
(d) All of the above

BPSC AE Mains 2017 Paper - VI

Ans : (d) : The problem of interference in an involutes pinion, which has to come in external mesh with a gear, can be avoided by,

- Increasing the pressure angle.
- Positive profile correction on pinion and corresponding negative profile correction on gear.
- Machining the pinion teeth through hobbing so that the interfering portion gets undercut.

561. Statement (I): All worm drives (worm and worm wheel) are reversible.
Statement (II): The worm and worm wheel are made of different materials.

ESE 2017

Ans. (d) : All worm drives are not reversible. Only low speed ratio worm drives are reversible while high speed ratio drives are non reversible.
So statement-I s wrong.
The worm wheel in general made from phosphor-bronze alloy, which is costly. The worm is usually made of hardened alloy steel.

562. Consider the following statements:
In the case of gears of involute profiles, increase in the centre to centre distances between the mounting shafts
1. increases the pressure angle
2. will not affect the law of gearing
3. shortens the path of contact
4. increases the contact ratio
Which of the above statements are correct?

(a) 1, 2 and 4 (b) 1, 2 and 3
(c) 1, 3 and 4 (d) 2, 3 and 4

ESE 2017

Ans. (b) : If the distance between centre is increased then pressure angle also increases, path of contact decreases and law of gearing will be unaffected.

563. If the speed of a mechanism is to be reduced in the ratio of 1000:1, which of the following systems would you choose?

(a) Bevel gear system
(b) Spur gear system
(c) Differential gear system
(d) Worm and worm wheel system

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : As, we know for a single start worm, each full turn of worm advances the gear by one tooth. So a gear with 24 teeth will provide a gear reduction of 24:1. So, for a reduction ratio of 1000:1, worm and worm wheel system is best.

564. In order to test the efficiency of a reducer gear train 1 kW input was given at the input end at a speed of 1440 rpm and at a output end the measured torque was 56.36 N.m. If the ratio of speed reduction in this unit is 10: 1, the efficiency is about

(a) 78% (b) 85%
(c) 63% (d) 96%

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Given,
Speed reduction = 10 : 1

$$\text{Output speed} = \frac{1440}{10} = 144 \text{ rpm}$$

$$\text{Output power} = T.\omega = 56.36 \times \frac{2\pi \times 144}{60}$$

$$= 849.88 \text{ W}$$

$$\text{Efficiency} = \frac{\text{Output}}{\text{Input}} \times 100 = \frac{849.88}{1000} \times 100 = 85\%$$

565. The differential gear is fitted on rear axle of automobiles; its function is

(a) To rotate the front wheels at different speeds
(b) To rotate the back wheels at the same speed during turning
(c) To rotate the back wheel at different speeds during turning

Search on Telegram @apna_pdf

(d) To permit the two back wheels to rotate at the different speeds when driving in the straight path.

GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : The differential gear is fitted on rear axle of automobiles; its function is to rotate the back wheel at different speeds during turning.

566. Consider the following profiles of mating gear teeth:

1. Involute profiles
2. Cycloidal profiles
3. Conjugate profiles

Which of these satisfy the law of gearing?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : All 3-profiles satisfy the law of gearing.

567. In the case of involute system of gears, if the centre distance is changed

(a) The velocity ratio changes
(b) The pressure angle changes
(c) The pitch circle remain unaffected
(d) The law of gearing fails to get satisfied

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : In the case of involute system of gears, if the centre distance is changed the pressure angle changes.

568. Which of the following is FALSE?

(a) A reverted gear train is one in which the first and last gears are on the same axis.
(b) Train value for a gear is the ratio of product of driven tooth numbers to product if driving tooth numbers.
(c) A planetary gear train is one in which the axes of some of the gears may have a motion.
(d) A compound gear train is one which has two or more gears on each axis.

ISRO Scientist/Engineer 17.12.2017

Ans. (b) : Train value $= \dfrac{\text{Product of driving tooth}}{\text{Product of driven tooth}}$

569. Velocity factor is used to take care of

(a) effect of high velocity
(b) possibility of fatigue failure
(c) possibility of high wear
(d) pitting

TNPSC AE 2017

Ans. (b) : Velocity factor is used to take care of possibility of fatigue failure. The ratio of the static load at failure to the dynamic load at failure was taken as the velocity factor (C_v). This means that an identical gear pair running at this speed would have a dynamic load equal to C_v times the static tangential load.

570. A spur gear with 22 number of teeth and a 28 mm pitch circle diameter will have a circular pitch as:

(a) 2 mm (b) 4 mm
(c) 6 mm (d) 8 mm
(e) 10 mm

(CGPSC Polytechnic Lecturer 2017)

Ans. (b) : Number of teeth (T) = 22
Pitch circle diameter (D) = 28 mm
Then circular pitch (P) = ?

We know that

$$P = \frac{\pi D}{T} = \frac{22}{7} \times \frac{28}{22}$$

$$\boxed{P = 4 \text{ mm}}$$

571. In case of helical gear, the relation between the normal pitch (P_N), axial pitch (P_C) and helix angle (α), is given by:

(a) $P_C = \dfrac{P_N}{\cos\alpha}$ (b) $P_C = \dfrac{P_N}{\sin\alpha}$
(c) $P_N = \dfrac{P_C}{\cos\alpha}$ (d) $P_N = \dfrac{P_C}{\sin\alpha}$
(e) $P_N = \dfrac{P_N}{\cos 2\alpha}$

(CGPSC Polytechnic Lecturer 2017)

Ans. (a) : In case of helical gear, the relation between the normal pitch (P_N), axial pitch P_C and helix angle (α) is given by

$$P_C = \frac{P_N}{\cos\alpha}$$

572. The train value for T_1 number of teeth on driver and T_2 number of teeth on driven gear is given by:

(a) $\dfrac{T_1}{T_2}$ (b) $\dfrac{T_2}{T_1}$
(c) $\dfrac{1}{2}\left(\dfrac{T_1}{T_2}\right)$ (d) $\dfrac{1}{2}\left(\dfrac{T_2}{T_1}\right)$
(e) $(T_1 - T_2)$

(CGPSC Polytechnic Lecturer 2017)

Ans. (a) : Speed Ratio–It is defined as the ratio of speed of driver gear to speed of driven gear

$$\text{Speed ratio} = \frac{\omega_{DVR}}{\omega_{DVN}}$$

$$\text{Then train value} = \frac{1}{\text{Speed Ratio}} = \frac{\omega_{DVN}}{\omega_{DVR}}$$

$$\text{Train value} = \frac{\omega_{DVN}}{\omega_{DVR}} = \frac{T_1}{T_2}$$

573. Stub teeth are provided for-

(a) High velocity ratios
(b) High power transmitting capacity
(c) Low noise
(d) Reducing number of the teeth for compact construction

Nagaland PSC CTSE 2017, Paper-I

Ans. (d) : Stub teeth are provided for reducing number, of teeth for compact construction, reduced interference in involutes gears, to improve capability to with stand shock and vibrations.

574. Velocity factor for ordinary cut gears operating at velocity 6 m/s is equal to-

(a) 0.5 (b) 0.75
(c) 0.33 (d) 1

Nagaland PSC CTSE 2017, Paper-I

Search on Telegram @apna_pdf

Ans. (c) : Velocity factor for ordinary gears operating at (velocity upto 12.5 m/sec) is equal to,

$$C_V = \frac{3}{3+V}$$

Here V = 6m/sec

$$C_V = \frac{3}{3+6} = 0.33$$

For carefully cut gear (for velocity upto 12.5 m/sec)

$$C_V = \frac{4.5}{4.5+V}$$

For very accurately cut and ground metallic gears (for velocity upto 20 m/sec)

$$C_V = \frac{6}{6+V}$$

For precision gear cut coin high accuracy (for velocity upto 20 m/sec)

$$C_V = \frac{0.75}{0.75+\sqrt{V}}$$

575. Involute profile is widely used for gear tooth because–

(a) pressure angle remains constant
(b) face and flank form a continuous curve
(c) involute rack has straight sided teeth
(d) all the above factors

Nagaland PSC CTSE 2017, Paper-I

Ans. (d) : Involute profile is widely used for gear tooth because all the above factors.

576. An epicyclic gear train has 3 shafts A, B and C. A is the input shaft running at 100 r.p.m. clockwise. B is the output shaft running at 250 r.p.m. clockwise. The torque on A is 50 kNm (clockwise), C is a fixed shaft. The torque needed to fix C is

(a) 20 kN m (anti-clockwise)
(b) 20 kN m (clockwise)
(c) 30 kN m (anti-clockwise)
(d) 30 kN m (clockwise)

ESE 2017

Ans. (c) : Given,

$N_A = 100$ rpm (CW)
$N_B = 250$ rpm (CW)
$\tau_A = 50$ kNm (CW)
$N_C = 0$
$\sum \tau N = 0$
$\tau_A N_A + \tau_B N_B + \tau_C N_C = 0$
$(50 \times 100) + (\tau_B \times 250) + 0 = 0$
$\tau_B = -20$ kNm
$\tau_B = 20$ kNm (anti clockwise)

Now $\sum \tau = 0$
$\tau_A + \tau_B + \tau_C = 0$
$\tau_C = -(\tau_A + \tau_B)$
$= -(50 - 20) = -30$ kNm
$= 30$ kNm (anti clockwise)

577. When the addendum of pinion and wheel is such that the path of approach and path of recess are half of their maximum possible values then the length of path of contact is given by,

r pitch circle radius of pinion
R pitch circle radius of wheel
'ϕ' pressure angle.

(a) $\frac{(R+r)\sin\phi}{2}$ (b) $\frac{(R+r)^2\cos\phi}{2}$
(c) $\frac{(R+r)^2\tan\phi}{2}$ (d) $\frac{(R+r)^2}{2\sin\phi}$

Kerala PSC Poly. Lect., 2017

Ans. (a) : $\frac{(R+r)\sin\phi}{2}$

578. Which is the incorrect relationship of gears?

(a) Circular pitch × Diameteral pitch = π
(b) Module = P.C.D. / No. of teeth
(c) Dedendum = 1.157 × module
(d) Addendum = 2.157 × module

GMB AAE 25.06.2017

Ans. (d) : Addendum = 2 × Module is the correct relationship of gears

579. In case of helical gears the angle between the plane containing the axes of the gears and plane passing through the pitch point is known as:

(a) Pitch angle (b) Lead angle
(c) Helix angle (d) pressure angle

WBPSC AE, 2017

Ans. (d) : In case of helical gears the angle between the plane containing the axes of the gears and plane passing through the pitch point is known as pressure angle.

580. In a speed gear box speeds are arranged in

(a) A.P. (b) G.P.
(c) H.P. (d) L.P.

WBPSC AE, 2017

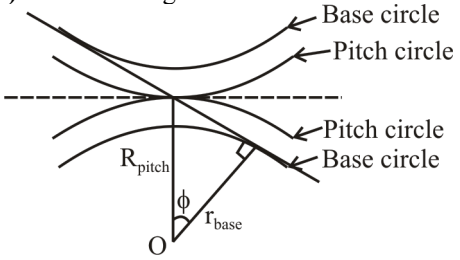
Ans. (b) : In a speed gear box speeds are arranged in G.P. (Geometric Progression).

581. For an involute gear, the ratio of base circle radius and pitch circle radius is equal to

(a) sin φ (b) cos φ
(c) sec φ (d) cosec φ

Sikkim PSC (Under Secretary), 2017

Ans. (b) : In involute gear



ϕ = Pressure angle
$r_{base} = R_{pitch}.\cos\phi$

$$\frac{r_{base}}{R_{pitch}} = \cos\phi$$

582. Which of the following statements is/are true for gear drives?

(a) Gear drives can transmit very large power
(b) Gear drives have low transmission efficiency

Search on Telegram @apna_pdf

(c) Gear drives require more space
(d) All of the above

Karnataka PSC Lect., 27.05.2017

Ans (a) : The gears are used to transmit power from one shaft to another when the shafts are at a small distance apart. It transmits exact velocity ratio. It has high efficiency, reliable service and compact layout. The gear drives has positive drives.

583. The common normal at the point of contact between a pair of teeth must always pass through
(a) Pitch circle (b) Pitch surface
(c) Pitch point (d) None of the above

Karnataka PSC Lect., 27.05.2017

Ans (c) : Pitch point- It is a common point of contact between two pitch circles.

584. An external gear with 60 teeth meshes with a pinion of 20 teeth, module being 8 mm. What is the centre distance in mm?
(a) 960 (b) 320
(c) 480 (d) 160

GPSC EE Pre, 28.01.2017

Ans. (b) : Given,
$T_g = 60$
$T_p = 20$
Module (m) = 8 mm

$$\text{Centre distance} = \frac{m}{2}\left(T_g + T_p\right)$$
$$= \frac{8}{2}(60+20) = \frac{8\times 80}{2}$$
$$= 4 \times 80$$
$$= 320 \text{ mm}$$

585. Suggest gearing arrangement for a stirrer to run at 36 rpm being driven by a motor running at 1440 rpm
(a) Helical gear (b) Differential gear
(c) Spur gear (d) Worm gear

APGENCO AE, 2017

Ans. (d) : When large (say more than 10) gear ratio is required. Worm gears are used. They are used in feed grass cutting machine or grass chaff cutter.

586. The details of two crossed helical gears for speed reduction is as follows. Pitch circle diameter in the plane of rotation for one gear is 80 mm and the helix angle is 30^0. For the other gear pitch circle diameter in the plane of rotation is 120 mm and the helix angle is 22.5^0. If the input speed is 1440 rpm, what is the output speed?
(a) 700 rpm (b) 800 rpm
(c) 1200 rpm (d) 900 rpm

APGENCO AE, 2017

Ans. (d) : $V_r = \frac{V_2}{V_1} = \frac{\omega_2}{\omega_1} = \frac{d_1}{d_2}\frac{\cos\phi_1}{\cos\phi_2} = \frac{N_2}{N_1}$

$\frac{N_2}{1440} = \frac{80\cos 30}{120\cos 22.5}$ or $N_2 = 900$ rpm

587. For two gears to mesh
(a) The diametral pitch of both gears must be the same
(b) Tooth thickness of both gears must be same
(c) Number of teeth on both gears must be same
(d) Whole depth of both gears must be same

Punjab PSC (Lect.) 06.08.2017

Ans. (a) : For two gears to mesh the diametral pitch of both gears must be the same.

588. In the design of spur gears, the Barth's equation is used to express
(a) Velocity Factor
(b) Geometry Factor
(c) Size Factor
(d) Surface Condition Factor

Punjab PSC (Lect.) 06.08.2017

Ans. (a) : The modified Lewis equation for bending stress is

$$P_t = K_v\, mb\sigma_b y$$

Where K_v is known as velocity factor and is given by Barth's equation below for known pitch line velocity V in m/s and is given by,

$$K_v^1 = \frac{6}{6+V}$$

589. Helical gears can be cut on
(a) universal milling machine
(b) horizontal milling machine
(c) vertical milling machine
(d) planetary milling machine

Punjab PSC (Lect.) 06.08.2017

Ans. (a) : Helical gears can be cut on universal milling machine.

590. Two mating spur gears have 25 teeth and 75 teeth. The pinion rotates at 1260 rpm. What is the rotational speed of the gear?
(a) 420 rpm (b) 840 rpm
(c) 1060 rpm (d) 1260 rpm

Punjab PSC (Lect.) 06.08.2017

Ans. (a)

$$\frac{T_1}{T_2} = \frac{N_2}{N_1} \Rightarrow \frac{75}{25} = \frac{1260}{N_1}$$
$$N_1 = \frac{1260}{3} = 420 \text{ rpm}$$

591. The minimum number of teeth to avoid interference in a two wheel set of equal size, when addendum is one module, is given by
(a) $\frac{2}{\sqrt{1+3\sin^2\phi}-1}$ (b) $2\left[\sqrt{1+3\sin^2\phi}-1\right]$
(c) $2\left[\sqrt{1+3\sin^2\phi}+1\right]$ (d) $\frac{2}{\sqrt{1+3\text{sub}^2\phi}+1}$

Punjab PSC (Lect.) 06.08.2017

Ans. (a)

$$T = \frac{2a_w}{\sqrt{1+\frac{1}{G}\left(\frac{1}{G}+2\right)\sin^2\phi}-1}$$

This gives the minimum number of teeth on the wheel for the given values of the gear ratio, the pressure angle and the addendum coefficient a_w.
For $a_w = 1$ i.e., when the addendum is equal to one module

Search on Telegram @apna_pdf

$$T \geq \frac{2}{\sqrt{1+\frac{1}{G}\left(\frac{1}{G}+2\right)\sin^2\phi}-1}$$

For equal number of teeth on the pinion and the wheel, G = 1 and

$$T_{min} = \frac{2}{\sqrt{1+3\sin^2\phi}-1}$$

592. Among the following, which are standard interchangeable Tooth Profiles?
(a) The 14.5° composite system
(b) The 20° full depth involutes system
(c) The 20° stub involutes system
(d) All of the above

Punjab PSC SDE 12.02.2017

Ans. (d) : All of the above

593. Hypoid gears are used for :
(a) Parallel shafts
(b) Intersecting shafts
(c) Non-parallel non-intersecting shafts
(d) None of these

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (c) : Hypoid gears are used for non-parallel non intersecting shafts. This provided more contact area and better tooth strength which allow more torque to be transmitted and high gear ratio to be used.
For parallel shaft – Spur gear, Helical gear,
Intersecting shaft – Bevel Gear.

594. Two mating spur gears have 40 and 120 teeth respectively. The pinion rotates at 12000 rpm and transmits a torque of 20 Nm. The torque transmitted by gear is:
(a) 80 Nm (b) 30 Nm
(c) 40 Nm (d) 60 Nm

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (d) : From Gears Ratio

$$GR = \frac{D_2}{D_1} = \frac{Z_2}{Z_1} = \frac{N_1}{N_2} = \frac{T_2}{T_1}$$

Where D_1 = Diameter of pinion
D_2 = Diameter of Gear
Z_1 = Teeth on pinion
Z_2 = Teeth on Gear
N_1 = Speed of Pinion
N_2 = Speed of Gear
T_2 = Torque transmitted from the Gears.
T_1 = Torque transmitted from the Pinion.

Given $Z_1 = 40$ teeth; $Z_2 = 120$ teeth
$N_1 = 12000$ rpm
and $T_1 = 20$N-m $T_2 = ?$
From the above relation.

$$\frac{Z_2}{Z_1} = \frac{T_2}{T_1}$$

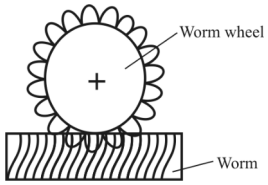
$$\frac{120}{40} = \frac{T_2}{20}$$

$$\boxed{T_2 = 60\text{N} - \text{m}}$$

595. A worm is basically a :
(a) Spur gear (b) Bevel gear
(c) Helical gear (d) Herringbone gear

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (c) : A worm is basically a helical gear. Worm gears are constructed of a worm and a gear, with non-parallel non-intersecting shaft, oriented 90° to each other.



596. The central gear of an epicyclic gear box known as :
(a) Ring gear (b) Sun gear
(c) Planet gear (d) Internal gear

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) Sun gear

597. The ratio of the number of teeth and pitch circle diameter is called ..... .
(a) pitch (b) circular pitch
(c) diametral pitch (d) module

GWSSB DEE 07.07.2016

Ans. (c) : The ratio of the number of teeth and pitch circle diameter is called diametral pitch.

598. The torque that can be transmitted safely by the spur gear tooth at zero pitch line velocity is known as:
(a) Average torque (b) Maximum torque
(c) Minimum torque (d) Stalling torque

RPSC ADE 2016

Ans. (d) : Stalling torque is the torque produced by a mechanical device whose output rotational speed is zero. It may also means that the torque load that causes the output rotational speed of a device to become zero.
The torque that can be transmitted safely by the spur gear tooth at zero pitch line velocity is known as stalling torque.

599. The ratio of face width to transverse pitch of a helical gear with the helix angle is normally
(a) Equal to 1/tan α
(b) more than 1.15/tan α
(c) less than 1.05/tan α
(d) Equal to 2/tan α

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : The ratio of face width to transverse pitch of a helical gear with the helix angle is more than $\frac{1.15}{\tan\alpha}$

600. In cycloidal profile gears, the pressure angle is:
(a) Dependent on the size of teeth
(b) Depends on diameter of gears
(c) Constant
(d) Varies with velocity ratio

GPSC Asstt. Prof. 28.08.2016

Ans. (a) : In cycloidal profile, pressure angle varies from maximum at the beginning of engagement, reduces to zero at the pitch point and again increases to maximum at the end of engagement resulting in improper running of gears, pressure angle depends on no. of teeth size of teeth.

Search on Telegram @apna_pdf

601. In a mitre bevel gear, the pitch cone angle is:

(a) Less than 90°
(b) 90°
(c) Greater than 90°
(d) Can be less or greater than 90°

GPSC Asstt. Prof. 28.08.2016

Ans. (b) : Mitre gears are a special class of bevel gears, where the shafts intersect at 90° and the gear ratio is 1:1. So, it have 90° of pitch cone angle.
For mitre bevel gear–

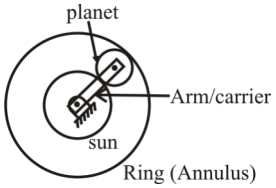
$$\left[\frac{\omega_1}{\omega_2} = 1\right]$$

602. If The annulus wheel of an epicyclical gear train has 120 teeth and planet has 20 teeth, the number of teeth on the sun gear is:

(a) 100 (b) 80
(c) 60 (d) 40

GPSC Asstt. Prof. 28.08.2016

Ans. (b) :



$R_{annulus} = 2R_{planet} + R_{sun}$
$R \propto T$ i.e. radius is proportional to teeth.

$$\text{Module } (m) = \frac{2R}{T} = \text{Constant}$$

$120 = 2 \times 20 + T_{sun}$
$T_{sun} = 80$ teeth

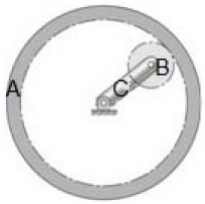
603. The pressure angle commonly used for involutes splines is

(a) 14½° (b) 20°
(c) 22½° (d) 30°

GPSC Asstt. Prof. 28.08.2016

Ans. (d) : Involute splines are available in several standard pressure angles. The 30° pressure angle spline are most commonly used pressure angle.

604. In the epicyclic gear train shown in the figure below, A is rotating at 10 rpm clockwise. A has 140 teeth and B has 35 teeth.



If the arm C makes five revolutions, then what is the ratio of speed of A to that of B?

(a) 1 : 5 (b) 2 : 5
(c) 5 : 1 (d) 5 : 2
(e) 5 : 3

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) :

Arm(c)	$(T_B = 35)B$	$A(T_A = 140)$
0	+x	$+x \cdot \frac{35}{140}$
y	y + x	$y + x \cdot \frac{35}{140}$

$N_C = y = 5$

$$N_A = 10 = y + x\left(\frac{35}{140}\right)$$

$$10 = y + x \times \frac{1}{4}$$

$$10 = 5 + \frac{x}{4}$$

$x = 20$
$N_B = y + x = 5 + 20 = 25$ rpm
$N_B = 25$ (ACW)

Therefore, $\frac{N_A}{N_B} = \frac{10}{25} = \frac{2}{5}$

605. Match the gear types in List-I with their applications with List-II.

	List-I		List-II
(a)	Worm gear	1.	Parallel shafts
(b)	Cross helical gear	2.	Non parallel, intersecting shaft gear
(c)	Bevel gear	3.	Non parallel, non-intersecting shaft
(d)	Spur gear	4.	Large speed ratio

(a) A-4, B-2, C-3, D-1 (b) A-4, B-3, C-2, D-1
(c) A-1, B-2, C-3, D-4 (d) A-1, B-3, C-2, D-4
(e) A-2, B-4, C-1, D-3

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) : A Worm gear have large speed ratio of 40:1.
Cross Helical Gear–Sets are used to transmit power and motion between non-intersecting & non-parallel axes.
Bevel gear are gears where the axes of the two shafts intersect and the tooth-bearing faces of gears.

606. In order to test the efficiency of reduced gear train, 2 kW input was given at the input end at a speed of 1800 rpm and at the output end the measured torque was 60 Nm. If the ratio of speed reduction in this unit is 9 : 1, the efficiency is about:

(a) 63% (b) 72%
(c) 78% (d) 85%
(e) 96%

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (a) : Speed reduction = 9:1

$$\text{Output speed} = \frac{N}{9} = \frac{1800}{9} = 200\,\text{rpm}$$

$$\text{Output power} = T.\omega = 60 \times \frac{2\pi \times 200}{60}$$

$$= 400\,\pi \text{ N-m}$$

$$\% \text{ efficiency} = \frac{\text{Output}}{\text{Input}} \times 100 = \frac{400\pi}{2000} \times 100 = 63\%$$

Search on Telegram @apna_pdf

607. A 15 teeth spur pinion has a module 2mm, runs at 20 rev/s and driver gear at a speed of 10 rev/s. Find the number of teeth on the gear and the theoretical centre to centre distance.

(a) 30 teeth, 45 mm (b) 45 teeth, 45 mm
(c) 45 teeth, 30 mm (d) 8 teeth, 30 mm

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Given,

$T_P = 15$ teeth
$m = 2$ mm
$\omega_p = 20$ rev/sec.
$\omega_D = 10$ rev/s

$$\frac{T_D}{T_P} = \frac{\omega_p}{\omega_D}$$

Teeth on driver gear $T_D = \frac{20}{10} \times 15 = 30 \text{teeth}$

$\boxed{T_D = 30 \text{ teeth}}$

Centre distance $x = r_1 + r_2$

$$= \frac{m}{2}(T_P + T_D) = \frac{2}{2} \times (15 + 30)$$

$\boxed{x = 45}$ mm

608. …….gears are used for transmitting motion/power between intersecting shafts.

(a) Spur (b) Helical
(c) Worms end worm (d) Bevel

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Bevel Gear–Bevel gears have a cone shaped appearance and are used to transmit force between two shaft, which intersect at one point (intersecting shafts). A bevel gear has a cone as its pitch surface and its teeth are cut along the cone.
Spur – parallel shaft.
Helical – parallel shaft.
Worms and worm wheel – Neither parallel nor intersecting.

609. ……provides a continuous variation of gear ratio from lowest to highest.

(a) Torque convertor (b) Gear box
(c) Both (a) and (b) (d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Torque Convertor provides a continuous variation of gear ratio from lowest to highest.

610. If the pitch circle diameter of a spur gear is 60 mm and number of teeth are 20. What would be the diametral pitch?

(a) 3 (b) 0.3
(c) 9.42 (d) 0.106

GPSC Asstt. Prof. (Prod.) 21.08.2016

Ans. (b) : Pitch circle Dia (D) = 60 mm
No. of teeth (T) = 20

$$P_d = \frac{T}{D_{mm}} = \frac{20}{60}$$

$P_d = 0.33$

611. Worm gear is an example of which of the following simple machines?

(a) Lever (b) Screw
(c) Wedge (d) Pulley

KPCL AE 2016

Ans. (b) : A worm is an example of screw, one of the six simple machines. One of the major advantages of worm gear drive units are that they can transfer motion in 90º degrees. The worm in the worm gear drive may have single or multiple starts.

612. When the leading edges of the teeth are not parallel to the axis of rotation, but are set at an angle so that can be meshed in parallel or crossed orientations, they are called_____

(a) Helical gears (b) Spur gears
(c) Worm gears (d) None of these

KPCL AE 2016

Ans. (a) : Where the leading edges of the teeth are not parallel to the axis of rotation, but are set at an angle so that can be meshed in parallel or crossed orientations, they are called helical gears.

613. .....is the distance travelled by a point on either pitch circle of the two wheels during the period of contact of a pair of gear teeth.

(a) Path of contact (b) Line of contact
(c) Arc of contact (d) Radius of contact

HPPSC AE (PWD) 10.09.2016

Ans. (c) : Arc of contact- The locus of a point on the pitch circle from the beginning to the end of engagement of two mating gear is known as the arc of contact.

$$\text{Arc of contact} = \frac{\text{Path of contact}}{\cos\phi}$$

614. When a pinion and cutting rack are in mesh and due to interference the material removed from pinion is known as:

(a) undercutting (b) backlash
(c) arc cutting (d) traction

HPPSC AE (PWD) 10.09.2016

Ans. (a) : Undercutting- A portion of addendum of one gear falls inside the base circle of meshing gear. The profile of the gear inside the base circle is radial. A gear having its material removed in this manner is known as undercut and this process is known as undercutting.

615. A spur gear has a module of 3 mm, number of teeth 16, face width 36 mm, and a pressure angle of 20 degree. It is transmitting a power of 3 kW at 20 rev/s. Taking a velocity factor of 1.5 and a form factor of 0.3, the stress in the gear tooth in MPa will be :

(a) 32 (b) 46
(c) 58 (d) 70

HPPSC Asstt. Prof. 18.11.2016

Ans. (b) : $m = 3$ mm, $\phi = 20°$ $C_v = 1.5$
$t = 16$ mm, $P = 3$ kW $y = 0.3$
$w = 36$ mm, $N = 20$ rev/s

For the safe condition

$$= F_t \times C_v \times s \le bmy(\sigma_b) \quad .....(1)$$

$$P = T \times \omega = F_t \times \frac{d}{2} \times \omega$$

$$3 \times 10^3 = F_t \times \frac{48}{2} \times 2 \times \pi \times 20 \qquad \left(\because m = \frac{d}{t} \Rightarrow 3 = \frac{d}{16}\right)$$

$d = 48$ mm

Search on Telegram @apna_pdf

$$F_t = \frac{3\times10^3\times2}{48\times2\times\pi\times20}$$ Put the value equation (1)

$$\frac{3\times10^3\times2}{48\times2\times\pi\times20}\times1.5\times1 = 36\times3\times0.3\sigma_b$$

$$\sigma_b = \frac{3\times10^3\times60\times1.5}{24\times2\times2\times20\times36\times3\times8.5} = 46.05\,\text{MPa}$$

616. A bronze spur pinion rotating at 600 rpm drives a cast iron spur gear at a transmission ratio of 4 : 1. The allowable static stresses for the bronze pinion and cast iron gear are 84 MPa and 105 MPa respectively. The pinion has 16 standard 20° full depth involute teeth of module 8 mm. The face width of both the gears is 90 mm. The power that can be transmitted from the stand point of strength is

(a) 31.64 kW (b) 78.70 kW
(c) 40.2 kW (d) 316.4 kW
(e) None of these

CGPSC AE 16.10.2016

Ans. (a) : Given, $N_p = 600$ rpm, V.R. $= T_g/T_p = 4$
$\sigma_{OP} = 84$ MPa, $\sigma_{OG} = 105$, $T_P = 16$
$m = 8$ mm, $b = 90$ mm, $C_S = 1$

$$v = \frac{\pi D_P N_P}{60} = \frac{\pi\times m\times T_P\times N_P}{60}$$

$$v = \frac{\pi\times0.128\times600}{60} = 4.02\,\text{m/s}$$

$$C_v = \frac{3}{3+v} = 0.427$$

$$W_{T(P)} = \sigma_{OP}\times C_v\times b\times\pi\times m\times Y_P$$

$$Y_P = 0.154 - \frac{0.912}{T_P} = 0.154 - \frac{0.912}{16} = 0.097$$

$$W_{T(P)} = 84\times0.427\times90\times\pi\times8\times0.097$$

$$W_{T(P)} = 7870\text{ N}$$

$$P = \frac{W_T\cdot v}{C_s} = \frac{7870\times4.02}{1} = 31637\,\text{W}$$

$$= 31.64\text{ kW}$$

617. In a simple gear train of three gear wheels, the first gear has 20 teeth, second gear 10 teeth and the third gear 40 teeth. The speed ratio of the third gear to first gear and the direction are

(a) 1/2 and opposite direction
(b) 1/2 and same direction
(c) 2 and opposite direction
(d) 2 and same direction
(e) none of these

CGPSC AE 16.10.2016

Ans. (b) : As we know, gear ratio

$$\frac{N_2}{N_1} = \frac{T_1}{T_2}$$

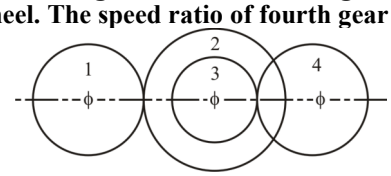
For simple gear strain

$$\frac{N_1}{N_3} = \frac{N_1}{N_2}\times\frac{N_2}{N_3} = \frac{T_2}{T_1}\times\frac{T_3}{T_2}$$

$$\frac{N_1}{N_3} = \frac{T_3}{T_1} = \frac{40}{20}$$

$$\frac{N_3}{N_1} = \frac{1}{2}$$ & same direction

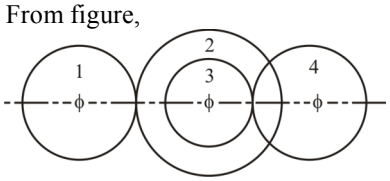
618. The following figure shows a compound gear train with gears 2 and 3 forming a compound wheel. The speed ratio of fourth gear is



(a) $\frac{N_4}{N_1} = \frac{T_4}{T_1}$ (b) $\frac{N_4}{N_1} = \frac{T_1\times T_3}{T_2\times T_4}$
(c) $\frac{N_4}{N_1} = \frac{T_1\times T_2}{T_3\times T_4}$ (d) $\frac{N_4}{N_1} = \frac{T_2\times T_4}{T_1\times T_3}$
(e) None of these

CGPSC AE 16.10.2016

Ans. (b) : From figure,



As we know, for compound gear train,

$$\frac{N_4}{N_1} = \frac{\text{Product of teeth of driver}}{\text{Product of teeth of follower}}$$

$$\boxed{\frac{N_4}{N_1} = \frac{T_1\times T_3}{T_2\times T_4}}$$

619. Which of the following is true for involute gears?

(a) Interference is inherantly absent.
(b) Variation in centre distance of shaft increases radial force.
(c) A convex flank is always in contact with conclave flank.
(d) Pressure angle is constant through the teeth engagement.
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (d) : For involute gears, the pressure angle is constant throughout the teeth engagement.

620. Match List-I with List-II and select the correct answer using the codes given below the lists :

List-I	List-II
A. Interference	1. Arc of approach, arc of recess, circular pitch
B. Dynamic load on tooth	2. Lewis equation
C. Static load	3. Minimum number of teeth on pinion
D. Contact ratio	4. Inaccuracies in tooth profile

Code :

	A	B	C	D
(a)	3	4	1	2
(b)	1	2	3	4
(c)	4	3	2	1
(d)	3	4	2	1

(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Search on Telegram @apna_pdf

Ans. (d)

A. Interference	3. Minimum number of teeth on pinion
B. Dynamic load on tooth	4. Inaccuracies in tooth profile
C. Static load	2. Lewis equation
D. Contact ratio	1. Arc of approach, arc of recess, circular pitch

621. In a machine tool gear box, the smallest and largest spindles are 100 rpm and 1120 rpm respectively. If there are 8 speeds in all, the fourth speed will be :

(a) 400 rpm (b) 280 rpm
(c) 800 rpm (d) 535 rpm
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (b)

$N_{max} = 1120$ rpm
$N_{min} = 100$ rpm, $n = 8$

According speed selection in gear box–

$N_{max} = N_{min}\, r^{n-1}$

$1120 = 100\,(r)$

$$r^7 = \frac{1120}{100} \Rightarrow r = \left(\frac{1120}{100}\right)^{1/7}$$

$r = 1.412$

$\therefore$ Fourth speed,

$N_4 = N_{min}\,(r)^{4-1}$
$= 100\,(1.412)^3$

$\boxed{N_4 = 281.51 \text{ rpm}}$

622. The number of teeth of a spur gear is 30 and it rotates at 200 rpm. What will be its circular pitch and the pitch line velocity if it has a module of 2 mm?

(a) $p = 2\pi$ mm. $V_p = 37699$ mm/min
(b) $p = 2\pi$ mm. $V_p = 36699$ mm/min
(c) $p = 0.5\pi$ mm. $V_p = 37699$ mm/min
(d) $p = 2\pi$ mm. $V_p = 39699$ mm/min

UPRVUNL AE 21.08.2016

Ans. : (a) $m = 2$ mm

$D = mT = 60$ mm

Circular pitch $= \dfrac{\pi D}{T} = m\pi = 2\pi$

Velocity on periphery $= r\omega \quad \left(\omega = \dfrac{2\pi N}{60}\right)$

$= 30 \times \dfrac{2\pi \times 200}{60}$

$= 200\,\pi$ mm/sec

$= 200\,\pi \times 60$ mm/min

$V = 37699.1$ mm/min

623. The velocity ratio between pinion and gear in a gear drive is 2 : 3 the module of teeth is 4.0 mm and sum of number of teeth on pinion and gear is 99. What is the centre distance between pinion and the gear?

(a) 49.5 mm (b) 198 mm
(c) 99 mm (d) 148.5 mm

UPRVUNL AE 21.08.2016

Ans. : (b) Velocity Ratio $= \dfrac{\omega_{gear}}{\omega_{pinion}} = \dfrac{2}{3} = \dfrac{T_{pinion}}{T_{gear}}$

$m = 4$ mm

$T_{pinion} + T_{gear} = 99$

Distance between centre $= \dfrac{m}{2}\left(T_{pinion} + T_{gear}\right) = \dfrac{4}{2}(99)$

Distance b/w centre = 198

624. The transverse section of a helical gear is identical to

(a) bevel gear (b) spur gear
(c) worm gear (d) spiral gear

GPSC Lect. 23.10.2016

Ans. (b) : The transverse section of a helical gear is identical to spur gear.

625. In case of Worm Wheel and Worm the maximum efficiency is obtained when

(a) Either Worm or Worm Wheel is driver
(b) Worm Wheel is driver
(c) Worm is driver
(d) Depends on other factors

APPSC AEE Screening Test 2016

Ans. (a) : In case of worm wheel and worm the maximum efficiency is obtained when either worm or worm wheel is driver.

626. Gears of watches are generally manufactured by

(a) Powder Metallurgy
(b) Machining on Gear Shaper
(c) Die Casting
(d) Stamping

APPSC AEE Screening Test 2016

Ans. (d) : Gears of watches are generally manufactured by stamping.

627. Spring driven watches and clocks utilise

(a) involute gears (b) cycloid gears
(c) epicycloid gears (d) straight rack gears

RPSC AE 2016

Ans : (b) Spring driven watches and clock utilize cycloid gears teeth.
A cycloid is the curve traced by a point on the circumference of a circle which rolles without slipping an a fixed straight line.

628. For a reverted gear trains the speed ratio is given by

(a) $\dfrac{\text{Product of the no. of teeth on drives}}{\text{Product of no. of teeth on drivens}}$

(b) $\dfrac{\text{Product of the no. of teeth on drivens}}{\text{Product of no. of teeth on driver}}$

(c) $\dfrac{\text{Addition of the no. of teeth on drivens}}{\text{Addition of no. of teeth on drivers}}$

(d) $\dfrac{\text{Addition of the no. of teeth on drivens}}{\text{Product of no. of teeth on drivers}}$

Nagaland PSC CTSE 2016 Paper-I

Ans. (b) : For, a reverted gear trains, the speed ratio is given by,

$$S.R = \frac{\omega_{DVR}}{\omega_{DVN}} = \frac{T_{DVN}}{T_{DVR}}$$

$$S.R = \frac{\text{Product of the no. of teeth on drivens}}{\text{Product of no. of teeth on driver}}$$

Search on Telegram @apna_pdf

629. Velocity factor for ordinary cut gears operating at velocity 9m/s is equal to

(a) 0.5 (b) 0.75
(c) 0.25 (d) 1

Nagaland PSC CTSE 2016 Paper-I

Ans. (c) : Velocity factor from ordinary cut gears operating at velocity 9 m/se. then

$$C_v = \frac{3}{3+v} = \frac{3}{3+9} = \frac{3}{12} = 0.25$$

630. Stub tooth are cut on gears

(a) Subjects to shock and vibration
(b) To reduce centre distance between shafts
(c) To reduce friction torque
(d) To improve transmission efficiency

Nagaland PSC CTSE 2016 Paper-I

Ans. (a) : Stub tooth are cut on gears subjects to shock and vibration.

631. Surface endurance limit of gear material is dependent upon its

(a) Brinnel Hardness number
(b) Elastic Strength
(c) Toughness
(d) Yield Strength

APPSC AEE Mains 2016, Paper-III

Ans. (a) : Surface endurance limit of gear material is dependent upon its Brinnel Hardness Number.

632. "Addendum" is defined as

(a) The radius of addendum circle
(b) The radial height of the tooth below the pitch circle
(c) The radial height of the tooth above the pitch circle
(d) It is the full depth of the tooth

RPSC Lecturer 16.01.2016

Ans. (c) : Addendum—It is defined as the radial distance from pitch circle to addendum circle.

633. If a spur gear has module of 4 mm, its circular pitch will be given by

(a) 2 mm (b) 3 mm
(c) 6.28 mm (d) 12.56 mm

RPSC Lecturer 16.01.2016

Ans. (d) : m = 4

Circular pitch (P_c) = ?

$$P_c = \frac{\pi D}{T}$$

$$m = \frac{D}{T}$$

$P_c = \pi m = 3.14 \times 4$

$P_c = 12.56$ mm

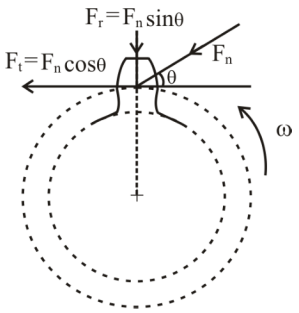
634. Power transmitted (Watts) by spur gear may be given as [Ft = tangential component of force (N), Fr = radial component of force (N), n = rotational speed (rpm), and d = pitch diameter (m)]

(a) $\frac{\pi dnF_t}{60}$ (b) $\left(\frac{\pi dn}{60}\right)^2 F_t$

(c) $\left(\frac{\pi dn}{60}\right)^2 F_r$ (d) $\frac{\pi dnF_r}{60}$

UPRVUNL AE 07.10.2016

Ans. (a) :



We know that,

$P = T \times \omega$

$$P = F_t \times \frac{d}{2} \times \frac{2\pi n}{60}$$

$$P = \frac{\pi dn}{60} \times F_t$$

635. Number of pairs of teeth in contact is given by (where, ϕ = pressure angle):

(a) (Arc of contact)/(Circular pitch)
(b) (Arc of contact × cos ϕ)/(Circular pitch)
(c) (Arc of contact)/(cos ϕ × Circular pitch)
(d) (Path of contact)/(Circular pitch)

UPRVUNL AE 07.10.2016

Ans. (a) : Contact ratio—The contact ratio is defined as the ratio of the length of arc of contact to the circular pitch or contact ratio is the average number of teeth in mesh during a contact cycle, its value always equal to or greater than one.

$$C.R. = \frac{\text{Length of arc of contact}}{\text{Circular pitch}}$$

636. Herringbone gear is a type of

(a) spiral bevel gear
(b) crossed helical gear
(c) hypoid gear
(d) double-helical gear with no groove in between the left and right inclinations

APPSC AEE Mains 2016, Paper-III

Ans. (d) : Herringbone gear is a type of double-helical gear with no groove in between the left and right inclinations.

637. Which of the following characteristics are applicable to stub 20^0 involute system-

(a) small interference
(b) strong tooth
(c) high production cost
(d) gear with small number teeth

RPSC 2016

Ans : (c) 20^0 Stub involute system require high production cost.
And minimum number of teeth on the pinion for 20^0stub involute is 14.

638. A pair of spur gears with module 5 mm and a centre distance of 450 mm is used for a speed reduction of 5 : 1 the number of teeth on pinion is-

(a) 60 (b) 90
(c) 30 (d) 50

RPSC 2016

Search on Telegram @apna_pdf

Ans : (c) m = 5 mm
c = 450 mm
speed reduction = 5 : 1
Speed reduction is inverse of number of teeth ratio

Speed reduction $\frac{N_P}{N_G}=\frac{T_G}{T_P}=5$ _____(1)

Center distance (c) = R + r

$$=\frac{m}{2}(T_G+T_P)$$

$$450=\frac{5}{2}(T_G+T_P)$$

$180 = T_G + T_P$
$180 = 5T_P + T_P = 6T_P$ (from 1)
$\boxed{T_P = 30}$

639. Profiles used for spur gears are:
(a) Epicycloids profiles
(b) Hypocycloid profiles
(c) Thread profiles
(d) Involutes profiles

(HPPSC LECT. 2016)

Ans : (d)
Profiles used for spur gear are Involute profiles.
An involute of a circle is a plane curve generated by a point on a tangent, which rolls on the circle without slipping or by a point on a string which in unwrapped from a reel. In connection with toothed wheels, the circle is known as base circle.

640. To accurately cut gears operating at velocities up to 20 m/s, the velocity factor is equal to :
(a) $\frac{3}{3+v}$ (b) $\frac{6}{6+v}$
(c) $\frac{9}{9+v}$ (d) $\frac{0.75}{1+v}+0.25$

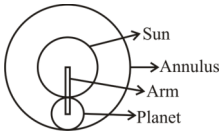
HPPSC W.S. Poly. 2016

Ans : (b) C_v = Velocity factor
(i) $C_v = \frac{3}{3+V}$, for ordinary cut gears operation at velocity up to 12.5 m/sec
(ii) $C_v = \frac{4.5}{4.5+V}$, for carefully cut gears operating at velocity upto 12.5 m/sec
(iii) $C_v = \frac{6}{6+V}$, for very accurately cut and ground metallic gear operation at velocity up to 10 m/sec.

641. In an Epicyclic gear train the number of teeth on Sun and annulus are 80 and 200 respectively. The number of teeth on planet Gear are-
(a) 60 (b) 30
(c) 90 (d) 100

TSPSC Managers, 2015

Ans. (a) :



We know that,
Epicyclic gear train
$R_{annulus} = 2R_{planet} + R_{sun}$
$\left[\because R \propto T \text{ i.e. radius is propartional to teeth}\left(m=\frac{2R}{T}=\text{constant}\right)\right]$
So, $200 = 2 \times T_{planet} + 80$
$\Rightarrow T_{planet} = \frac{120}{2} = 60$

642. In order to cut 30 T gear we use No. 4 cutter which is suitable for the range 2 T to 34 T. If helical teeth with helix angle α are to be cut, the size of cutter is given by
(a) (number of teeth) /α
(b) (number of teeth) /cos α
(c) (number of teeth) /$(\cos\alpha)^2$
(d) (number of teeth) /$(\cos\alpha)^3$

VIZAG MT 2015

Ans. (d) : Size of cutter $=\frac{(\text{number of teeth})}{(\cos\alpha)^3}$

643. Interference is inherently absent in the following types of gears :
(a) Involute (b) Cycloidal
(c) Stub (d) Hypocycloidal

KPSC ADF 2015

Ans. (b) : Interference is inherently absent in the cycloidal types of gears.

644. The pressure angle recommended by BIS for gear is :
(a) 14.5^o (b) 20^o
(c) 25^o (d) 30^o

KPSC ADF 2015 / ESE 2006

Ans. (b) : The pressure angle recommended by BIS for gear is 20^o.

645. The Lewis form factor of gear tooth depends on
(a) the elastic modulus of the tooth
(b) the module
(c) the number of teeth
(d) the pitch circle diameter

BPSC Asstt. Prof. 29.11.2015

Ans. (c) : $y=\left(\frac{t^2}{6hm}\right)$ = Lewis form factor

$P_t = mb\sigma_b y$ the value of y independent of the size of tooth and depend only on No. of teeth on gear and system of teeth beam strength and replaced by S_b.
$S_b = mb\sigma_b y$ known as lewis equation
Note- Lewis form factor for 20° full depth involute is

$$\boxed{y=\pi\left(0.154-\frac{0.912}{T}\right)}$$

646. Undercut of a gear tooth can be avoided by :
(a) decreasing the pressure angle
(b) improving the heat treatment
(c) using smaller rake angle for the cutter
(d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (d) : If the addendum of the mating gear is more than the limiting value then undercut is taking place.

Search on Telegram @apna_pdf

647. Power transmitted by an involute gear is given by
(F_T, F_R, v are Tangential force, Radial force and velocity respectively)
(a) $P = F_T \times v$ (b) $P = F_R \times v$
(c) $P = (F_T + F_R) \times v$ (d) $P = (F_T - F_R) \times v$
TSGENCO AE 14.11.2015

Ans. (a) : Given–
F_T = Tangential force
F_R = Radial force
V = velocity
Power transmitted, P = Tangential force × velocity
$P = F_T \times V$

648. An internal gear having 60 teeth is meshing with an external gear having 20 teeth. Module is 6 mm. The centre distance of two gears is
(a) 120 mm (b) 180 mm
(c) 240 mm (d) 300 mm
MPPSC AE 08.11.2015

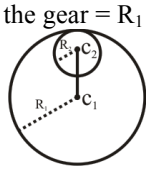
Ans. (a) : Let, T teeth of gear
Given, Teeth of gear (T_1) = 60 & $T_2 = 20$
module (m) = 6 mm $\Rightarrow m_1 = m_2 = m = 6$ mm

$\because \quad m = \dfrac{D}{T}$ where, D = diameter of gear
T = teeth of gear

$\therefore D = mT$

$\therefore$ radius of gear (R) $= \dfrac{D}{2} = \dfrac{mT}{2}$

Let, R_1 and R_2 are the radius of meshing gear.
$\therefore$ centre distance of the gear = $R_1 - R_2$



$$= \frac{mT_1}{2} - \frac{mT_2}{2} = \frac{m}{2}(T_1 - T_2)$$

$$= \frac{6}{2} \times (60 - 20) = 3 \times 40 = 120 \text{ mm}$$

Note- Option (c) is given by the commission.

649. For two wheels of equal size with 20^o Pressure angle and addendum equal to one module, the minimum number of teeth of each wheel must be
(a) 10 (b) 13
(c) 15 (d) 17
TSPSC AEE 2015

Ans. (b) : Data given as,
$G = 1, m = 1, \phi = 20^o$
then

$$t_{min} = \frac{2A_p}{\left(\sqrt{1 + G(G+2)\sin^2\phi} - 1\right)}$$

$$t_{min} = \frac{2}{\sqrt{\left(1 + 3\sin^2\phi\right)} - 1}$$

$$= \frac{2}{\sqrt{1 + 3\left(\sin 20^o\right)^2} - 1} = 12.32 \simeq 13$$

650. Gears produced by die casting are generally used for
(a) high torque transmission
(b) light duty
(c) low temperature application
(d) high axial thrust transmission
(KPSC AE 2015)

Ans : (b) Gear produced by die casting are generally used for light duty.
Methods of manufacturing gears:-
(i) Casting **(ii)** Hot rolling
(iii) Extruding **(iv)** Stamping
(v) Coining **(vi)** Powder- metallurgy

651. Which one of the following pairs is not correctly matched?
(a) Positive drive-belt drive
(b) High velocity ratio-worm gearing
(c) Non-parallel and non-intersecting-spiral gear
(d) Diminished noise and smooth operation-helical gear
OPSC AEE 2015 Paper-I

Ans : (a) (i) Negative drive: Belt drive
(ii) High Velocity ratio: worm gearing
(iii) Non-Parallel and non-intersecting: spiral gear
(iv) Diminished noise and smooth operation: Helical gear

652. A 1.5 kW motor is running at 1440 rpm. It is to be connected to stirrer running at 36 rpm. The gearing arrangement suitable for this application is
(a) differential gear (b) helical gear
(c) worm gear (d) spur gear
GPSC AE 26.07.2015
GATE 2000

Ans. (c) : worm gear

653. In a Gear Train of n wheels, the speed ratio is defined as
(a) $\dfrac{N_1}{N_n}$ (b) $\dfrac{N_n}{N_1}$
(c) $\dfrac{T_1}{T_n}$ (d) $\dfrac{T_n}{T_1}$
TANGEDCO AE 2015

Ans. (a) : Speed ratio = $\dfrac{1}{\text{Train value}}$

Train value = $\dfrac{N_n}{N_i}$

$\therefore$ Speed ratio = $\dfrac{N_i}{N_n}$

654. Minimum center distance is to be maintained between two gears with respect to
(a) Yield strength of the material
(b) Ultimate strength of the material
(c) Fatigue strength of the material
(d) Compressive strength of the material
TANGEDCO AE 2015

Ans. (d) : Compressive strength of the material.

Search on Telegram @apna_pdf

655. In a fully automatic transmission the
(a) torque is continuously transmitted to the driving wheels
(b) power is continuous transmitted to the driving wheels
(c) tractive effect is continuously transmitted to the driving wheels
(d) driving force is continuously transmitted to the driving wheels

TANGEDCO AE 2015

Ans. (a) : In fully automatic transmission in the torque is continuously transmitted to the driving wheels.

656. In an involute pinion and gear system, the interference can be avoided by:
(a) decreasing number of teeth in pinion
(b) lowering the pressure angle
(c) taking long and short addendum system
(d) making the gears using from milling cutter

HPPSC Asstt. Prof. 2014

Ans. (c) : Methods to remove interference:-
(1) Undercut
(2) By increasing the number of teeth
(3) By increasing the pressure angle
(4) Stub tooth
(5) Increasing the centre distance
(6) Decrease the addendum of gear and increase same for pinion.

657. Which of the following gives the value of face angle of a bevel gear?
(a) pitch angle + addendum angle
(b) pitch angle – addendum angle
(c) axial pitch
(d) diametral pitch

UPRVUNL AE 2014

Ans : (a) value of face angle of bevel gear
Face Angle= Pitch Angle + addendum Angle

658. Which of the following gives the value of root angle of a bevel gear?
(a) pitch angle + addendum angle
(b) pitch angle – addendum angle
(c) pitch angle + dedendum angle
(d) pitch angle – dedendum angle

UPRVUNL AE 2014

Ans : (d) The value of root angle of bevel gear.
Root Angle = Pitch Angle - Dedendum Angle.

659. Among the following types of gears, which gears offer a refinement over spur gears?
(a) Skew Gear
(b) Advanced spur gears
(c) External Gears
(d) Helical Gears

UPRVUNL AE 2014

Ans. : (d) Helical gears offer a refinement over spur gears.
- Helical gears have teeth that are set on as angle to the gear axis since the teeth engage more gradually, they have a smother and quieter operation than spur gear.
- Helical gear also have greater tooth strength and a higher load carrying capacity.

660. Which type of Gear meshing should be employed to transmit torque to a linear force?
(a) Epicyclical Gear (b) Helical Gear
(c) Bevel Gear (d) Rack and pinion

ISRO Scientist/Engineer 24.05.2014

Ans. (d) : Type of Gear meshing should be employed to transmit torque to a linear force rack and pinion.

661. Consider the following statements
1. Cheaper low quality gear in small numbers
2. The tooling costs are reasonable
3. Poor surface finish and dimensional accuracy
4. Due to low precision and high backlash, they are noisy
5. They are suited for non-critical applications

Out of the above which are the characteristics of sand cast gears?
(a) 1, 2, 3 and 4 (b) 1, 2, 4 and 5
(c) 2, 3, 4 and 5 (d) 1, 2, 3, 4 and 5
(e) 1, 4 and 5

CGPSC AE 26.04.2015 Shift-I

Ans. (d) : The characteristics of sand cast gears are
(i) Cheaper low quality gear in small numbers.
(ii) The tooling costs are reasonable
(iii) Poor surface finish and dimensional accuracy.
(iv) Due to low precision and high backlash, they are noisy.
(v) They are suited for non-critical application.

662. When the pitch angle in Bevel gears is less than 90^o it is referred to as an
(a) external Bevel gear
(b) internal Bevel gear
(c) crown gear
(d) meter gear

TNPSC AE 2014

Ans. (a) : When the pitch angle in Bevel gears is less than 90^o it is referred to as an external Bevel gear.

663. Reduction ratio of a worm gear drive with a 60 teeth wheel and a double start worm with 12 threads is
(a) 60 (b) 30
(c) 12 (d) 5

TNPSC AE 2014

Ans. (b) :

Velocity ratio	Number of starts
20 and above	Single start
12 - 36	Double start
8 - 12	Triple start
6 - 12	Quadruple start
4 - 10	Sextuple start

664. Two mating spur gears have 30 and 90 teeth respectively. The pinion rotates at 1200 rpm and transmits a torque of 20 Nm. The torque transmitted by the gear is
(a) 6.6 Nm (b) 20 Nm
(c) 40 Nm (d) 60 Nm

TNPSC AE 2014

Search on Telegram @apna_pdf

Ans. (d) : We assume that there is a no loss in power transmission

so, $P_P = P_G$

$[T\omega]_P = [T\omega]_G$

$T_P N_P = T_G . N_G$

$$T_G = 20 \times \frac{90}{30} \qquad \left[\frac{N_P}{N_G} = \frac{Z_G}{Z_P}\right]$$

$\boxed{T_G = 60\ N-m}$

665. For a reverted your train following details are given

(i) Number of teeth on driving gear A and C are 20 and 30 respectively

(ii) Number of teeth on driven gears of B and D are 60 and 50 respectively. if the driving gear 'A' rotates with 600 rpm. the final driven gear D will rotate at

(a) 200 rpm (b) 120 rpm

(c) 300 rpm (d) 240 rpm

GPSC Lect. (Poly.) 07.12.2014

Ans. (b) : $\frac{N_D}{N_A} = \frac{T_A \times T_C}{T_B \times T_D} = \frac{20 \times 30}{60 \times 50}$

$$N_D = \frac{600}{2} \times \frac{2}{5}$$

$$N_D = \frac{240}{2} \text{rpm}$$

$\boxed{N_D = 120 \text{rpm}}$

666. For the design of gear teeth, according to Buckingham equation

(a) $F_d > F_w$ (b) $F_w = F_d$

(c) $F_r > F_w$ (d) $F_w > F_d$

Where F_t = Tangential load

F_w = Wear load

F_d = Dynamic load

GPSC Lect. (Poly.) 07.12.2014

Ans. (d) : Tangential tooth load, $F_T = \sigma_b$ mby

Wear load, $F_w = D_p.b.Q.K.$

$$Q = \frac{2G}{G+1}$$

Dynamic load, $F_d = S.C_v. F_{leff}$

S = Service Factor

C_v = Velocity factor

F_{eff} = Effective tangential force

D_p = Dia of pinion

b = Face width of tooth

For safe design

$\boxed{F_w > F_d}$

667. In a conventional lathe, the lead screw has 4 threads per inch. It is required to cut the threads with 2 mm pitch. The train value for the given set of change gear will be

(a) 0.25 (b) 3.175

(c) 0.5 (d) 0.315

GPSC Lect. (Poly.) 07.12.2014

Ans. (d) :

668. The circular pitch of a toothed wheel with 24 teeth and a module of 4.25 mm is :

(a) 1.35 mm (b) 4.25 mm

(c) 6.67 mm (d) 13.35 mm

Kerala PSC Poly. Lect. 09.01.2014

Ans. (d) : $P_C = \pi m = \pi \times 4.25 = 13.35$ mm

669. The maximum efficiency of a worm and worm wheel system in terms of friction angle □ is :

(a) 1– cos/1 + cos □ (b) 1 – sin □/1 + cos □

(c) 1 – sin □/1 + sin □ (d) 1 – tan □/1 + tan □

Kerala PSC Poly. Lect. 09.01.2014

Ans. (c) : 1 – sin □/1 + sin □

670. A worm has a lead angle of 22.5^0. This corresponds to a helix angle of :

(a) 22.5^0 (b) 45^0

(c) 55^0 (d) 67.5^0

Kerala PSC Poly. Lect. 09.01.2014

Ans. (d) : $\lambda = 22.5$ (λ = Lead angle)

$\Psi = 90 - \lambda$ (Ψ = Helix angle)

$= 90 - 22.5 = 67.5$

671. Which one of the following types of gears can be used for speed reduction purpose only

(a) spur gears

(b) bevel gears

(c) helical gears

(d) worm and worm-wheel

Haryana PSC Civil Services Pre, 2014

Ans. (d) : worm and worm wheels are used for speed reduction only because worm and worm wheels have very high velocity ratio.

672. Initial contact between the driving and driven gear teeth occurs at a point where –

(a) addendum circle of driven wheel interacts the line of action

(b) dedendum circle of driven wheel interacts the line of action

(c) dedendum circle of the driver wheel interacts the line of action

(d) addendum circle of the driver wheel interacts the addendum circle of driven gear

Haryana PSC Civil Services Pre, 2014

Ans. (a) : Initial contact between the driving and driven gear teeth occurs at a point where addendum circle of driven gear interacts the line of action.

673. A pair of 20^0 full depth involute spur gears having 30 and 50 teeth respectively and module 4 mm, are in mesh. The addendum of larger gear will be:

(a) 3 mm (b) 6 mm

(c) 9 mm (d) None of these correct

MPPSC State Forest Service Exam, 2014

Ans. (d) : Addendum–It is the radial height of the teeth above the pitch circle. Its standard value is one module. So, addendum = 1 module = 4 mm

674. In hypoid gears, axes of the shaft are.

(a) parallel

(b) intersecting at any angles

(c) intersecting at 90° only

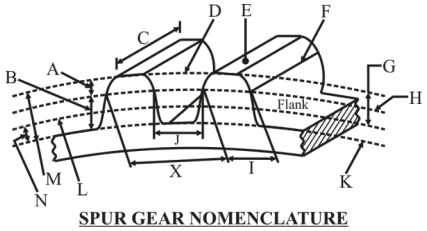
(d) neither parallel nor intersecting

MPPSC State Forest Service Exam, 2014

Search on Telegram @apna_pdf

Ans. (d) : Hypoid gear are a type of spiral bevel gear with the difference that hypoid gears have axes, that are non-intersecting & non-parallel.

675. What does top Land refer to in the figure given below?

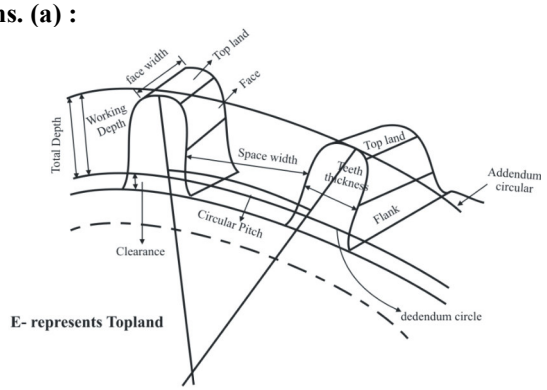


SPUR GEAR NOMENCLATURE

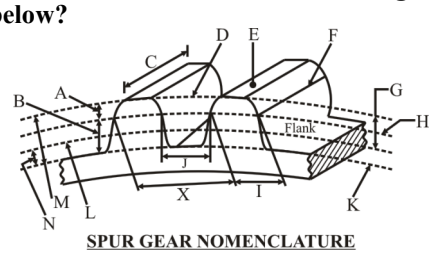
(a) E (b) Both E and F
(c) C and E (d) Only C

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) :



676. What does X refer to in the figure given below?



SPUR GEAR NOMENCLATURE

(a) Circular Pitch (b) Tooth Space
(c) Clearance (d) Face width

MPSC Dy. Engg. (GWD) 19.05.2013

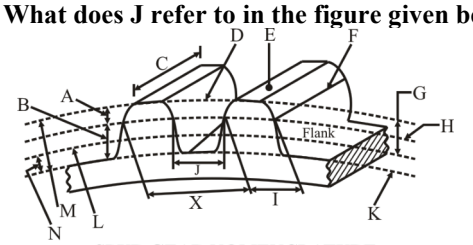
Ans. (a) : X represents circular pitch.

Circular pitch is the distance measured along the circumference of pitch circle from a point an one tooth to a corresponding point on the adjacent tooth.

$$\text{Circular Pitch}\left(P_C\right) = m\pi = \frac{\pi d}{T}$$

m = module
d = Pitch circle dia
T = number of teeth.

677. What does J refer to in the figure given below?



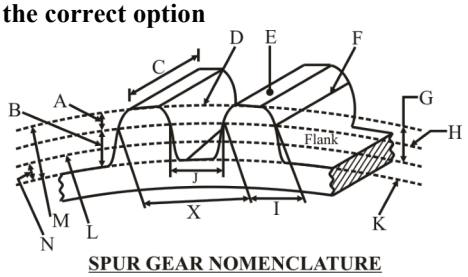
SPUR GEAR NOMENCLATURE

(a) Circular Pitch (b) Tooth Space
(c) Clearance (d) Face width

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : J refers to Tooth space. Tooth space is the space between adjacent tooth.

678. Refer to the figure given below and pick out the correct option



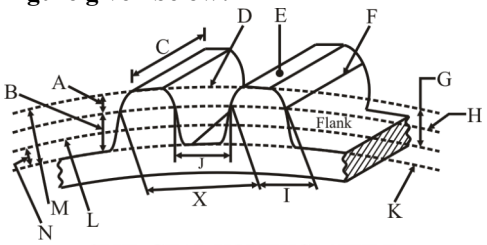
SPUR GEAR NOMENCLATURE

(a) M = A + B – G (b) M = G + N
(c) N = G – A – B (d) G = A + B + M

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : M = G + N
Total depth = working depth + clearance

679. What represents the Tooth thickness in the figure given below?



SPUR GEAR NOMENCLATURE

(a) I (b) X
(c) M (d) N

MPSC Dy. Engg. (GWD) 19.05.2013

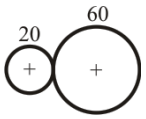
Ans. (a) : Tooth thickness is shown by I

680. Two meshed gears, where the small gear has twenty teeth and big gear has sixty teeth; for every three rotations of small gear, the big gear rotates.

(a) only once (b) three times
(c) nine times (d) none of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) :



$$\frac{N_1}{N_2} = \frac{T_2}{T_1}$$

$$N_2 = N_1 \frac{T_1}{T_2}$$

$$= \frac{20 \times 3}{60} = \frac{60}{60}$$

$$= 1$$

For three rotation of small gear big gear rotates only once.

Search on Telegram @apna_pdf

681. In the gear train of 1:10 as shown in the figure the pinion transmits 250 kw at 1800 rpm. What is the tangential load on the gear tooth
