CONTENTS

- **Mechanical Engineering Exam Syllabus** **3-7**
- **Mechanical Engineering Exam Papers Analysis Chart** **8-13**
- **Mechanical Engineering Exam Papers Pie Chart and Bar Graph** **14**
- **Thermodynamics** **15-165**
  - Basic Concepts & Zeroth Law of Thermodynamics 15
  - First Law of Thermodynamics 60
  - Second Law of Thermodynamics 82
  - Entropy 114
  - Availability and Irreversibility 127
  - Properties of Pure Substances, Gases and Gas Mixture 136
  - Thermodynamic Relations 158
- **Power Plant Engineering** **166-297**
  - Steam Power Plant 166
  - Fuels and Combustion 209
  - Steam Turbine 215
  - Steam Nozzle 232
  - Gas Turbine 242
  - Jet Propulsion 261
  - Compressors 268
  - Nuclear Power Plant 290
- **Refrigeration and Air Conditioning** **298-412**
  - Introduction to Refrigerating machine 298
  - Vapour Compression System 325
  - Refrigerants and Components of Refrigeration System 346
  - Vapour Absorption System 366
  - Psychometric Chart and its Application 374
- **Internal Combustion Engine** **413-512**
  - Air Standard Cycles 413
  - SI and CI Engines 436
  - Fuels 461
  - Supercharging 471
  - IC Engine performance and Testing 475
  - Engine Cooling and Lubrication 491
  - Automobile Engineering 494
- **Fluid Mechanics** **513-766**
  - Properties of Fluid 513
  - Pressure and its Measurement 545
  - Hydrostatic Forces on Surfaces 561
  - Buoyancy and Floatation 576
  - Fluid Kinematics 595
  - Fluid Dynamics 621
  - Flow Through Pipes 663
  - Laminar Flow 693
  - Turbulent Flow 705
  - Boundary Layer Theory 712
  - Flow over Notches and Weirs 723
  - Dimensional and Model Analysis 735
  - Fluid Flow Around Submerged Bodies 749
  - Flow of Compressible Fluids 753
- **Fluid Machinery** **767-859**
  - Impact of Jets 767
  - Hydraulics Turbines 772
  - Reciprocating Pumps 820
  - Centrifugal Pumps 829
  - Miscellaneous Hydraulic Machines 854
- **Heat and Mass Transfer** **860-1005**
  - Steady and Unsteady Heat Conduction 860
  - Free and Forced Convection 926
  - Heat Transfer by Radiation 949
  - Boiling and Condensation 980
  - Heat Exchanger 983
  - Mass Transfer 1003
- **Industrial Engineering** **1006-1160**
  - Break Even Analysis 1006
  - Inventory Control 1015
  - Forecasting 1040
  - Queuing Theory 1047
  - Line balancing, Loading and Sequencing 1055
  - PERT and CPM 1061
  - Linear Programming, Transportation, Assignments 1079
  - Quality Control and Analysis 1096
  - Work Study, Work Measurement and Value Engineering 1111
  - Material Requirement Planning 1136
  - Production Planning and Control 1142
- **Miscellaneous Question** **1161-1200**

सत्यमेव जयते

UPPSC

Uttar Pradesh Public Service Commission

Government of UP, Prayagraj

Combined State Engineering Services

(General Recruitment/Special Recruitment) Examination

Examination Pattern and Syllabus

The following two objective type papers will be for the Combined State Engineering Services Examination.

PAPER-I

Subject	No. of Questions	Marks	Total Marks	Time
General Hindi	25 (Each question of 3 marks)	75	375	2.30 Hours
Main Subject (Mech. Engg.-I)	100 (Each question of 3 marks)	300		

PAPER-II

Subject	No. of Questions	Marks	Total Marks	Time
General Studies	25 (Each question of 3 marks)	75	375	2.30 Hours
Main Subject (Mech. Engg.-II)	100 (Each question of 3 marks)	300		

Personal Examination (Interview) – 100 Marks

Total – 375 + 375 + 100 = 850 Marks

SYLLABUS

General Hindi – Hindi syllabus will be made in such a way that the candidates under standing of Hindi language and efficient use of words can be checked. Its level will be of high school.

General Studies – The question paper of General Studies will include information focusing on current events and their scientific aspects of such things which come in everyday experience and which can be expected from an educated person. The question paper will also included such questions in the history, politics and geography of India, to which candidates will be able to answer without special study.

MECHANICAL ENGINEERING

PAPER-I

1. **Engineering Mechanics:** Analysis of force systems, friction, cendtroid and centre of gravity, trusses and beams, principle of virtual work, kinematics and kinetics of particle, kinematics and kinetics of rigid bodies.
2. **Mechanisms and Machines:** Velocity and acceleration of links, cams and followers gears and gear trains clutches, belt drives, brakes and dynamometers, Flywheel and governors, balancing of rotating and reciprocating masses, balancing of multi cylinder engines, Free and forced vibration, damped vibration, whirling of shafts.

Search on Telegram @apna_pdf

3. **Mechanics of Solids:** Stresses and strains, compound stresses strains, Torsion of circular shafts, stresses and deflections in beams unsymmetrical bending, curved beams, Thin and thick cylinders and spheres, Buckling of columns, Energy methods, helical and leaf springs.

4. **Design of Machine Elements:** Design for Static and dynamic loading, Theories of failure, fatigue principles of design of rivetted, welded and bolted joints, shafts, springs, bearings, brakes, clutches and flywheels.

5. **Engineering Materials:** Crystal systems and crystallography, crystal imperfections, Alloys and phase diagrams,

   Heat treatment, ferrous and non ferrous metals and alloys, Mechanical properties and testing.

6. **Manufacturing:** Metal casting, metal forming, metal joining, Mechanics of metal cutting, machining and machine tool operations, unconventional machining methods limits, fits and tolerances, inspection: Surface roughness, comparators, computer integrated manufacturing, Flexible manufacturing systems, jigs and fixtures.

7. **Industrial Engineering:** Production, planning and control, inventory control and operation, research, CPM and PERT.

8. **Mechatronics and Robotics:** Microprocessors and microcontrollers, Architecture, Programming, Computer interfacing Programmable logic controller, sensors and actuators, Piezoelectric accelerometers, Hall effect sensors, optical encoder, resolver, Inductosyn, Pneumatic and Hydraulic Actuators, stepper motor, control system, mathematical modeling, control signals, controllability and observability, Robotics: Robot classification, robot specification. Notation: Direct and inverse kinematics homogeneous co-ordinates and arm equation of four axix SCARA Robot.

MECHANICAL ENGINEERING

PAPER-II

1. **Thermodynamics:** Thermodynamic systems and processes, properties of pure substances, concepts and applications of zeroth, first and second law of thermodynamics, entropy, availability and irreversibility, detailed analysis of thermodynamic cycles, ideal and real gases, fuels and combustion.

2. **Fluid Mechanics:** Basic concepts and properties of fluids, manometry, fluid statics, buoyancy, equations of motion, Bernoulli's equation and applications, viscous flow of incompressible fluids, laminar and turbulent flows, flow through pipes and head losses in pipes, dimensional analysis, Forces on immersed bodies and boundary layer over a flat plate, isentropic and adiabatic flows, normal shock waves.

3. **Heat Transfer:** Modes of heat transfer, steady and unsteady heat conduction, thermocouple time constant, critical thickness of insulation, heat transfer from fins, momentum and energy equations for boundary layer flow on a flat plate. Free and forced convection, radiation heat transfer, Stefan-Boltzmann law, shape factor, black and grey body radiation heat exchange, boiling and condensation, heat exchanger analysis, LMTD and NTU – effectiveness methods.

4. **Energy conversion:** SI and CI engines, performance characteristics and testing of IC engines, combustion phenomena in SI and CI engines, carburetion and fuel injection systems, emissions and emission control. Reciprocating and rotary pumps, pelton wheel, Francis and Kaplan turbines, velocity diagrams impulse and reaction principles steam and gas turbines; Rankine and Brayton cycles with regeneration and reheat, high pressure boilers, draft, condensers. Unconventional power systems, including nuclear, MHD, biomass, wind and tidal systems, utilization of solar energy; Reciprocating and rotary compressors; theory and applications, Theory of propulsions, pulsejet and ramjet engines.

5. **Environmental control:** Vapour compression, vapour absorption, steam jet and air refrigeration systems, properties of refrigerant and their nomenclature, psychometrics properties and processes, psychrometic relations, use of pschrometic chart, load estimation, supply air conditions, sensible heat factors, air conditioning system layout, comfort chart, comfort and industrial air conditioning.

ESE MECHANICAL ENGINEERING

Contents for syllabi of both the Papers together for Preliminary Examination/ Stage-I (objective type Paper–II) and separately for Main/ Stage-II Examination (Conventional type Paper-I and Paper – II).

PAPER–I

1. Fluid Mechanics:

Basic Concepts and Properties of Fluids, Manometry, Fluid Statics, Buoyancy, Equations of Motion, Bernoulli's equation and applications, Viscous flow of incompressible fluids, Laminar and Turbulent flows, Flow through pipes and head losses in pipes.

2. Thermodynamics and Heat transfer:

Thermodynamic systems and processes; properties of pure substance; Zeroth, First and Second Laws of Thermodynamics; Entropy, Irreversibility and availability; analysis of thermodynamic cycles related to energy conversion: Rankine, Otto, Diesel and Dual Cycles; ideal and real gases; compressibility factor; Gas mixtures.

Modes of heat transfer, Steady and unsteady heat conduction, Thermal resistance, Fins, Free and forced convection, Correlationsfor convective heat transfer, Radiative heat transfer – Radiation heat transfer co - efficient; boiling and condensation, Heat exchanger performance analysis.

3. IC Engines, Refrigeration and Air conditioning:

SI and CI Engines, Engine Systems and Components, Performance characteristics and testing of IC Engines; Fuels; Emissions and Emission Control. Vapour compression refrigeration, Refrigerants and Working cycles, Compressors, Condensers, Evaporators and Expansion devices, Other types of refrigeration systems like Vapour Absorption, Vapour jet, thermo electric and Vortex tube refrigeration. Psychometric properties and processes, Comfort chart, Comfort and industrial air conditioning, Load calculations and Heat pumps.

4. Turbo Machinery:

Reciprocating and Rotary pumps, Pelton wheel, Kaplan and Francis Turbines, velocity diagrams, Impulse and Reaction principles, Steam and Gas Turbines, Theory of Jet Propulsion – Pulse jet and Ram Jet Engines, Reciprocating and Rotary Compressors – Theory and Applications

5. Power Plant Engineering:

Rankine and Brayton cycles with regeneration and reheat, Fuels and their properties, Flue gas analysis, Boilers, steam turbines and other power plant components like condensers, air ejectors, electrostatic precipitators and cooling towers – their theory and design, types and applications;

6. Renewable Sources of Energy:

Solar Radiation, Solar Thermal Energy collection - Flat Plate and focusing collectors their materials and performance. Solar Thermal Energy Storage, Applications – heating, cooling and Power Generation; Solar Photovoltaic Conversion; Harnessing of Wind Energy, Bio-mass and Tidal Energy – Methods and Applications, Working principles of Fuel Cells.

PAPER–II

7 . Engineering Mechanics:

Analysis of System of Forces, Friction, Centroid and Centre of Gravity, Dynamics; Stresses and Strains - Compound Stresses and Strains, Bending Moment and Shear Force Diagrams, Theory of Bending Stresses - Slope and deflection-Torsion, Thin and thick Cylinders, Spheres.

8. Engineering Materials:

Basic Crystallography, Alloys and Phase diagrams, Heat Treatment, Ferrous and Non Ferrous Metals, Non metallic materials, Basics of Nano-materials, Mechanical Properties and Testing, Corrosion prevention and control

9. Mechanisms and Machines:

Types of Kinematics Pair, Mobility, Inversions, Kinematic Analysis, Velocity and Acceleration Analysis of Planar Mechanisms, CAMs with uniform acceleration and retardation, cycloidal motion, oscillating followers; Vibrations –

Search on Telegram @apna_pdf

Free and forced vibration of undamped and damped SDOF systems, Transmissibility Ratio, Vibration Isolation, Critical Speed of Shafts. Gears – Geometry of tooth profiles, Law of gearing, Involute profile, Interference, Helical, Spiral and Worm Gears, Gear Trains- Simple, compound and Epicyclic; Dynamic Analysis – Slider – crank mechanisms, turning moment computations, balancing of Revolving & Reciprocating masses, Gyroscopes –Effect of Gyroscopic couple on automobiles, ships and aircrafts, Governors.

10. Design of Machine Elements:

Design for static and dynamic loading; failure theories; fatigue strength and the S-N diagram; principles of the design of machine elements such as riveted, welded and bolted joints. Shafts, Spur gears, rolling and sliding contact bearings, Brakes and clutches, flywheels.

11. Manufacturing ,Industrial and Maintenance Engineering:

Metal casting-Metal forming, Metal Joining, Machining and machine tool operations, Limits, fits and tolerances, Metrology and inspection, computer Integrated manufacturing, FMS, Production planning and Control, Inventory control and operations research – CPM-PERT. Failure concepts and characteristics-Reliability, Failure analysis, Machine Vibration, Data acquisition, Fault Detection, Vibration Monitoring, Field Balancing of Rotors, Noise Monitoring, Wear and Debris Analysis, Signature Analysis, NDT Techniques in Condition Monitoring.

12. Mechatronics and Robotics:

Microprocessors and Microcontrollers: Architecture, programming, I/O, Computer interfacing, Programmable logic controller. Sensors and actuators, Piezoelectric accelerometer, Hall effect sensor, Optical Encoder, Resolver, Inductosyn, Pneumatic and Hydraulic actuators, stepper motor, Control Systems - Mathematical modeling of Physical systems, control signals, controllability and observability. Robotics, Robot Classification, Robot Specification, notation; Direct and Inverse Kinematics; Homogeneous Coordinates and Arm Equation of four Axis SCARA Robot.

GATE MECHANICAL ENGINEERING

Section 1: Engineering Mathematics

Linear Algebra: Matrix algebra, systems of linear equations, eigen values and eigenvectors.

Calculus: Functions of single variable, limit, continuity and differentiability, mean value theorems, indeterminate forms; evaluation of definite and improper integrals; double and triple integrals; partial derivatives, total derivative, Taylor series (in one and two variables), maxima and minima, Fourier series; gradient, divergence and curl, vector identities, directional derivatives, line, surface and volume integrals, applications of Gauss, Stokes and Green's theorems.

Differential equations: First order equations (linear and nonlinear); higher order linear differential equations with constant coefficients; Euler-Cauchy equation; initial and boundary value problems; Laplace transforms; solutions of heat, wave and Laplace's equations.

Complex variables: Analytic functions; Cauchy-Riemann equations; Cauchy's integral theorem and integral formula; Taylor and Laurent series.

Probability and Statistics: Definitions of probability, sampling theorems, conditional probability; mean, median, mode and standard deviation; random variables, binomial, Poisson and normal distributions.

Numerical Methods: Numerical solutions of linear and non-linear algebraic equations; integration by trapezoidal and Simpson's rules; single and multi-step methods for differential equations.

Section 2: Applied Mechanics and Design

Engineering Mechanics: Free-body diagrams and equilibrium; friction and its applications including rolling friction, belt-pulley, brakes, clutches, screw jack, wedge, vehicles, etc.; trusses and frames; virtual work; kinematics and dynamics of rigid bodies in plane motion; impulse and momentum (linear and angular) and energy formulations; Lagrange's equation.

Mechanics of Materials: Stress and strain, elastic constants, Poisson's ratio; Mohr's circle for plane stress and plane strain; thin cylinders; shear force and bending moment diagrams; bending and shear stresses; concept of shear centre; deflection of beams; torsion of circular shafts; Euler's theory of columns; energy methods; thermal stresses; strain gauges and rosettes; testing of materials with universal testing machine; testing of hardness and impact strength.

Search on Telegram @apna_pdf

Theory of Machines: Displacement, velocity and acceleration analysis of plane mechanisms; dynamic analysis of linkages; cams; gears and gear trains; flywheels and governors; balancing of reciprocating and rotating masses; gyroscope.

Vibrations: Free and forced vibration of single degree of freedom systems, effect of damping; vibration isolation; resonance; critical speeds of shafts.

Machine Design: Design for static and dynamic loading; failure theories; fatigue strength and the SN diagram; principles of the design of machine elements such as bolted, riveted and welded joints; shafts, gears, rolling and sliding contact bearings, brakes and clutches, springs.

Section 3: Fluid Mechanics and Thermal Sciences

Fluid Mechanics: Fluid properties; fluid statics, forces on submerged bodies, stability of floating bodies; control-volume analysis of mass, momentum and energy; fluid acceleration; differential equations of continuity and momentum; Bernoulli's equation; dimensional analysis; viscous flow of incompressible fluids, boundary layer, elementary turbulent flow, flow through pipes, head losses in pipes, bends and fittings; basics of compressible fluid flow.

Heat-Transfer: Modes of heat transfer; one dimensional heat conduction, resistance concept and electrical analogy, heat transfer through fins; unsteady heat conduction, lumped parameter system, Heisler's charts; thermal boundary layer, dimensionless parameters in free and forced convective heat transfer, heat transfer correlations for flow over flat plates and through pipes, effect of turbulence; heat exchanger performance, LMTD and NTU methods; radiative heat transfer, Stefan- Boltzmann law, Wien's displacement law, black and grey surfaces, view factors, radiation network analysis

Thermodynamics: Thermodynamic systems and processes; properties of pure substances, behavior of ideal and real gases; zeroth and first laws of thermodynamics, calculation of work and heat in various processes; second law of thermodynamics; thermodynamic property charts and tables, availability and irreversibility; thermodynamic relations.

Applications: Power Engineering: Air and gas compressors; vapour and gas power cycles, concepts of regeneration and reheat. I.C. Engines: Air-standard Otto, Diesel and dual cycles. Refrigeration and air-conditioning: Vapour and gas refrigeration and heat pump cycles; properties of moist air, psychrometric chart, basic psychrometric processes. Turbomachinery: Impulse and reaction principles, velocity diagrams, Pelton-wheel, Francis and Kaplan turbines; steam and gas turbines.

Section 4: Materials, Manufacturing and Industrial Engineering

Engineering Materials: Structure and properties of engineering materials, phase diagrams, heat treatment, stress-strain diagrams for engineering materials.

Casting, Forming and Joining Processes: Different types of castings, design of patterns, moulds and cores; solidification and cooling; riser and gating design. Plastic deformation and yield criteria; fundamentals of hot and cold working processes; load estimation for bulk (forging, rolling, extrusion, drawing) and sheet (shearing, deep drawing, bending) metal forming processes; principles of powder metallurgy. Principles of welding, brazing, soldering and adhesive bonding.

Machining and Machine Tool Operations: Mechanics of machining; basic machine tools; single and multi-point cutting tools, tool geometry and materials, tool life and wear; economics of machining; principles of non-traditional machining processes; principles of work holding, jigs and fixtures; abrasive machining processes; NC/CNC machines and CNC programming.

Metrology and Inspection: Limits, fits and tolerances; linear and angular measurements; comparators; interferometry; form and finish measurement; alignment and testing methods; tolerance analysis in manufacturing and assembly; concepts of coordinate-measuring machine (CMM).

Computer Integrated Manufacturing: Basic concepts of CAD/CAM and their integration tools; additive manufacturing.

Production Planning and Control: Forecasting models, aggregate production planning, scheduling, materials requirement planning; lean manufacturing.

Inventory Control: Deterministic models; safety stock inventory control systems.

Operations Research: Linear programming, simplex method, transportation, assignment, network flow models, simple queuing models, PERT and CPM.

01.

Thermodynamics

1. Basic Concepts & Zeroth Law of Thermodynamics

1. Internal energy of a perfect gas depends on

(a) temperature, specific heats and pressure
(b) temperature, specific heats and enthalpy
(c) temperature, specific heats and entropy
(d) temperature only

Kerala PSC AM 09.08.2021

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
Mizoram PSC 2014, Paper-I
WBPSC AE 2008
UKPSC AE 2007 Paper -II

Ans. (d) : For Perfect Gas internal energy,

$U = f(T)$

For Real Gas internal energy,

$U = f(T,V)$

Where T = Temperature (K)
V = Volume

2. Work done in a free expansion process is

(a) Zero (b) minimum
(c) maximum (d) positive

Kerala PSC AM 09.08.2021
GPSC DEE, Class-2 (GWSSB) 04.07.2021

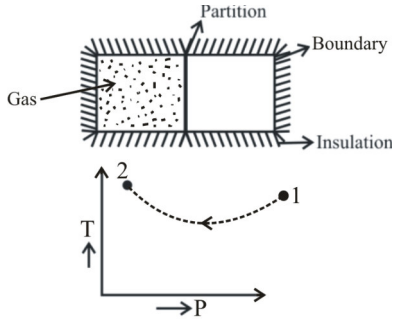
APPSC AEE Screening Test 2016
UKPSC AE 2007 Paper -II
OPSC Civil Services Pre 2006
CSE Pre-2002, 2001

Ans. (a) : Consider an insulated container divided in two parts, ideal gas is filled in one compartment other is vacuum. When partition is removed gas moved to vacuum there has no resistance.



For free expansion–

Heat (Q) = 0, workdone (W) = 0

3. During throttling process :

(a) internal energy does not change
(b) pressure does not change
(c) volume does not change
(d) enthalpy does not change

JPSC AE, 10.04.2021, Paper-I
Assam PSC AE (IWT) 14.03.2021
OPSC AEE 2019 PAPER - II

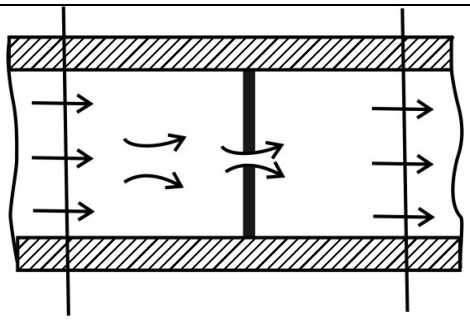
UKPSC AE-2013, 2007 Paper-II
J&K PSC Civil Services Pre, 2010
TNPSC AE, 2008
J & K PSC Screening, 2006

Ans. : (d) During throttling process enthalpy does not change.

Throttling process:- Steam is said to be throttled when it passes through a restricted opening such as a narrow aperture or a slightly opened valve. The leakage of a fluid through a crack in the vessel is an example of throttling

Search on Telegram @apna_pdf



It may be noted that in throttling process:-

(i) No heat is supplied or rejected ($_1Q_2 = 0$)
(ii) No Work is done by the expanding fluid ($_1W_2=0$)
(iii) No Change in the internal energy (dU=0)
(iv) The enthalpy or total heat of the fluid remains constant ($h_1=h_2$)

4. Heat and work are :

(a) Intensive properties (b) Extensive properties
(c) Point functions (d) Path functions

UPCL AE 29.08.2021
Kerala PSC AM 09.08.2021
NLC GET 17.11.2020, Shift-II

Nagaland PSC CTSE 2017 Paper-2
UP Jal Nigam AE 2016
Nagaland PSC (CTSE) 2016, Paper-II
UPRVUNL AE 2014
RPSC AEN Pre-2013, GATE 2011
UKPSC AE 2007 Paper -II

Ans. (d) : Heat and work both are path function.
Similarities between heat and work :
(i) Both are recognized at the boundary of the system, as they cross the boundary so they are considered as boundary phenomena.
(ii) System possesses energy, but neither heat and work.
(iii) Both are associated with process not state. Heat and work have no meaning at a state.
(iv) Both are path functions.

- **Path function-** Magnitude depends on the path followed during the process.
- **Point function-** Magnitude depends on state only and not a how the system approaches that state.

5. The measurement of temperature is based on

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) None of these

Kerala PSC AM 09.08.2021
APPSC Poly Lect. Automobile Engg., 2020
TNPSC AE 2019, WBPSC AE, 2017
UPRVUNL AE 2014, 2016
GPSC Lect. (Auto) 16.10.2016

MPPSC State Forest Service Exam, 2014
Mizoram PSC 2014, Paper-I
J&K PSC Civil Services Pre, 2013
ESE 2009, CSE Pre-2009

Ans. (a)
1. Zeroth law of thermodynamics provides the basis of temperature measurement.
2. First law of thermodynamics provides conservation of law of energy.
3. Second law of thermodynamics provides the basic concept of entropy.

6. Which one of the following is the extensive property of the system?

(a) Density (b) Volume
(c) Pressure (d) Temperature

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II
GPSC Executive Engineer 23.12.2018
Assam PSC CCE Pre 2015

RRB SSE 02.09.2015 Shift-I
UPRVUNL AE 2014
VIZAG STEEL MT 2011
TNPSC AE, 2008, ESE 1999

Ans. (b) : Density, pressure and temperature are Intensive properties because these are independent of mass. Volume is extensive property because it depends upon the mass.

7. An isolated system

(a) is a specified region where transfer of energy and/or mass take place
(b) is a region of constant mass and only energy is allowed to cross the boundaries
(c) cannot transfer either energy or mass to or from the surroundings
(d) none of the above

VIZAG Steel MT 24.01.2021
HPPSC Poly. Lect. 05.07.2021
APPSC Poly Lect. Automobile Engg., 2020
RPSC AE 2018
Karnataka PSC Lect., 27.05.2017
GWSSB AAE, 27.12.2015
TSPSC AEE 2015
WBPSC AE 2008, CSE Pre 2002

Ans. (c)			
Types of System	**Energy**	**Mass**	**Example**
1. Closed system	Yes	No	Piston cylinder arrangement without valves
2. Open system	Yes	Yes	Piston cylinder arrangement with valves, pump etc.
3. Isolated system	No	No	Universe, perfectly thermal flask

8. For a polytropic expansion (PV^n = constant), the temperature and pressure are related as.

(a) $\frac{T_1}{T_2}=\left(\frac{P_1}{P_2}\right)^{n-1}$ (b) $\frac{T_1}{T_2}=\left(\frac{P_1}{P_2}\right)^{\frac{n}{n-1}}$

(c) $\frac{T_1}{T_2}=\left(\frac{P_1}{P_2}\right)^{\frac{n-1}{n}}$ (d) $\frac{T_1}{T_2}=\left(\frac{P_1}{P_2}\right)^{\frac{n}{n+1}}$

Search on Telegram @apna_pdf

CGPSC AE 15.01.2021
GPSC DEE, Class-2 (GWSSB) 04.07.2021
RPSC AE 2018
TNPSC AE (Industries) 09.06.2013
UKPSC AE-2013, Paper-II
UKPSC AE 2012 Paper–II
OPSC Civil Services Pre. 2011
ISRO Scientist/Engineer 2011, 2007

Ans. (c) : For Polytropic process, (PV^n = constant)

$$\frac{T_1}{T_2} = \left(\frac{P_1}{P_2}\right)^{\frac{n-1}{n}} = \left(\frac{V_2}{V_1}\right)^{n-1}$$

9. Isentropic flow is

(a) Reversible adiabatic flow
(b) Irreversible adiabatic flow
(c) Frictionless fluid flow
(d) Reversible isothermal flow

NLCIL GET 17.11.2020, Shift-II
TSPSC Manager (Engg.) HMWSSB 12.11.2020
ISRO Scientist/Engineer (RAC) 22.04.2018
ISRO Scientist/Engineer 17.12.2017
UPPSC AE 12.04.2016 Paper-II
Mizoram PSC 2014 Paper-I
ESE 2011

Ans. (a) : Isentropic flow is reversible adiabatic flow.
We know that,
For isentropic flow $\Delta S = 0$

$$\Delta S = \frac{\delta Q}{T} + \delta \dot{S}_{gen}$$

$\delta Q = 0$ (for adiabatic flow)

$\delta \dot{S}_{gen} = 0$ (for reversible flow)

So $\Delta S = 0$

and we can say that flow will be isentropic.

10. An ideal gas at 27°C is heated at constant pressure till its volume becomes 3 times. What would be then the temperature of gas?

(a) 81°C (b) 627°C
(c) 543°C (d) 327°C

GPSC ARTO Pre 30.12.2018
GPSC EE Pre, 28.01.2017
RPSC IOF & BOILER 20.09.2017
RPSC VPITI 14.02.2016
KPSC ADF 2015
J&K PSC Civil Services Pre, 2013
ESE 2008

Ans. (b) : Given data
$T_1 = 27°C + 273 = 300$ K
Pressure (P) = constant i.e. $P_1 = P_2 = P$
Volume (V_1) = V and $V_2 = 3V$
temperature (T_2) = ?
Applying Ideal gas equation –

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\Rightarrow \quad \frac{P \times V}{300} = \frac{P \times 3V}{T_2}$$

$$\Rightarrow \quad T_2 = 900 \text{ K}$$

or $T_2 = 627°C$

11. Pressure reaches a value of absolute zero

(a) at a temperature of 273 K
(b) under vacuum condition
(c) at the earth's centre
(d) when molecular momentum of system becomes zero

Nagaland PSC (CTSE) 2016, Paper-II
APPSC AEE Mains 2016 Paper-III
Nagaland PSC CTSE 2015 Paper-II
GWSSB AAE, 27.12.2015
J&K PSC Civil Services Pre, 2013
ESE 2002

Ans. (d) : Pressure reaches a value of absolute zero of two possibilities.
Absolute zero temperature – The temperature at which motion of molecule completely stopped i.e., 0 K.
According to kinetic theory of gases, the P exerted by a gas of density ρ and rms velocity v is given by,

We know that, $P = \frac{1}{3}\rho v^2$

At 0 K molecule momentum is zero then v must be zero. So, pressure reaches a value of absolute zero.
Note : According to Third law of thermodynamics : Entropy of pure substance in thermodynamics equilibrium is zero at absolute zero temperature (0 K).

12. What is the standard fixed point of thermometry?

(a) The ice point
(b) The steam point
(c) The triple point of water
(d) None of the above

HPCL Engineer 12.08.2021 Shift-I
Assam PSC AE (PHED), 18.10.2020
AAI Jr. Executive 29.11.2018
Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014
UPSC JWM Advt. No.-52/2010

Ans. (c) : The triple point of water is the standard fixed point of thermometry triple point is the temperature at which all three phases of substance solid, liquid and gas (ice, water, steam) can co-exists in thermal equilibrium simultaneously.
Triple point of water = 0.01°C= 273.16K

13. Air is compressed adiabatically in a steady flow process with negligible change in potential and kinetic energy. The work done in the process is given by

(a) $-\int pdv$ (b) $+\int pdv$
(c) $-\int vdp$ (d) $+\int vdp$

UPPSC AE 12.04.2016 Paper-II
GPSC ARTU 01.05.2016

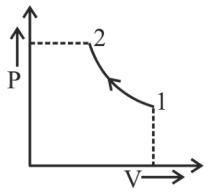
VIZAG Steel MT (Re Exam) 24.11.2013
TNPSC AE 2008
CSE Pre-2000, GATE 1996

Ans. : (c) Open system work:-

$$\int \delta W = -\int_1^2 Vdp$$



For reversible adiabatic compression work done

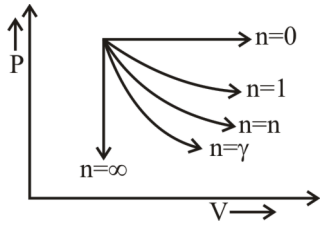
$$= \int dw = -\int vdp$$

14. If the value of n is infinitely large in a polytropic process $PV^n = C$, then the process is _____ .

(a) isothermal (b) isobaric
(c) isentropic (d) isochoric

UPPSC AE 13.12.2020, Paper-2
VIZAG MT, 14.12.2020
RPSC IOF, 2020
ISRO Scientist/Engineer 22.04.2018
RPSC AE 2018, TNPSC AE 2018
UKPSC AE 2007 Paper -II

Ans. (d) :



PV^n = Constant
$n = 0 \rightarrow$ Isobaric
$n = 1 \rightarrow$ Isothermal
$n = n \rightarrow$ Polytropic
$n = \gamma \rightarrow$ Isentropic
$n = \infty \rightarrow$ Isochoric (Constant volume)

15. Change in enthalpy of a system is the heat supplied at

(a) Constant entropy (b) Constant volume
(c) Constant temperature (d) Constant pressure

UPCL AE 29.08.2021
RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
UPPSC AE 13.12.2020, Paper-2
WBPSC AE, 2017
Rajasthan AE (Nagar Nigam) 2016 Shift-3
MPPSC State Forest Service Exam, 2014
RPSC Vice Principal ITI 2008
ESE 2005

Ans. (d) According to first law of thermodynamics

$\partial Q = dU + \partial W$
$\partial Q = dU + PdV$

We know that -

$h = U + PV$
$dh = dU + PdV + VdP$

(VdP = 0 because of constant pressure)

$\boxed{dh = \partial Q}$

16. A process in which the working substance neither receives nor gives out heat to its surroundings during its expansion or compression, is called :

(a) isothermal process (b) hyperbolic process
(c) polytrophic process (d) adiabatic process

ISRO Scientist/Engineer (RAC) 12.01.2020
MECON MT 2019
AAI Jr. Executive 29.11.2018
Karnataka PSC Lect., 27.05.2017
RRB SSE 01.09.2015 Shift-I
VIZAG STEEL MT 2015
OPSC Civil Services Pre 2006

Ans. (d) : A process in which the working substance neither receives nor gives out heat to its surroundings during its expansion or compression, is called Adiabatic process.

17. A closed system is one in which :

(a) mass does not cross boundaries of the system, though energy may do so
(b) mass crosses the boundary but not the energy
(c) neither mass nor energy crosses the boundaries of the system
(d) both energy and mass cross the boundaries of the system

TSPSC AEE 2015, UPRVUNL AE 2014
J&K PSC Civil Services Pre, 2013
ESE 2011, 2010, 1999
OPSC Civil Service Pre-2006

Ans. (a) : Isolated system – Neither mass nor energy cross the system boundary.
Closed system – Only energy crosses the system boundary.
Open system – Mass and energy both crosses the boundary.

18. According to kinetic theory of gases, absolute zero temperature is obtained when :

(a) volume of the gas is zero
(b) pressure of the gas is zero
(c) kinetic energy of the gas is zero
(d) specific heat of the gas is zero

CGPSC AE 15.01.2021
GPSC Engineer, Class-II Pre-19.01.2020
CIL MT 27.02.2020
GPSC Executive Engineer 23.12.2018
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (c) : According to kinetic theory of gases Absolute zero temperature is obtained when the root mean square velocity of gas molecules reduces to zero.

Search on Telegram @apna_pdf

As we know that,

$$v_{rms} = \sqrt{\frac{3RT}{M}}$$

At T = 0 K (absolute zero temperature)

v_{rms} = zero

Thus, kinetic energy of the gas becomes zero.

19. The following are the examples of some intensive and extensive properties

1. pressure 2. Temperature
3. volume 4. Velocity
5. electric charge 6. Magnetization
7. viscosity 8. Potential energy

Which one of the following sets gives the correct combination of intensive and extensive

	Intensive	Extensive
(a)	1,2,3,4	5,6,7,8
(b)	1,3,5,7	2,4,6,8
(c)	1,2,4,7	3,5,6,8
(d)	2,3,6,8	1,4,5,7

GWSSB AAE, 27.12.2015
Haryana PSC Civil Services Pre, 2014
J&K PSC Civil Services Pre, 2010
UPSC JWM Advt. No.-52/2010
CSE Pre-1995

Ans. (c)
Intensive Properties :– Properties which are independent of mass
Ex.– Pressure, temperature, velocity, viscosity.
Extensive Properties :– Properties which depends upon mass.
Ex.– Volume, electric charge, magnetization, potential energy.

20. The definition of 1K as per the internationally accepted temperature scale is

(a) 1/100th the difference between normal boiling point and normal freezing point of water.
(b) 1/273.15th the normal freezing point of water
(c) 100 times the difference between the triple point of water and the normal freezing point of water.
(d) 1/273.16th of the triple point of water.

Nagaland PSC (CTSE) 2016, Paper II
Haryana PSC Civil Services Pre, 2014
ISRO Scientist/Engineer 12.05.2013
ESE 2004, GATE -1994

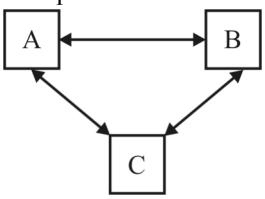
Ans. (d) : According to internationally accepted definition $1K = \left(\frac{1}{273.16}\right)^{th}$ of Triple point of water (H_2O)

21. When two bodies are in thermal equilibrium with a third body, they are also in thermal equilibrium with each other. This statement is

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) Not a law of thermodynamics

GPSC ARTO 01.05.2016
Nagaland PSC CTSE 2015 Paper-II
RRB SSE 02.09.2015 Shift-II
UPRVUNL AE 2014, APPSC Poly. Lect. 2013
WBPSC AE 2008, 2003

Ans. (a) : Zeroth law of thermodynamics- This law was given by RH follower
"According to this law if body A is in the thermal equilibrium with body B and body B is in thermal equilibrium with body C separately then body A and C will be in thermal equilibrium with each other".
Note- Zeroth law of the thermodynamics provide a concept of thermal equilibrium.



22. An open system

(a) is a specified region where transfers of energy and / or mass take place
(b) is a region of constant mass and only energy is allowed to cross the boundaries
(c) cannot transfer either energy or mass to or from the surroundings
(d) has an enthalpy transfer across its boundaries and the mass within the system is not necessarily constant

UJVNL AE 12.09.2021
GPSC DEE, Class-2 (GWSSB) 04.07.2021
CIL MT 27.02.2020
BPSC Poly. Lect. 2016
HPPSC Lect. 2016
VIZAG STEEL MT 2015

Ans. : (a)

system	mass transfer	Energy transfer
open system	✓	✓
closed system	×	✓
Isolated system	×	×

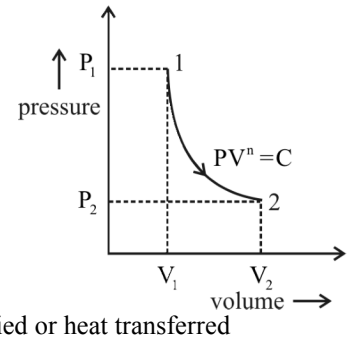
23. The heat absorbed or rejected during a polytropic process is equal to :

(a) $\left(\frac{\gamma - n}{\gamma - 1}\right)^{1/2} \times$ workdone
(b) $\left(\frac{\gamma - n}{n - 1}\right) \times$ workdone
(c) $\left(\frac{\gamma - n}{\gamma - 1}\right)^{2} \times$ workdone
(d) $\left(\frac{\gamma - n}{\gamma - 1}\right) \times$ workdone

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Oil India Limited Sr. Engineer (Drilling) 30.11.2019
MPPSC AE 2016, ESE 2002

Search on Telegram @apna_pdf

Ans. : (d)



Heat supplied or heat transferred

$$Q_{1\text{-}2}=\frac{\gamma\text{-}n}{\gamma\text{-}1}\times\frac{mR(T_1\text{-}T_2)}{n\text{-}1}$$

$$\text{work done during polytropic expansion}=\frac{mR(T_1\text{-}T_2)}{n\text{-}1}$$

$$Q_{1\text{-}2}=\frac{\gamma\text{-}n}{\gamma\text{-}1}\times\text{work done}$$

24. The net work done in a polytropic process is given by

(a) $\frac{P_1V_1-P_2V_2}{n-1}$ (b) $\frac{P_2V_2-P_1V_1}{n-1}$

(c) $\frac{P_1V_1-P_2V_2}{n+1}$ (d) $\frac{P_2V_2-P_1V_1}{n+1}$

WPSC AE 2017, APGENCO AE 2012
UKPSC AE 2007 Paper -II, WBPSC AE 2003

Ans. (a) : For polytropic process $[PV^n = C]$

$$[PV^n = C] = P_IV_I^n = P_FV_F^n \quad \leftarrow \begin{bmatrix} I = \text{initial} \\ F = \text{final} \end{bmatrix}$$

$$P=\frac{C}{V^n};\quad W=\int_{v_I}^{v_F}PdV=\int_{v_I}^{v_F}\frac{C}{V^n}dV$$

$$W=C\int V^{-n}dV=C\left(\frac{V^{-n+1}}{-n+1}\right)_{V_I}^{V_F}$$

$$W=C\left[\frac{V_F^{-n+1}-V_I^{1-n}}{1-n}\right]$$

$$=\frac{1}{1-n}\left[CV_F^{1-n}-CV_I^{1-n}\right] \quad ...(i)$$

$\because$ $PV^n = C = P_IV_I^n = P_FV_F^n$

keep the value of C in equation (i)

$$W=\frac{1}{1-n}\left[P_FV_F^nV_F^{1-n}-P_IV_I^nV_I^{1-n}\right]$$

$$=\frac{1}{1-n}\left[P_FV_F-P_IV_I\right]$$

$$\begin{vmatrix} P_F = P_2 \\ P_I = P_1 \end{vmatrix}$$

$$W=\frac{1}{1-n}\left[P_2V_2-P_1V_1\right]$$

$$\boxed{W=\frac{P_1V_1-P_2V_2}{n-1}}$$

25. For which of the following situations, zeroth law of thermodynamics will not be valid?

(a) 50 cc of water at 25°C is mixed with 150cc of water at 25°C

(b) 500 cc of milk at 15°C is mixed with 100cc of water at 15°C

(c) 5 kg of wet steam at 100°C is mixed with 50kg of dry and saturated steam at 100°C.

(d) 10 cc of water at 20°C is mixed with 10 cc of sulphuric acid at 20°C.

ISRO Scientist/Engineer (RAC) 12.01.2020
GPSC Asstt. Director of Transport 05.03.2017
MPSC Poly. Lect. 2014
ISRO Scientist/Engineer 2012

Ans. (d) : Two bodies in contact are at same temperature when in thermal equilibrium In case of 10cc of water at 20°C is mixed with 10 cc of sulphuric acid at 20°C there is no equilibrium between components because there will be an spontaneous ionic reaction.

26. A cylinder contains $5m^3$ of ideal gas at a pressure of 1 bar. This gas is compressed in a reversible isothermal process till its pressure increases to 5 bar.

(a) 804.7 (b) 953.2

(c) 981.7 (d) 1012.2

Vizag Steel (MT) 2017
GPSC Asstt. Director of Transport 05.03.2017
ISRO Scientist/Engineer (RAC) 07.05.2017
GATE 2013

Ans. (a) Volume $(V_1) = 5.0m^3$

Initial pressure (P_1) = 1 bar = 100 kPa

Final Pressure (P_2) = 5 bar = 500 kPa

We know that,

Work done (W) $=\int_{P_1}^{P_2}VdP$.....(i)

Since, process is isothermal

Therefore, PV = mRT = constant.....(ii)

Now equations (i) and (ii)

$$W=\int_{P_1}^{P_2}\frac{c}{P}dP=c\,ln\left(\frac{P_2}{P_1}\right)$$

$$W=P_1V_1ln\left(\frac{P_2}{P_1}\right)\quad(\because P_1V_1=P_2V_2)$$

$$W=(100\times5)\times ln\left(\frac{500}{100}\right)$$

W = 804.7 kJ

27. Which of the following sets have all intensive properties?

(a) Pressure, temperature, density, specific volume

(b) Pressure, volume, energy, specific volume

(c) Pressure, energy, volume, density

(d) Pressure, heat, density, specific volume

VIZAG Steel MT 24.01.2021 Shift-I

Search on Telegram @apna_pdf

(CGPSC Polytechnic Lecturer 2017)
TRB Polytechnic Lecturer 2017
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (a) : Intensive Properties– It is the properties which is independent of mass is known as intensive properties
Ex.– Pressure, Temperature, Density, Thermal conductivity all form of specific energy etc.

28. Consider the following properties :

1. Energy	**2. Entropy**
3. Gibbs Energy	**4. Volume**
5. Pressure	**6. Temperature**
7. Viscosity	**8. Elasticity**

Which of the above are intensive properties?
(a) 1, 3, 5, 6 (b) 5, 6, 7, 8
(c) 1, 3, 5, 6, 7, 8 (d) 4, 5, 6, 8

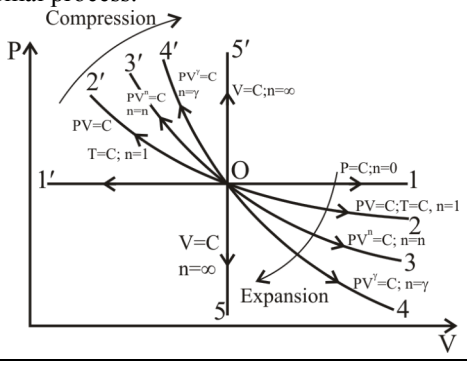
UPPSC AE 13.12.2020, Paper-2
GPSC ARTO Pre 30.12.2018
Nagaland PSC CTSE 2015 Paper-II
APPSC IOF, 2009

Ans. (b) : Intensive Properties– An intensive property is one that does not depend on the mass of substance or system.
Ex.: Temperature, pressure, density, specific volume, all specific quantity, viscosity, kinetic viscosity, specific heat (C_p & C_v) velocity, specific enthalpy, specific entropy, thermal diffusivity etc.
Extensive Property– An extensive property of a system depends on size or the amount of matter in the system.
Ex.: Volume, kinetic energy enthalpy, entropy, all type of energy electrical resistance.

29. The value of n=1 in the polytropic process indicates it to be
(a) Isothermal process (b) Reversible process
(c) Irreversible process (d) Adiabatic process

APGCL AM, 2021
Rajasthan AE (Nagar Nigam) 2016 Shift-3
ISRO Scientist/Engineer 2006
OPSC Civil Services Pre 2006

Ans. (a) : Polytropic process $PV^n = C$
if $n = 1$ then $PV^1 = C$
$PV = C$
In this equation temperature is constant so for $n = 1$ is isothermal process.



30. A mass m of a perfect gas at pressure p_1 and volume V_1 undergoes an isothermal process. The final pressure is p_2 and volume is V_2. The work done on the system is considered positive. If R is the gas constant and T is the temperature, then the work done in the process is _____

(a) $p_1V_1 \ell n\frac{V_2}{V_1}$ (b) $-p_1V_1 \ell n\frac{p_1}{p_2}$
(c) $RT \ell n\frac{V_2}{V_1}$ (d) $-mRT \ell n\frac{p_2}{p_1}$

Assam Engg. College AP/Lect. 18.01.2021
TRB Polytechnic Lecturer 2017
GATE 2017, TNPSC AE 2013

Ans. (b) : For isothermal process temperature is constant (T = C)
$PV = C$
or $P_1V_1 = P_2V_2 = \text{constant}$

Work done by the system $= \int_{v_1}^{v_2} Pdv$ $\quad p_1v_1 = p_2V_2 = C$

$= \int_{v_1}^{v_2} \frac{C}{V}dv$ $\quad \frac{V_2}{V_1} = \frac{p_1}{p_2}$

$= C \ell n\frac{V_2}{V_1}$

$= C \ell n\frac{p_1}{p_2}$

$= p_1V_1 \ell n\frac{p_1}{p_2}$ or $p_1V_1 \ell n\frac{V_2}{V_1}$

Work done in the process

$= -p_1V_1 \ell n\frac{p_1}{p_2}$ or $-p_1V_1 \ell n\frac{V_2}{V_1}$

31. Which thermometer is independent of the substance or material used in its construction?
(a) mercury thermometer
(b) alcohol thermometer
(c) ideal gas thermometer
(d) resistance thermometer

Nagaland PSC CTSE 2017 Paper-2
Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014
CSE Pre-2006

Ans. (c) Ideal gas thermometer is independent of substance or material used in it's construction. Ideal gas thermometers are based on Ideal gas equation $(PV = n\bar{R}T)$

32. For polytropic process (Pv^n = constant), the value of 'n' between two states (1 and 2) is given as:

(a) $n = \frac{ln(P_1 - P_2)}{ln(v_1 - v_2)}$ (b) $n = \frac{ln(P_1P_2)}{ln(v_1v_2)}$
(c) $n = \frac{ln\frac{(P_1)}{P_2}}{ln\frac{(v_1)}{v_2}}$ (d) $n = \frac{ln(P_1/P_2)}{ln(v_2/v_1)}$

Search on Telegram @apna_pdf

Oil India Ltd. Sr. Engg. (Production) 30.11.2019
CGPSC AE 25.02.2018
ISRO Scientist/Engineer 2010
WBPSC AE 2003

Ans. (d) : Polytropic process 1-2 follow $Pv^n = C$
Then the value of n
here n is polytropic process.

$$Pv^n = C$$

$$\Rightarrow \quad P_1v_1^n = P_2v_2^n$$

Take log both side

$$\ln P_1 + n \ln v_1 = \ln P_2 + n \ln v_2$$

$$\ln P_1 - \ln P_2 = n \ln v_2 - n \ln v_1$$

$$\ln\left[\frac{P_1}{P_2}\right] = n \ln\left[\frac{v_2}{v_1}\right]$$

$$n = \frac{\ln[P_1/P_2]}{\ln[v_2/v_1]}$$

33. A pump handling a liquid raises its pressure from 1 bar to 30 bar. Take the density of the liquid as 990 kg/m^3. The isentropic specific work done by the pump in kJ/kg is

(a) 0.10 (b) 0.30
(c) 2.50 (d) 2.93

GPSC ARTO Pre 30.12.2018
GPSC Executive Engineer 23.12.2018
GPSC Asstt. Director of Transport 05.03.2017
GATE 2011

Ans. (d) : Given, $P_2 = 30$ bar, $P_1 = 1$ bar, $\rho = 990$ kg/m^3

Specific workdone by pump $= \dfrac{(P_2 - P_1)}{\rho}$

$$= \frac{(30-1)\times 100 \text{ N/m}^2}{990 \text{ kg/m}^3}$$

$$= 2.93 \text{ kJ/kg}$$

34. The unit of temperature in S.I. unit is

(a) Centigrade (b) Celsius
(c) Fahrenheit (d) Kelvin

CGPSC AE 15.01.2021
Rajasthan Nagar Nigam AE 2016, Shift-II
MPPSC State Forest Service Exam, 2014

Ans. (d) : Kelvin is the unit of temperature in the SI system.

35. Heat flows from one body to other when they have

(a) Different specific heat
(b) Different heat contents
(c) Different atomic structure
(d) Different temperatures

GPSC Asstt. Prof. 28.08.2016
Rajasthan Nagar Nigam AE 2016, Shift-I
GPSC Lect. 23.10.2016

Ans. (d) : Heat flows from one body to other when they have different temperatures.

- Heat transfer has direction as well as magnitude. The rate of heat conduction in a direction is proportional to the temperature gradient.
- Heat $Q = mc\Delta T$
  $Q = mc(T_2 - T_1)$
  $Q \propto \Delta T$
  or $Q \propto (T_2 - T_1)$

36. The work done per unit mass of air in a compressor will be minimum, when n is equal to

(a) 1 (b) 1.2
(c) 1.3 (d) 1.4

JPSC AE, 10.04.2021, Paper-I
Assam PSC AE (PHED), 18.10.2020
WBPSC AE, 2017

Ans. (a) : Work done per unit mass of air in compressor will be minimum if value of n is equal to 1. The law followed by compressor is PV = C (Isothermal Process)
If value of n increases the work done on compressor increases.

37. If the internal energy and enthalpy of a gaseous substance are functions only of temperature and are independent of pressure, then the substance must be

(a) a liquid-vapour mixture
(b) an ideal gas
(c) a real gas
(d) saturated vapour

Haryana PSC AE (PHED) 04.09.2020, Paper-I
Nagaland PSC CTSE 2015 Paper-II
WBPSC AE, 2007

Ans. (b) : Enthalpy and internal energy of an ideal gas are function of temperature only and independent of pressure.
$\because$ For ideal gas, internal energy (U) = f(T)

38. A thermodynamic system refers to :

(a) Any defined region in space
(b) A specified mass in fluid flow
(c) A specified region of constant volume
(d) A prescribed and identifiable quantity of matter

JPSC AE, 10.04.2021, Paper-I
TSPSC Manager (Engg.) HMWSSB 12.11.2020
UPRVUNL AE 2014

Ans. :(d) A thermodynamic system refers to a prescribed and identifiable quantity of mater and in simple word we say that a specified region where we focus our study.

39. The thermodynamic process in which the heat energy supplied is used to increase the internal energy:

(a) Isochoric process (b) Isentropic process
(c) Isobaric process (d) Isothermal process

VIZAG Steel MT 24.01.2021
Nagaland PSC CTSE 2015 Paper-II
ESE 2008

Search on Telegram @apna_pdf

Ans. (a) : A constant volume (Isochoric) thermodynamic process in which the system is confined by mechanical rigid boundaries. No direct mechanical work can be done on the surroundings by a system with rigid boundaries, therefore the heat transferred into or out of the system equals to change in internal energy.

$Q = dU + PdV$

$V = Constant$

$dV = 0$

$$\boxed{Q = dU = U_2 - U_1}$$

40. The gas constant R is equal to the _____.

(a) Addition of specific heats at constant pressure and constant volume

(b) Ratio of specific heat at constant pressure and specific heat at constant volume

(c) Difference between the specific heat at constant pressure and specific heat at constant volume

(d) Product of specific heats at constant pressure and volume

UPCL AE 29.08.2021

Assam PSC AE (IWT) 14.03.2021
VIZAG MT, 14.12.2020
HPPSC Asstt. Prof. 18.09.2017
Assam PSC CCE Pre 2015
UKPSC AE 2012 Paper–II
ESE 2012, ISRO Scientist/Engineer 2010

Ans. (c) : According to Mayer's formula–

The gas constant (R) is equal to the difference of two specific heats.

$$\boxed{R = C_p - C_V} \text{ J/kgK}$$

$$\boxed{\gamma = \frac{C_P}{C_V}}$$

41. Air coming out of a punctured football

(a) becomes hotter

(b) becomes cooler

(c) remains at same temperature

(d) attains atmospheric temperature

AAI Jr. Executive 29.11.2018
WBPSC AE, 2017
Kerala PSC AE (Irrigation) 05.04.2017

Ans. (b) : When air is coming out punctured tyre, puncture acts like a Nozzle when fluid is passed through nozzle, velocity increase and pressure decrease, resulting in decreasing of temperature. You can observe this phenomenon by keeping your hand near mouth and blowing.

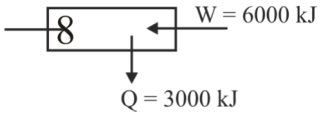
42. A tank containing air is stirred by a paddle wheel. The work input to the paddle wheel is 6000 kJ. The heat transferred to the surroundings from the tank is 3000 kJ. The external work done by the system is

(a) Zero (b) 3000 kJ

(c) 6000 kJ (d) 9000 kJ

UPPSC AE 13.12.2020, Paper-2
Rajasthan Nagar Nigam AE 2016 Shift-I
ESE 1999

Ans. (a)



This is a case of constant volume process (isochoric process) in irreversible constant volume process, the system does not perform work on the surrounding at the expense of internal energy.

43. In an adiabatic process, the work done for a given pair of end sates depends on:

(a) End states only (b) Mass of the system

(c) Value of index n (d) Heat transferred

CIL MT 27.02.2020, APGENCO AE, 2017
TNPSC ACF 2012

Ans. (a) : End state are determined by the internal energy (U) level at these states.

If heat energy ∂Q is given to a system by first law of thermodynamics

$$\partial Q = \partial W + dU$$

For adiabatic process $\partial Q = 0$

Hence $\partial W = dU$

Above equation shows that work done in an adiabatic process depends only upon end states (i.e. point function).

44. The specific heat of ideal gas depend on

(a) Temperature

(b) Volume

(c) Molecular weight and structure

(d) Pressure

ISRO Scientist/Engineer (RAC) 07.05.2017
TRB Poly. Lect., 2012, GATE 1996

Ans. (c) : The specific heat of ideal gas depend on molecular weight and structure.

45. Which one of the properties given is an intensive property of the system?

(a) Composition (b) Volume

(c) Kinetic energy (d) Entropy

HPPSC Poly. Lect. 05.07.2021
TSPSC AEE 2015, UPRVUNL AE 2014

Ans. : (a) Intensive Property – Composition
Extensive Property– Volume, Kinetic Energy, Entropy

46. In highly rarefied gases, the concept of this loses validity

(a) Thermodynamic equilibrium

(b) Continuum

(c) Stability

(d) Macroscopic view point

GPSC EE Pre, 28.01.2017
GPSC Asstt. Director of Transport 05.03.2017
ESE 2012

Search on Telegram @apna_pdf

Ans. (b) : Continuum- In this approach we consider system to be a continuous from of matter. It means that we do not consider the gaps/spaces between the atoms or molecules that are actually present. Instead, we consider a uniform distribution of matter with no spaces or gaps.
But in rarefied gas, gaps will be created among atoms and molecules invalid.

47. A control volume implies
(a) an isolated system
(b) a closed system
(c) a specified mass in fluid flow
(d) a fixed region in space

GPSC ARTO 01.05.2016
APPSC AEE Mains 2016 (Civil Mechanical)
ESE 2010

Ans. (d) : Control volume is a volume in space of special interest for particular Analysis. The surface of the control volume is referred as a control surface & is a closed surface. It implies a fixed region in space.

48. Which of the following is not a property of the system?
(a) Temperature (b) Pressure
(c) Volume (d) Heat

TNPSC AE 2017
Rajasthan Nagar Nigam AE 2016, Shift-II
UKPSC AE 2012, 2007 Paper–II

Ans. (d) : Heat is not a property of the system it is the form of energy whereas temperature, pressure and volume are the property of the system.

49. The value of the universal g as constant is
(a) 8.314 J/kg K (b) 83.14 kJ/kg K
(c) 848 kJ/kg K (d) 8.314 kJ/kg K

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Kerala PSC Poly. Lect. 09.01.2014
TNPSC AE (Industries) 09.06.2013

Ans. (d) :

50. A process in which no heat is supplied or rejected from the system and entropy is not constant is known as
(a) isothermal (b) isentropic
(c) polytropic (d) hyperbolic

ISRO Scientist/Engineer 11.10.2015
MPPSC State Forest Service Exam, 2014
Mizoram PSC 2014, Paper-I

Ans. (c) : Polytropic Process–The Polytropic process is also known as the general law for the expansion and compression of gases, and is given by the relation.

$$PV^n = \text{Constant}$$

- No heat is supplied or rejected from the system and entropy is constant then this process is called isentropic process.
- No heat is supplied or rejected from the system and entropy is not constant is is known as polytropic process.

51. The change in internal energy in a reversible process occurring in a closed system is equal to the heat transferred if the process occurs at constant
(a) temperature (b) pressure
(c) volume (d) enthalpy

CGPSC Poly. Lect. 22.05.2016
Assam PSC CCE Pre 2015
ESE 2005

Ans. (c) According to first law of thermodynamics for a process

$\delta Q = dU + \delta W$
$= dU + pdV$

For constant volume process

$\delta Q = dU + 0 \quad (dV = 0)$

$\delta Q = dU$

$dU = mc_v dT$ (For an ideal gas)

The change in internal energy in a closed system is equal to the heat transferred if the process occurs at constant volume.

52. If a gas is allowed to expand through a very minute aperture, then such a process is known as
(a) free expansion
(b) adiabatic expansion
(c) throttling
(d) parabolic expansion

Nagaland PSC (CTSE) 2018, Paper-II
TRB Asstt. Prof., 2012, TNPSC AE, 2008

Ans. (c) : When the air or gas flowing through a small or minute opening then enthalpy remains constant. It is known as isenthalpic or throttling process.

- It is highly irreversible process.
- There is no work and heat transfer takes place.
- During throttling process pressure always decreases.
- During throttling process temperature may or may not be increase or decrease or remains constant.
- For an ideal gas temperature remains constant.

53. In an isothermal process, the internal energy of molecules
(a) Increases
(b) Decreases
(c) Depends on temperature
(d) Remains constant

ISRO Scientist/Engineer (RAC) 07.05.2017
MPSC State Forest Service Exam 2014

Ans. (d) : We know that, internal energy U

$U = mc_v \Delta T$

For unit mass

$\Delta u = c_v \Delta T$

For a fluid, value of c_v will remain constant

$\Delta u \propto \Delta T$

For isothermal process $\Delta T = 0$

So,

$\Delta u = \text{constant}$

Search on Telegram @apna_pdf

54. The expression $\int_1^2 pdv$ gives the measure of work done during :

(a) steady flow reversible process
(b) non-flow reversible process
(c) open system and any process
(d) any system and any process

Nagaland PSC CTSE 2015, Paper-II
J & K PSC Screening, 2006

Ans. (b) : $\int_1^2 pdv$ is applicable in –

- Closed system or Non flow process
- Reversible process
- Quasistatic process

55. Cyclic integral of this is zero :

(a) Work transfer (b) Heat transfer
(c) Temperature (d) Latent heat

J&K PSC Civil Services Pre, 2010
UPSC JWM Advt. No.-52/2010

Ans. (c) : $\oint T = 0$

Temperature is a property i.e point function.

56. For steady flow through an insulated horizontal constant diameter pipe, which property remains constant?

(a) Enthalpy (b) Internal energy
(c) Entropy (d) Volume

GPSC ARTO Pre 30.12.2018
ESE 2012

Ans. (a) : For steady flow through an insulated horizontal constant diameters pipe, enthalpy remains constant.

Note-GPSC gives correct answer as option (d).

57. A frictionless piston-cylinder device contains a gas initially at 0.8 MPa and 0.015 m^3. It expands quasi-statically at constant temperature to final volume of 0.030 m^3. The work output (in kJ) during this process will be:

(a) 8.32 (b) 12.00
(c) 554.67 (d) 8320.00

GPSC ARTO Pre 30.12.2018, GATE 2009

Ans. (a) : Given, $P_1 = 0.8$ MPa
$V_1 = 0.015\ m^3$
$V_2 = 0.030\ m^3$

For isothermal process, $W = P_1V_1 \ln \frac{V_2}{V_1}$

$= 0.8 \times 0.015 \ln \left(\frac{0.030}{0.015}\right)$

$\boxed{W = 8.32\,kJ}$

58. A perfect gas at 27 ºC is heated at constant pressure till its volume is double. The final temperature is

(a) 54ºC (b) 108ºC
(c) 327ºC (d) 600ºC

UPCL AE 29.08.2021
ISRO Scientist/Engineer (RAC) 29.11.2015
ISRO Scientist/Engineer 2011

Ans. (c) : Gas equation,

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

Constant pressure $= P_1 = P_2 = P$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$\frac{V_2}{V_1} = \frac{T_2}{T_1}$$

$$\frac{2V_1}{V_1} = \frac{T_2}{300}$$

$T_2 = 600\ K = (600 - 273)°C$

$T_2 = 327°C$

59. Which of the following is not a path function

(a) Thermal conductivity (b) Kinetic Energy
(c) Heat (d) Work

APPSC AEE Screening Test 2016
BPSC AE 2012 Paper - V

Ans. (a) : Thermal conductivity – point function
Heat, work, – path function

60. A series of operations, which takes place in a certain order and restore the initial conditions at the end, is known as

(a) Reversible cycle
(b) Irreversible cycle
(c) Thermodynamic cycle
(d) None of these

Vizag Steel (MT) 2017
UPPSC AE 12.04.2016 Paper-II

Ans. (c) : Thermodynamic cycle– A series of operation which takes place in a certain order and restore the initial conditions at the end, is known as thermodynamic cycle.

61. Consider the following properties:

1. Temperature
2. Viscosity
3. Specific entropy
4. Thermal conductivity

Which of the above properties of a system is/are intensive?

(a) 1 only (b) 2 and 3 only
(c) 2, 3 and 4 only (d) 1, 2, 3 and 4

Gujarat PSC AE 2019, ESE 2009

Ans. : (d) : Intensive Properties are as follows-

- Temperature
- Viscosity
- Specific entropy
- Thermal conductivity
- Specific volume
- Specific enthalpy

Search on Telegram @apna_pdf

62. The gauge pressure in a truck tire before and after the journey was recorded as 200 kPa and 220 kPa respectively at the location where atmospheric pressure and temperature was 100 kPa and 27ºC respectively. How much the rise in temperature of tire air after trip?

(a) 20ºC (b) 27ºC
(c) 47ºC (d) Insufficient data

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Ans. : (c) : Given

P_{atm} = 100 kPa, T_{atm} = 27 ºC = 300 K
P_{gauge1} = 200 kPa, P_{gauge2} = 220 kPa
$[P_1]_{Abs}$ = 300 kPa, $[P_2]_{Abs}$ = 320 kPa

Then,

$$V_1 = V_2$$

$$\frac{P_1}{P_2} = \frac{T_1}{T_2}$$

$$T_2 = \frac{T_1 \times P_2}{P_1} = \frac{300 \times 320}{300}$$

$$\boxed{T_2 = 320\,K = 47°C}$$

63. Air is compressed in a cylinder such that the volume changes from 0.2 to 0.02 m^3. The initial pressure is 200 kPa. If the pressure is constant, the approximate work is

(a) –36 kJ (b) –40 kJ
(c) –46 kJ (d) –52 kJ

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (a)

Work done, If the pressure is constant,

$$w = \int_1^2 PdV$$
$$= P(V_2 - V_1)$$
$$= 200 \times (0.02 - 0.2)$$
$$= -36 \text{ kJ}$$

64. Thermocouples are generally used for measuring temperature:

(a) 500 ºC (b) 1000 ºC
(c) 1500 ºC (d) 2000 ºC

TNPSC AE 2018, SJVN ET 2013

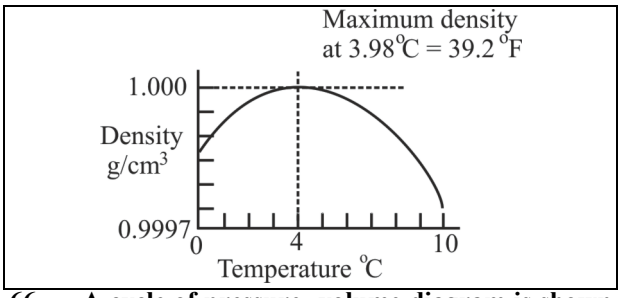
Ans. (c) : Thermocouples are generally used for measuring temperature up to 1500ºC

65. The density of water is maximum at

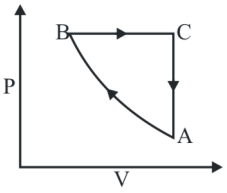
(a) 20 ^{0}C (b) 4 ^{0}C
(c) 0 ^{0}C (d) -4 ^{0}C

UPPSC AE 12.04.2016 Paper-II
GWSSB DEE 07.07.2016

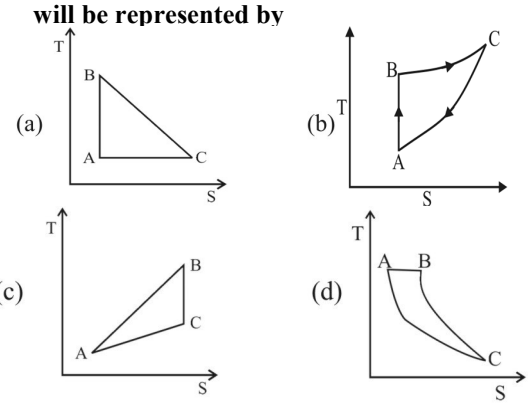
Ans. : (b) The density of water is maximum at 4 ^{0}C. In ice, the water molecules are in a crystal lattice that has a lot of empty space. When the ice melts to liquid water, the structure collapses and the density of the liquid increases.
Thus, the density of water is a maximum at 4 ^{0}C



66. A cycle of pressure- volume diagram is shown in the figure :

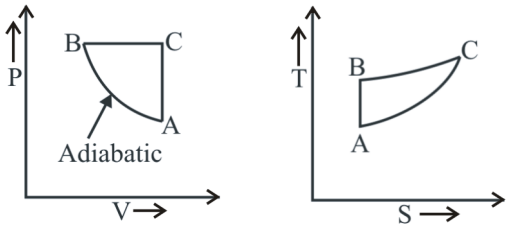


Same cycle on temperature-entropy diagram will be represented by



MPPSC AE 2016
ISRO Scientist/Engineer 2012, ESE 1995

Ans. (b)



Process A-B is adiabatic process so
In T-S diagram a vertical line is obtained (ΔS = Constant)
Process B-C is isobaric process (P = Constant)
So, $V \propto T$ $(V\uparrow\downarrow \rightarrow T\uparrow\downarrow)$
Process C-A is isochoric process (V = Constant)
$P \propto T$

67. A gas has

(a) two specific heat (b) three specific heat
(c) four specific heat (d) one specific heat

Rajasthan Nagar Nigam AE 2016, Shift-II
GWSSB AAE, 27.12.2015

Ans. (a) : A gas has two specific heat.
C_p = Specific heat at constant pressure.
C_v = Specific heat at constant volume.

Search on Telegram @apna_pdf

68. A system will be in thermodynamic equilibrium if it is in

(a) mechanical equilibrium only
(b) thermal equilibrium only
(c) chemical equilibrium only
(d) all of the above

TNPSC AE 2017, WBPSC AE, 2007

Ans. (d) : For a thermodynamic system to be in equilibrium it should be in :–
(1) Mechanical equilibrium i.e. no influence of external forces
(2) Thermal equilibrium i.e. equality of temperature
(3) Chemical equilibrium i.e. no chemical reaction potential should be present
(4) Phase equilibrium

69. 1 m^3 of air at a pressure of 10 kg/cm^2 is allowed to expand freely to a volume of 10 m^3. The work done will be

(a) Zero (b) –ve
(c) +ve (d) 10^5 kg m

GPSC EE Pre, 28.01.2017
ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. (a) : In free expansion-
Work done (W) = 0
Q = 0

70. The value of $\frac{C_p}{C_v}$ for air is :

(a) 1 (b) 1.4
(c) 1.8 (d) 2.3

GMB AAE 25.06.2017, MPSC Poly. Lect. 2014

Ans. (b) : For air

$$\boxed{\frac{C_p}{C_v} = \gamma = 1.4}$$

$$C_p = \frac{\gamma R}{\gamma - 1} = 1.005 kJ/kgK$$

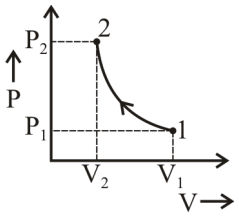
$$C_v = \frac{R}{\gamma - 1} = 0.718 kJ/kgK$$

71. In an adiabatic process, 5000 J of work is performed on a system. In the nonadiabatic process by which the system returns to its original state, 1000 J of heat is added to the system. The work done during the non-adiabatic process is

(a) +6000 J (b) –6000 J
(c) +4000 J (d) –4000 J

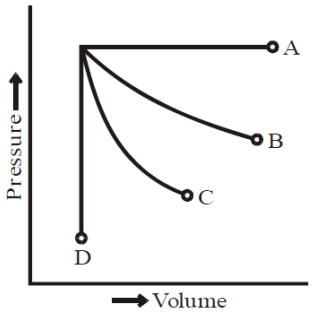
RPSC IOF & Boiler 20.09.2017
UPSC JWM Advt. No.-50/2010

Ans. (a) :



In adiabatic process,
$\delta Q = 0$
$\delta W = -5000$ J
We know that,
$\delta Q = U_2 - U_1 + \delta W$
$0 = (U_2 - U_1) - 5000$
$U_2 = U_1 + 5000$ J
$U_2 - U_1 = 5000$ J
From non-adiabatic 2 to 1,
$\delta Q = U_1 - U_2 + \delta W$
$1000 = -5000 + \delta W$
$\boxed{\delta W = 6000 J}$

72.

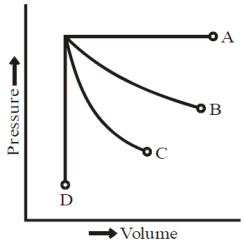


The figure shows thermodynamic expansion processes A, B, C and D. Which line is very close to the isentropic process?

(a) A (b) B
(c) C (d) D

TRB Poly. Lect., 2012
UPSC JWM Advt. No.-50/2010

Ans. (c) : For expansion process



Process	n	
Isobaric(A)	0	P = Constant
Isothermal(B)	1	T = C
Polytropic(C)	n	PV^n = Constant
Adiabatic(D)	γ	PV^γ = Constant
Isochoric(D)	∞	PV^∞ = Constant

73. An isochoric process is a

(a) Constant pressure process
(b) Constant volume process
(c) Constant temperature process
(d) Constant entropy process

GPSC Lect. 23.10.2016
WBPSC AE, 2007

Ans. (b) : Isochoric means constant volume.

Search on Telegram @apna_pdf

74. Intensive property of a system is one whose value :

(a) depends on the mass of the system, like volume

(b) does not depend on the mass of the system, like temperature, pressure, etc.

(c) is not dependent on the path followed but on the state

(d) is dependent on the path followed and not on the state

J&K PSC Civil Services Pre, 2013
OPSC Civil Services Pre 2006

Ans. (b) : Intensive property – Physical property that does not depend on the size or mass of sample like temperature, pressure, density, viscosity, velocity etc.

Extensive property- Property that depend on size or mass of sample like, volume, mass, entropy, energy etc.

75. Mole fraction of a component of gas equal to

(a) 1/f (b) f^2

(c) f (d) f/p

where f → volume fraction, and

p → pressure of the mixture

APPSC Poly. Lect. 2013, JPSC AE 2013 Paper-I

Ans. (c) : Mole fraction of a component of gas mixture is equal to volume fraction (f)

76. A reversible polytropic process is given by

(a) $\frac{T_1}{T_2}=\left(\frac{\rho_1}{\rho_2}\right)^{n-1}$ (b) $\frac{P_1}{P_2}=\left(\frac{\rho_1}{\rho_2}\right)^{n-1}$

(c) $\frac{T_1}{T_2}=\left(\frac{P_1}{P_2}\right)^{n-1}$ (d) $\frac{P_1}{P_2}=\left(\frac{\rho_1}{\rho_2}\right)^{\frac{n-1}{n}}$

BPSC Poly. Lect. 2016, VIZAG STEEL MT 2015

Ans. (a) : PV^n = Constant (for polytropic process)

PV/T = Constant

$$\frac{P_1V_1}{T_1}=\frac{P_2V_2}{T_2}$$

$$\frac{P_1}{P_2}=\frac{V_2}{V_1}\times\frac{T_1}{T_2}$$

$$\left(\frac{P_1}{P_2}\right)=\left(\frac{V_2}{V_1}\right)^n$$

$$\frac{T_1}{T_2}\times\frac{V_2}{V_1}=\left(\frac{V_2}{V_1}\right)^n$$

$$\frac{T_1}{T_2}=\left(\frac{V_2}{V_1}\right)^{n-1}$$

$$V\propto\frac{1}{\rho}$$

$$\frac{T_1}{T_2}=\left(\frac{\rho_1}{\rho_2}\right)^{n-1}$$

77. The vapour pressure (mm Hg) of solid NH_3 is given by

$$\ln p = 23.05 - \frac{3754}{T}$$

and that of liquid ammonia is given by

$$\ln p = 19.49 - \frac{3063}{T}$$

Where, T is in Kelvin. What will be the triple point temperature of NH_3?

(a) 140.3 K (b) 195.2 K

(c) 225 K (d) 280 K

GATE 2021, APPSC Poly Lect. 13.03.2020

Ans. (b) : Given data :

$$\ln p = 23.03 - \frac{3754}{T} \quad \text{..... (1)}$$

Vapour pressure (mm Hg) of solid NH_3 is –

For liquid ammonia –

$$\ln p = 19.49 - \frac{3063}{T} \quad \text{.....(2)}$$

At triple point all three phases co-exist so all properties of substances should be identical

Subtracting equation (2) from equation (1)

$$= 3.54 - \frac{691}{T} = 0$$

$$\Rightarrow T = \frac{691}{3.54}$$

$$\Rightarrow T = 195.197\ K = 195.23\ K$$

78. A new temperature scale in degrees N is to be defined. The boiling and freezing points on this scale are 400°N and 100°N respectively. What will be the reading on new scale corresponding to 60°C?

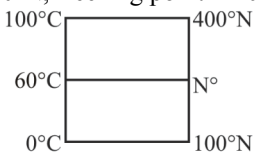
(a) 280°N (b) 180°N

(c) 220°N (d) 120°N

TSPSC AEE 2017, CSE Pre-2006, 1995

Ans. (a) : Given,

Boiling Point 400°N, freezing point = 100°N



$$\frac{60-0}{100-0}=\frac{N-100}{400-100}$$

$$\frac{60}{100}=\frac{N-100}{300}$$

$$N - 100 = 180$$

$$\boxed{N = 280°N}$$

79. Two gases having molecular weight 32 and 28 expand at constant pressure through the same temperature range. The ratio of work done by the two gases will be :

(a) 8 : 7 (b) 7 : 6

(c) 3 : 2 (d) 7 : 8

CGPSC AE 15.01.2021, CGPSC AE 16.10.2016

Search on Telegram @apna_pdf

Ans. (d) : Given,

Gas A, $(M_{wt})_A = 32$

Gas B, $(M_{wt})_B = 28$

Work done, $W_{1-2} = P(V_2 - V_1) = R(T_2 - T_1)$

$W \propto R$

$W \propto \frac{R_u}{M_{wt}}$ (R_u = Universal Gas Constant)

$\frac{W_1}{W_2} = \frac{(M_{wt})_2}{(M_{wt})_1} = \frac{28}{32} = \frac{7}{8}$

80. The ratio of specific heat of a gas at constant pressure and the specific heat of the gas at constant volume

(a) is always constant

(b) varies with temperature

(c) varies with pressure

(d) is not constant

GPSC Engineer Class-II Pre-19.01.2020

APPSC AEE Screening Test 2016

Ans. (a) : The ratio of specific heat of a gas at constant pressure and the specific heat of the gas at constant volume is always constant.

$$\gamma = \frac{C_p}{C_v}$$

81. Thermodynamic work is the product of

(a) Two intensive

(b) Two extensive properties

(c) An intensive property and change in an extensive property

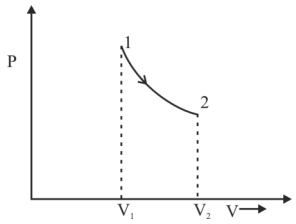
(d) An extensive property and change in an intensive property

UPPSC AE 12.04.2016 Paper-II

CSE Pre-1998

Ans. : (c) For quasistatic process work done is calculated by

$\int P.dV$



Pressure = Intensive property.

Volume (dV) = change in an extensive property.

Thermodynamic work is the product of an intensive property and change in an extensive property.

82. The maximum work by an expansion of a gas in a closed system is possible when process takes place at constant

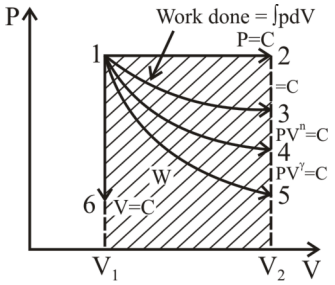
(a) Pressure (b) Enthalpy

(c) Temperature (d) Volume

Rajasthan AE (Nagar Nigam) 2016 Shift-3

UPPSC AE 12.04.2016 Paper-II

Ans. (a) : We know that,



Closed system work on P-V diagram, is the area under P-V should be projected on volume axis and mathematically expression for closed system work is

$\int_{V_1}^{V_2} PdV$

$\therefore \quad W_{closed} \int_{V_1}^{V_2} pdV$

According to graph,

$W_{1-2} > W_{1-3} > W_{1-4} > W_{1-5} > W_{1-6}$

So, max work obtain in expansion process is isobaric process & min work about to zero in isochoric process.

83. Consider the following statements about isolated system

1. No heat is transferred
2. No work is done
3. No mass flows across the boundary of the system
4. No chemical reaction takes place within the system

Of above, which are correct

(a) 1 and 2 (b) 1 and 3

(c) 1, 2 and 3 (d) 3 and 4

Nagaland PSC CTSE 2015 Paper-II

GATE 1999

Ans. (c) : Isolated System– It is a special case of closed system in which neither mass nor energy cross the boundary of the system.

Or

A system that does not interact with its surroundings, that is its total energy and mass stay constant.

Ex.: Universe, thermal flask.

84. The velocity of sound in an ideal gas does not depend on

(a) the specific heat ratio of the gas

(b) the molecular weight of the gas

(c) the temperature of the gas

(d) the density of the gas

Nagaland PSC CTSE 2015 Paper-II

CSE Pre-2002

Ans. (d) : Velocity of sound in an ideal gas

$C = \sqrt{\gamma RT}$; $C = f(\gamma, R, T)$

Where, γ = Specific heat ratio

R = Gas constant

T = Temperature

The velocity of sound in an ideal gas does not depend on the density of gases.

Search on Telegram @apna_pdf

85. The value of an extensive property is essentially dependent on :

(a) Mass or extent of the system
(b) Interaction of system with its surroundings
(c) Path followed by the system is going from one state to another
(d) Nature of boundaries, rigid or flexible

TSPSC Managers, 2015, ESE 2013

Ans. (a) : The value of an extensive property is essentially dependent on mass or extent of the system.

86. Match List I with List II and select the correct answer using the codes given below the lists:

A. Bomb calorimeter i. Pressure
B. Exhaust gas calorimeter ii. Enthalpy
C. Junker gas calorimeter iii. Volume
D. Throttling calorimeter iv. Specific heat

Code:

	A	B	C	D
(a)	iii	iv	i	ii
(b)	ii	iv	i	iii
(c)	iii	i	iv	ii
(d)	iv	iii	ii	i

APPSC Poly. Lect. 2013, ESE 1998

Ans. (a) :

List I		List II
A) Bomb calorimeter	-	Volume
B) Exhaust gas calorimeter	-	Specific heat
C) Junker gas calorimeter	-	Pressure
D) Throttling calorimeter	-	Enthalpy

87. The specific heat ratio k is given by the following expression :

(a) $1 + (C_P/R)$ (b) $\dfrac{1}{1-(R/C_v)}$

(c) $1 + (R/C_v)$ (d) $1 + (C_v/R)$

TSPSC AEE 28.08.2017 (Civil/Mechanical)
CSE Pre-1999

Ans. (c) :

$$C_p - C_v = R$$

$$\frac{C_p}{C_v} - 1 = \frac{R}{C_v}$$

$$k - 1 = \frac{R}{C_v}$$

$$k = 1 + \frac{R}{C_v}$$

88. A certain amount of an ideal gas is initially at a pressure P_1 and temperature T_1. First, it undergoes a constant pressure process 1-2 such that $T_2 = 3T_1/4$. Then, it undergoes a constant volume process 2-3 such that $T_3 = T_1/2$. The ratio of the final volume to the initial volume of the ideal gas is

(a) 0.25 (b) 0.75
(c) 1.0 (d) 1.5

GPSC Asstt. Director of Transport 05.03.2017
GATE 2014

Ans. (b) : For (1-2) process: Constant pressure process ($P_1 = P_2$)

$$\frac{T_1}{V_1} = \frac{T_2}{V_2} \Rightarrow V_2 = \frac{T_2}{T_1} \times V_1$$

For (2-3) : Constant volume process ($V_3 = V_2$)

Given, $T_2 = \dfrac{3T_1}{4}$

$$V_2 = \frac{3T_1}{4T_1} \times V_1 = \frac{3}{4} V_1$$

$$\frac{V_3}{V_1} = \frac{V_2}{V_1} = \frac{3}{4} = 0.75$$

89. The constant volume gas thermometer works on the principle that

(a) At low pressure, the temperature of the gas is independent of its pressure at constant volume
(b) At high pressure, the temperature of the gas is independent of its pressure at constant volume
(c) At low pressure, the temperature of the gas is proportional to its pressure at constant volume
(d) At high pressure, the temperature of the gas is proportional to its pressure at constant volume

GPSC Asstt. Director of Transport 05.03.2017
ESE 2012

Ans. (c) : The constant volume gas thermometer works on the principle that at low pressure, the temperature of gas is proportional to its pressure at constant volume.

90. The absolute zero pressure will be

(a) when molecular momentum of the system becomes zero
(b) at sea level
(c) at the temperature of –273K
(d) at the center of the earth

Nagaland PSC (CTSE) 2018, Paper-II
ESE 2002

Ans. (a) : Absolute zero pressure means there are no collisions between molecules to applied per unit area force occurs due to collision of molecules at absolute zero these is no momentum between molecules so no force developed. Atmospheric pressure is measured from absolute zero pressure.

91. What are the properties of a thermodynamic system whose value for the entire system is equal to the sum of their values for individual parts of the system?

(a) Thermodynamic properties
(b) Extensive properties
(c) Intensive properties
(d) Specific properties

TNPSC AE 2018, CSE Pre-2006

Ans. (b) : Extensive properties- Extensive properties of matter that changes as the amount of matter changes
Example- Volume, enthalpy, entropy etc.

Search on Telegram @apna_pdf

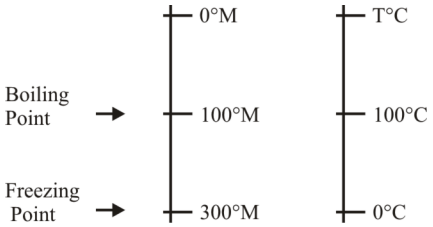
Intensive properties- An intensive properties is a bulk property, meaning that it is a local physical property of a system that does not depends on the system size or the amount of material in the system.
Example- Pressure, temperature, refractive index, density and hardness of object.

92. A new temperature scale say °M, the boiling and freezing point of water at 1 atm are 100°M and 300°M respectively. Correlate this scale with centigrade scale. The reading of 0°M on centrigrade scale is :

(a) 0°C (b) 50°C
(c) 100°C (d) 150°C

GPSC ARTO Pre 30.12.2018, ESE 2001

Ans. (d) :



$$\frac{300-0}{100-0}=\frac{0-T}{100-T}$$

$30000 - 300T = -100T$

$200T = 30000$

$\boxed{T = 150°C}$

93. Enthalpy in the fundamental unit is expressed as:

(a) MLT^{-2} (b) $ML^{-2}T^{-2}$
(c) ML^2T^{-2} (d) ML^2T^{-1}

AAI Jr. Executive 29.11.2018
CSE Pre-1994

Ans. (c) : Enthalpy is type of energy.
Energy and work is same unit

$W = F \times S$

$= [ML^2T^{-2}]$

94. A reversible process requires that

(a) there be no heat transfer.
(b) Newton's law of viscosity be satisfied.
(c) temperature of system and surrounding be equal.
(d) there will be no viscous or Coulomb friction in the system.

JPSC AE, 10.04.2021, Paper-I
UPRVUNL AE 05.07.2021

Ans. (d) : A reversible process requires that there will be no viscous or coulomb friction in the system.

95. Total heat of a substance is also known as :

(a) Internal energy (b) Entropy
(c) Thermal capacity (d) Enthalpy

CGPSC AE 15.01.2021
J & K PSC Screening, 2006

Ans. (d) : Total heat of a substance is known as Enthalpy
It is represented by H in kJ.

$\boxed{H = U + PV}$ → Flow work

Where, U = Internal Energy

96. For which of the following substances, the internal energy and enthalpy are functions of temperature only?

(a) Any gas (b) Saturated steam
(c) Water (d) Perfect gas

CGPSC AE 15.01.2021, WBPSC AE, 2017

Ans. (d) : For perfect gas or ideal gas the internal energy and enthalpy are functions of temperature only.
Then, Internal energy, $U = f(T)$
Enthalpy, $H = f(T)$

97. The sum of internal energy (U) and the product of pressure and volume (PV) is known as :

(a) Work done (b) Entropy
(c) Power (d) Enthalpy

CGPSC AE 15.01.2021, WBPSC AE 2003

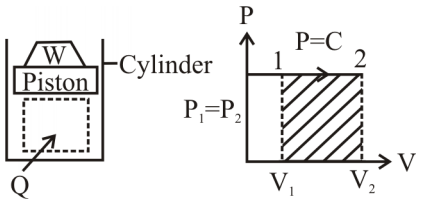
Ans. (d) : Enthalpy $\boxed{(H) = U + PV}$

98. Heat is supplied to air in a cylinder fitted with frictionless piston held by a constant weight. The process is

(a) Isothermal (b) Adiabatic
(c) Isobaric (d) Isochoric

Assam PSC AE (PHED), 18.10.2020
RPSC AEN Pre-2013

Ans. (c) : As weight is constant that means the pressure will be constant. The process is isobaric.



Constant pressure heat addition (at constant pressure) $W = P\int dv$

99. Work is a

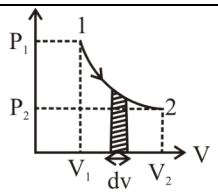
(a) point function
(b) path function
(c) It depends on the state
(d) None of the above

Assam PSC AE (PHED), 18.10.2020
WBPSC AE, 2017

Ans. (b) : Heat and work both are path function it is not property it is a boundary phenomenon.

- Energy transfer due to temperature difference is called heat.

Search on Telegram @apna_pdf



$dw = Pdv$

So, $\int_1^2 dw = \int_1^2 pdv$

100. The hyperbolic process is governed by -

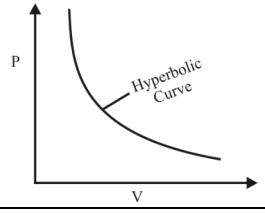
(a) Boyle's Law (b) Charles Law
(c) Gay-Lussac Law (d) Avogadro's Law

ISRO Scientist/Engineer 22.04.2018
GMB AAE 25.06.2017

Ans. (a) : According to the Boyles law at constant temperature pressure is inversely proportional to its given volume.

$$P \propto \frac{1}{V} \quad \text{(at T = const.)}$$

$$\boxed{PV = \text{constant}}$$



101. If a fluid expands suddenly into vacuum through an orifice of large dimension, then such a process is called

(a) free expansion
(b) hyperbolic expansion
(c) adiabatic expansion
(d) throttling

J&K PSC Civil Services Pre, 2013
APGCL AM, 2021

Ans. (a) :
Free expansion : Free expansion of gas occurs when it is subjected to expansion against the vacuum.
Hyperbolic expansion : It is Isothermal expansion (T = Constant).
Throttling : It is a process where a high pressure fluid is converted into low pressure by using throttle valve.

102. The gas with highest value of adiabatic index is:

(a) Helium (b) Nitrogen
(c) Oxygen (d) Methane

TSPSC Managers, 2015
UPSC JWM Advt. No.-52/2010

Ans. (a) : $\gamma \propto \frac{1}{\sqrt{M}}$

Element	Adiabatic Index (γ)
Helium (He)	1.67
Nitrogen (N_2)	1.4
Oxygen (O_2)	1.4
Methane	1.313

103. Identify open system and closed system from the following

(a) Blood circulation and respiration in human body
(b) Fuel system and radiator in cars
(c) Air compressor and boiler
(d) Shell and tube heat exchanger and blower

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (c) : Air compressor is an open system, while boiler can be a closed system if you include the pipes it is connected.

104. Flow of work may be expressed as

(a) Pdt (b) $(P_1V1 - P_2V_2)/n - 1$
(c) Td (d) Pdv

Nagaland PSC CTSE 2017, 2016 Paper-II

Ans. (d) : The work done in pushing the fluid is:
$W_{flow} = F.ds = P.A.ds. = P.dv$
Flow work is necessary for maintaining a continuous flow through a control volume.

105. If the time taken by a system to execute a process through a finite gradient is infinitely large, what is the nature of the process?

(a) becomes reversible
(b) remains irreversible
(c) becomes isothermal
(d) is adiabatic

UPSC JWM Adv. No-16/2009, ESE 2013

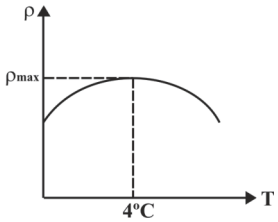
Ans. (a) : A reversible process is carried out infinitely slowly with an infinitesimal gradient, so that every state passed through by the system is an equilibrium state. So a reversible process coincides with a quasi-static process.

106. When water at 0°C is heated, its specific volume under standard atmosphere

(a) First increases then decreases
(b) First decreases then increases
(c) Increases steadily
(d) Decreases steadily

UPCL AE 29.08.2021
ISRO Scientist/Engineer 07.05.2017

Ans. (b) : Specific volume first decrease ↓ and then increase ↑.



Density of water first increases till 4ºC and then decreases.

$$\boxed{\uparrow \rho \propto \frac{1}{V\downarrow}}$$

Therefore, before 4ºC volume will decrease and increase on further heating.

Search on Telegram @apna_pdf

107. Which one of the following is the correct statement? Two adiabatic processes will _____

(a) Intersect at absolute zero temperature
(b) Never intersect
(c) Become orthogonal at absolute zero temperature
(d) Become parallel at absolute zero temperature

UPRVUNL AE 21.08.2016, CSE Pre-2007

Ans. : (b) Two adiabatic process will never intersect.

108. A battery is used to light a bulb, run a fan and heat an electric iron in case of a power failure. If each of the above, the systems has 100 W rating and is run for 15 minutes, what are the work done (W) and heat transferred (Q) by the battery?

(a) W = 90 kJ and Q = 90 kJ
(b) W = 180 kJ and Q = 0 kJ
(c) W = 270 kJ and Q = 0 kJ
(d) W = 90 kJ and Q = 180 kJ

Nagaland PSC CTSE 2015 Paper-II, CSE Pre-2005

Ans. (c) : Given, $P_{fan} = 100$ W

$P_{bulb} = 100$ W

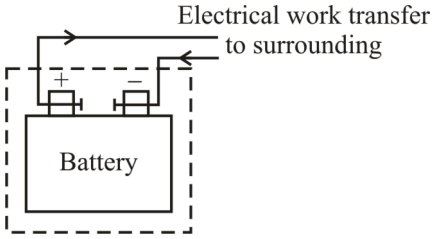
$P_{electric\ iron} = 100$ W

Total power $(P_{total}) = P_{fan} + P_{bulb} + P_{electric\ iron}$

$= 100 + 100 + 100$

$= 300$ W

Time = 15 minutes



Total workdone by battery in 15 minutes

$W = 300 \times 15 \times 60$

$= 270000$

$= 270$ kJ

There is flow of electrons to surrounding only from battery, so electrical workdone by battery and no heat transfer.

109. Which one of the following thermodynamic processes approximates the steaming of food in a pressure cooker?

(a) Isochoric (b) Isobaric
(c) Isothermal (d) Isenthalpic

GWSSB AAE, 27.12.2015, ESE 2007

Ans. (a) : Isochoric process is known as constant volume process or isometric process. In this process heat takes at given constant volume process for example pressure cooker.

110. An ideal gas as compared to a real gas at very high pressure occupies

(a) more volume (b) less volume
(c) same volume (d) no such correlation

Karnataka PSC Lect., 27.05.2017
TRB Asstt. Prof., 2012

Ans. (a) : For ideal gas,

$PV = nRT$

$P \propto \frac{1}{V}$ .....(i)

For real gas,

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT$$

$P \propto \frac{1}{V - b}$ .....(ii)

From (i) & (ii)

An ideal gas as compared to a real gas at very high pressure occupies more volume.

111. Absolute zero temperature is taken as _____.

(a) –373ºC (b) 273ºC
(c) –273.15ºC (d) 237ºC

UPRVUNL AE 05.07.2021

Ans. (c) : Absolute zero is the lowest limit of thermodynamic temperature scale, taken as zero Kelvin. At zero Kelvin (–273 ºC) the particle stop moving and all disorder disappears, thus nothing can be colder than absolute zero on the Kelvin scale.

112. Pyrometer works based on

(a) Laser technology (b) Photo conduction
(c) Thermal emission (d) Tyndall effect

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : Pyrometer–A pyrometer is a type of thermometer used to measure high temperature. It is used for measuring temperature without any physical contact. It is used for measuring body temperature by measuring its electromagnetic radiation.

113. The temperature at which the Kelvin and Fahrenheit scales coincide is _____.

(a) 474 K (b) 350 K
(c) 474 F (d) 574 K

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : The temperature at which the Kelvin and Fahrenheit scales coincides is 574 Kelvin.

114. Energy that crosses the system boundaries is known as _____

(a) Energy in transit (b) global energy
(c) stored energy (d) local energy

HPPSC Workshop Suptd. 08.07.02021

Ans. (a) : Energy that crosses the system boundaries is known as energy in transit.

115. An absolute zero temperature, a reversible adiabatic line is also an :

(a) Isothermal Line (b) Isobaric Line
(c) Isochoric Line (d) Isenthalpic Line

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : At absolute zero temperature a reversible adiabatic line is also known as Isothermal line.

116. When the valve of an evacuated bottle is opened the atmospheric air rusher into it. If the atmospheric pressure is 100 kPa and 0.8 m^3 of air enters into the bottle, then the work done by the air will be

Search on Telegram @apna_pdf

(a) 80 kJ (b) 70 kJ
(c) 60 kJ (d) 50 kJ

APGCL AM, 2021

Ans. (a) : The displacement work done by air

$W_d = \int_{Bottle} Pdv + \int_{\substack{free\ air \\ boundary}} Pdv$

$= 0 + P\Delta V$

$= 0 + 100 \times 0.8$

$= 80$ kJ Ans.

117. Which of the following represents a closed system?

(a) Bomb calorimeter (b) Boiler
(c) Universe (d) Centrifugal pump

JPSC AE, 10.04.2021, Paper-I

Ans. (a) : Bomb calorimeter is closed system.

Open System–Type of system that allow mass and energy transfer.

Ex-Nozzle, turbine, piston cylinder with valve.

Closed System–Type of system that allow energy transfer.

Ex-Piston cylinder without valve, hot gases in rigid cylinder, bomb calorimeter.

Isolated System–Type of system that does not allow both mass and energy transfer.

Ex-Universe, thermoflask.

118. Which amongst the following is not a property of the system?

(a) Heat
(b) Composition
(c) Specific volume
(d) Thermal conductivity

JPSC AE, 10.04.2021, Paper-I

Ans. (a) : Heat is not a property of the system.

Heat and work are path functions.

Property is the characteristic of system which can be measured.

Example of property ⇒ Pressure, Volume, Temperature

119. In a thermoelectric thermometer for t°C temperature, the emf is given as: $E = 0.003t - 5 \times 10^{-7}t^2 + 0.5 \times 10^{-3}$ volts. Thermometer is having reference junction at ice point and is calibrated at ice point and steam point. What is the temperature shown by the thermometer for a substance at 30°C?

(a) 33.23°C (b) 36.28°C
(c) 41.23°C (d) 46.28°C

ESE 18.07.2021

Ans. (a) : $E = 0.003t - 5 \times 10^{-7}t^2 + 0.5 \times 10^{-3}$ volt

At ice point, when t = 0°C,

$E = 0.5 \times 10^{-3}$V

At steam point t = 100°C

$E = 0.003 \times 100 - 5 \times 10^{-7} \times (100)^2 + 0.5 \times 10^3$

$= 0.2955$V

At 30°C

$E = 0.003 \times 30 - 5 \times 10^{-7} \times (30)^2 + 0.5 \times 10^{-3}$

$= 0.09005$V

- When the gas thermometer reads 30°C the thermocouple will read

$= \frac{100}{0.2955} \times 0.09005$

$\approx 33.23\,^0$C

120. Consider the following statements for comparison of heat and work:

1. Both heat and work are transient phenomena.
2. Both heat and work are boundary phenomena.
3. Both heat and work are path functions and inexact differentials.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1, 2 and 3
(c) 2 and 3 only (d) 1 and 3 only

ESE 18.07.2021

Ans. (b) :

- Both heat and work are transient boundary phenomenon.
- Both heat and work are path function and inexact differentials.

121. What is the value of mass of the air in a room of size 4m × 5m × 6m at 100 kPa and 25°C? (Take R = 0.287 kPa.m^3.kg^{-1}.K^{-1}).

(a) 150 kg (b) 180 kg
(c) 140 kg (d) 130 kg

ESE 18.07.2021

Ans. (c) : Given, P = 100 kPa,

T = 25 + 273 = 298K

R = 0.287 kJ/kg

Volume (V) = 4 × 5 × 6 = 120 m^3

$P = \rho RT$

$PV = mRT$

$m = \frac{PV}{RT}$

$= \frac{100 \times 120}{0.287 \times 298}$

m = 140 kg

122. Statement (I): If two systems are in thermal Equilibrium with a third system, then they are not in thermal equilibrium with each other. Statement (II): Zeroth law of thermodynamics is the basis for temperature.

ESE 18.07.2021

Ans. (d) :

When a body A is in the thermal equilibrium with a body B, and separately with body C, then bodies B and C will be in thermal equilibrium with each other. This is known as zeroth law of thermodynamics. It is the basis of the temperature measurement.

Hence, statement (I) is incorrect.

Search on Telegram @apna_pdf

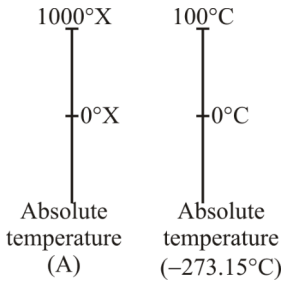
123. In an unknown temperature scale freezing point of water is 0°X and boiling point of water is 1000°X. The absolute zero in degree X is:

(a) −2731.5 (b) −273.15

(c) 0 (d) 2731.5

AAI Jr. Executive 26.03.2021

Ans. (a) :



$$\frac{100-0}{100+273.15}=\frac{1000-0}{1000-A}$$

$100000 - 100A = 373150$

$-100A = 273150$

$\boxed{A = -2731.5°X}$

124. A perfect gas is compressed to half of its initial volume. This is done using:

Process I– isothermal process and

Process II – polytropic process with index, n = 1.25

Larger work input is required in:

(a) Same in Process I and II

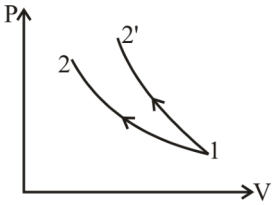
(b) Cannot be predicted

(c) Process I

(d) Process II

AAI Jr. Executive 26.03.2021

Ans. (d) :



1-2 – Isothermal process

1-2′ – Polytropic process

(n = 1.25)

From the PV diagram, it is clear that area under polytropic process is more than isothermal process.

125. Which of the following is a non quassi static process?

(a) Gradual compression of gas inside a piston cylinder arrangement

(b) Expansion of gas in a cylinder under constant pressure

(c) Free or unrestricted expansion of gas

(d) Rapid leakage of air from a bicycle tyre

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : Free or unrestricted expansion of gas.

126. For an ideal gas as a working fluid for a given heat input Q, the process that gives the maximum work among the following four processes is

(a) Isothermal (b) Constant volume

(c) Constant pressure (d) Isentropic

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (c) : For an ideal gas as a working fluid for a given heat input Q. At constant pressure, the area under the P-V curve is maximum. Thus, maximum work is obtained.

127. An adiabatic system is a thermally insulated system with its surroundings and

(a) does not exchange work with its surroundings.

(b) exchanges work with surroundings.

(c) Both (a) and (b)

(d) None of the above

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : For thermally insulated system, neither mass nor energy exchanges with surroundings, but exchanges work with surroundings.

128. The term N.T.P. stands for_____

(a) Nominal Temperature and Pressure

(b) Natural Temperature and Pressure

(c) Normal Temperature and Pressure

(d) Normal Thermodynamic and Pressure

RPSC IOF, 2020

Ans. (c) : The term NTP stands for Normal Temperature and Pressure.

129. Which property is an intensive property of the system?

(a) Specific enthalpy (b) Volume

(c) Kinetic energy (d) Entropy

RPSC IOF, 2020

Ans. (a) : Specific enthalpy is the intensive property. Such as specific volume. Specific entropy etc. All specific property is intensive properties.

Extensive (Depend upon mass)	**Intensive (Do not depend upon mass)**
1. Mass	Temperature
2. Kinetic Energy	Pressure
3. Volume	Density
4. Entropy	Viscosity

130. Which of the following property is used as thermometric property in constant - volume gas thermometer?

(a) Volume (b) Pressure

(c) Electric resistance (d) Voltage

APPSC Poly Lect. 13.03.2020

Ans. (b) : In the constant volume gas thermometer pressure is used as thermometric property.

Thermometer	**Thermometric properties**
1. Constant volume gas thermometer	Pressure (P)
2. Constant pressure gas thermometer	Volume (V)

Search on Telegram @apna_pdf

3. Electric Resistance thermometer	Resistant (R)
4. Thermocouple	Thermal emf (e)
5. Mercury in glass thermometer	Length (L)

131. If specific heat ratio for a gas is γ, the change in internal energy of a mass of gas at constant pressure P, when volume changes from V to 2V is

(a) $\frac{PV}{\gamma-1}$ (b) $\frac{R}{\gamma-1}$

(c) PV (d) $\frac{\gamma PV}{\gamma-1}$

UPPSC AE 13.12.2020, Paper-2

Ans. (a) : Given,

Specific heat ratio = γ

$V_i = V$

$V_f = 2V$

From ideal gas equation, $PV = mRT$

$V \propto T,$

Thus, $T_1 = T$

$T_2 = 2T$

Change in internal energy,

$\Delta U = m C_v dT$

$= m C_v (T_2 - T_1)$

$\Delta U = m C_v (2T - T)$

$\Delta U = m C_v T$

$$\Delta U = \frac{mRT}{\gamma-1} = \frac{PV}{\gamma-1}$$

132. Which one of the following is an example of a open system?

(a) a cylinder piston

(b) a mass sliding on an inclined plane

(c) a water tank with both inflow and outflow of water

(d) a rigid insulated vessel

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : An open system can exchange both energy and matter with its surrounding.

133. We would like to analyse an electric geyser (storage type water heater), for which a student chooses the system to be all the contents of the insulated container including the heater coil. In the first law analysis of this system, the electric power supplied to the geyser should be treated as

(a) heat input

(b) work input

(c) energy change

(d) internal sources of heat

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : Energy transfer due to temperature difference is taken as heat transfer while energy transfer other than temperature difference is taken as work transfer.

134. The density ρ and specific volume v are related by the expression

(a) ρv =1 (b) ρ/v = 1

(c) $\rho^2 = 1/v$ (d) $v^2 = 1/\rho$

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : $m = \rho V$

$$\frac{m}{V} = \rho \Rightarrow \frac{V}{m} = \frac{1}{\rho} \qquad \left[\because \text{sp.volume}(v) = \frac{V}{m}\right]$$

$$\text{Specific volume } (v) = \frac{1}{\rho}$$

135. Enthalpy of formation is defined as zero for

(a) Only oxygen in gas phase

(b) Only nitrogen in gas phase

(c) Only water in vapour phase

(d) All chemical elements in their naturally occurring phase

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : All element in their standard states (oxygen gas, solid carbon in the form of graphite etc) how a standard enthalpy of formation of zeros as there is no change invalid in their formation.

136. A perfect gas is heated at constant pressure from 30°C till its volume become double. Then the final temperature is:

(a) 333 °C (b) 120 °C

(c) 60 °C (d) 303 °C

CIL MT 27.02.2020

Ans. (a) : According to charles law at constant pressure the volume V of a gas is directly proportional to its absolute temperature T,

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$V_1 = V$

$V_2 = 2V$

$$\frac{V}{303} = \frac{2V}{T_2} \qquad (T_1 = 273 + 30 = 303 \text{ K})$$

$T_2 = 606 - 273$

$T_2 = 333$ °C

137. When an ideal gas expands, its temperature

(a) remains constant

(b) increases

(c) decreases

(d) may increase or decrease

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : When an ideal gas expands its temperature may increase or decrease.

138. Which of the following statements is correct with respect to temperature?

(a) Temperature is an intensive property of the system

(b) Temperature is not a property of the system

(c) Temperature is an extensive property of the system

(d) Temperature does not change with volume

APPSC Poly Lect. Automobile Engg., 2020

Search on Telegram @apna_pdf

Ans. (a) : Intensive Property– Intensive property are independent of mass or size of the system.
Example– Pressure, Temperature, Density viscosity etc.

139. Quasi-static process
(a) is infinitely slow process
(b) experiences thermodynamic equilibrium at every small point on its path
(c) reversible process
(d) All of the above

GPSC Engineer, Class-II Pre-19.01.2020

Ans. (d) : Quasi-static process is infinitely slow process. It experiences thermodynamic equilibrium at every small point on its path and it is reversible process.

140. An electrical resistance thermometer shows a resistance of 3 ohm at 0^0C and 6 ohm at 200^0C. What is the temperature when the resistance indicates 5 ohm?
(a) 233.3^0 (b) 133.3^0C
(c) 150^0C (d) 300^0C

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : The resistance and temperature relation is given by

$R_t = R_o (1+\alpha t)$

R_0 = resistance at 0^0C

$R_0 = 3$ ohm

$R_{200} = 6$ ohm

So that,

$3 = R_0 (1+\alpha\times 0) \Rightarrow 3 = R_0$ --------- (I)

$6 = R_0 (1+\alpha\times 200)$ $6 = R_0 + 200\ R_0\alpha)$ ---------- (II)

On solving Equ. (I) and (II)

$6 = 3 + 200 \times 3 \times \alpha$

$6 = 3 + 600\alpha$

$3 = 600\alpha$

$$\alpha = \frac{3}{600} = 0.005$$

Now R = 5 ohm

$5 = R_0 (1+\alpha t)$

$5 = 3(1+0.005 \times t)$

$5 = 3 + 0.005 \times 3 \times t$

$2 = 0.005 \times 3 \times t$

$$t = \frac{2}{0.005\times 3}$$

$$= \frac{2}{15}\times 10^3$$

$t = 133.3^0$C

141. Efficiency of a heat engine is defined as the ratio of -
(a) Total heat input/Net work output
(b) Net work input/Total heat output
(c) Total heat output /Net work input
(d) Net work output/Total heat input

MECON MT 2019

Ans. (d) : Net work output/Total heat input

142. A non-flow device compresses air isothermally at a temperature of 500^oC from a pressure of 5.0 MPa to a final pressure of 15.0 MPa. If the device uses 200 kJ/kg of work input, then this process is
(a) impossible
(b) irreversible
(c) either reversible or irreversible
(d) reversible

BHEL ET 2019

Ans. (a) : Given -

$T_1 = 500^0$C

$T_1 = 273 + 500$

$= 773$ K

$P_1 = 5.0$ MPa

$P_2 = 15.0$ MPa

work input = 200 kJ/kg

For non-flow isothermal process

$$\text{work done } W_{Isothermal} = P_1 V_1 ln \left(\frac{P_1}{P_2}\right)$$

$$= mRT_1 ln\left(\frac{P_1}{P_2}\right)$$

where, m = 1, R = 0.287 kJ/kg-K

$$W_{Isothermal} = 1 \times 0.287 \times 773\ ln\left(\frac{5}{15}\right)$$

$= -243.728$ kJ/kg

W = 243 kJ/kg (–ve means work done on the system)

Actual work input of the device

= 200 kJ/kg

Here, work done of the system 200 kJ/kg is less than actual work done of the system 243.7285 kJ/kg.

So, its impossible

143. Pick the correct statement regarding path function.
(a) The differentials of point functions are inexact differentials
(b) The differentials of point functions & path functions are exact differentials.
(c) The differentials of path function are inexact differentials.
(d) The differentials of path functions are exact differentials.

BHEL ET 2019

Ans. (c) : The differential of path functions are inexact differentials where as differential of point functions are exact differentials.

144. The pressure inside a balloon is proportional to the square of its diameter. It contains 2 kg of water at 150 kPa with 85% quality. The balloon and water are now heated so that a final pressure of 600 kPa is reached. the process undergone by the water is given by p-v equation as :
(a) $pv^{-2/3}$ = constant (b) $pv^{2/3}$ = constant
(c) $pv^{2/5}$ = constant (d) $pv^{-2/5}$ = constant

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (a) : Given as,

$P_1 = 150$ kPa

$P_2 = 600$ kPa

$m = 2$ kg

$x = 0.85$

$$V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi\left(\frac{D}{2}\right)^3 = \frac{4}{3}\pi\frac{D^3}{8}$$

$$V = \frac{\pi}{6}D^3$$

$$D = \left(\frac{6V}{\pi}\right)^{\frac{1}{3}}$$

$$P \propto D^2$$

$$P = KD^2$$

$$P = K\left[\left(\frac{6V}{\pi}\right)^{\frac{1}{3}}\right]^2$$

$$\frac{P}{V^{2/3}} = \text{constant}$$

$$PV^{-2/3} = \text{constant}$$

145. A gas goes through a process given by $pv^2 = c$. It expands from state 1 of 350 kPa and 0.049 m^3 to a final pressure of 150 KPa. Work delivered during this process in kJ is :

(a) 4.765 (b) 8.5

(c) 5.915 (d) 3.897

BHEL ET 2019

Ans. (c) : Given - $PV^2 = C$

at state 1, –

$P_1 = 350$ kPa

$V_1 = 0.049\ m^3$

$P_2 = 150$ kPa

According to $PV^2 = C$, $n = 2$

$$P_1 V_1^2 = P_2 V_2^2$$

$$350 \times (0.049)^2 = 150 \times (V_2)^2$$

$$(V_2)^2 = \frac{350 \times (0.049)^2}{150}$$

$$V_2 = 0.07484\ m^3$$

$$\text{Work done } W = \frac{P_1V_1 - P_2V_2}{n-1}$$

$$= \frac{350 \times 0.049 - 150 \times 0.0744848}{2-1}$$

$$= 5.9222 \text{ kJ}$$

146. Pressure exerted by a gas in a closed container is:

(a) Weak function of Density and Temperature

(b) Weak function of Density and Volume

(c) Strong function of Density and Temperature

(d) Strong function of Density and Volume

OPSC AEE 2019 PAPER - II

Ans. : (c) : Pressure exerted by a gas in a closed container is strong function of density and temperature. We know that,

$$PV = mRT$$

$$P = \frac{m}{V}RT \qquad \left[\because P = \frac{m}{V}\right]$$

$$P = \rho RT$$

$$\boxed{P = f(\rho, T)}$$

147. The condition for the reversibility of a cycle is

(a) the pressure and temperature of the working substance must not differ, appreciably, from those of the surroundings at any stage in the process

(b) all the processes, taking place in the cycle of operation, must be extremely slow

(c) the working parts of the engine must be friction free

(d) all of the above

Gujarat PSC AE 2019, ESE 2016

Ans. : (d) : The condition for the reversibility of a cycle is

- The pressure and temperature of the working substance must not differ, appreciably from those in the process.
- The working parts of the engine must be friction free.

148. Which of the following processes are thermodynamically reversible?

(a) Throttling

(b) Free expansion

(c) Constant volume and constant pressure

(d) Isothermal and adiabatic

TNPSC AE 2019

Ans. (d) : Throttling, Free expansion, Constant volume and constant pressure processes are thermodynamically irreversible whereas isothermal and adiabatic processes are thermodynamically reversible.

149. A piston cylinder arrangement has air at 600 kPa, 290 K and volume of 0.01 m^3. During a constant pressure process, if it gives 54 kJ of work, the final volume must be

(a) 0.10 m^3 (b) 0.05 m^3

(c) 0.01 m^3 (d) 0.15 m^3

JPSC AE PRE 2019

Ans. (a) : Given,

$P_1 = 600$ kPa

$T_1 = 290$ K

$W = 54$ kJ

$V_1 = 0.01\ m^3$

$V_2 = ?$

$W = PdV$

$= P(V_2 - V_1)$

$54 \times 10^3 = 600 \times 10^3\ (V_2 - 0.01)$

$V_2 = 0.1\ m^3$

150. A polytropic process with n = –1, initiates with P = V = 0 and ends with P = 600 kPa and V = 0.01 m^3. The work done is

(a) 2 kJ (b) 3 kJ

(c) 4 kJ (d) 6 kJ

JPSC AE PRE 2019

Search on Telegram @apna_pdf

Ans. (b) : Given,

$n = -1$

$P_1 = 0$

$V_1 = 0$

$P_2 = 600$ kPa

$V_2 = 0.01\ m^3$

$$W = \frac{P_1V_1 - P_2V_2}{n-1} = \frac{0 - 600 \times 0.01}{-1-1}$$

$= 3$ kJ

151. For an ideal gas, enthalpy is represented by

(a) H = U – RT (b) H = U + RT

(c) H = RT – U (d) H = –(U + RT)

JPSC AE PRE 2019

Ans. (b) : H = U + PV

PV = mRT

for unity mass, m = 1

H = U + mRT

H = U + RT

152. Which one of the following represents the energy in storage?

(a) Work (b) Heat

(c) Energy (d) Internal energy

JPSC AE PRE 2019

Ans. (d) : Internal energy represents the energy in storage.

153. The pressure of air in an automobile tyre at temperature of 27°C is 1.75 bar (gauge). Due to running the temperature of air in the rises to 87°C. What will be the gauge pressure during this running? [P_{atm} = 1.01 bar, volume of tyre is assumed constant]

(a) 2.302 bar (b) 2.914 bar

(c) 1.677 bar (d) 3.180 bar

SJVN ET 2019

Ans. (a) : $P_{abs} = P_{atm} + P_{gauge}$

$= 1.01 + 1.75$

$= 2.76$ bar

$$\therefore \frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$(P_2)_{abs} = \frac{(P_1)_{abs} \times T_2}{T_1} = \frac{2.76 \times 360}{300}$$

$$(P_2)_{gauge} = 3.312 - 1.01$$

$= 2.302$ bar

154. A non-flow reversible process takes place according to $V = \frac{15}{P}\ m^3$, where *P* is in bar. What will be the work done if pressure changes from 1 bar to 10 bar? [Given. ln (10) = 2.3025]

(a) 3.453 MN-m, expansion

(b) 3.453 N-m, compression

(c) 3.453 MN-m compression

(d) 3.453 N-m, expansion

SJVN ET 2019

Ans. (c) : Given,

$$V = \frac{15}{P}\ m^3$$

$P_1 = 1$ bar

$P_2 = 10$ bar

$P_1V_1 = P_2V_2$

$$\frac{P_1}{P_2} = \frac{V_2}{V_1},\ \frac{V_1}{V_2} = \frac{10}{1}$$

Non flow work $= \int PdV$

$$= \int_{10}^{1} \left(\frac{15}{V}\right) dV$$

$$= 15 \int_{10}^{1} \left(\frac{1}{V}\right) dV$$

$$= 15[\ell n 1 - \ell n 10]$$

$$= 15[0 - 2.3025]$$

$$= -34.538 \times 10^5\ Nm$$

$$= -3.4538\ MN\text{-}m$$

$$= 3.4538\ MN\text{-}m\ (Compression)$$

155. Certain quantities cannot be located on the graph by a point but are given by the area under the curve corresponding to the process. These quantities in concepts of thermodynamics are called as

(a) cyclic functions (b) point functions

(c) path functions (d) real functions

ESE 2019

Ans. (c) : Path functions like heat transfer and work transfer cannot be represented by points in the graph, but can be given by the area under the curve.

Heat transfer will be area under curve in T-s diagram while work transfer will be the area under curve in P-V diagram.

156. A sample of ideal gas has an internal energy U and is then compressed to one-half of its original volume while the temperature stays the same. What is the new internal energy of the ideal gas in terms of U ?

(a) U (b) 1/2U

(c) 1/4U (d) 2U

RPSC Vice Principal ITI 2018

Ans. (a) : Internal energy of a perfect gas is only function of temperature only.

For real gas internal energy is function of temperature and volume both U = f (T, V).

157. Specific heat at constant pressure can be given as (Where 'ϒ' is ratio of specific heats at constant pressure and constant volume, R is a gas constant, J is the Joule constant.)

(a) $\frac{\gamma R}{J(\gamma - 1)}$ (b) $\frac{JR}{\gamma(\gamma - 1)}$

(c) $\frac{\gamma R}{J(R - 1)}$ (d) $\frac{R}{J(\gamma - 1)}$

HPPSC AE 2018

Search on Telegram @apna_pdf

Ans. (a) : We know that

$$C_p - C_v = \frac{R}{J} \quad \text{.....(i)}$$

and $\frac{C_p}{C_v} = \gamma$ .....(ii)

then $C_v = \frac{C_p}{\gamma}$

Putting the value of C_v in equation (i)

$$C_p - \frac{C_p}{\gamma} = \frac{R}{J}$$

$$C_p \frac{(\gamma - 1)}{\gamma} = \frac{R}{J}$$

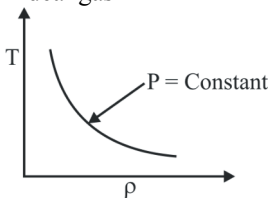
$$C_p = \frac{\gamma.R}{(\gamma - 1)} = \frac{\gamma.R}{J(\gamma - 1)}$$

158. The ordinate and abscissa of the diagram to depict the isobaric processes of an ideal gas as a hyperbola are, respectively

(a) temperature and entropy
(b) internal energy and volume
(c) temperature and density
(d) enthalpy and entropy

ESE 2018

Ans. (c) : For an ideal gas



$PV = mRT$

$P = \rho RT = \text{constant}$

$\rho T = \text{constant}$

i.e. equation of hyperbola.

159. Nitrogen at 25 atm and 37°C is contained in a cylinder of volume $10m^3$. The cylinder is placed in a large container of 150 times the cylinder volume. The container is perfectly evacuated and insulated. The nitrogen gas is allowed to discharge and fill the container. Calculate the final pressure after the system has reached equilibrium.

(a) 0.267 atm (b) 0.322 atm
(c) 0.259 atm (d) 0.167 atm

GPSC ARTO Pre 30.12.2018

Ans. (d) : Given, $T_1 = T_2 = 37°C = 310$ K

$P_1 = 25$ atm

$V_1 = 10\ m^3$

$V_2 = 150V_1 = 1500\ m^3$

As the system is insulated,

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\Rightarrow \frac{25 \times 10}{T_1} = \frac{P_2 \times 1500}{T_2} \Rightarrow \boxed{P_2 = 0.167\,\text{atm}}$$

160. A container filled with 2 kg of O_2 is heated at constant pressure from 27 °C to 127 °C. The heat supplied in this process is:

(a) 225 kJ (b) 100 kJ
(c) 205 kJ (d) 182 kJ

AAI Jr. Executive 29.11.2018

Ans. (d) : Heat supplied at constant pressure

$Q = mc_pdT$

$= 2 \times 0.918 \times (127–27)$ [$\because$ C_p for oxygen = 0.918]

$= 183.6$ KJ

161. The unit of 'a' in van der Walls equation for one mole is:

(a) Nm^4 (b) Nm^5
(c) Nm^3 (d) Nm^2

AAI Jr. Executive 29.11.2018

Ans. (a) : Vander wall's equation one mole

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT$$

$$P = \frac{a}{V^2}$$

$a = (\text{Pressure}) \times (\text{Volume})^2$

$$= \frac{N}{m^2} \times (m^3)^2$$

$$= \frac{N}{m^2} \times m^6$$

$= Nm^4$

162. A 120-V electric resistance heater draws 10 A. It operates for 10 min in a rigid volume. Calculate the work done on the air in the volume.

(a) 720000 kJ (b) 720 kJ
(c) 12000 J (d) 12 kJ

RPSC Vice Principal ITI 2018

Ans. (b) :

$W = VIt = 120\ V \times 10\ A \times (10 \times 60)\ s$

$= 72 \times 10^4\ J = 720\ kJ.$

163. A steel tank placed in hot environment contains 5 kg of air at 4atm at 30°C. A portion of the air is released till the pressure becomes 2 atm. Later, the temperature of the air in the tank is found to be 150°C. The quantity of air allowed to escape is

(a) 4.72 kg (b) 4.12 kg
(c) 3.71 kg (d) 3.21 kg

ESE 2018

Ans. (d) : Given, $m_1 = 5$kg

$P_1 = 4$ atm

$= 4 \times 101.325$ kPa

$= 405.3$ kPa

$T_1 = 30 + 273 = 303$ K

$P_2 = 2$ atm

$= 2 \times 101.325$ kPa

$= 202.68$ kPa

$T_2 = 150 + 273 = 423$ K

From gas equation

$PV = mRT$

Search on Telegram @apna_pdf

$$V = \frac{m_1 R T_1}{P_1} = \frac{5 \times 0.287 \times 303}{405.3}$$

$$V = 1.072 \text{ m}^3$$

Again from gas equation for final state

$$m_2 = \frac{P_2 V}{R T_2}$$

$$= \frac{202.65 \times 1.072}{0.287 \times 423}$$

$$= 1.79 \text{ kg}$$

Amount of gas escaped = $m_1 - m_2$

$= 5 - 1.79$

$= 3.209$ kg

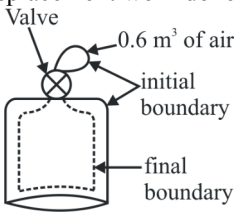
164. When the valve of an evacuated bottle is opened, the atmospheric air rushes into it. If the atmospheric pressure is 101.325 kPa and 0.6 m^3 of air enters into the bottle, then the work done by the air will be

(a) 80.8 kJ (b) 70.8 kJ

(c) 60.8 kJ (d) 50.8 kJ

ESE 2018

Ans. (c) : The displacement work done by air



$$W = \int_{\text{Bottle}} PdV + \int_{\text{Free air boundary}} PdV$$

$= 0 + P\Delta V$

$= 101.325 \times 0.6$

$= 60.8$ kJ

165. The heat energy stored in the gas and used for raising the temperature of the gas is known as

(a) external energy (b) internal energy

(c) kinetic energy (d) molecular energy

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (b) : The heat energy stored in the gas and used for raising the temperature of the gas is known as internal energy.

166. When the gas is cooled at constant pressure

(a) its temperature increases but volume decreases

(b) its volume increases but temperature decreases

(c) both volume and temperature increases

(d) both volume and temperature decreases

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Charle's law states that for a gas at constant pressure. The volume V of a given quantity of gas is directly proportional to the absolute temperature of the gas. So, at constant pressure both temperature and volume decreases when gas is cooled.

167. Process is called reversible process if

(A) A system passes through a continuous series of equilibrium states during process.

(B) These equilibrium states cannot be located on property diagram, cannot be joined by line as a path.

(C) These equilibrium states can be located on property diagram, can be joined by line as a path.

Which of the statement given above is/are correct?

(a) (A) only (b) (A) and (C) only

(c) (B) and (C) only (d) (C) only

MPSC Lect. (Prod.) 2018

Ans. (b) : Process is called reversible process if,

(a) A system passes through a continuous series of equilibrium states during process.

(b) These equilibrium states can be located on property diagram, can be joined by line as a path.

168. Joules law states the specific internal energy of a gas depends only on

(a) the pressure of the gas

(b) the volume of the gas

(c) the temperature of the gas

(d) pressure and volume of the gas

TNPSC AE 2018

Ans. (c) : Joules law states the specific internal energy of a gas depends only on the temperature of the gas.

$u = f(T)$ only

169. The molecular mass expressed in gram (i.e. 1g-mole) of all gases, a NTP occupies a volume of

(a) 0.224 liters (b) 2.24 liters

(c) 22.4 liters (d) 224 liters

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The molecular mass expressed in gram of all gases at NTP occupies a volume of 22.4 liters.

170. The gauge pressure reading on an automobile tire is 240 kPa when the tire temperature is –30°C. The automobile is driven to a warmer climate and the tire temperature increases to 65°C. Assume the mass and the volume do not change. Then, estimate the gauge pressure in the tire.

(a) 480.5 kPa (b) 333.8 kPa

(c) 320.4 kPa (d) 280.6 kPa

HPPSC Asstt. Prof. 20.11.2017

Ans. (b) : Given, $(P_g)_1 = 240$ kPa, $T_1 = -30°C = 243K$.

$T_2 = 65°C = 338$ K , $(P_g)_2 = ?$

From ideal gas equation

$PV = mRT$

V and m are constant,

$P \propto T$

$$\frac{(P_g)_2}{(P_g)_1} = \frac{T_2}{T_1}$$

$$(P_g)_2 = \frac{338}{243} \times 240 = 333.827 \text{ kPa} \approx 333.8 \text{ kPa}$$

Search on Telegram @apna_pdf

171. Which of the following does not transfer work to or from a system?

(a) A moving piston
(b) The expanding membrane of a balloon
(c) An electrical resistance heater
(d) A membrane that bursts

HPPSC Asstt. Prof. 20.11.2017

Ans. (d) : A membrane that bursts does not transfer work to or from a system because it is considered as free expansion process.
For free expansion process, W = 0

172. In a quasi equilibrium process, the pressure.

(a) remains constant
(b) varies with location
(c) is everywhere constant at an instant
(d) depends only on temperature

HPPSC Asstt. Prof. 20.11.2017

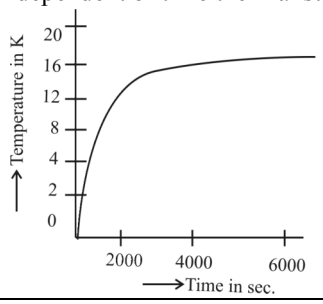
Ans. (c) : In a quasi equilibrium process, the pressure is everywhere constant at an instant.

173. The heat transfer problems in which the temperature at a particular point in the system periodically reaches the same value belong to

(a) Quasi-unsteady state (b) Quasi-steady state
(c) Steady process (d) Unsteady process

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (b) : Quasi steady state in which temperature at a particular point in the system periodically reaches the same value.
This state is independent of time thermal stress.



174. A bicycle pump forces air into the tyre against a pressure of 5 bar. If the piston is pushed slowly, the process can be approximated to

(a) Adiabatic (b) Isothermal
(c) Throttling (d) Free compression

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : When, air pushed in a tyre, the process is isentropic compression, pressure and temperature raised, but after some time temperature drop to ambient temperature, similarly. If we pushed slowly, the pressure increase but temperature is constant. So, the process is isothermal.

175. What will be the volume occupied by a given mass of air at a temperature of 400° C if the same mass of air occupied 2 m^3 at 15° C, while the pressure remain unchanged?

(a) 4.67 m^3 (b) 14.78 m^3
(c) 284.5 m^3 (d) 0.046 m^3

GPSC Asstt. Director of Transport 05.03.2017

Ans. (a) : Given, $T_1 = 15°C$ or $15 + 273 K = 288 K$
$T_2 = 400 + 273 = 673 K$
$V_1 = 2\ m^3$
$T_2 = 400°C = 673.15 K$
$V_2 = ?$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$V_2 = \frac{V_1}{T_1} \times T_2 = \frac{2 \times (273 + 400)}{288} = \frac{1346}{288}$$

$V_2 = 4.67\ m^3$

176. The molecular volume of a perfect gas at 600 kPa and 27° C will be

(a) 4.17 m^3/kg mol (b) 400 m^3/kg mol
(c) 0.15 m^3/kg mol (d) 41.7 m^3/kg mol

GPSC Asstt. Director of Transport 05.03.2017

Ans. (a) : We know,

$PV = n\bar{R}T$
$\bar{R} = 8314$ J/kg mol K
$T = 27 + 273 = 300$ K
$P = 600 \times 10^3\ N/m^2$
$PV = n\bar{R}T$

$$V = \frac{n\bar{R}T}{P}$$

$$\frac{V}{n} = \frac{\bar{R}T}{P} = \frac{8314 \times 300}{600 \times 10^3} = 4.17\ m^3/\text{kg-mol}$$

177. At Pressure P and absolute temperature T, the mass m of an ideal gas fills a closed container of volume V. An additional mass 2m of the same gas is introduced into the container and the volume is then reduced to V/3 and the temperature to T/3. The pressure of the gas will now be

(a) 3P (b) 2P
(c) P/3 (d) 9P

GPSC Asstt. Director of Transport 05.03.2017

Ans. (a) : If m_0 is molecular mass of the gas then for initial condition.

$$PV = \frac{m}{m_0} \cdot RT$$

After, 2m mass has been added

$$P' \cdot \frac{V}{3} = \frac{3m}{m_0} \cdot R \cdot \frac{T}{3}$$

So, comparing above two equations.
We get, $P' = 3P$

178. A reversible adiabatic path, on a P-V diagram, for an ideal gas passes through state A where P = 1 MPa and V = 0.0025 m^3. Given that the ratio of specific heats for the gas is 1.4, the slope of the path at A is

(a) 4×10^5 kPa/m^3 (b) -4×10^5 kPa/m^3
(c) -5.6×10^5 kPa/m^3 (d) 5.6×10^5 kPa/m^3

GPSC Asstt. Director of Transport 05.03.2017

Search on Telegram @apna_pdf

Ans. (c) : Given, $P = 1\ MPa = 1 \times 10^6\ N/m^2$

$V = 0.0025\ m^3$

$$\gamma = \frac{C_p}{C_v} = 1.4$$

In reversible adiabatic process

$PV^\gamma = Constant, \quad \therefore V^\gamma dP + P_\gamma V^{\gamma-1} dV = 0$

$$\Rightarrow \quad \frac{dP}{dV} = \frac{-\gamma P}{V} = -\frac{1.4 \times 1 \times 10^6}{0.0025}$$

$$\frac{dP}{dV} = -5.6 \times 10^5\ kPa/m^3$$

179. An insulated rigid vessel contains some gas and an electrical resistor. In a certain interval of time the resistor connected to an external electric power source heats the gas. Considering the vessel and its contents as the system,

(a) Heat and work transfers are zero
(b) Heat and work transfers are positive
(c) Heat transfer is zero and work transfer is negative
(d) Heat transfer is positive and work transfer is zero.

GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : An insulated rigid vessel contains some gas and an electrical resistor in a certain interval of time the resistor connected to an external power source heats the gas. So, heat transfer is due to insulation and work done on the system, so, it is negative.

180. This process is one in which there is only work interaction between the system and the surroundings

(a) Diabetic process
(b) Adiabatic process
(c) Isothermal process
(d) Quasi-static process

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Adiabatic process is a type of thermodynamic process which occurs without transferring heat or mass between the system and its surroundings.

181. In which of the following processes, the heat is fully converted into work?

(a) Reversible adiabatic process
(b) Reversible isobaric process
(c) Reversible isometric process
(d) Reversible isothermal process

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : Reversible means that in principle, the process is done infinitely slowly so that the microscopic reverse from the final state exactly regenerates the initial state. So, in reversible isothermal process the heat is fully converted into work.

182. Isochoric changes in ideal gas are characterized by

(a) $\frac{V}{T} = Const$ (b) $PV = Const$

(c) $\frac{P}{T} = Const$ (d) None of these

ISRO Scientist/Engineer 17.12.2017

Ans. (c) : For isochoric process

Volume (V) = Constant

From ideal gas equation

$PV = nRT$

$$\frac{PV}{T} = Constant$$

as $V = Constant$

So $\frac{P}{T} = Constant$

183. Match List 1 with List 2 and choose the correct answer from the code-

List-I (laws of thermodynamics)	List-II (Defines)
A. First	(i) Absolute zero temperature
B. Second	(ii) Internal Energy
C. Zeroth	(iii) Temperature
D. Third	(iv) Entropy

	(A)	(B)	(C)	(D)
(a)	i	ii	iii	iv
(b)	iii	iv	ii	i
(c)	iv	ii	i	iii
(d)	ii	iv	iii	i

RPSC IOF & BOILER 20.09.2017

Ans. (d)

(A) First→(ii) Internal Energy
(B) Second→(iv) Entropy
(C) Zeroth→ (iii) Temperature
(D) Third → (i) Absolute zero Temperature

184. The heat capacity of the substance is given by expression:

(a) Heat capacity = (Mass) + (specific heat)
(b) Heat capacity = (Mass) – (specific heat)
(c) Heat capacity = (Mass) × (specific heat)
(d) Heat capacity = (Mass) / (specific heat)
(e) Heat capacity = $(Mass)^2 + (specific\ heat)^2$

(CGPSC Polytechnic Lecturer 2017)

Ans. (c) : Heat Capacity–Heat capacity or thermal capacity is a physical property of matter, defined as the amount of heat to be supplied to a given mass of a material to produce a unit change in its temperature. Heat capacity is an extensive property. It is denoted by C

$C = m \times c\ (J/k)$

Where

m → mass of the system
c → Specific heat

185. 1°C is equal to

(a) 273.15 K (b) 274.15 K
(c) 283.15 K (d) 263.15 K

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : 1°C is equal to Kelvin, 274.15 K.

186. Which of the following are intensive properties?

(1) Density **(2) Pressure**
(3) Energy **(4) Enthalpy**
(5) Temperature

Search on Telegram @apna_pdf

Options:

(a) 1, 2 and 4 (b) 1, 2 and 5
(c) 1, 3, 4 and 5 (d) 2, 3 and 4
(e) 1, 2, 3 and 4

CGPSC ARTO & TSI 07.01.2017

Ans. (b) : Intensive Properties :- It is the properties which is independent of mass is known as intensive properties.

Ex. Pressure, Temperature, Density, Thermal Conductivity and all specific energy etc.

Extensive properties :-It is the property which depend upon the mass of system is known as extensive properties.

Ex. Volume, Mass, All form of Energy [K.E., P.E, Enthalpy, Entropy and Internal Energy etc.

Note :-

1. The ratio of two extensive properties are known as intensive properties

$$\text{Density } (\rho) = \frac{\text{Mass(Extensive)}}{\text{Volume(Extensive)}}$$

↓

Intensive

2. All specific forms except specific density is always on intensive properties

Ex. Specific Enthalpy, Specific Entropy, Specific Internal Energy etc.

• Heat capacity is a extensive properties.

187. The measurement of elevated temperature is generally above 500°C. The instrument used for this purpose is known as:

(a) Monometer (b) Pyrometer
(c) Potentiometer (d) Tachometer
(e) Rotameter

CGPSC ARTO & TSI 07.01.2017

Ans. (b) :

- **Pyrometer :-** It is an instrument that measures temperature remotely, i.e by measuring radiation from the object without having to be in contact.
  The main difference between Thermometer and pyrometer is that the Thermometer is device to measure temperature and pyrometer is a remot-sensing thermometer used to measure high temperature.
- **Monometer-** It is an instrument used to measure and indicate pressure.
- **Potentiometer -**It is defined as a 3 terminal variable resistor in which the resistance is mainally varied to control the flow of electric current. A potentiometer acts as an adjustable voltage divider.
- **Tachometer -** It is an instrument designed to measure the rotation speed of a shaft or disk.
- **Rotameter -** It is a flow meter that measures volumetric flow of liquid and gases.

188. The speed of sound in air varies as

(a) $\sqrt{T}$ (b) $\sqrt{p}$
(c) $1/\sqrt{p}$ (d) p

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (a) : $C = \sqrt{\gamma RT}$

$C \propto \sqrt{T}$

189. In a Steady flow process, the ratio of

(a) Heat transfer is constant
(b) Work transfer is constant
(c) Mass flow at inlet and outlet same
(d) All of these

Vizag Steel (MT) 2017

Ans. (d) : In a steady flow Process, the ratio of
■ Heat transfer is constant
■ Work transfer is constant
■ Mass flow at inlet and outlet is same.

190. The reading of temperature on the Celsius scale is 60° C. What is equivalent reading of temperature on the Fahrenheit scale?

(a) 130°F (b) 132°F
(c) 136°F (d) 140°F
(e) 146°F

(CGPSC Polytechnic Lecturer 2017)

Ans. (d) : We know that

$$\frac{C-0}{100-0} = \frac{F-32}{212-32}$$

$$\frac{C}{5} = \frac{F-32}{9}$$

C = 60°C then

$$\frac{60}{5} = \frac{F-32}{9} = 12$$

$$F - 32 = 108$$

$$\boxed{F = 140°F}$$

191. The root mean square velocity of the gas molecules is given by

where, k = Boltzmann's constant
T = absolute Temperature
m = mass of one molecule of a gas

(a) $\sqrt{\frac{kT}{m}}$ (b) $\sqrt{\frac{2kT}{m}}$
(c) $\sqrt{\frac{3kT}{m}}$ (d) $\sqrt{\frac{5kT}{m}}$

GMB AAE 25.06.2017

Ans. (c) : The root mean square velocity of the gas molecules is given by–

$$Q = V_{rms} = \sqrt{\frac{3kT}{m}}$$

192. The specific heat of air increases with increase in

(a) temperature
(b) pressure
(c) both pressure and temperature
(d) Variation of its constituents

WBPSC AE, 2017

Search on Telegram @apna_pdf

Ans. (a) : Air is diatomic gas (or non-monoatomic gas). As the temperature increases both C_p and C_v increases but their ratio γ decreases.

193. Work done is zero for the following process:

(a) Constant volume (b) Free expansion
(c) Throttling (d) All of the above

WBPSC AE, 2017

Ans. (d) :

- At constant volume,

$V = \text{Constant}$

$dV = 0$

$\therefore$ Work done, $W = PdV$

$= P \times 0 = 0$

$\boxed{W = 0}$

- Free expansion,

$\boxed{W = 0}$

$\boxed{Q = 0}$

In the free expansion of an ideal gas even though initial and final temperatures are same. The process is not isothermal because temperature reduces in between.

- Throttling process,

No change in enthalpy from one state to another state ($h_1 = h_2 = h = \text{Constant}$)

No workdone ($W = 0$)

Process is adiabatic ($Q = 0$)

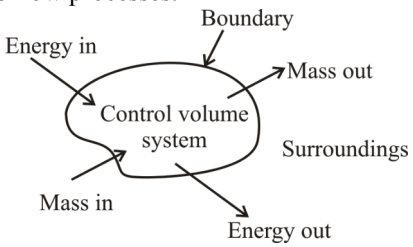
Process called isenthalpic

194. The processes occurring in open system which permit the transfer of mass to and from the system, are known as

(a) flow processes (b) non-flow processes
(c) adiabatic processes (d) none of these

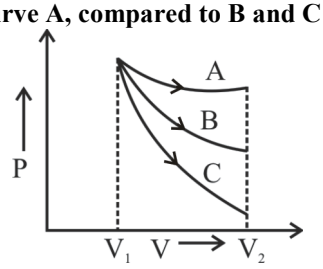
Sikkim PSC (Under Secretary), 2017

Ans. (a) : The process occurring in open system which permit the transfer of mass to and from the system are known as flow processes.



Example–Heat exchanger, pump, compressor, turbine and system with valve.

195. The curve A, compared to B and C represents



(a) Isobaric expansion
(b) Isochoric expansion
(c) Adiabatic expansion
(d) Isothermal expansion

Karnataka PSC Lect., 27.05.2017

Ans. (d) : Isothermal expansion

196. Following are the methods of measuring temperature:

A. By measuring the expansion of liquids like alcohol, pentane in capillary glass tubes
B. By measuring the expansion of mercury in capillary glass tube, radiation in pyrometers and production of emf in thermocouples
C. By measuring velocity of sound in gases and motion of electrons

Which of the statements given above is/are correct?

Select the code for the correct answer for the options given below:

(a) B alone (b) A and B only
(c) C alone (d) A, B and C

Karnataka PSC Lect., 27.05.2017

Ans. (d) : The methods of measuring temperature

(i) By measuring the expansion of liquids like alcohol, pentane in capillary glass tubes.
(ii) By measuring the expansion of mercury in capillary glass tube, radiation in pyrometers and production of 'emf' in thermocouples.
(iii) By measuring velocity of sound in gases and motion of electrons.

197. A diathermic wall is one which:

(a) permits thermal interactions
(b) prevents thermal interactions
(c) encourages thermal interactions
(d) does not exist

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (a) : A diathermic or dibatic wall is one that heat can pass through.

It is made from a thermal conductor it is essentially a thermal wall in other word diathermic wall is permit thermal interaction.

198. Statement (I) : The specific heat at constant pressure for an ideal gas is always greater than the specific heat at constant volume.

Statement (II) : Heat added at constant volume is not utilized for doing any external work.

ESE 2017

Ans. (a) : When gas is heated at constant pressure (C_P) it requires more heat energy as there is change is in internal energy as well as external work done.

But in case of constant volume (C_V) there is no external work done, so that the given heat has to increase only internal energy. Therefore C_P is always greater than C_V.

$$C_P = \left(\frac{dh}{dT}\right)_{P=\text{Const.}}$$

$$C_V = \left(\frac{du}{dT}\right)_{V=\text{Const.}}$$

Search on Telegram @apna_pdf

We know that enthalpy of fluid is more in value as compared to internal energy of the fluid.

$h > u$

So, $C_P > C_V$

199. All gases behave ideally under:

(a) high temperature conditions
(b) low pressure conditions
(c) high pressure conditions
(d) high pressure and high temperature conditions

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (b) : Generally a gas behaves more like a ideal gas at higher temperature and lower pressure as the potential energy due to intermolecular forces becomes less significant compared with the particles kinetic energy and size of the molecule becomes less significant compared to the empty space between them.

200. During throttling process:

(a) there is no change internal energy
(b) no work is done
(c) heat exchange does not takes place
(d) all of the above

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (d) : A throttling process is defined as the process in which there is no change in enthalpy from state one to state two ($h_1 = h_2$) no work is done, $W = 0$
Process is adiabatic, $Q = 0$

201. Pick up the correct relationship from the following

(a) $TdS = dH - Vdp$ (b) $TdS = dH + Vdp$
(c) $TdS = dU - Vdp$ (d) $TdS = dH - pdV$

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (a) : $TdS = du + PdV$
$TdS = dh - VdP$
above equations are applicable for reversible and irreversible process and for open and closed system both.
Where, T = Temperature of system
dS = Entropy of the system
du = Internal energy
dh = Enthalpy
V = Volume
P = Pressure

202. The specific heat of an ideal gas depend on its _____alone.

(a) Pressure (b) Volume
(c) Entropy (d) Temperature

APPSC AEE MAINS 2016 PAPER-III

Ans. (d) : Specific Heat– The specific heat is the amount of heat per unit mass required to rise the temperature by one degree Celsius.
$\Delta Q = mc\Delta T$

$$C = \frac{\Delta Q}{m\Delta T}$$

Where,
m = mass (kg)
C = Specific heat J/kg°C
ΔQ = Change in thermal energy (J)
ΔT = Change in temperature (°C)

203. A tyre with an inside volume of $1m^3$ contains air at 77^0C with a pressure of 5 bar. Air is an ideal gas under these conditions. The mass(kg) of air in the tyre is :

(a) 0.172 (b) 2.4
(c) 4.98 (d) 0.06

RPSC ADE 2016

Ans. (c) : $V_1 = 1\ m^3$
$T_1 = 273 + 77 = 350$ K
$P_1 = 5$ bar $= 5\times 10^5$ Pa

For air $R = \frac{8.314}{29} = 0.287$

For ideal gas equation –

$PV = mRT$

$5 \times 10^5 \times 1 = m \times 0.287 \times 350$

$$m = \frac{5\times 10^5}{0.287\times 350} = 4977.6 \text{ gram}$$

$m = 4.977 = 4.98$ kg

204. General gas equation is

(a) C_p-C_v= R (b) PV=nRT
(c) PV=zRT (d) PV=mRT

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (d) : General gas equation –
$PV = mRT$
where
P = pressure of gas
V = volume of gas
R = gas constant
T = temperature of gas
m = mass of 1 mole of gas

205. The amount of steam (at 100°C) required to raise the temperature of 200 g of water from 60°C to 100°C is

(a) 10 g (b) 16.8 g
(c) 20 g (d) 14.8 g

ISRO Scientist/Engineer 03.07.2016

Ans. (d) : Latent heat of steam = 2257 kJ/kg
Specific heat of water = 4.187 kJ/kg

$m \times 2257 = 0.2 \times 4.187 \times 40$

$m = 14.8$ g

206. Air is heated from 0°C to 100°C in a sealed metal container. Its density

(a) Increases slightly
(b) Decreases slightly
(c) Remains the same
(d) Change cannot be predicted

ISRO Scientist/Engineer 03.07.2016

Ans. (b) : Heated $0°C \xrightarrow{\Delta T} 100°C$
'Temperature Increased'
Ideal gas $PV = mRT$

$$P = \frac{m}{V}RT \qquad \left[\because P = \frac{m}{v}\right]$$

$P = \rho RT$
ρ = Density

Search on Telegram @apna_pdf

So, $\frac{P}{\rho} = RT$

$$\boxed{T \propto \frac{1}{\rho}}$$

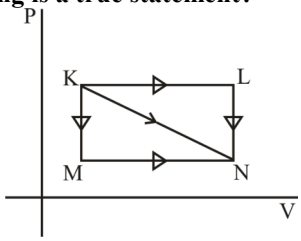
If temperature increase (↑) then
Density decreased (↓)

207. A perfect gas obeys
(a) Boyle's law only
(b) Charles' law only
(c) both Boyle's law and Charles' law
(d) None of the above

APPSC AEE Screening Test 2016

Ans. (c) : A perfect gas obeys both Boyle's law and Charles' law.

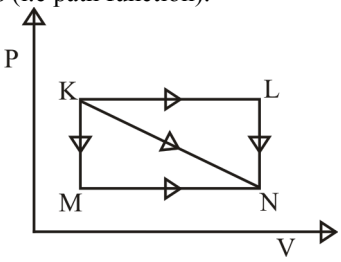
208. An ideal gas can be taken from point K to point N in three different paths: K→L→N, K→N, K→M→N. Which of the following is a true statement?



(a) The same work is done during each process.
(b) The same amount of heat is added to the gas during each process
(c) The same change in internal energy during each process
(d) The same entropy generated during each process

APPSC AEE MAINS 2016 PAPER-III

Ans. (c) : From this diagram we get that the same change in internal energy during each process as it is the property of the system (i.e point function) whereas work and heat for each process will be different because of area under P–V and T–S diagram will be different for each process (i.e path function).



209. Which of the following is correct statement for 'Energy (E)'?
(a) 'Energy (E)' is not the property of system
(b) 'Energy (E)' is path function
(c) Change in energy between two states of a system is different for different path followed
(d) $\oint dE = 0$

UPRVUNL AE 07.10.2016

Ans. (d) : • Energy E is the property of system and it is the point function.
• Change in energy between two states of a system is same for different path followed.
• For a cycle
$\oint dE = 0$

210. Which of the following equations is incorrect? (where V,P,T and Q are volume, pressure, temperature and heat transfer respectively)
(a) $\oint dV = 0$ (b) $\oint dP = 0$
(c) $\oint dT = 0$ (d) $\oint dQ = 0$

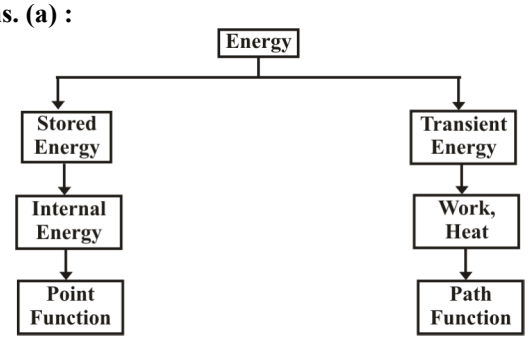
RPSC LECTURER 16.01.2016

Ans. (d) :
$\oint Q \neq 0$
$\oint V = 0$
$\oint P = 0$
$\oint T = 0$
Because V,P,T are properties of the system whereas Q and work (W) not a properties of the system.
Cyclic integration of the system properties will be equal to zero.

211. Which of the following statements is correct for "Energy"
(a) It is a point function
(b) It is a path function
(c) It is not a conserved quantity
(d) It can be measured by thermometer

RPSC LECTURER 16.01.2016

Ans. (a) :



212. Consider the following statements, which is the true statement?
(a) Dashpot is an open system
(b) Throttling is a reversible process
(c) Turbine is an isolated system
(d) Isothermal expansion is an irreversible process

GPSC ARTO 01.05.2016

Ans. (d) : Isothermal expansion means Temperature as the process are constant is an irreversible process.

213. Which is not a thermometric property
(a) Pressure (b) Wavelength
(c) Resistance (d) Flow rate

Nagaland PSC (CTSE) 2016, Paper-II

Search on Telegram @apna_pdf

Ans. (d) : Flow rate is not a thermometric property

Ex:-

Some Instrument	Thermometric property
(1)Constant Volume gas thermometer	Pressure
(2)Electrical resistance thermometer	Resistance
(3)Thermo Couple	Voltage (emf)
(4)Pyrometer	Wavelength

214. Which one is correct regarding the concept of continuum

(a) Mean free path of gas in a container is equal to or greater than the dimension of container

(b) Mean free path of gas in a container is less than or greater than the dimension of container

(c) Mean free path has no significance in continuum approach

(d) Mean free path is essential for calculating pressure in continuum approach

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : Mean free path of gas in a container is must be very small, compare to system dimension, Such that

$$(K_n) < 0.01$$

K_n – Knudson Number

215. The values of heat transfer and work transfer for the four processes of a thermodynamic cycle are given below :

Process	Heat transfer (kJ)	Work transfer (kJ)
1.	400	400
2.	zero	350
3.	–200	–200
4.	zero	–350

The thermal efficiency and work ratio for the cycle will be respectively.

(a) 50% and 0.27 (b) 33% and 0.27

(c) 33% and 0.37 (d) 50% and 0.37

UPRVUNL AE 21.08.2016

Ans. : (a) $\eta_{th} = \dfrac{\text{Net work done}}{\text{Heat supplied}}$

$$= \frac{400 + 350 - 200 - 350}{400}$$

$$\eta_{th} = \frac{200}{400} = 50\%$$

$$\text{Work ratio} = \frac{\text{Net work}}{\text{Positive work}} = \frac{W_{net}}{W_T} = \frac{200}{750}$$

Work ratio = 0.27

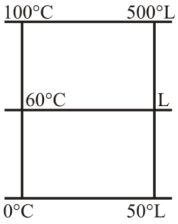
216. A new temperature scale in degree L is to be defined. The boiling and freezing points of water on this scale are 500°L and 50°L respectively. What will be the reading on new scale corresponding to 60^0C?

(a) 220^0L (b) 320^0L

(c) 180^0L (d) 280^0L

UPRVUNL AE 21.08.2016

Ans. : (b)



We know that,

$$\frac{60-0}{100-0} = \frac{L - 50°L}{500°L - 50°L}$$

$$\frac{60}{100} = \frac{L - 50°L}{450°L}$$

$$\frac{3}{5} = \frac{L - 50°L}{450°L}$$

$$3 = \frac{L - 50°L}{90°L}$$

$$270°L = L - 50°L$$

$$L = 270°L + 50°L$$

$$\boxed{L = 320°L}$$

217. Which of the following statement is correct?

(a) A sphere a cube and a thin circular plate of the same mass are made of the same material. If all of them are heated to the same high temperature the rate of cooling is maximum for the plate and minimum for the sphere.

(b) One mole of a monoatomic ideal gas is mixed with one mole of diatomic ideal gas. The molar specific heat of the mixture at constant volume is 2R. where R is the molar gas constant.

(c) Boilers are occasionally scrubbed by rapidly and artificially circulating water inside them to remove any thin water film which may have formed on their inside.

(d) The average kinetic energy of 1 kg of all ideal gases, at the same temperature is the same.

UPRVUNL AE 21.08.2016

Ans. : (b) One mole of a monoatomic ideal gas is mixed with one mole of diatomic ideal gas. The molar specific heat of the mixture at constant volume is 2R. where R is the molar gas constant.

218. Which one of the following is not a property of the system

(a) Pressure (b) Temperature

(c) Work transfer (d) Entropy

GPSC Lect. 23.10.2016

Ans. (c) : Properties of substances are things which depend only on point such as mass, temperature, volume and pressure.

219. The increase in pressure

(a) lowers the boiling point of a liquid

(b) raises the boiling point of a liquid

(c) does not affect the boiling point of a liquid

(d) none of these

GPSC Lect. 23.10.2016

Search on Telegram @apna_pdf

Ans. (b) : Increase in pressure raises the boiling point of a liquid.

220. A thermometer works on the principle of

(a) Law of stable equilibrium
(b) Zeroth law of thermodynamics
(c) First law of thermodynamics
(d) Second law of thermodynamics

ISRO Scientist/Engineer 03.07.2016

Ans. (b) : A thermometer works on the principle of Zeroth law of thermodynamic.

221. Properties of substances like pressure, temperature and density in thermodynamics coordinates are

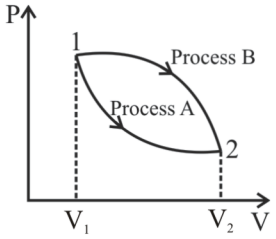
(a) Cyclic function (b) Point function
(c) Real Function (d) Path function

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (b) : **Point Functions**–They depends on state only and not on process (how a system reaches that state) and they are exact differentials.

Example–Pressure, temperature, enthalpy, volume, entropy etc.

i.e. $\int_1^2 dV = V_2 - V_1 = \Delta V$



Path Functions–The depends on how a system reaches that state (i.e. process). So path function boundary phenomenon and are inexact differentials. They are not properties of system.

Example–Heat work and entropy generation etc.

$$\int_1^2 \delta W = W_{1-2} \neq \Delta W = W_2 - W_1$$

or $$\int_1^2 \delta Q = Q_{1-2} \neq \Delta Q = Q_2 - Q_1$$

222. Which one of the following is the extensive property of Thermodynamic System?

(a) Heat (b) Density
(c) Pressure (d) Temperature

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (a) : Extensive property – Depends of the mass of system.

Ex- Mass, volume, internal energy, heat capacity, enthalpy, entropy, Helmholtz energy, Gibbs energy

Intensive property – Independent of the mass of system Ex- pressure, temperature, density, concentration, melting point, boiling point, surface tension, viscosity.

223. Match List-I with List-II and select the correct answer :

List-I	List-II
A. Throttling process	1. No work done
B. Isentropic process	2. No change in entropy
C. Free expansion	3. Constant internal energy
D. Isothermal process	4. Constant enthalpy

Code :

	A	B	C	D
(a)	4	2	1	3
(b)	1	2	4	3
(c)	4	3	1	2
(d)	1	3	4	2

(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (a)

Throttling process	Constant enthalpy ($h_1 = h_2 = h$)
Isentropic process	No change in entropy (S = Constant)
Free expansion	No work done [(W = 0, Q = 0)]
Isothermal process	Constant internal energy, It is U = f(T) for ideal gas

224. As differentials, heat and work would be described mathematically as

(a) exact (b) inexact
(c) point function (d) discontinuity

Assam PSC CCE Pre 2015

Ans. (b) : As differentials, heat and work would be described mathematically as inexact. Because they depends on path followed by processes.

225. The amount of heat required to raise the temperature of the unit mass of gas through one degree at constant volume is called-

(a) Specific heat at constant volume
(b) Specific heat at constant pressure
(c) Kilo Joule
(d) None of these

NPCIL ET, 2015

Ans. (a) : The amount of heat required to raise the temperature of the unit mass of gas through one degree at constant volume is called specific heat at constant volume.

$$\boxed{Q = mc_v\Delta T}$$

226. In free expansion of a ideal gas between two equilibrium states, the work transfer involved

(a) can be calculated by joining the two states on p-v coordinates by any path and estimating the area below

Search on Telegram @apna_pdf

(b) can be calculated by joining the two states by a quasi-static path and then finding the area below
(c) is zero
(d) is equal to heat generated by friction during expansion

Nagaland PSC CTSE 2015 Paper-II

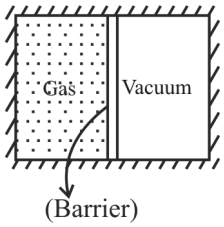
Ans. (c) : In free expansion of a gas between two equilibrium states, the work transfer involved is zero and heat transfer also zero.
Free expansion is an irreversible process so entropy is not constant for this process.

$(W)_{\text{free expansion}} = 0$ but $\left(\int pdV\right)_{\text{free expansion}} \neq 0$

227. The temperature in a process in which work is done by expanding a gas under adiabatic condition will
(a) Increase
(b) Decrease
(c) Remain unchanged
(d) Decrease/increase depending on properties of gas

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : For expansion of gas under adiabatic condition.



Let, process 1 - 2 is adiabatic expansion of ideal gas, $Q_{1\text{-}2} = 0$
We know, $Q_{1\text{-}2} = U_{1\text{-}2} + W_{1\text{-}2}$

$$-U_{1\text{-}2} = W_{1\text{-}2} \Rightarrow -mC_p dT = \int_1^2 pdV$$

$$dT = -\frac{p}{mC_p}\int_1^2 pdV \Rightarrow dT < 0$$

So, temperature will decrease during the adiabatic expansion.

228. Which of the following is not the intensive property?
(a) pressure (b) heat
(c) density (d) temperature

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (b) Intensive property which not depends on the mass.
Exp.- Pressure, Temperature, Density, viscosity, specific energy etc.
Extensive property-Which depends on the mass.
Exp.- Volume, Energy, entropy, enthalpy, heat etc.

229. The difference between two specific heats, $C_p - C_v = \frac{R}{J}$. This relation is valid for
(a) any gas (b) perfect gases
(c) real gases (d) pure gases

ISRO Scientist/Engineer 11.10.2015

Ans. (b) : $C_p - C_v = R \rightarrow$ "Ideal gas or Perfect gas"
All perfect gases are ideal gas and for perfect gas C_p & C_v not changes with temperature.

230. Work output from a system is at the expense of internal energy is a non flow process carried out
(a) at constant pressure (b) at constant volume
(c) adiabatically (d) polytropically

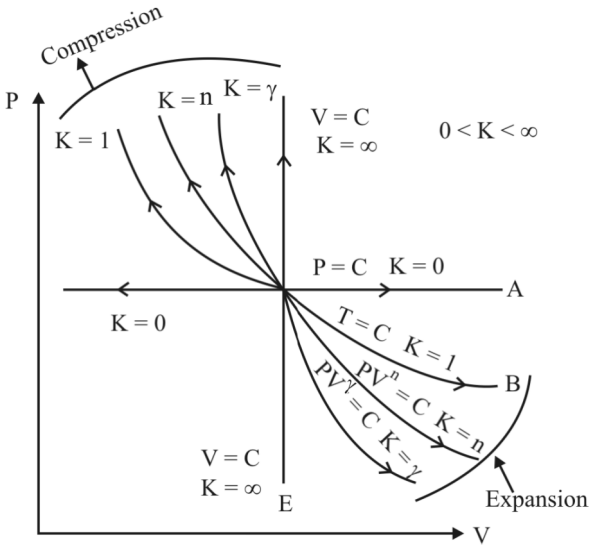
TSPSC AEE 2015

Ans. (c) : Work output from a system is at the expense of internal energy is a non flow process carried out adiabatically.

231. The general law of expansion or compression is $PV^n = C$. the process is said to be hyperbolic if n is equal to
(a) zero (b) 1
(c) γ (d) ∞

Assam PSC CCE Pre 2015

Ans. (b) : A general equation $PV^n = C$ is such that the following table gives different process for different value of K.
Let $PV^K = C$



n	Process
0	Isobaric
1	Isothermal
1<n<γ	Polytropic
γ	Adiabatic
∞	Isochoric

For P–V diagram

$$\left(\frac{dp}{dv}\right)_{\text{adiabatic}} = \gamma\left(\frac{dp}{dv}\right)_{\text{isothermal}}$$

∴ Slope of adiabatic curve in P–V curve > slope of isothermal in P–V curve.

Search on Telegram @apna_pdf

232. The gas at pressure P in the vessel is compressed suddenly to half of its original volume. Then pressure of the gas after a long time becomes :

(a) 1/2 P (b) 2P

(c) Less than 2P (d) Greater than 2P

TSPSC Managers, 2015

Ans. (b) : According gas equation.

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2} \quad \ldots\ldots (i)$$

Let $V_1 = V$, $P_1 = P$

after compressed $V_2 = \frac{V}{2}$, $P_2 = ?$

$\therefore$ From equation(i) $PV = \frac{V}{2} \times P_2$

$$\boxed{P_2 = 2P}$$

233. The efficiency of a Carnot engine using an ideal gas as the working substance is

(a) $\frac{(T_1 - T_2)}{T_1}$ (b) $\frac{T_1}{(T_1 - T_2)}$

(c) $\frac{(T_1T_2)}{(T_1 - T_2)}$ (d) $\frac{(T_1 - T_2)}{(T_1T_2)}$

VIZAG STEEL MT 2015

Ans. (a) : $\eta = \frac{T_1 - T_2}{T_1}$

234. 100% efficiency of a thermal cycle cannot be achieved because of

(a) it is not possible to achieve 0K temperature

(b) leakage

(c) non-availability of ideal substance

(d) frictional losses

GWSSB AAE, 27.12.2015

Ans. (a) : 100% efficiency of a thermal cycle cannot be achieved because it is not possible to achieve 0K temperature.

235. Thermocouples are used for measuring which of the following parameter?

(a) Humidity (b) Pressure

(c) Temperature (d) Density

UPRVUNL AE 2014

Ans : (c) Thermocouples are work like temperature sensor.

- From this, we can measure a temperature range from 200ºC to 1600ºC.
- It work on the principal of Seebeck effect.

236. Which among the following gives the correct relationship between Centigrade and Fahrenheit scales?

(Where C : degree Centigrade and F : degree Fahrenheit)

(a) C = 5/9 (F – 32) (b) F = (9/5)C–32

(c) C = (9/5) (F – 32) (d) C = 9/5 (F – 32)

UPRVUNL AE 2014

Ans. : (a) $\frac{C}{100} = \frac{F - 32}{180}$

$$C = \frac{100}{180}(F - 32) = \frac{5}{9}(F - 32)$$

$$\frac{C}{5} = \frac{F - 32}{9}$$

Where F = Fahrenheit

ºC= Centigrade

237. Mean square molecular speed is :

(a) directly proportional to density

(b) inversely proportional to density

(c) directly proportional to the square root of density

(d) inversely proportional to the square root of density

UPRVUNL AE 2014

Ans. : (d) Mean square molecular speed (V)–

$$V \propto \frac{1}{\sqrt{d}}$$

$$\frac{V_1}{V_2} = \sqrt{\frac{d_2}{d_1}}$$

Where d = Density.

So, It is inversely proportional to the square root of density.

238. Bi-Metallic strips made of two different materials bend during a rise is temperature because of

(a) Differences in coefficient of linear expansion

(b) Differences in elastic properties

(c) Differences in thermal conductivities

(d) Difference in stress

TNPSC AE 2014

Ans. (a) : Bi-Metallic strips made of two different materials bend during a rise is temperature because of differences in coefficient of linear expansion.

239. The instrument which measures the temperature of the source without direct contact is

(a) Bi-metallic cut-out

(b) Vapour pressure thermometer

(c) Pyrometer

(d) Thin film thermometer

TNPSC AE 2014

Ans. (c) : Pyrometer–Pyrometer is a device use for measuring relatively high temperature, such as are encountered in furnace. Most pyrometer works by measuring radiation from the body whose temperature is to be measured. Radiation devices have the advantage of not touching the material being measured.

240. In a steady flow reversible adiabatic process work done is equal to

(a) Change in internal energy

(b) Change in entropy

(c) Change in enthalpy

(d) Heat transferred

TNPSC AE 2014

Search on Telegram @apna_pdf

Ans. (c) : In a steady flow reversible adiabatic process work done is equal to change in enthalpy.

241. Which parameter remains constant during a reversible adiabatic process?

(a) Enthalpy (b) Temperature
(c) Entropy (d) Internal Energy

Kerala PSC Poly. Lect. 09.01.2014

Ans. (c) : Entropy remains constant for a reversible adiabatic process.

Change in entropy is given by- $\Delta S = \int_1^2 \frac{dQ}{T} + S_{generation}$ for adiabatic process heat transfer is zero (Q = 0), So, $\int_1^2 \frac{dQ}{T} = 0$

and for reversible process entropy generation is considered to be zero. So the $S_{gen} = 0$.

Therefore the overall change is entropy for the reversible adiabatic process becomes zero.

242. A system is capable of exchanging energy with its surroundings in the form of n-reversible work modes. The number of independent variables that completely specify the state of the system is

(a) n-2 (b) n-1
(c) n (d) n+1

Haryana PSC Civil Services Pre, 2014

Ans. (d) : Number of independent variables = number of work modes + 1 = n+1

243. When a gas is heated, change takes place in :

(a) pressure (b) volume
(c) temperature (d) All of these

MPSC Poly. Lect. 2014

Ans. (d) : When a gas is heated, changes takes place in pressure volume and temperature.

244. The atomic mass of oxygen is :

(a) 12 (b) 14
(c) 16 (d) 32

MPSC Poly. Lect. 2014

Ans. (c) : Atomic mass of Oxygen = 16
Atomic mass of Carbon = 12
Atomic mass of Nitrogen = 14
Atomic mass of Sulphur = 32.

245. The principle of working of the constant volume thermometer is based on

(a) Boyle's law (b) Charle's law
(c) Gay – Lussac's law (d) Equation of state

TNPSC AE 2014

Ans. (c) : Constant volume gas thermometer– This thermometer works on the principle of Law of Gay-Lussac. The law states that when the temperature of an ideal gas increases, there is a corresponding increase in pressure. Also, when the temperature decrease, the pressure too decrease correspondingly.

246. Which of the following is an example of irreversible process?

(a) Polytropic expansion of fluid
(b) Unrestricted expansion of gases
(c) Isothermal expansion
(d) Electrolysis

JPSC AE 2013 Paper-V

Ans. (b) : Irreversible process- In an irreversible process, there is a loss of heat due to friction, radiation and conduction.

In an actual practice, most of the processes are irreversible to some degree The main causes for the irreversibility may be.

(i) Mechanical and fluid friction
(ii) Unrestricted expansion
(iii) Heat transfer with a finite temperature difference.

247. Which of the following is considered as thermodynamic potential?

(a) Temperature (b) Internal energy
(c) Enthalpy (d) Entropy

JPSC AE 2013 Paper-V

Ans. (c) : Enthalpy is considered as thermodynamic potential.

248. 2 kg of substance receives 500 kJ and undergoes a temperature change from 100°C to 200°C. Then average specific heat of substance during the process will be:

(a) 5 kJ/kg °K (b) 2.5 kJ/kg °K
(c) 10 kJ/kg °K (d) 25 kJ/kg °K

SJVN ET 2013

Ans. (b) : m = 2kg
Q = 500 kJ
$T_1 = 100^oC$
$T_2 = 200^oC$
$Q = mc\Delta T$
$500 = 2 \times c\ (200 - 100)$
$\boxed{C = 2.5\ kJ/kg^oK}$

249. For non-flow closed system the value of net energy transferred as heat and work equals change in:-

(a) Enthalpy (b) Entropy
(c) Internal energy (d) None of the above

UKPSC AE-2013, Paper-II

Ans. (c) : $\Delta Q - \Delta W = \Delta U$

250. The specific heats of gases increase with the rise in:

(a) Volume
(b) Temperature
(c) Volume and pressure
(d) None of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : The specific heat of gases increases with the rise in temperature.

251. An ideal gas is heated from temperature T_1 and T_2 by keeping its volume constant. The gas is expanded back to its initial temperature according to the law $PV^n = C$. If the entropy change in the two processes are equal, then the value of n in terms of the adiabatic index γ is

Search on Telegram @apna_pdf

(a) $n=\frac{\gamma+1}{2}$ (b) $n=\frac{\gamma-1}{2}$

(c) $n=\frac{\gamma+2}{4}$ (d) $n=\frac{\gamma+4}{2}$

JPSC AE 2013 Paper-V

Ans. (a) :

$$c_v \ell n\left(\frac{T_2}{T_1}\right)=c_v \ell n\left(\frac{T_1}{T_2}\right)+R\ell n\frac{V_1}{V_2}$$

$$\frac{V_1}{V_2}=\left(\frac{T_1}{T_2}\right)^{\frac{1}{n-1}}$$

$$c_v \ell n\left(\frac{T_2}{T_1}\right)=c_v \ell n\left(\frac{T_1}{T_2}\right)+\frac{R}{(n-1)}\ell n\frac{T_2}{T_1}$$

$$c_v \ell n\left(\frac{T_2}{T_1}\right)=-c_v \ell n\left(\frac{T_2}{T_1}\right)+\frac{R}{(n-1)}\ell n\left(\frac{T_2}{T_1}\right)$$

$$2c_v=\frac{R}{n-1}$$

$$c_p-c_v=R$$

$$2c_v=\frac{c_p-c_v}{n-1}$$

$$2(n-1)=\frac{c_p}{c_v}-1$$

$$2n-2=\gamma-1$$

$$2n=\gamma+1$$

$$\boxed{n=\frac{\gamma+1}{2}}$$

252. A vessel having a volume of 0.6 m^3 contains 3.0 kg of liquid water and water vapour mixture in equilibrium at a pressure of 0.5 MPa. The specific volume is

(a) 0.8 m^3/kg (b) 0.2 m^3/kg

(c) 0.6 m^3/kg (d) 0.2 kg/m^3

APPSC Poly. Lect. 2013

Ans. (b) : Given, V = 0.6 m^3, Pressure, P = 0.5 MPa = 5 bar, m = 3kg

Thus,

$$\text{Specific volume, } v=\frac{V}{m}=\frac{0.6}{3}=0.2 \text{ m}^3/\text{kg}$$

253. During a process involving one kg of working fluid in an insulated cylinder-piston arrangement the temperature of the fluid decreases from 350°C to 250°C. The specific heat of the fluid at constant volume is 0.8 kJ/kg°C. Considering the contents of the cylinder as the system, what will be the work done and its nature?

(a) 80 kJ (on the system)

(b) Zero

(c) 80 kJ (by the system)

(d) 125 kJ (by the system)

RPSC AEN Pre-2013

Ans. (c) : Given, m = 1kg

C_v = 0.8 kJ/kg°C

T_1 = 350°C , T_2 = 250°C

work done = Heat (Q) = $mC_v\Delta T$

= 1 × 0.8 × (350 – 250)

= 1 × 0.8 × 100

= 80 kJ (By the system)

254. The unit of work is

(a) kW (b) kWh

(c) kW/h (d) kJ/s

UKPSC AE 2012 Paper–II

Ans. (b) : kWh

255. The work in a closed system undergoing an isentropic process is given by

(a) $\frac{\gamma}{\gamma-1}mR(T_1-T_2)$ (b) $\frac{\gamma-1}{\gamma}mR(T_1-T_2)$

(c) $\frac{1}{\gamma-1}mR(T_1-T_2)$ (d) $\frac{\gamma}{\gamma-1}m(T_1-T_2)$

(Notations used have usual meaning)

UKPSC AE 2012 Paper–II

Ans. (c) : $\frac{1}{\gamma-1}mR(T_1-T_2)$

256. If 2 bar of air at 27°C is heated to 177°C at constant volume, the pressure will be

(a) 6.56 bar (b) 3 bar

(c) 9 bar (d) 13.11 bar

ISRO Scientist/Engineer 2012

Ans. (b) : P_1 = 2 bar

T_1 = 27°C

T_2 = 177°C

Gas equation, $\frac{P_1V_1}{T_1}=\frac{P_2V_2}{T_2}$

At constant volume $V_1 = V_2$

So, $\frac{P_1}{T_1}=\frac{P_2}{T_2}$

T_1 = 273 + 27 = 300 K

T_2 = 177 + 273 = 450 K

$\frac{2}{300}=\frac{P_2}{450}$

P_2 = 3 bar

257. The equation of state for a perfect gas is

(a) $\frac{P}{V}=RT$ (b) $\frac{P}{T}=\frac{V}{R}$

(c) PV = RT (d) $\frac{P}{\rho}=T$

APPSC AEE 2012

Ans. : (c) The equation of state for a perfect gas is

PV = mRT.

R = gas constant

Unit of R = $\frac{J}{kg-K}$

Value of R = 0.287 kJ/kg – K (for air)

Search on Telegram @apna_pdf

258. Extensive property of a system is one whose value

(a) depends on the mass of the system, like volume

(b) does not depend on the mass of the system like temperature

(c) is not dependent on the path followed but on the state

(d) is dependent on the path followed and not on the state

TRB Asstt. Prof., 2012

Ans. (a) : Extensive properties– It is the property which depends upon the mass of the system, is known as extensive properties.

Example– Volume, mass, all form of energy (K.E, P.E., Enthalpy, Entropy and Internal Energy).

Intensive Properties– It is the property which is independent of mass is known as intensive properties.

Example- Pressure, Temperature, Density, thermal conductivity, etc and all specific energy.

Note-

(1) The ratio of two extensive properties are known as intensive properties.

$$\text{Density}(\rho) = \frac{\text{Mass}}{\text{Volume}}$$

(Mass: Extensive; Volume: Extensive; Density: Intensive)

(2) All specific forms except specific density is always on intensive properties. Ex. Specific enthalpy, specific entropy etc.

(3) Heat capacity is a extensive properties.

259. Water is boiled at 1×10^5 Pa pressure in a coffee maker equipped with an immersion type electric heating element. The coffee maker initially contains 1 kg of water. Once boiling started, it is observed that half of the water in the coffee maker evaporated in 18 minutes. If the heat loss from the coffee maker is negligible, the power rating of the heating element is

(a) 0.90 kW (b) 1.52 kW

(c) 1.05 kW (d) 1.24 kW

ISRO Scientist/Engineer 2012

Ans. (c) : Pressure $P = 1 \times 10^5$ Pa

$m = 1$ kg

$t = 18$ minutes

Heat supplied for evaporating water $= Q = mH_v$

H_v = enthalpy of vaporization

$= 2257$ kJ/kg

$$\therefore \quad Q = \frac{1}{2} \times 2257$$

$H_v = 1128.5$ kJ

$$\text{Power (P)} = \frac{1128.5}{18 \times 60} = \frac{H_v}{t(\text{sec})}$$

$\simeq 1.05$ kW

260. Which pair of the following alternatives is correctly matched ?

List – I		List – II
(a) Heat	–	Point function
(b) Energy	–	Path function
(c) Entropy	–	Second law of thermodynamics
(d) Gibbs function	–	Path function

UKPSC AE 2012 Paper–II

Ans. (c) : Entropy – Second law of thermodynamics

261. For an adiabatic process,

(a) PV = a constant (b) PV^n = a constant

(c) $\frac{P}{\rho^\gamma}$ = a constant (d) $\frac{P}{K^\rho}$ = a constant

APPSC 2012

Ans. : (c) For an adiabatic process

$$\frac{P}{\rho^\gamma} = \text{constant}$$

γ = Ratio of the specific heat at constant pressure to the specific heat at Constant volume.

$C_p / C_v = 1.4$ for air.

262. When air expands from initial pressure P_1 and volume V_1 to final volume $5V_1$ following the law $PV^n = C$

(a) greater the value of n, greater the work obtained

(b) smaller the value of n, smaller the work obtained

(c) for n = 0, the work obtained is the greatest

(d) for n = 1.4, the work obtained is the greatest

ISRO Scientist/Engineer 2012

Ans. (c) : Given- Air expand

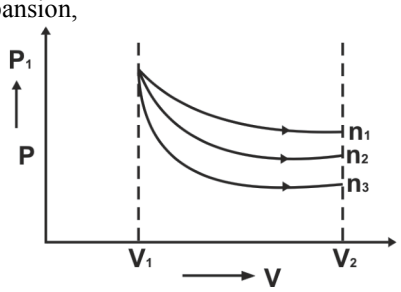
Initial pressure = P_1

Initial volume = V_1

Final volume = $5V_1$

$PV^n = C$

For Expansion,



Here, $n_1 < n_2 < n_3$

$\therefore$ Larger the value of n smaller is work obtained

$$W = \frac{P_1V_1 - P_2V_2}{n-1} \longrightarrow \text{Isotropic process}$$

$\therefore$ For n = 0 [P = Constant]

The work obtained is greatest.

263. Properties of substances like pressure temperature and density in thermodynamic co-ordinates are

Search on Telegram @apna_pdf

(a) path functions
(b) point functions
(c) cyclic functions
(d) thermodynamic functions

TNPSC ACF 2012

Ans. (b) : Point function
(a) Variable which depends on ends state only.
(b) All properties are point function.
(c) They should satisfy exact differential concleture.
Ex- Pressure, Temp, density.

264. An electric heater is left on for 30 minutes. During this time it uses 1200 W of electric energy. The total cost of the electricity will be if electricity costs 7 paisa per kWh
(a) 252 paisa (b) 25200 paisa
(c) 4200 paisa (d) 4.2 paisa

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (d) : Given-

Time (t) = 30 min $= \frac{1}{2}$ hr Power (P) = 1200 W

Price of 1 kWh = 1 unit = 7 paisa

We know that,

$$\text{Total cost} = \frac{P \times t \times \text{unit cost}}{1000}$$

$$= \frac{1200 \times 0.5 \times 7}{1000} = 4.2 \text{ paisa}$$

265. Match the following :

1.	**Closed system**	**a.**	**Increase in static pressure**
2.	**Open system**	**b.**	**Increase in kinetic energy**
3.	**Pump**	**c.**	**Heat, mass and work interact**
4.	**Turbine**	**d.**	**Heat and work interact**
5.	**Nozzle**	**e.**	**Delivers work**

(a) 1–d, 2–c, 3–a, 4–e, 5–b
(b) 1–c, 2–d, 3–b, 4–e, 5–a
(c) 1–c, 2–a, 3–d, 4–e, 5–b
(d) 1–d, 2–c, 3–e, 4–a, 5–b

OPSC Civil Services Pre. 2011

Ans. (a) :

1. Closed system	Heat and work interact
2. Open system	Heat, mass and work interact
3. Pump	Increase in static pressure
4. Turbine	Delivers work
5. Nozzle	Increase in kinetic energy

266. Pressure of 1 (one) atmosphere is equivalent to:
(a) 0.101325 MPa (b) 750 mm of mercury
(c) 1 bar (d) 0.101325 kPa

OPSC Civil Services Pre. 2011

Ans. (a) :
1 atmosphere pressure = 101325 Pa
= 1.01325 bar
= 760 mm of mercury
= 760 Torr
= 0.101325 MPa
= 14.6959 Pound-force per square inch

267. What is the process in which the temperature of the working substance remains constant during its expansion or compression called as?
(a) Isothermal process (b) Hyperbolic process
(c) Adiabatic process (d) Polytrophic process

VIZAG STEEL MT 2011

Ans. (a) : In thermodynamics, an isothermal process is a type of thermodynamic process in which the temperature of system remains constant : $\Delta T = 0$
- $\Delta T = 0$, or T = constant
- $dU = 0 = mC_V\Delta T$ (for ideal gas only, internal energy)
- Q = 0 for adiabatic process.

268. Which law states that change of internal energy of a perfect gas is directly proportional to the change of temperature.
(a) Boyle's law (b) Charles law
(c) Gay-lussac law (d) Joule's law

VIZAG STEEL MT 2011

Ans. (d) : Boyle's law- The volume of a given mass of a gas varies as its absolute pressure, provided the moles and temperature remains constant.
Charle's law- The volume of a given gas varies directly as its absolute temperature provided the moles and pressure is kept constant.
Gay-lussac law- The pressure of a given mass of a gas varies directly as its absolute temperature provided the moles and volume is kept constant.
Joule's law- This law states that "The internal Energy of a given quantity of a gas depends on the temperature.

269. What happen when a gas is heated at constant pressure.
(a) Its temperature will increase
(b) Its volume will increase
(c) Both temperature and volume will increase
(d) Neither temperature nor volume will increase

VIZAG STEEL MT 2011

Ans. (c) : When a gas is heated at constant pressure then both temperature and volume will increase.

270. Which of the following gas has a minimum molecular mass?
(a) Oxygen (b) Nitrogen
(c) Hydrogen (d) Methane

VIZAG STEEL MT 2011

Ans. (c) : Atomic mass of hydrogen = 1.007
Atomic mass of Oxygen = 15.99
Atomic mass of Nitrogen = 14.006
Atomic mass of chlorine = 35.5
So molecular mass of hydrogen (H_2)= 2 × 1.007
= 2.014 u
molecular mass of Oxygen (O_2)= 2 × 15.99 = 31.99
molecular mass of Nitrogen (N_2) = 2 × 14.006 = 28.01u
molecular mass of Chlorine (Cl_2) = 2 × 35.5 = 71 u

Search on Telegram @apna_pdf

271. Which efficiency a machine can be called as an idea machine?

(a) Between 60 and 70%
(b) Between 70 and 80%
(c) Between 80 and 90%
(d) 100%

VIZAG STEEL MT 2011

Ans. (d) : An ideal machine, the work output is equal to work input, i.e. the efficiency of an ideal machine is 1 (or 100%).

272. What is the heat energy stored in the gas used for raising the temperature of the gas known as?

(a) External energy (b) Internal energy
(c) Kinetic energy (d) Molecular energy

VIZAG STEEL MT 2011

Ans. (b) : Internal energy is the heat energy stored in the gas used for raising the temperature of the gas.

273. ITPS defines which of the following as a reference for calibration of temperature scale?

(a) Ice Point
(b) Lamda Point
(c) Normal Boiling Point of Water
(d) Triple Point of Water

OPSC Civil Services Pre. 2011

Ans. (d) : Triple point of water is a reference for calibration of temperature scale.

274. The specific heat of an ideal gas C_p and C_v

(a) Vary with temperature
(b) Vary with pressure
(c) Vary with both pressure and temperature
(d) Are constant

UPSC JWM Advt. No.-52/2010

Ans. (d) : C_p, C_v and γ are constant for ideal gas.
C_p, C_v and γ are varies only for non -monoatomic real gases

275. Consider the following statements about thermodynamic properties of system :

1. Heat transferred at constant volume increase the internal energy of the system.
2. Heat transferred at constant pressure increases the enthalpy of a system.
3. The enthalpy of an ideal gas depends on the temperature only.

Which of these statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (a) : All options are correct.

276. Consider the following properties :

1. Specific heat 2. Thermal diffusivity
3. Dynamic viscosity 4. Density

Which of these properties of air increase with increase of temperature ?

(a) 1, 2, 3 and 4 (b) 1 and 2 only
(c) 2 and 3 only (d) 1, 2 and 3 only

UPSC JWM Advt. No.-50/2010

Ans. (d) : The properties of air increase with increase of temperature such as,

$$PV = mRT \Rightarrow P = \frac{m}{v}RT \Rightarrow P = \rho RT$$

$$\frac{P}{\rho} = RT \Rightarrow \boxed{T \propto \frac{1}{\rho}}$$

'T' is inversely proportional the density 'ρ'.

- T is directly proportional to the specific heat, thermal diffusivity & dynamic viscosity.

277. When 2 gm of a gas A is introduced into an evacuated flask kept at 25°C, the pressure is found to be 1 atmosphere. If 3 gm of another gas B is then added to the same flask, the total pressure becomes 1.5 atmospheres. Assuming ideal gas behaviour, the ratio of molecular weights, $M_A : M_B$ will be

(a) 1 : 3 (b) 3 : 1
(c) 2 : 3 (d) 3 : 2

UPSC JWM Advt. No.-50/2010

Ans. (a) : Given,

$W_A = 2$ gm, $W_B = 3$ gm
$P_A = 1$ atm
$P_{total} = 1.5$ atm

Ideal gas equation,

$PV = nRT$

$$\Rightarrow \quad n = \frac{W(\text{Weight of tubes})}{M(\text{Molecular weight})}$$

So, $$PV = \frac{W}{M}RT$$

$$M = \frac{WRT}{PV}$$

So, $$M_A = \frac{W_1RT}{P_1V} = \frac{2RT}{1\times V} \qquad \left[\because P_t = 1.5\,\text{atm and } \because P_t = P_A + P_B\right]$$

$$M_B = \frac{W_2RT}{P_2V} = \frac{3RT}{0.5V}$$

$$\frac{M_A}{M_B} = \frac{2RT}{V}\times\frac{0.5V}{3RT} = 1:3$$

278. Air with initial condition of P_1, V_1 expands to final condition of $\frac{P_1}{2}$, $3V_1$. The process is

(a) Hyperbolic
(b) Adiabatic
(c) Polytropic with $n > 1$
(d) Polytropic with $n < 1$

ISRO Scientist/Engineer 2010

Ans. (d) : Air,

Initial pressure = P_1

Final pressure = $\frac{P}{2}$

Expansion to this process,
Initial volume = V_1
Final volume = $3V_1$

Search on Telegram @apna_pdf

$$\frac{P_1}{P_2}=\left(\frac{V_2}{V_1}\right)^n$$

$$\frac{P_1}{P/2}=\left(\frac{3V_1}{V_1}\right)^n$$

$2 = 3^n$

$n = 0.63$

279. Consider the following statements about heat and work:

1. **Both are path functions**
2. **Both are exact differentials.**
3. **Work is low grade energy and heat is high grade energy.**
4. **Heat is low grade energy and work is high grade energy.**

Which of the following options are true?

(a) 1 and 2 (b) 1 and 3
(c) 1 and 4 (d) 2 and 3

DRDO Scientists 2009

Ans. (c) : Heat and work are-
1. Both are path function (inexact differential)
2. Heat is low grade energy and work is high grade energy.

280. The control volume of an open system may involve :

(a) Fixed and moving boundaries
(b) Real and imaginary boundaries
(c) Both (a) and (b)
(d) None of the above

APPSC IOF, 2009

Ans. (c) : Control Volume–The surface may be open or closed to mass flows and it may flows from energy in terms of heat transfer and work across it. The boundaries may be movable or stationary.

281. An adiabatic process is one in which :

(a) no heat enters or leaves the gas
(b) the change in internal energy is equal to work done
(c) the temperature of the gas changes
(d) all of the above

APPSC IOF, 2009

Ans. (d) : Adiabatic Process–
- No heat enters or leaves the gas
- The change in internal energy is equal to work done

$\delta Q = dU + \delta W$

$0 = dU + \delta W$

$\boxed{\delta W = -dU}$

- The temperature of the gas changes

282. The coefficient of linear expansion of a solid is L. The volume V of a cube of this solid on being heated by 1°C will change by

(a) VL (b) 3VL
(c) 3L (d) $\frac{VL}{3}$

ISRO Scientist/Engineer 2009

Ans. (b) Coefficient of linear expansion of a solid is = L.
Volume = V
$\Delta T = 1°C$.
We know that,
$V = a^3$
Take log both side
$\log V = \log a^3$
$= 3 \log a$
Partially differentiate both side

$$\frac{dV}{V}=3\frac{da}{a}$$

$$dV = 3\frac{da}{a}.V$$

$= 3 (L \times 1) \times V$
$= 3 VL$

283. The relation PV^γ = constant, where γ is the ratio of the specific heats of ideal gas, is applicable to

(a) Any adiabatic process
(b) Only reversible adiabatic process
(c) Only irreversible adiabatic process
(d) Only isothermal process

ISRO Scientist/Engineer 2009

Ans. (b) : PV^γ = constant
Its Adiabtaic process
γ = only reversible adiabatic process

284. The ratio of specific heats of a gas is 1.4 and the value of specific heat at constant pressure is 7.0 *cal/mole°C*. The difference between specific heat at constant pressure and specific heat at constant volume will be (in *cal/mole°C*)

(a) 1.4 (b) 1.7
(c) 5.0 (d) 2.0

ISRO Scientist/Engineer 2009

Ans. (d) : Ratio of specific heat of gas $\gamma=\frac{C_p}{C_v}=1.4$
Specific heat at constant pressure C_p = 7.0 cal/mole°C

$C_p - C_v = R$

or $\gamma=\frac{C_p}{C_v}$

$$1.4=\frac{7}{C_v}$$

$$C_v=\frac{70}{14}$$

$C_v = 5$

So, $C_p - C_v = 7 - 5 = 2$ cal/mole°C

285. By which one of the following the Kelvin temperature of a system can be measured?

(a) Mercury-in-glass thermometer
(b) Thermocouple
(c) Constant-volume gas thermometer
(d) Resistance thermometer

UPSC JWM Adv. No-16/2009

Search on Telegram @apna_pdf

Ans. (c) : The Kelvin temperature of a system can be measured by Constant Volume gas thermometer.

286. In the macroscopic approach, in the study of thermodynamics

i. the structure of matter is taken into account

ii. the structure of matter is not considered

iii. only a limited number of properties are used to describe the state of matter

iv. the values of the properties needed for the description of the system cannot be measured.

Of the statements :

(a) I alone is correct (b) I and II are correct

(c) II and III are correct (d) All are correct

TNPSC AE, 2008

Ans. (a) : In the macroscopic approach, the study of the thermodynamics the structure of matter is taken into account.

In this approach the individual molecular behaviour is neglected and average molecular behaviour is studied.

This approach is applicable for the continuum concept.

287. The generally used device for temperature measurement inside the furnace is

(a) gas thermometer

(b) optical pyrometer

(c) alcohol thermometer

(d) mercury thermometer

TNPSC AE, 2008

Ans. (b) : Optical pyrometer is a device generally used for temperature measurement inside the furnace.

288. Work done in reversible adiabatic process is given by

(a) $\frac{P_2V_2 - P_1V_1}{1-n}$ (b) $\frac{P_2V_2 - P_1V_1}{1-\gamma}$

(c) $\frac{P_2V_2 - P_1V_1}{\gamma-1}$ (d) $\frac{\gamma-1}{J}(P_2V_2 - P_1V_1)$

TNPSC AE, 2008

Ans. (b) : Workdone (W) in reversible adiabatic process is given by

$$W = \frac{P_1V_1 - P_2V_2}{\gamma-1} \quad \text{or} \quad W = \frac{P_2V_2 - P_1V_1}{1-\gamma}$$

289. The density of air at 10°C and 1MPa abs, in SI units is

(a) 1.231 (b) 12.31

(c) 118.4 (d) 65.0

ISRO Scientist/Engineer 2008

Ans. (b) : Density of air ρ = ?

T = 10°C

= 273 + 10

T = 283 K

P = 1MPa

PV = mRT

$$P = \frac{m}{V}RT$$

$$P = \rho RT$$

$$\rho = \frac{P}{RT}$$

$$= \frac{1\times10^6}{287\times283}$$

$$= 12.31 \text{ kg/m}^3$$

290. A well insulated vessel containing air is heated to double the pressure and temperature 150% in excess of initial. The amount of air that leaked is

(a) 20% (b) 22.5%

(c) 25% (d) 0%

ISRO Scientist/Engineer 2008

Ans. (c) : For ideal gas

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2} \text{ (air is an Ideal gas)}$$

$$\frac{P_1V_1}{T_1} = \frac{2P_1V_2}{1.5T_1}$$

$$V_1 = \frac{4}{3}V_2$$

The amount of air leaked

$$\frac{V_1 - V_2}{V_1}\%$$

$$\frac{V_1 - \frac{3}{4}V_1}{V_1}\%$$

= 25%

291. An unconstraint thin circular disc has a concentric hole in it. On heating the diameter of the hole will

(a) increase

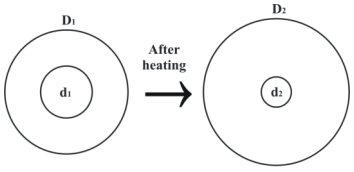
(b) decrease

(c) Remain constant

(d) first increase then decrease

ISRO Scientist/Engineer 2008

Ans. (b) : After heating the metal tends to elongate, it will also elongate towards the center of the concentric hole to fill some part of hole and make its diameter small.



($d_1 > d_2, D_2 > D_1$)

292. Kinetic energy of the molecules in terms of absolute temperature (T) is proportional to

(a) T (b) T^{-4}

(c) T^2 (d) $\sqrt{T}$

ISRO Scientist/Engineer 2008

Search on Telegram @apna_pdf

Ans. (a) : Kinetic energy of molecules given by

$$E = \frac{3}{2}kT$$

where k = Boltzman constant

T = Absolute temperature

So, $E \propto T$

293. The quantity of heat required to change the temperature of 1 gm of ice cream -6°C to -5°C is known as

(a) Latent heat of freezing
(b) Freezing heat
(c) Heat of vaporization
(d) Specific heat

ISRO Scientist/Engineer 2008

Ans. (d) :

294. A vessel of volume 1 m^3 contains oxygen (molecular weight = 32) at p = 1 bar and T = 47°C. The mass of oxygen in the vessel is (take universal gas constant as 8314 J/kmol-K)

(a) 40.0 kg (b) 3.0 kg
(c) 1.2 kg (d) 1.0 kg

DRDO Scientists 2008

Ans. (c) : Ideal gas equation

$$PV = mRT$$

$$R = \frac{R'}{M} \qquad (R' = \text{Universal gas constant})$$

$$1\times10^5\times1 = m\times\frac{8314}{32}(273+47)$$

$$m = 1.199 \text{ kg}$$

295. Temperature of a gas is due to

(a) its heating value
(b) kinetic energy of molecules
(c) repulsion of molecules
(d) attraction of molecules

TNPSC AE, 2008

Ans. (b) : The temperature of a gas is due to kinetic energy of molecules. As temperature increases, the molecules of the gas have the more kinetic energy.

296. The specific heat of diatomic gas at constant pressure is given by (R = universal gas constant and M = molecular weight of gas)

(a) $\frac{5}{2}\frac{R}{M}$ (b) $\frac{5}{2}MR$

(c) $\frac{7}{2}\frac{R}{M}$ (d) $\frac{7}{2}MR$

ISRO Scientist/Engineer 2008

Ans. (c) : We know that,

$$c_P = \frac{\gamma R_g}{(\gamma-1)}$$

For di-atomic

$$\gamma = \frac{7}{5} = 1.4$$

$$R_g = \frac{R}{M}$$

$$c_P = \frac{\gamma R_g}{(\gamma-1)} = \frac{1.4\times R_g}{(1.4-1)}$$

$$= \frac{1.4\times R_g}{0.4} = \frac{1.4\times R}{0.4M} \qquad (\because R_g = R/M)$$

$$c_P = \frac{7}{2}\frac{R}{M}$$

R = Universal Gas Constant

R_g = Characteristic Gas Constant

M = Molecular Weight

For, mono-atomic $\gamma = 5/3 = 1.66$, the minimum value of $\gamma = 1$ and maximum is 1.67.

The general formula for γ of any gas is given as

$$\gamma = 1 + \frac{2}{f}$$

Where,

f = Degree of freedom for mono-atomic f = 3 and for di-atomic f = 5.

297. The universal gas constant of a gas is the product of molecular weight of the gas and

(a) Gas constant
(b) Specific heat at constant pressure
(c) Specific heat at constant volume
(d) None of the above

ISRO Scientist/Engineer 2007

Ans. (a) : $PV = mRT$

We know that,

No. of mole (n) = $\frac{m}{M}$

so, m = nM

and $PV = n\bar{R}T$

$PV = nMRT$

where R = gas characteristic constant n = No. of mole, m = molecular mass, M = molecular weight, $\bar{R}$ = universal gas constant, T = Temperature

$$PV = nMRT$$

$$MR = \bar{R}$$

298. Bulk modulus K of a perfect gas in terms of pressure P in an isothermal process is related by the equation.

(a) K = 3P (b) K = P
(c) K = $\frac{P}{2}$ (d) K = 2P

WBPSC AE, 2007

Ans. (b) : K = P for isothermal process

K = γP for adiabatic process

299. A process in which all thermodynamic properties are same at the start and at the end of the process is known as

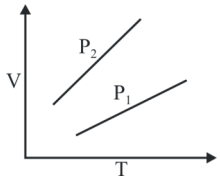
(a) reversible process (b) quasi-static process
(c) cyclic process (d) irreversible process

OPSC Civil Services Pre 2006

Ans. (c) : If properties at the start and at the end of process is same, the process is called cyclic process.

Search on Telegram @apna_pdf

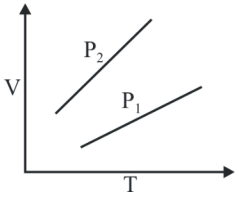
300. The volume versus temperature T graph for a certain amount of a perfect gas at two pressure P_1 and P_2 are as shown in the figure. It can be concluded that-



(a) The pressure P_1 is greater than the pressure P_2
(b) The adiabatic index for P_1 is higher than that for P_2
(c) P_1 represents monoatomic gas and P_2 represents diatomic gas
(d) None of the above

ISRO Scientist/Engineer 2006

Ans. (a) : Slope $= \left(\frac{V}{T}\right)$



Slope $(\text{Slope})_2 > (\text{Slope})_1$

$$\left(\frac{V}{T}\right)_2 > \left(\frac{V}{T}\right)_1$$

$$\frac{R}{P_2} > \frac{R}{P_1} \qquad (\because \text{Ideal gas equation})$$

$PV = mRT$

$\therefore \boxed{P_1 > P_2}$ $\qquad \frac{V}{T} = \frac{mR}{P} = \left(\frac{V}{T}\right)_1 = \frac{mR}{P_1}$

301. In case of ideal triatomic gas, the ratio of specific heat C_P/C_V would be-

(a) 1 (b) 1.33
(c) 1.40 (d) 1.41

ISRO Scientist/Engineer 2006

Ans. (b) : Specific heat

$$\gamma = \frac{C_P}{C_V}$$

$$\gamma = 1 + \frac{2}{f}$$

Where f is degree of freedom

f = 6 for triatomic gas

$$\gamma = 1 + \frac{2}{6} = 1.33$$

302. For polytropic process the specific heat is given by the relation :

$$C_n = C_p \frac{n-k}{(n-1)}$$

For $1 < n < k$, C_n will be :

(a) Zero (b) Positive
(c) Infinite (d) Negative

J & K PSC Screening, 2006

Ans. (d) : For polytropic process.

$$C_n = C_v\left(\frac{n-k}{n-1}\right) \qquad 1 < n < k$$

$$C_n = C_v\left(\frac{n-k}{n-1}\right) \qquad 1 < n < k$$

put $n = 1.2$ & $k = 1.4$

$$C_n = C_v\left[\frac{1.2-1.4}{1.2-1}\right] = -C_v$$

C_v is always positive Hence C_n will be negative.

2. First Law of Thermodynamics

303. A 100 W electric bulb was switched on in a 2.5m × 3m× 3m size thermally insulated from having temperature of 20°C. The room temperature at the end of 24 hrs will be

(a) 100°C (b) 470°C
(c) 370°C (d) 600°C

Consider density and specific heat of air as 1.2 kg/cm^3 and 0.718 kW/°C/kg

HPPSC ADF 05.03.2019
GPSC Executive Engineer 23.12.2018
ISRO Scientist/Engineer (RAC) 22.04.2018
AAI Jr. Executive 29.11.2018
VIZAG STEEL MT 10.06.2012
GATE 2006

Ans. (b) : Heat supply to thermally insulated room

$Q = 100 \times 24 \times 60 \times 60 = 8640$ kJ

Mass of air in room (m) $= \rho_{air} \times$ volume of room

$= 1.2 \times 2.5 \times 3 \times 3$

$m = 27$ kg

Heat supply to insulated room = rise internal energy of air inside the room

$8640 = 27 \times 0.718\,(T_2 - 20°)$

$T_2 = 465°C \simeq 470\,°C$

304. A steel ball of mass 1 kg and specific heat 0.4 kJ/kg °C is at a temperature of 60 °C. It is dropped into 1 kg water at 20 °C. The final steady state temperature of water is :

(a) 23.5 °C (b) 30 °C
(c) 35 °C (d) 40 °C

RPSC Vice Principal ITI 2018
GPSC ARTO Pre 30.12.2018
Vadodara Muncipal Corp. DEE, 2018
ISRO Scientist/Engineer (RAC) 07.05.2017
ISRO Scientist/Engineer 11.10.2015
GATE 1999

Ans. (a) $m_b = 1$ kg
$c_b = 0.4$ kJ/kgk
$T_{b_1} = 60°C$
$m_w = 1$ kg
$T_{w_1} = 20°C$

Search on Telegram @apna_pdf

Let the final steady state temperature of ball and water be T°C.

$$m_b c_b (T_{b_1} - T) = m_w c_w (T - T_{w_1})$$

$$1 \times 0.4\,(60° - T) = 1 \times 4.18\,(T - 20°)$$

$$\boxed{T = 23.5°C}$$

305. A mixture of gasses expands from 0.03 m^3 to 0.06 m^3 at a constant pressure of 1 MPa and absorbs 84 kJ of heat during the process. The change in internal energy of the mixture is

(a) 30 kJ (b) 54 kJ
(c) 84 kJ (d) 114 kJ

PPSC Asstt. Municipal Engineer 15.06.2021
ISRO Scientist/Engineer (RAC) 22.04.2018
TSPSC AEE 2017
Assam PSC CCE Pre 2015, TNPSC AE 2013
UKPSC AE 2012 Paper–II, CSE Pre-1994

Ans. (b) : Given,

$V_1 = 0.03m^3$ $V_2 = 0.06m^3$

$\delta W = PdV$

$P = 1000$ kPa

$W = 1000(0.06 - 0.03)$

$= 1000 \times 0.03$

$= 30$ kJ

$Q = 84$ kJ

So, $\delta Q = dU + \delta W$ (I^s Law of thermodynamics)

$84 = dU + 30$

$dU = 54$ kJ

306. The first law of thermodynamics is the law of

(a) Conservation of heat
(b) Conservation of momentum
(c) Conservation of energy
(d) Conservation of mass

HRRL (HPCL) Engineer 07.08.2021
Assam PSC AE (IWD) 14.03.2021
TSPSC Manager (Engg.) HMWSSB 12.11.2020
Rajasthan AE (Nagar Nigam) 2016 Shift-3
GPSC Lect. 23.10.2016
VIZAG Steel MT 2011
OPSC Civil Services Pre 2006

Ans. (c) : First law of thermodynamics is the law of conservation of energy which states that energy can neither can be created, nor destroyed however it can be converted from one form to another.

For a thermodynamic process:

$$\boxed{\partial Q = dE + \partial W}$$

For a thermodynamic cycle

$$\oint \delta Q = \oint \delta W$$

307. A 2 kW, 40 liters water heater is switched on for 20 minutes. The heat capacity C_P for water is 4.2 kJ/kgK. Assuming all the electrical energy has gone into heating the water, increase of water temperature in degree centigrade is

(a) 2.7 (b) 4.0
(c) 14.3 (d) 8.3

TSPSC AEE 2017, GPSC AE 26.07.2015
VIZAG STEEL MT 10.06.2012
PSPCL AE, 2012, GATE 2003

Ans. (c) : Energy given by heater = Energy taken by water

$P.t = mC_p\Delta T$

$2\times10^3\times20\times60 = 10^3\times 40\times10^{-3}\times 4.2\times\Delta T$

$\Delta T = 14.3°C$

308. The cyclic integral of (δQ – δW) for a process is equal to

(a) Positive
(b) Negative
(c) Zero
(d) Positive or negative depending upon the type of process

Nagaland PSC CTSE 2015 Paper-II
RRB SSE 03.09.2015 Shift-II
UKPSC AE-2013, Paper-II
ESE 2007

Ans. (c) : According to first law of thermodynamics

$\delta Q = dU + \delta W$

$\delta Q - \delta W = dU$

$$\therefore \quad \oint (\delta Q - \delta W) = \oint (dU)$$

Cyclic integration of a property of system is always zero. i.e. in a cyclic process no change in properties of system,

$$\oint (\delta Q - \delta W) = 0$$

$$\therefore \quad \boxed{\oint (\delta Q) = \oint (\delta W)}$$

or $(\Sigma Q)_{cyclic} = (\Sigma W)_{cyclic}$

309. For a closed system, difference between the heat added to the system and work done by the gas, is equal to the change in-

(a) Internal energy (b) Entropy
(c) Enthalpy (d) Temperature

ISRO Scientist/Engineer 2006
WBPSC AE 2003, ESE 2003

Ans. (a) : For a closed system, difference between the heat added to the system and work done by the gas, is equal to the change in Internal Energy.

Internal energy $\Delta E = Q - W$

310. 170 kJ of heat is supplied to a system at constant volume. Then the system rejects 180 kJ of heat at constant pressure and 40 kJ of work is done on it. The system is finally brought to its original state by an adiabatic process. If the initial value of internal energy is 100 kJ, then which one of the following statements is correct?

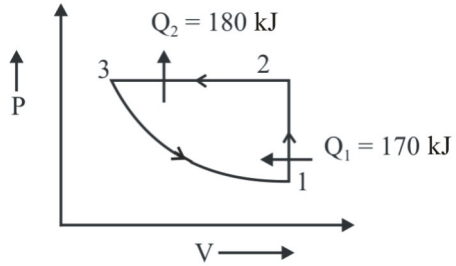
(a) the highest value of internal energy occurs at the end of the constant volume process
(b) the highest value of internal energy occurs at the end of the constant pressure process

Search on Telegram @apna_pdf

(c) the highest value of internal energy occurs after adiabatic expansion
(d) internal energy is equal at all the points.

Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014
ESE 2004

Ans. (a)



$1 \rightarrow 2$ Constant volume
$2 \rightarrow 3$ Constant pressure
$3 \rightarrow 1$ Adiabatic

$\boxed{U_1 = 100\,kJ}$

$Q_2 = 180$ kJ
$Q_1 = 170$ kJ

In process $1 \rightarrow 2$
$\delta Q = dU + \delta W$
$170 = dU + 0$
$170 = U_2 - U_1$
$U_2 = 170 + U_1$
$\boxed{U_2 = 170 + 100 = 270\,kJ}$

In process (2–3)
$\delta Q = dU + \delta W$
$-180 = U_3 - U_2 - 40$
$\boxed{U_3 = 130\,kJ}$

Means highest value of internal energy occurs at end of constant volume process which is $\boxed{U_2 = 270}$

$\boxed{U_2 > U_3 > U_1}$

311. A 10 kg solid at 100°C with a specific heat of 0.8 kJ/kg°C s immersed in 40 kg of 20°C liquid with a specific heat of 4.0 kJ/kg°C. The temperature after a long time if the container is insulated will be

(a) 30°C (b) 28°C
(c) 26°C (d) 24°C

ISRO Scientist/Engineer (RAC) 12.01.2020
GPSC ARTO 01.05.2016
ISRO Scientist/Engineer 11.10.2015

Ans. (d) : Equivalent Temperature $T_{equ.}$

$$= \frac{m_1 C_{p_1} T_1 + m_2 C_{p_2} T_2}{m_1 C_{p_1} + m_2 C_{p_2}}$$

$$T_e = \frac{10 \times 0.8 \times (100 + 273) + 40 \times 4 \times (20 + 273)}{10 \times 0.8 + 400 \times 4}$$

$$= \frac{8 \times 373 + 160 \times 293}{8 + 160}$$

$T_e \cong 296.81$ K

$T_e = 23.81^\circ C$

$\boxed{T_e \simeq 24^0 C}$

312. If δQ is the heat transferred to the system and δW is the work done by the system, then which of the following is an exact differential?

(a) δQ (b) δW
(c) δQ+ δW (d) δQ – δW

Nagaland PSC CTSE 2017, 2016 Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (d) : According to first law of thermodynamics.

$\boxed{dU = \delta Q - \delta W}$

dU = change in Internal Energy which is exact differential.
δQ = Inexact differential
δW = Inexact differential

313. A 1000 kg vehicle travelling at 80 m/s impacts a plunger attached to a piston-cylinder arrangement. If all of the energy of the vehicle is absorbed by the 20 kg of liquid contained in the cylinder, what is the maximum temperature rise of the liquid? (The specific heat of the liquid is 4.0 kJ/kg.°C)

(a) 55°C (b) 40°C
(c) 45°C (d) 50°C

Vododara muncipal Corp. DEE 2018
ISRO Scientist/Engineer 2009

Ans. (b) : Mass of vehicle (m) = 1000 kg
speed v = 80 m/s
Mass of liquid contained
m = 20 kg
c = 4.0 kJ/kg°C
ΔT = ?

$$\frac{1}{2}mv^2 = mc\Delta T$$

$$\frac{1}{2} \times 1000 \times 80^2 = 20 \times 4 \times (\Delta T)$$

$\Delta T = 40°C$

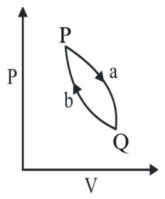
314. A system is taken from state "P" to state "Q" along two different paths "a" and "b". The heat absorbed and work done by the system along these paths are "Q_a", "Q_b" and "W_a", "W_b" respectively. Which among the following will be true?

(a) $W_a + Q_a = W_b + Q_b$
(b) $Q_a = Q_b$
(c) $W_a = W_b$
(d) $Q_a - W_a = Q_b - W_b$

UPRVUNL AE 2014
UKPSC AE 2012 Paper–II

Search on Telegram @apna_pdf

Ans. : (d) $Q_a - W_a = Q_b - W_b$



315. A system undergoes a change of rate during which 100 kJ of heat is transferred to it and does 50 kJ of work. The system is brought back to its original state through a process during which 120 kJ of heat is transferred to it. The work done by the system is

(a) 50 kJ (b) 79 kJ
(c) 170 kJ (d) none of these

ISRO Scientist/Engineer (RAC) 12.01.2020
TRB Poly. Lect., 2012

Ans. (c) $Q_1 = 100$ kJ, $W_1 = 50$kJ
$Q_2 = 120$kJ, $W_2 = ?$
As per Ist law of thermodynamics
Process 1-2 & Process (2-1)

$$\sum dQ = \sum dW$$

$$Q_{1-2} + Q_{2-1} = W_{1-2} + W_{2-1}$$
$$100 + 120 = 50 + W_{2-1}$$
$$220 = 50 + W_{2-1}$$
$$W_{2-1} = 220 - 50$$
$$\boxed{W_{2-1} = 170\text{kJ}}$$

316. A gas expands in a frictionless piston cylinder arrangement. The expansion process is very slow, and is resisted by an ambient pressure of 100 kPa. During the expansion process, the pressure of the system (gas) remains constant at 300 kPa. The change in volume of the gas is 0.01 m^3. The maximum amount of work that could be utilized from the above process is

(a) 0 kJ (b) 1 kJ
(c) 2 kJ (d) 3 kJ

TSPSC AEE 2017, GATE 2008

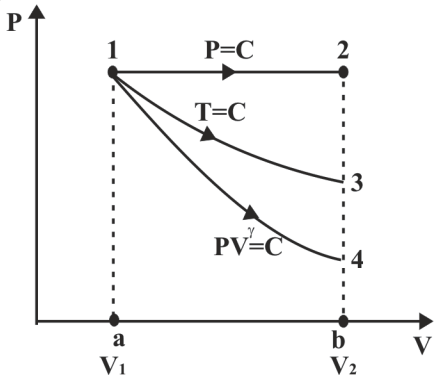
Ans. (c) : W = Resistance pressure × ΔV
W = P × ΔV
W = 100 × 0.01
W = 1 kJ This is required for atmosphere, means against atmosphere we have to do this but question is that how much we can use.
Now total work done = Total resistance × ΔV
= 300 × 0.01 = 3 kJ
1 kJ for atmosphere, 2 kJ for use.
So, answer is 2 kJ.

317. Starting from the same initial conditions, an ideal gas expands from volume V_1 to V_2 in three different ways, the work done by the gas is W_1 if the process is purely isothermal, W_2 if purely isobaric and W_3 is purely adiabatic, then

(a) $W_2 > W_1 > W_3$ (b) $W_2 > W_3 > W_1$
(c) $W_1 > W_2 > W_3$ (d) $W_1 > W_3 > W_2$

GPSC ARTO Pre 30.12.2018
ISRO Scientist/Engineer 03.07.2016

Ans. (a) :



We know that area under the P-V diagram will be equal to the work done for any process.
From above figure
Area under 1-2-b-a (P = constant) W_2
Area under 1-3-b-a-1 (T = constant) W_1
Area under 1-4-b-a-1 (PV^{γ} = constant) W_3
So, we can say that
$W_2 > W_1 > W_3$

318. According to first law of thermodynamics

(a) Mass and energy are mutually convertible
(b) Heat and work are mutually convertible
(c) Heat flows from hot substance to cold substance
(d) Carnot engine is most efficient

APPSC AEE 2012
ISRO Scientist/Engineer 2011

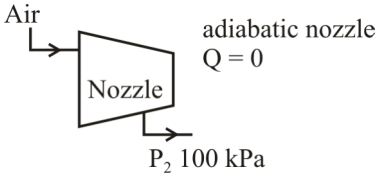
Ans. (b) : According to first law of thermodynamics–
- Total amount of energy the system is constant
- Energy can be transfer from one form to another
- Heat and work are mutually convertible

319. Air enters an adiabatic nozzle at 400 kPa and 900 K, with negligible velocity. If the flow is ideal and exit pressure is 100 kPa, the exit temperature in K and exit velocity in m/s are respectively

(a) 605.7, 768.7 (b) 225, 1164.8
(c) 516.9, 877.5 (d) 129.2,880.1

Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (a)
$P_1 = 400$ kPa
$T_1 = 900$ K
$V_1 = 0$



Search on Telegram @apna_pdf

$T_2 = ?$

$V_2 = ?$

$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_2}{900} = \left(\frac{100}{400}\right)^{\frac{1.4-1}{1.4}}$$

$$T_2 = 900 \times \left(\frac{100}{400}\right)^{\frac{0.4}{1.4}}$$

$T_2 = 605.7$ K

From SFEE

$$h_1 + \frac{c_1^2}{2000} + \frac{gz_1}{1000} + q_{cv} = h_2 + \frac{c_2^2}{2000} + \frac{gz_2}{1000} + W_{cv}$$

$q_{cv} = 0$, $W_{cv} = 0$ } adiabatic nozzle

$z_1 = z_2$

$c_1 = 0$

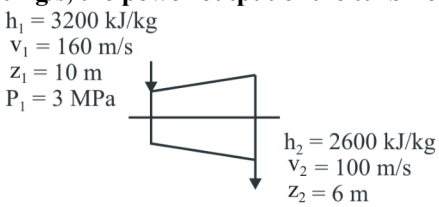
$$h_1 = h_2 + \frac{c_2^2}{2000}$$

$$c_2 = \sqrt{2000(h_1 - h_2)} = \sqrt{2000(C_p)[T_1 - T_2]}$$

$$= \sqrt{2000 \times 1.005 \times (900 - 605.66)}$$

$= 769.177$ m/s

320. The inlet and outlet conditions of steam for an adiabatic steam turbine are as indicated in the figure. The notations are as usually followed. If the mass rate of steam through the turbine is 20 kg/s, the power output of the turbine is



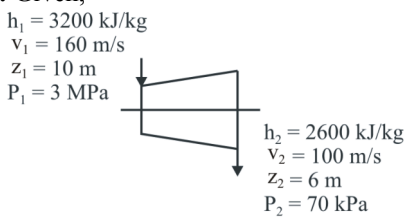
(a) 12.157 MW (b) 12.941 MW

(c) 168.001 MW (d) 168.785 MW

ISRO Scientist/Engineer 11.10.2015

GATE 2009

Ans. (a) : Given,



Applying the steady flow energy equation (SFEE)–

$$\dot{m}\left(h_1 + \frac{v_1^2}{2} + gz_1\right) + Q = \dot{m}\left(h_2 + \frac{v_2^2}{2} + gz_2\right) + W$$

Where $Q = 0$ For adiabatic flow

$$\dot{m}\left(h_1 + \frac{v_1^2}{2} + gz_1\right) = \dot{m}\left(h_2 + \frac{v_2^2}{2} + gz_2\right) + W$$

On unit balancing, we get

$$\dot{m}\left(h_1 + \frac{v_1^2}{2000} + \frac{gz_1}{1000}\right) = \dot{m}\left(h_2 + \frac{v_2^2}{2000} + \frac{gz_2}{1000}\right) + W$$

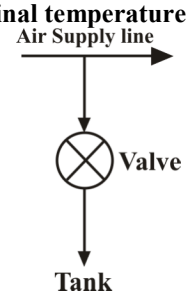
$$20\left(3200 + \frac{(160)^2}{2000} + \frac{9.81 \times 10}{1000}\right) = 20\left(2600 + \frac{(100)^2}{2000} + \frac{9.81 \times 6}{1000}\right) + W$$

$64257.96 = 52101.17 + W$

$W = 12156.79$ kW $= 12.1568 \times 10^6$ W

≈ 12.157 MW

321. A rigid, insulated tank is initially evacuated. The tank is connected with a supply line through which air (assumed to be ideal gas with constant specific heats) passes at 1 MPa, 350°C. A valve connected with the supply line is opened and the tank is charged with air until the final pressure inside the tank reaches 1 MPa. The final temperature inside the tank



(a) is greater than 350°C

(b) is less than 350°C

(c) is equal to 350°C

(d) may be greater than, less than or equal to 350°C, depending on the volume of the tank

Gujarat PSC AE 2019, GATE 2008

Ans. : (a) : The final temperature in the tank when initially evacuated tank is connected to pipe line.

$T_2 = \gamma \times$ temperature in pipe line

$= \gamma \times T_1$

$= 1.4 \times (350 + 273)$

$= 872.2$ K $= 599.2^\circ$C

$\boxed{T_2 = 600^\circ C}$

322. In a steady state flow process taking place in a device with a single inlet and single outlet, the work done per unit mass flow rate is given by $w = -\int_{inlet}^{Outlet} vdp$ where v is the specific volume and p is the pressure, the expression of w given above

(a) Is valid only if the process is both reversible and adiabatic

(b) Is valid only if the process is both reversible and isothermal

(c) Is valid for any reversible process

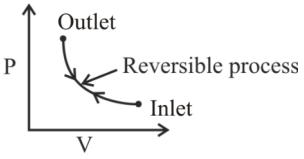
(d) Is incorrect; it must be $w = \int_{inlet}^{Outlet} pdv$

GPSC Asstt. Prof. 28.08.2016, GATE 2008

Search on Telegram @apna_pdf

Ans. (c) : A reversible process is defined as a process in which the system and surroundings can be returned to the original conditions from the final state without producing any changes in the thermodynamic properties of the universe, if the process is reversed.

So, $w = -\int_{inlet}^{Outlet} vdp$, Represents a reversible process



323. The first law of thermodynamics takes the form W = –ΔH when applied to:

(a) A closed system undergoing a reversible adiabatic process

(b) An open system undergoing an adiabatic process with negligible change in kinetic and potential energies

(c) A closed system undergoing a reversible constant volume process

(d) A closed system undergoing a reversible constant pressure process

GPSC Asstt. Prof. 28.08.2016, GATE 1993

Ans. (b) : First law of thermodynamics defines, the internal energy (E) is equal to the difference of the heat transfer (Q) in a system and work (W) done by system.

W = –ΔH is an open system, undergoing an adiabatic process, ΔK.E and ΔP.E is zero.

Steady flow equation,

$H_1 + Q = H_2 + W$

In adiabatic process, Q = 0

So, $H_1 - H_2 = W \Rightarrow W = -\Delta H \ \therefore \ (H_2 > H_1)$

324. The internal energy of a certain system is a function of temperature alone and is given by the formula E = 25+0. 25t kJ. If this system executes a process for which the work done done by it per degree temperature increases is 0.75 KN-m, $\frac{dE}{dt} = Q - W$, the heat interaction per degree temperature increase, in kJ. is

(a) –1.00 (b) 1.00

(c) –0.50 (d) 0.50

MPPSC AE 2016, ESE 1995

Ans. : (b) E = 25 + 0.25t KJ

$$\frac{dE}{dt} = 0.25 kJ/°c$$

and

$$\frac{\delta W}{dt} = 0.75 kJ/°c$$

from the first law of thermodynamics

$\delta Q = \delta W + dE$

$$\frac{\delta Q}{dt} = \frac{\delta W}{dt} + \frac{dE}{dt}$$

$\delta Q = 0.25 + 0.75$

$\delta Q = 1.00$ kJ

325. A closed system receives 60 KJ heat but its internal energy decreases by 30 KJ. Then the work done by the system is

(a) 30 KJ (b) 90 KJ

(c) –30 KJ (d) –90 KJ

RPSC VPITI 14.02.2016, ESE 2010

Ans. (b) : Given Internal energy = – 30 KJ

Receive heat = + 60 KJ

Then work done in closed system

dQ = dU + dW

+ 60 = –30 + dW

dW = + 90 KJ

326. An ideal gas is filled in a balloon kept in an evacuated and insulated room When the balloon ruptures, the gas fills up the entire room. Now internal energy of gas..... and the enthalpy of gas..... at the end of this process.

(a) increases, increases

(b) constant, decreases

(c) constant, constant

(d) decreases, increases

(HPPSC LECT. 2016), GATE 2008

Ans. : (c) An ideal gas is filled in a balloon kept in an evacuated and insulated room. when the balloon ruptures, the gas fills up the entire room. Now internal energy of gas constant and the enthalpy of gas constant at the end of this process.

Internal energy of gas (dU) = $mc_v dt$

Enthalpy of gas (dH) = $mc_p dt$

Internal energy and Enthalpy of an ideal gas is a function of temperature

dU = f (T)

dH = f (T)

327. A steam turbine receives steam steadily at 10 bar with an enthalpy of 3000 kJ/kg and discharges at 1 bar with an enthalpy of 2700 kJ/kg. The work output is 250 kJ/kg. The change in KE and PE are negligible. The heat transfer from the turbine casing to the surroundings is equal to :

(a) 0 kJ (b) 50 kJ

(c) 150 kJ (d) 250 kJ

RPSC ADE 2016, GATE 2000

Ans. (b) : P_1 = 10 bar

h_1 = 3000 kJ/kg

P_2 = 1 bar

h_2 = 2700 kJ/kg

w = 250 kJ/kg

SFEE (Steady flow energy equation)

$$h_1 + \frac{c_1^2}{2} + gz_1 + q = h_2 + \frac{c_2^2}{2} + gz_2 + w$$

h_1 =Inlet enthalpy (kJ/kg)

c_1 = Inlet velocity m/s

z_1 = Potential energy at inlet

q = heat transfer

h_2 = outlet enthalpy (kJ/kg)

c_2 = outlet velocity (m/s)

Search on Telegram @apna_pdf

z_2= potential energy at outlet
w = work done
3000 + q = 2700 + 250
q = 2700 – 3000 + 250
= – 300 + 250
q = – 50
(-ve) sign denote heat transfer from the turbine
q = 50 kJ

328. A gas contained in a cylinder is compressed, the work required for compression being 5000 kJ. During the process, heat interaction of 2000 kJ causes the surroundings to be heated. The change in internal energy of the gas during the process is

(a) –7000 kJ (b) –3000 kJ
(c) 3000 kJ (d) 7000 kJ

TSPSC AEE 2017, GATE 2004

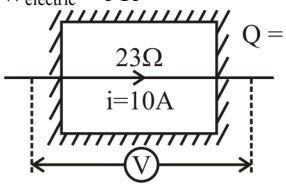
Ans. (c) : We know, From I[st] Law of thermodynamics
dQ = dU + dW
dW = – 5000 kJ (gas is compressing the cylinder)
dQ = –2000 kJ (Surrounding is being heated)
So,
–2000 = – 5000 + dU
dU = 3000 kJ

329. The contents of a well-insulated tank are heated by a resistor of 23W in which 10A current is flowing. Consider the tank along with its contents as a thermodynamic system. The work done by the system and the heat transfer to the system are positive. The rates of heat (Q), work (W) and change in internal energy (ΔU) during the process in kW are

(a) Q = 0, W = – 2.3, ΔU = + 2.3
(b) Q = + 2.3, W = 0, ΔU = + 2.3
(c) Q = – 2.3, W = 0, ΔU = – 2.3
(d) Q = 0, W = + 2.3, ΔU = – 2.3

GPSC Asstt. Director of Transport 05.03.2017
GATE 2011

Ans. (a) : Given,
$W_{electric} = i^2R$



Q = 0, Adiabatic

$W_{electric} = 10^2 \times 23 = -2.3$ kW (on system)
First law : Q – W = ΔU
$Q - (-W_{electric}) = \Delta U$
ΔU = +2.3 kW, $W_{electric}$ = –2.3 kW, Q = 0

330. An insulated rigid vessel contains a mixture of fuel and air. The mixture is ignited by a minute spark. The contents of vessel experience

(a) increase in temperature, pressure and energy
(b) decrease in temperature, pressure and energy
(c) increase in temperature and pressure but increase in energy
(d) increase in temperature and pressure but no change in energy

ISRO Scientist/Engineer (RAC) 07.05.2017
GATE 1993

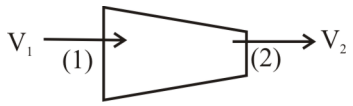
Ans. (d) : It is obvious that energy cannot be created its just transferred from one form to another.
So the mixture is ignited by a minute spark in an insulated rigid vessel contains a mixture of fuel and air, increase in temperature and pressure but not change in energy.

331. A small steam whistle (perfectly) insulated and doing no shaft work) causes a drop of 0.8 kJ/kg in enthalpy of steam from entry to exit. The kinetic energy of the steam at entry is negligible, the velocity of steam at exit is :

(a) 4 m/s (b) 40 m/s
(c) 80 m/s (d) 120 m/s

Vadodara Muncipal Corp. DEE, 2018
GATE 2001

Ans. (b) : From SFEE



$$h_1 + \frac{v_1^2}{2000} + \frac{gz_1}{1000} + q = h_2 + \frac{v_2^2}{2000} + \frac{gz_2}{1000} + w$$

$$h_1 = h_2 + \frac{v_2^2}{2000}$$

$$\frac{v_2^2}{2000} = h_1 - h_2 = \Delta h$$

$$v_2 = \sqrt{2000 \times \Delta h}$$

$$= \sqrt{2000 \times 0.8}$$

$$\boxed{v_2 = 40 m/s}$$

332. The first law of thermodynamics was developed by-

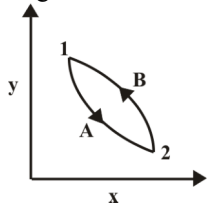
(a) Joule (b) Kelvin
(c) Charles (d) Carnot

RPSC AE 2018, UKPSC AE-2013, Paper-II

Ans. (a) : The first law of thermodynamics was developed by Joule.
First law of thermodynamics— When a closed system executes a complete cycle the sum of heat interactions is equal to the sum of work interaction.

$$\Sigma Q = \Sigma W$$

The summations being over the entire cycle.



$$Q_{A\,1-2} + Q_{B\,2-1} = W_{A\,1-2} + W_{B\,2-1}$$

Search on Telegram @apna_pdf

333. First law of thermodynamics for steady flow

(a) accounts for all energy entering and leaving a control volume

(b) is an energy balance for a specified mass of fluid

(c) is primarily concerned with heat transfer

(d) is an expression of the conservation of linear momentum

CGPSC AE 15.01.2021
TSGENCO AE 14.11.2015

Ans. (a) : First law of thermodynamic for steady flow energy equation, the total energy entering a system must be equal to total energy leaving the system. For a specified mass (i.e. unit mass)

$$u_1 + P_1V_1 + \frac{v_1^2}{2} + gz_1 + q_{1-2} =$$

$$u_2 + P_2V_2 + \frac{v_2^2}{2} + gz_2 + w_{1-2}$$

334. For an ideal gas with constant of specific heats, for calculation of the specific enthalpy,

(a) it is sufficient to know only the temperature.

(b) both temperature and pressure are required to be known.

(c) both temperature and volume are required to be known.

(d) both temperature and mass are required to be known.

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (a) : For ideal gas, specific enthalpy is a function of temperature only.
For real gases, specific enthalpy is function of temperature and pressure both.

335. In an internal combustion engine, if during compression, the heat rejected is 60 kJ/kg and work input is 120 kJ/kg, then what will be the change in internal energy of the working fluid?

(a) Loss of internal energy is 60kJ/kg

(b) Gain of internal energy is 60kJ/kg

(c) Loss of internal energy is 120kJ/kg

(d) Gain of internal energy is 120kJ/kg

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : Change in internal energy
$\Delta U = Q - W$
$= -60 - (-120)$
$= 60$ kJ/kg
it is gain of internal energy.

336. A constant volume chamber of 0.3 m^3 capacity contains 2 kg of gas at 278 K. Heat is transferred to the gas until the temperature is 373 K. the work done and the heat transferred during the process are _____, if the coefficient of specific heat at constant volume is 1.51 kJ/kg K.

(a) 287 kJ, 287 kJ (b) 143.5 kJ, 287 kJ

(c) 143.5 kJ, 430 kJ (d) 0,287 kJ

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (d) : As we know that at constant volume, the work done of the system is zero.
V = constant $\Rightarrow dV = 0$
Work done $(W) = PdV$
$W = P \times 0 = 0$
Given- constant volume
$V = 0.3\ m^3$
$m = 2kg, \quad T_1 = 278$ k
$T_2 = 372$ k
$C_v = 1.51$ kJ/kgK
Heat transferred,
$Q = C_v \Delta T = mC_v(T_2 - T_1)$
$= 2 \times 1.51 \times (373 - 278)$
$= 2 \times 1.51 \times 95$
$= 287$ kJ

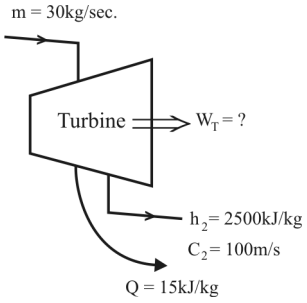
337. For an ideal gas turbine enthalpy of gas at entry and exit are 3000 kJ/kg and 2500 kJ/kg respectively. The velocity of gas are 200 m/s and 100 m/s respectively at the entry and exit. Heat loss of gas to the surrounding is 15 kJ/kg. The approximate power developed by turbine if mass flow rate of gas is 30 kg/s

(a) 16 MW (b) 0.55 MW

(c) 15 MW (d) 15.5 MW

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) : $h_1 = 3000$ kJ/kg, $m = 30$ kg/sec.
$C_1 = 200$ m/s
using,



SFEE –

$$m\left[h_1 + \frac{C_1^2}{2000}\right] - Q = m\left[h_2 + \frac{C_1^2}{2000}\right] + W_T$$

$$m\left[h_1 + \frac{C_1^2}{2000}\right] = m\left[h_2 + \frac{C_2^2}{2000} + Q\right] + W_T$$

$$30 \times \left[3000 + \frac{(200)^2}{2000}\right] = 30 \times \left[2500 + \frac{100^2}{2000} + 15\right] + W_T$$

$$90600 = 75600 + W_T$$

$$W_T = 15000\text{kW}$$

$$\boxed{W_T = 15\text{MW}}$$

338. "The internal energy of a gas is a function of temperature."
Which of the following names is associated with the above law?

(a) Joule (b) Charles

(c) Boyle (d) Dalton

Assam PSC AE (IWT) 14.03.2021

Search on Telegram @apna_pdf

Ans. (a) : Joule's Law– Joule's law states that the internal energy of an ideal gas does not change if volume and pressure changes but does changes if temperature changes. The internal energy of ideal gas is a function of temperature only.

Charles Law– The volume of a given mass of a perfect gas varies directly as its absolute temperature when the absolute pressure remains constant.

$$V \propto T \text{ or } \frac{V}{T} = \text{Constant}$$

Boyle's Law– The absolute pressure of a given mass of a perfect gas varies inversely as its volume, when the temperature remains constant.

$$P \propto \frac{1}{V}$$

Dalton's Law–The total pressures exerted is equal to the sum of partial pressures of individual gases.

$$P = \sum_i P_i = P_1 + P_2 + P_3 + ...$$

339. A tank containing a fluid is stirred by a paddle wheel. The work input to the paddle wheel is 5090 kJ. The heat transfer from the tank is 1500 kJ. What is the change in internal energy of this control mass? (Consider the tank and the fluid inside a control surface)

(a) –3590 kJ (b) + 3590 kJ
(c) + 4590 kJ (d) –4590 kJ

ESE 18.07.2021

Ans. (b) : Given, work, W = 5090 kJ
Heat transfer, $\Delta Q = -1500$ kJ
$\Delta Q = \Delta U + \Delta W$
$\Delta U = \Delta Q - \Delta W = -1500 - (-5090)$
$= 3590$ kJ

340. During the charging of a storage battery, the current is 20 A and the voltage is 12.8V. The rate of heat transfer from the battery is 10W. At what rate is the internal energy increasing?

(a) –256 J/s (b) + 246 J/s
(c) + 256 J/s (d) –246 J/s

ESE 18.07.2021

Ans. (b) : Given,
I = 20 A
V = 12.8V
Q = 10W (heat transfer from battery)
Q = –10W
$\Delta Q = \Delta U + \Delta W$
$-10 = \Delta U - IV$
$-10 = \Delta U - (20)(12.8)$
$\Delta U = +246$ W
$\boxed{\Delta U = 246 \text{ J/s}}$

341. Assume air as a perfect gas. It flows into a diffuser at 300 m/s, 300 K and 100 kPa. At exit, the velocity is negligibly small, but the pressure is high. Assuming zero heat transfer, the exit temperature is:

(a) 452.6K (b) 344.8K
(c) 325K (d) 425K

AAI Jr. Executive 26.03.2021

Ans. (b) : Given, $v_1 = 300$ m/s, $T_1 = 300$ K
$T_2 = ?$, $v_2 \simeq 0$

$$C_pT_1 + \frac{v_1^2}{2000} = C_pT_2 + \frac{v_2^2}{2000}$$

$$C_pT_2 = C_pT_1 + \frac{v_1^2}{2000}$$

$$1.005T_2 = (1.005 \times 300) + \left(\frac{300^2}{2000}\right)$$

$$= 301.5 + 45$$

$$T_2 = \frac{346.5}{1.005}$$

$$T_2 = 344.77\,K$$

342. A closed system contains a simple compressible pure substance. The difference between work done by the system and heat transferred to the system is a _____ function.

(a) both point and path
(b) point
(c) path
(d) neither point nor path

AAI Jr. Executive 26.03.2021

Ans. (b) : From first law of thermodynamics,
dQ = dU + dW
dQ – dW = dU
Where dU is the internal energy and it is the point function of the system.

343. 1 kg of water falls from an altitude of 1000 m above ground level. What is the change in the temperature of water at the foot of the fall, if there are no losses during the fall? (Take specific heat of water as 1 kcal. kg^{-1}. K^{-1} and g = 9.81 m/s^2)

(a) 3.35°C (b) 2.35°C
(c) 3.32°C (d) 4.12°C

ESE 18.07.2021

Ans. (b) : Given, mass of water, m = 1 kg
Altitude, h = 1000 m
C_P = 1 kcal/kg
Since total energy is conserved
Loss of Potential energy = Gain in Thermal energy
$mgh = mc_p\Delta T$

$$1 \times 9.81 \times 1000 = \frac{1 \times 1000 \times 4.18\,J}{kg\,K} \times \Delta T$$

$\Delta T = 2.346°C$
$\boxed{\Delta T = 2.35^\circ C}$

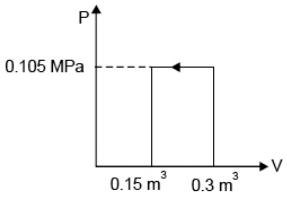
344. A stationary mass of gas is compressed without friction from an initial state of 0.3 m^3 to 0.15 m^3 and 0.105 MPa, the pressure remaining constant during the process. There is a transfer of 40 kJ of heat from the gas during the process. How much does the internal energy of the gas change?

Search on Telegram @apna_pdf

(a) –24.25 kJ (b) –19.62 kJ
(c) –15.91 kJ (d) –12.72 kJ

ESE 18.07.2021

Ans. (a) : Given, $V_1 = 0.3\ m^3$, $V_2 = 0.15\ m^3$
$P_2 = P_1 = 0.105\ MPa = 105\ kPa$
$\Delta Q = -40\ kJ$



Work done,
$W = PdV$
$= 0.105\ (0.15 - 0.3) \times 10^3$
$W = -15.75\ kJ$
From first law of thermodynamics,
$dQ = dU + dW$
$-40 = dU - 15.75$
$\boxed{dU = -24.25\ kJ}$

345. In a closed system, the heat and work for a process 1-2 is 10 kJ and 30 kJ respectively. What is the work during the return process 2-1, if the heat is 20 kJ?
(a) 40 kJ (b) 30 kJ
(c) 20 kJ (d) Zero

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Given
$Q_1 = 10\ kJ$ $Q_2 = 20\ kJ$ $W_1 = 30\ kJ$
By first law :
$$\oint Q = \oint W$$
$Q_1 + Q_2 = W_1 + W_2$
$10 + 20 = 30 + W_2$
$W_2 = 0\ kJ$

346. If a closed system receives 30 kJ of heat while undergoing 91 kJ of reduction in internal energy, then :
(a) 121 kJ of work is done by the system
(b) 61 kJ of work is done by the system
(c) 61 kJ of work is done on the system
(d) 121 kJ of work is done on the system

NLC GET 17.11.2020, Shift-II

Ans. (a) : In a closed system heat transfer is equal to the sum of internal energy and work transfer
So, $\delta Q = dU + \delta W$
Given, $\delta Q = 30\ kJ$
$dU = -91\ kJ$ (–ve sign indicates reduction in energy)
$\delta W = ?$
$\delta Q = dU + \delta W$
$30 = -91 + \delta W$
$\delta W = 121\ kJ$
δW = +ve so, 121 kJ work is done by the system
δW = – ve so, work done on the system.

347. If the work done on a closed system is 40 kJ/kg, and heat rejected from the system is 80 kJ/kg, then its internal energy is _____ .
(a) decreased by 120 kJ/kg
(b) increased by 120 kJ/kg
(c) increased by 40 kJ/kg
(d) decreased by 40 kJ/kg

VIZAG MT, 14.12.2020

Ans. (d) : Given,
$\delta W = -40\ kJ/kg$
$\delta Q = -80\ kJ/kg$
$du = ?$
From first law of thermodynamics,
$\delta Q = dU + \delta W$
$-80 = dU - 40$
$dU = 40 - 80$
$\boxed{dU = -40\,kJ/kg}$
Means internal energy decreased by 40 kJ/kg.

348. The statement of first law of thermodynamics for an isolated system is
(a) $\Delta E = 0$ (b) $\Delta E = \delta Q - \delta W$
(c) $\Delta E = \delta Q$ (d) $\Delta E = -\delta W$

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : The First law of thermodynamics states that the total energy of an isolated system is constant.
Isolated system, where no energy transfer is possible, (ΔE=0), meaning the energy of the isolated system always constant.

349. If in a constant volume expansion occurs at 10 m^3 and pressure varies from 1 bar to 2 bar, then the work transfer is:
(a) 0 kJ (b) 20 kJ
(c) 40 kJ (d) 10 kJ

NLCIL GET 17.11.2020, Shift-II

Ans. (a) : Given, $V = 10\ m^3$
$P_1 = 1$ bar
$P_2 = 2$ bar
Work transfer in closed system = $\int P.dV$
Volume is constant. So, work transfer is zero.

350. The change in internal energy of the system, if the heat supplied to the system is 63 kJ and the work done by the system is 100 kJ, is:
(a) – 163 k (b) + 163 kJ
(c) – 37 kJ (d) + 37 kJ

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : Given, $dQ = 63\ kJ$
$dW = +100\ kJ$ (W.D by the system)
According to first law of thermodynamic
$dQ = dU + dW$
$dU = 63 - 100$
$\boxed{dU = -37\,kJ}$

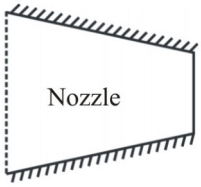
Search on Telegram @apna_pdf

351. Air at 27°C and 100 kPa enters in a steady flow to a nozzle at a velocity of 100 m/s. If the inlet area of the nozzle is 0.5 m^2, what is the mass flow rate through the system

(a) 116 kg/s (b) 232 kg/s
(c) 58 kg/s (d) 143 kg/s

ISRO Scientist/Engineer 12.01.2020

Ans. (c) : Given, $P_1 = 100$ kPa, $T_1 = 300$ K
$v_1 = 100$ m/sec, $A_1 = 0.5\ m^2$



$$\rho_1 = \frac{P_1}{RT_1} = \frac{100}{0.287 \times 300}$$

$\rho_1 = 1.1614\ kg/m^3$

Mass flow rate, $\dot{m} = \rho_1 \times A_1 \times v_1$

$\dot{m} = 1.1614 \times 0.5 \times 100$

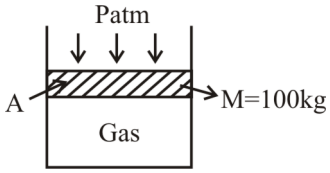
$\dot{m} = 58.07$ kg/sec.

352. A gas is contained in a cylinder with a moveable piston of 100 kg mass. When 2500 J of heat flow into the gas, the internal energy of the gas increases by 1500 J. What is the distance through which the piston rises?

(a) 2 m (b) 1 m
(c) 2.5 m (d) 0.5 m

ISRO Scientist/Engineer 12.01.2020

Ans. (b) :



Q = 2500 J

$(\Delta U) = 1500$ J

Applying first law of thermodynamics,

$Q = (\Delta U)_{gas} + W_{gas}$

$2500 = 1500 + W_{gas}$

$W_{gas} = 1000$ J

$W_{gas} = (F_{atm} + F_{piston}) \times \Delta x_{piston\ rise}$

As area of piston is not given, assuming W.D. on atmosphere to be zero.

$W_{gas} = F_{piston} \times \Delta x = mg.\ \Delta x$

$1000\ J = 100 \times 9.81 \times \Delta x$

$\Delta x = 1.01\ m \simeq 1\ m$

353. A piston-cylinder device with air at an initial temperature of 30°C undergoes an expansion process for which pressure and volume are related as given below:

p(kPa)	100	37.9	14.4
V (m^3)	0.1	0.2	0.4

The work done by the system for n = 1.4 will be

(a) 4.8 kJ (b) 6.8 kJ
(c) 8.4 kJ (d) 10.6 kJ

ESE 2020

Ans. (d) :

$$\text{Work done, } W = \frac{P_1V_1 - P_3V_3}{n-1}$$

$$= \frac{100 \times 0.1 - 14.4 \times 0.4}{1.4 - 1}$$

$$\boxed{W = 10.6\,kJ}$$

354. In a reversible non-flow process, the gas undergoes a process according to, pV = 2.8 Where, p is in bar and volume is in m^3. What will be the work done by the gas if pressure of gas increases from 0.7 bar to 7 bar? [Assuming $e^{2.3} = 10$]

(a) 6.4 kJ (b) –6.4 kJ
(c) –644 kJ (d) –64 kJ

APPSC Poly Lect. 13.03.2020

Ans. (c) : Given, PV = 2.8, $P_1 = 0.7$ bar, $P_2 = 7$ bar

Work done for non-flow process in hyperbolic process or isothermal process,

$$W = C \ln \frac{P_1}{P_2} \qquad \text{Where, } C = P_1V_1 = P_2V_2$$

$$W = P_1V_1 \ln \frac{P_1}{P_2}$$

$$= 2.8 \times 10^5 \ln \frac{0.7}{7}$$

$$= 2.8 \times 10^5 \ln(0.1)$$

$$= 2.8 \times 10^5 (-2.30) \qquad [\because e^{2.3} = \ln 10]$$

$$\boxed{W = -644.72\,kJ}$$

355. The rate of heat transfer between an electric motor and its surroundings is given by $Q = e^{-t} - 1$ Where, t is in seconds and Q is in kW. The shaft of motor rotates at a speed of 200 rad/s and applies a torque of 20 N–m on the load. The motor draws a constant electric power input of 5 kW. The time rate of change of energy (kW) of motor is given by :

(a) e^{-t} (b) $1 + e^{-t}$
(c) 1^{-et} (d) $2 + e^{-t}$

APPSC Poly Lect. 13.03.2020

Ans. (a) : Given : $Q = e^{-t} - 1$

Let, Initial time rate of change of energy = 0

Final time rate of change of energy = $\frac{dQ}{dt}$

$$\therefore \frac{dQ}{dt} = -e^{-t} - 0 = -e^{-t}$$

Rate of change of energy = Initial – Final

$= 0 - (-e^{-t})$

$= e^{-t}$

Search on Telegram @apna_pdf

356. A cylinder of 50 litre capacity contains oxygen at temperature of 27^0C and at absolute pressure 10 MPa. What will be the density of oxygen? [Gas constant for oxygen is 0.26 kJ/kg-K]

(a) 1.28 kg/m^3 (b) 12.8 kg/m^3
(c) 128.2 kg/m^3 (d) 1282 kg/m^3

APPSC Poly Lect. 13.03.2020

Ans. (c) : Given :
Pressure (P) = 10 MPa = 10×10^6 N/m^2
Temperature (T) = 27^0C + 273 = 300 K
Volume (V) = 50 litre = 0.05 m^3
Gas constant for oxygen (R) = 0.26 kJ/kg-K
$= 0.26 \times 10^3$ J/kg-K
PV = mRT (Let, m = mass of oxygen)

$$m = \frac{PV}{RT} = \frac{10\times10^6\times0.05}{0.26\times10^3\times300} = 6.41 \text{ kg}$$

$$\Rightarrow m = 6.41 \text{kg}$$

We know that–
mass (m) = volume (V) ×density (ρ)

$$\Rightarrow \rho = \frac{m}{V} = \frac{6.41}{0.05}$$

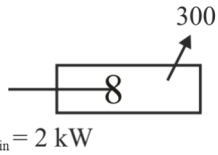
$$\Rightarrow \boxed{\rho = 128.2 \text{ kg/m}^3}$$

357. A 2 kW electric resistance heater submerged in 5 kg water is turned on and kept on for 10 minutes. During the process, 300 kJ of heat is lost from the water, the temperature rise of water is

(a) 0.40^0C (b) 43.1^0C
(c) 57.4^0C (d) 71.8^0C

UPPSC AE 13.12.2020, Paper-2

Ans. (b) : dW = 2 × 10 × 60 kJ
According to first law of thermodynamics,



$\delta Q = dU + \delta W$
$-300 = dU - 2 \times 10 \times 60$
As, heat is lost and work done on system; –ve sign takes.
$dU = 1200 - 300 = 900$
$mC_v dT = 900$

$$dT = \frac{900}{5\times4.2} = 42.85 \simeq 43.1^0\text{C}$$

358. If the fluid is an ideal gas, the temperature of gas in tank after it is charged ___ times initial temperature.

(a) 2 (b) 1.9
(c) 1.4 (d) 1.67

Oil India Senior Officer 23.12.2020

Ans. (c) : If the fluid is an ideal gas, the temperature of gas in tank after it is charged γ times initial temperature.
$T_2 = \gamma T_1$
$\gamma = 1.4$

359. Dry saturated steam enters a frictionless adiabatic nozzle with negligible velocity at a temperature of 300^oC [h_1 = 2751 kJ/kg]. It is expanded to a pressure of 5 MPa isentropically [h_2 = 2651 kJ/kg]. What will be the exit velocity of steam?

(a) 447.21 m/s (b) 572.33 m/s
(c) 14.14 m/s (d) 150.32 m/s

SJVN ET 2019

Ans. (a) : As per SFEE

$$h_1 + \frac{v_1^2}{2000} + q = w + \frac{v_2^2}{2000} + h_2 \quad \text{(if h in kJ/kg)}$$

$w = 0, q = 0, v_1 = 0$

$$v_2 = \sqrt{2000\times(2751-2651)} = 447.21 \text{ m/s}$$

360. Hydrogen gas is enclosed in piston cylinder arrangement at a pressure of 3 bar and 300K. The cylinder has a volume of 1.5 m^3. The process undergoes isothermal expansion to 3 m^3. Work done by gas is:

(a) 311 kJ (b) 251 kJ
(c) 350 kJ (d) 425 kJ

HPPSC ADF 05.03.2019

Ans. (a) : Given-
P_1 = 3 bar
T_1 = 300 k
V_1 = 1.5 m^3, V_2 = 3 m^3

$$W_{Isothermal} = P_1V_1 \ln\left(\frac{V_2}{V_1}\right)$$

$$= 3\times10^5\times1.5\ln\left(\frac{3}{1.5}\right)$$

$= 3 \times 1.5 \times 0.6931 \times 10^5$
= 311.85 kJ

361. The short coming of first law of thermodynamics is

(a) Direction of process
(b) Possibility of process
(c) Quality of energy
(d) Quantity of energy

JPSC AE PRE 2019

Ans. (a, b, c) : The short coming of first law of thermodynamics is–
- Direction of process
- Possibility of process
- Quality of energy

362. In a steady flow process, across the control volume mass and energy flow

(a) Varies continuously
(b) Remain constant
(c) Depends on control surface
(d) Depends on type of process

JPSC AE PRE 2019

Search on Telegram @apna_pdf

Ans. (b)
Assumptions made in steady flow processes are
(i) Control volume moves relative to the coordinate frame.
(ii) The state of the mass at each discrete area of flow on the control surface does not vary with time. The rate at which heat and work cross the control surface remain constant.

363. What is the rise in temperature of 80 litres of water in 40 min by a heater of 2 kW. If whole of the heater energy used to raise the water temperature?
(a) 14.3ºC (b) 1.43ºC
(c) 2.52 ºC (d) 25.2 ºC

OPSC AEE 2019 PAPER - II

Ans. : (a) :
Heat taken by water = Heat given by heater
$\text{Heat (Q)} = mC_p\Delta T = \text{Power} \times \text{time}$
$80 \times 4.2 \times \Delta T = 2 \times 40 \times 60$
$\Delta T = \frac{2 \times 40 \times 60}{80 \times 4.2}$
$= 14.28^\circ C$
$\approx 14.3^\circ C$

364. A system executes a cycle during which there are four heat transfers Q_{12} = 220 kJ, Q_{23} = -25 kJ, Q_{34} = -180 kJ, Q_{41} = 50 kJ. The work during tube of the processes is W_{12} = 15 kJ, W_{23} = -10 kJ, W_{34} = 60 kJ. The work done during the process 4 – 1 is
(a) –230 kJ (b) 0 kJ
(c) 230 kJ (d) 130 kJ

TNPSC AE 2019

Ans. (b) : According to first law of thermodynamics
$[\Sigma Q] = [\Sigma W]$ [for cyclic process]
$Q_{1-2} + Q_{2-3} + Q_{3-4} + Q_{4-1} = W_{1-2} + W_{2-3} + W_{3-4} + W_{4-1}$
$220 + (-25) + (-180) + 50 = 15 + (-10) + 60 + W_{4-1}$
$\boxed{W_{4-1} = 0 \text{ kJ}}$

365. For a heat engine cycle, which of the following relation is always true [Q = heat transfer, W= work transfer]
(a) $\sum_{\text{cycle}} Q = 0 \sum_{\text{cycle}} W = 0$ (b) $\sum_{\text{cycle}} Q = \sum_{\text{cycle}} W$
(c) $\sum_{\text{cycle}} Q > \sum_{\text{cycle}} W$ (d) $\sum_{\text{cycle}} Q < \sum_{\text{cycle}} W$

SJVN ET 2019

Ans. (b) : $\sum_{\text{cycle}} Q = \sum_{\text{cycle}} W$

366. Flow work is analogous to
(a) Stirring work (b) Electrical work
(c) Displacement work (d) Shaft work

JPSC AE PRE 2019

Ans. (c) : Work in steady flow process = $\int VdP$
Work in non-flow process = $\int PdV$

367. An electric generator coupled to a windmill produces an average electric power of 6 kW. The power is used to charge a storage battery. Heat transfer from the battery to the surroundings is 0.3 kW. What will be the amount of energy stored in the battery in 2 hours?
(a) 41040 kW (b) 114 kW
(c) 11.4 kJ (d) 41040 kJ

SJVN ET 2019

Ans. (d) : Given,
$\delta Q = -0.3$ kW
$\delta W = -6$ kW
$dU = ?$
$dU = \delta Q - \delta W$
$dU = -0.3 + 6 = 5.7$ kW
$dU = 5.7 \times 2 \times 3600 = 41040$ kJ

368. For a non-flow constant pressure process the heat exchange is equal to:
(a) Zero
(b) The work done
(c) The change in internal energy
(d) The change in enthalpy

OPSC AEE 2019 PAPER - II

Ans. (d) Since enthalpy change of a system undergoing a process
$dH = Tds + VdP$
For reversible process
$\because Tds = \delta Q$
$\therefore dH = \delta Q + VdP$
If pressure is constant
$dP = 0$
$\boxed{dH = \delta Q}$

369. During steady flow compression process of a gas with mass flow rate of 2 kg/s, increase in specific enthalpy is 15 kJ/kg and decrease in kinetic energy is 2 kJ/kg. The rate of heat rejection to the environment is 3 kW. The power needed to drive the compressor is :
(a) 23 kW (b) 2 kW
(c) 29 kW (d) 37 kW

GPSC ARTO Pre 30.12.2018

Ans. (c) : From steady flow equation,
$$\dot{m}\left[h_1 + \frac{V_1^2}{2000}\right] + \dot{Q} = \dot{m}\left[h_2 + \frac{V_2^2}{2000}\right] + \dot{W}$$
$$\dot{W} = \dot{m}(h_1 - h_2) + \dot{m}\left(\frac{V_1^2}{2000} - \frac{V_2^2}{2000}\right) + \dot{Q}$$
$= 2(-15) + 2(2) - 3$
$= -30 + 4 - 3$
$\dot{W} = -29$ kW
The power needed to drive the compressor is 29 kW.

370. The specific heat of concentrated orange juice is 5.8 kJ/kg °C. How much heat must be removed to cool 2.0 kg of juice from 30.0°C to 0.0°C?
(a) 24kJ (b) 338kJ
(c) 348kJ (d) 600kJ

Vadodara Muncipal Corp. DEE, 2018

Search on Telegram @apna_pdf

Ans. (c) Heat removed = $mc\Delta T$
$= 2 \times 5.8 \times (30 - 0)$
$= 348$ kJ

371. In a cyclic process, heat transfers are 157 kJ, –262 kJ, –486 kJ and 315 kJ. Net work for this cyclic process is:
(a) 176 kJ (b) 151 kJ
(c) 276 kJ (d) 252 kJ

AAI Jr. Executive 29.11.2018

Ans. (c) : For a cyclic process
$\oint Q = \oint W$
$\oint Q = 157 - 262 - 486 + 315$
$= -276$ kJ
$\oint W = 276$ kJ

372. During the charging of a storage battery, the current *I* is 20A and the voltage E in 12.8V. The ratio of heat transfer from the battery is 16W. At what rate is the internal energy increasing?
(a) 256 Js^{-1} (b) 272 Js^{-1}
(c) 0 (d) 240 Js^{-1}

ISRO Scientist/Engineer 22.04.2018

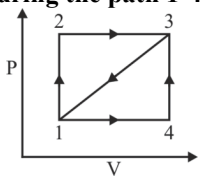
Ans. (d) : I = 20A
E = 12.8V
Q = 16W
U = ?
Energy store in battery during charging = $VI - Q$
$= 12.8 \times 20 - 16$
$= 256 - 16$
$= 240W\ (Js^{-1})$

373. Statement I: The energy of an isolated system is constant.
Statement II: The entropy of an isolated system can increase but cannot decrease.

ESE 2018

Ans. (b) : Energy of the isolated system is constant as there is no energy interaction. Entropy of an isolated system always increases and never decreases.

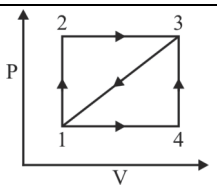
374. A system absorbs 100 kJ as heat and does 60 kJ work along the path 1-2-3. The same system does 20 kJ work along the path 1-4-3. The heat absorbed during the path 1-4- 3 is



(a) –140 kJ (b) –80 kJ
(c) 80 kJ (d) 60 kJ

ESE 2018

Ans. (d) : Given,
$Q_{123} = 100$ kJ
$W_{123} = 60$ kJ
$W_{143} = 20$ kJ



For path 1–2–3
$Q_{123} = U_3 - U_1 + W_{123}$
$U_3 - U_1 = 100 - 60 = 40$ kJ
For path 1–4–3
$Q_{143} = U_3 - U_1 + W_{143}$
$= 40 + 20 = 60$ kJ

375. Heat transferred to a closed stationary system constant volume is equal to
(a) work transfer
(b) increased in internal energy
(c) increase in enthalpy
(d) increase in gibbs function

RPSC IOF & BOILER 20.09.2017

Ans. : (b) $\delta Q = dU + \delta W$
for constant volume close system
$W = 0$
Hence,
$\delta Q = dU$

376. In a reversible isothermal expansion process, the fluid expands from 10 bar and 2 m^3 to 2 bar and 10 m^3. During this expansion process, 100 kW of heat is supplied. Then the work done during the process is
(a) 33.3 kW (b) 80 kW
(c) 100 kW (d) 20 kW

BPSC AE Mains 2017 Paper - V, ESE 2009

Ans. : (c) Assuming ideal gas and reversible isothermal process,
$\delta Q = dU + \delta W$
$\delta Q = \delta W$
for isothermal and ideal gas
$U = f(T)$
As heat transfer is 100 kW is given, work will also be equal to 100 kW.

377. Consider the following devices :
1. Internal combustion engine working on Otto cycle
2. Internal combustion engine working on Diesel cycle
3. Gas turbines
4. Steam turbines

In which of the above devices, the equation dQ = dU + Pdv is not applicable ?
(a) 2 and 3 (b) 1 and 4
(c) 3 and 4 (d) 1 and 2

UPSC JWM 2017

Ans. (c) : $\delta Q = dU + \delta W$ ...(1)
$\delta Q = dU + PdV$ ...(2)
The equation (2) is applicable for the closed system.

Search on Telegram @apna_pdf

378. A system is composed of a gas contained in a cylinder fitted with a piston. The gas expands from the state 1 for which $E_1 = 75$ kJ to a state 2 for which $E_2 = -25$ kJ. During the expansion, the gas does 60 kJ of work surroundings. The heat transferred to or from the systems during process is:

(a) – 30 kJ (b) – 40 kJ
(c) 30 kJ (d) 40 kJ

TRB Polytechnic Lecturer 2017

Ans. (b) : Given as,
$E_1 = 75$ kJ, $E_2 = -25$ kJ
$W = 60$ kJ
$Q = ?$
We know that
$Q = \Delta E + W$
$Q = (-25 - 75) + 60$
$Q = -40$ kJ

379. During a constant pressure expansion of a gas, 33.3% heat is converted into work while the temperature rises by 20K. The specific heat of the gas at constant pressure as a proportion of work, W is

(a) 8% (b) 10%
(c) 12% (d) 15%

ESE 2017

Ans. (d) : Work (W) = 33.3% Q
$W = 0.33\ Q$
Temperature rise (ΔT) = 20 K
We know that $Q = C_P\ \Delta T$

$$\frac{W}{0.33} = C_P \times 20$$

$$C_P = 0.15\ W$$

i.e. specific heat of the gas at constant pressure is 15% of the work.

380. A cylinder contains $10m^3$ of an ideal gas at a pressure of 2 bar. This gas is compressed in a reversible isothermal process till its pressure increases to 15 bar. What quantum of work will be required for this process?
(You can use the table given herewith.)

Number	2	2.5	3	5	7
Log_{10}	0.301	0.397	0.475	0.698	0.845

(a) 4500 kJ (b) 4030 kJ
(c) 450 kJ (d) 403 kJ

ESE 2017

Ans. (b) : Given,
$V_1 = 10\ m^3$
$P_1 = 2$ bar
$P_2 = 15$ bar
For reversible isothermal process work done is given by

$$W_{1\text{-}2} = P_1V_1\ ln\left(\frac{P_1}{P_2}\right)$$

$$2\times10^5\times10\ ln\left(\frac{2}{15}\right) = -4029.8 \simeq 4030\ \text{kJ (work done on the system)}$$

381. A gas is compressed in a cylinder by a movable piston to a volume one-half its original volume. During the process 300 kj heat left the gas and internal energy remained same. The work done on gas in Nm will be

(a) 300 Nm (b) 3000 Nm
(c) 30000 Nm (d) 300000 Nm

WBPSC AE, 2017

Ans. (d) : $\delta Q = dU + PdV$
$\delta Q = U_2 - U_1 + W$
$\delta Q = 0 + W$ $\quad [\because\ U = f(T)$
$W = -300\ kJ$ $\quad U = U_2 = U_1$
$= -300\times1000\ J$ $\quad$ or $T_2 = T_1 = T]$
$= -300000$ N-m
[–ve means work done on the gas]

382. Energy is added to 5 kg of air with a paddle wheel until $\Delta T = 100°C$. Find the paddle wheel work if the rigid container is insulated :

(a) –358 kJ (b) –382 kJ
(c) +358 kJ (d) +382 kJ

HPPSC Asstt. Prof. 20.11.2017

Ans. (a) : Given, m = 5kg, $\Delta T = 100$ °C
Because process is constant volume process.
$W = mc_v\Delta T$ $\quad (c_v)_{air} = 0.718$ kJ/kg-K
$= -5 \times 0.718 \times 100$
$W = -359$ kJ $\rightarrow$ (negative sign is because work is on the system)

383. The energy of the isolated system is always a constant, which is given by:

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) Third law of thermodynamics
(e) Law of stable equilibrium

CGPSC Polytechnic Lecturer 2017

Ans. (b) : Isolated System–An isolated system is a thermodynamic system that cannot exchange either energy or mass outside the boundaries of the system.
So, $\Delta E = 0, \Delta m = 0$
So from the first law of thermodynamics energy of the isolated system will be remain constant.

384. A fan consumes 20 W of electric power and discharges air from a ventilated room at 0.25 kg/s. The maximum air outlet velocity is nearly

(a) 4.7 m/s (b) 8.7 m/s
(c) 10.2 m/s (d) 12.7 m/s

UPSC JWM 2017

Ans. (d) : Fan convert electrical energy into mechanical energy.

$$\text{Power} = \frac{1}{2}\times\text{Mass flow rate of air}\times\left(\text{discharge velocity}\right)^2$$

$$P = \frac{1}{2}\dot{m}v^2$$

$$v = \sqrt{\frac{2P}{\dot{m}}} = \sqrt{\frac{2\times20}{0.25}} = 12.65\text{m/s}$$

Maximum air outlet velocity $\simeq 12.7$m/s

Search on Telegram @apna_pdf

385. Which of the following is a low grade energy?

(a) Mechanical work (b) Electrical energy
(c) Wind power (d) Kinetic energy
(e) Heat energy

(CGPSC Polytechnic Lecturer 2017)

Ans. (e) : High Grade Energy–Energy that can be completely transformed into work without any loss i.e. fully utilizable.

Example–

1. Mechanical work
2. Electrical work
3. Wind energy
4. Tidal energy
5. Water energy
6. Kinetic energy

Low Grade Energy–Energy of which only a certain portion can be converted into mechanical work is called low grade energy.

Example–

1. Heat or thermal energy.
2. Heat drive from combustion of fossil fuels.
3. Heat drive from nuclear fission or fusion.

386. Oxygen expands in a reversible adiabatic manner through a nozzle from an initial pressure and initial temperature, and with an initial velocity of 50 m/s. There is a decrease of 38 K in temperature across the nozzle. (C_p for oxygen is 0.9185 kJ/kg.K). The exit velocity is :

(a) 268.9 m/s (b) 278.5 m/s
(c) 300 m/s (d) None of these

RPSC ADE 2016

Ans. (a) : For Nozzle –

$$h_1 + \frac{v_1^2}{2} = h_2 + \frac{v_2^2}{2}$$

$$\frac{v_2^2}{2} = c_p\left(T_1 - T_2\right) + \frac{v_1^2}{2}$$

$$= 0.9185 \times 10^3 \times (38) + \frac{50^2}{2}$$

$v_2 = 268.89$ m/s

387. Which one of the following statements holds good for the equation : dQ = dE + dW

(a) Any process undergone by a closed stationary system
(b) Any process reversible and irreversible and for any system
(c) A closed system when only pdV work is present
(d) Only reversible process

RPSC VPITI 14.02.2016

Ans. (b) : Equation dQ = dE + dW

For any process-Reversible or Irreversible system-Closed or opened system

dQ = dU + P.dV ⇒ Only for non flow/closed system stationary and reversible process.

dQ = dU + dW ⇒ For any process reversible or irreversible closed stationary system

388. Heat transfer in a cyclic process are +20 kJ, -5 kJ, -10 kJ and +15 kJ. Net work done for this cycle will be given by:

(a) +0 kJ (b) -20 kJ
(c) +20 kJ (d) -10 kJ

UPRVUNL AE 07.10.2016

Ans. (c) : From first law of thermodynamics.

$$\oint Q = \oint W$$

$Q_{Net} = W_{net}$

$W_{net} = 20 - 5 - 10 + 15$

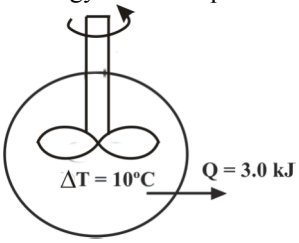
$W_{net} = +20$ kJ

389. 1 kg liquid (specific heat = 3.0 kJ/kg-K) is stirred in closed chamber and its temperature is raised by 10°C. Heat loss to the surrounding is 3.0 kJ. The work done on the water during the process will be:

(a) 36 kJ (b) 30 kJ
(c) 27 kJ (d) 33 kJ

UPRVUNL AE 07.10.2016

Ans. (d) : From energy balance equation.



Work done on the closed system (W) = Change in internal energy of the system + heat loss to the surrounding.

$W = mC_v\Delta T + Q_{Loss}$

$W = 1 \times 3 \times 10 + 3$

$W = 33$ kJ

390. A 500 W electric bulb was switched on in a 2 × 3 × 4 m size thermally insulated room having temperature of 25 °C. What will be the room temperature at the end of 16 hours?

(a) 120 °C (b) 420 °C
(c) 920 °C (d) 1120 °C
(e) 1420 °C

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (e) : Heat generated = P × 16 × 60 × 60 Joule

$$= \frac{500}{1000} \times 16 \times 60 \times 60\,\text{kJ}$$

Heat dissipated = $\rho \times V \times C_v \times (T - 25)$

$$= \frac{500}{1000} \times 16 \times 60 \times 60$$

$= 1.24 \times 2 \times 3 \times 4 \times 0.7\,(T - 25)$

$T = 1420°C$

391. A vertical cylinder with a freely floating piston contains 0.2 kg air at 1.1 bar and a small electric resistor. The resistor is wired to an external 12 volt battery. When a current of 2 amp is passed through the resistor for 100 sec, the piston sweeps a volume of 0.02 m^3.

Assume:

Search on Telegram @apna_pdf

(i) Piston and cylinder are insulated.
(ii) Air behaves as an ideal gas with C_v = 718J/kgK.

Find the rise in temperature of air, in °C.

(a) 1.4 (b) 1.6
(c) 1.7 (d) 1.9
(e) 2.1

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (a) : Given,

m = 0.2 kg, P = 1.1 bar
E = 12 V, I = 2A
t = 100 sec, $V_s = 0.02\ m^3$,
C_v = 718 J/kgK

Insulation cond^n, $\delta Q = 0$

$$\delta Q = \delta U + \Delta W$$
$$0 = mC_v\Delta T + \delta W_{air} - \delta W$$
$$\Delta T = \frac{\delta W_{air} - \delta W}{mC_v}$$
$$= \frac{(1.1\times10^5\times0.02) - (12\times2\times100)}{0.2\times718}$$
$$\boxed{\Delta T = 1.4°C}$$

392. During charging of tank from a pipeline, the temperature of fluid is T in the pipeline. The final temperature in the tank will be T multiplied by

(a) C_p (b) C_v
(c) C_p/C_v (d) $C_p \times C_v$

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : The final temperature in the tank will be $C_p/C_v.T$.

393. From the following, in which case uniform state uniform flow process model may be applied

(a) Flow through a partially opened valve
(b) Flow through a pipe line in an open tank
(c) Flow through a pipe line in an closed tank
(d) Flow through fully opened valve

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : In case uniform state uniform flow process model may be applied when flow through a pipe line in an open tank.

394. The.....corollary of the.....law of thermodynamics, that energy is conserved, is the application of the conservation of energy to closed systems.

(a) First, second (b) Second, first
(c) First , first (d) Second, second

HPPSC AE (PWD) 10.09.2016

Ans. (c) : First , first

395. A piston-cylinder containing air expands at a pressure of 150 kPa from a temperature of 285 K to a temperature of 550 K. The mass of air is 0.05 kg and C_V = 0.7176. Then the change in internal energy will be:

(a) 13.31 kJ (b) 3.8 kJ
(c) 9.51 kJ (d) 1.23 kJ

HPPSC AE (PWD) 10.09.2016

Ans. (c) : Given than,

P = 150 kPa
$= 150 \times 10^3$ Pa
T_1 = 285 K
T_2 = 550 K
m = 0.05 kg
C_V = 0.7176

By the first law of thermodynamics–

$$dQ = du + dw$$
$$\because \quad du = mC_V dT$$
$$du = 0.05 \times 0.7176 \times (550–285)$$
$$du = 9.5008\ kJ$$

396. Specific heat at constant volume C_v =

(a) $\frac{R}{\gamma-1}$ (b) $\frac{\gamma-1}{\gamma-R}$
(c) $\frac{(\gamma-1)R}{\gamma}$ (d) $\frac{\gamma R}{\gamma-1}$
(e) None of these

Where R = Gas constant
γ = Adiabatic exponent

CGPSC AE 16.10.2016

Ans. (a) : $C_p - C_v = R$

$$\therefore \quad C_v = \frac{R}{\gamma-1}$$
$$C_p = \frac{\gamma R}{\gamma-1}$$

397. A closed system undergoes a process during which 200 kJ of heat is added to it. The system is then restored to its initial state. If the heat transfer and work transfer for the second process are -75 kJ and +100 kJ respectively what is the work transfer for the first process?

(a) 50 kJ (b) 25 kJ
(c) 75 kJ (d) 100 kJ

UPRVUNL AE 21.08.2016

Ans. : (b) Q_1 = 200 kJ W_1 = ?
Q_2 = –75 kJ W_2 = + 100 kJ
As per Ist law of thermodynamics
$\Sigma dQ = \Sigma dW$
$Q_1 + Q_2 = W_1 + W_2$
$200 - 75 = W_1 + 100$
$125 - 100 = W_1$
$\boxed{W_1 = 25\ kJ}$

398. Air at 100 kPa, 2°C occupies a 10 liter piston-cylinder device that is arranged to maintain constant air pressure. This device is now heated until its volume is 20 liters. The work produced by the air is

(a) 20 kJ (b) 10 kJ
(c) 2 kJ (d) 1 kJ

ISRO Scientist/Engineer 03.07.2016

Search on Telegram @apna_pdf

Ans. (d) : At, $P = 100$ kPa

$T = 2°C$

$V_1 = 10$ liter $= 10 \times 10^{-3}$ m^3

$V_2 = 20$ liter $= 20 \times 10^{-3}$ m^3

At Constant pressure–

Work done (W) $= P(V_2 - V_1)$

$= 100 \times 10^3 (20 \times 10^{-3} - 10 \times 10^{-3})$

$= 100 \times 10^3 \times 10 \times 10^{-3}$

$= 1000$ J

$W = 1$ kJ

399. A system is undergoing a cycle that consists of three processes. During the first process, the work is 5 kJ and the heat is 23 kJ. In the second process no work takes place and the heat interaction is –50 kJ. The third process is adiabatic. The work in the third process is

(a) –32 kJ (b) –23 kJ

(c) –22 kJ (d) zero

ISRO Scientist/Engineer 03.07.2016

Ans. (a) :

Process	Heat	Work
1	23 kJ	5 kJ
2	–50 kJ	0
3	0 (Adiabatic)	W

According to first low of thermodynamic

$$\Sigma Q = \Sigma W$$

$$23 - 50 + 0 = 5 + 0 + W$$

$W = -32$ kJ

400. Air at 100 kPa and 280K is compressed steady to 600 KPa and 400K. The mass flow rate of the air is 0.02 Kg/s, and a heat loss of 16 KJ/kg occurs during the process. Determine power input to the compressor.

(a) 3.2 KW (b) 2.7 KW

(c) 2.9 KW (d) 3.0 KW

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : $h_1 - \dot{q} = h_2 - w$

$$w = (h_2 - h_1) + \dot{q}$$

$$= \dot{m}\left[(C_pT_2 - C_pT_1) + \dot{q}\right]$$

$= 0.02[(1.005 \times 400 - 1.005 \times 280) + 16]$

$= 2.732$ KW

401. Which one of the following equations represents the first law of thermodynamics?

(a) $\partial Q = dU + PdV$ (b) $\partial W = dU + dV$

(c) $\partial Q = Tds$ (d) $Tds = dU + PdV$

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (a) : First law for a process

$$\partial Q = dE + \partial W$$

Where, E = Total energy

$$E = U + KE + PE$$

If we consider change in KE and PE is zero(i.e. stationary system).

Then,

$$\partial Q = dU + \partial W$$

For closed system

$$\partial Q = dU + PdV$$

First law for a cycle

$$\oint \partial Q = \oint \partial W$$

Note-Official answer is given (d).

402. A closed system undergoes a process 1-2 for which the values of $Q_{1\text{-}2}$ and $W_{1\text{-}2}$ are +40 kJ and +60 kJ, respectively. If the system is returned to state 1, and $Q_{2\text{-}1}$ is –30 kJ, what is the value of the work $W_{2\text{-}1}$?

(a) +20 kJ (b) –50 kJ

(c) –80 kJ (d) +40 kJ

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : Initial and final condition is identical so it is a cyclic process.

First law of thermodynamics for cyclic process.

$$\oint \delta Q = \oint \delta W$$

or $$(\Sigma Q)_{cycle} = (\Sigma W)_{cycle}$$

Given, $Q_{1-2} = 40$ kJ

$W_{1-2} = 60$ kJ

$Q_{2-1} = -30$ kJ

Heat transfer equal to work transfer

$$Q_{1-2} + Q_{2-1} = W_{1-2} + W_{2-1}$$

$$40 - 30 = 60 + W_{2-1}$$

$$10 = 60 + W_{2-1}$$

$$W_{2-1} = -50 \text{ kJ}$$

The negative sign implies that the work is done on the system.

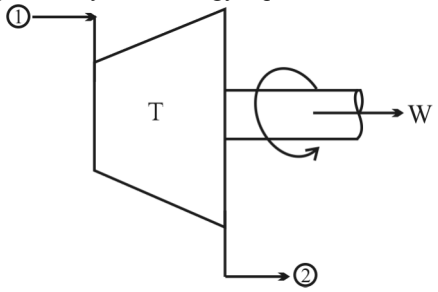
403. In a steady flow, adiabatic turbine, the changes in the internal energy, enthalpy, kinetic energy and potential energy of the working fluid, from inlet to exit, are –150 kJ/kg, –130 kJ/kg, –40 kJ/kg and 0 kJ/kg respectively. Which one of the following gives the amount of work developed by the turbine?

(a) 190 kJ/kg (b) 170 kJ/kg

(c) 150 kJ/kg (d) 90 kJ/kg

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : Steady flow energy equation of turbine –



$$h_1 + \frac{C_1^2}{2} + gz_1 + q = h_2 + \frac{C_2^2}{2} + gz_2 + w$$

Search on Telegram @apna_pdf

$$(q\text{-}w) = (h_2 - h_1) + \left(\frac{C_2^2}{2} - \frac{C_1^2}{2}\right) + g(z_2 - z_1)$$

For adiabatic turbine q = 0

$$-w = (h_2 - h_1) + \left(\frac{C_2^2 - C_1^2}{2}\right) + g(z_2 - z_1)$$

$-w = -130 - 40 - 0$

$w = 170$ kJ/kg

Change in internal energy i.e., 150 kJ / kg is superfluous data.

404. A mixture of gases expands from 0.03 m^3 to 0.08 m^3 at a constant pressure of 1 MPa and absorbs 76 kJ of heat during the process. The change in internal energy of the mixture is

(a) 116 kJ (b) 46 kJ
(c) 26 kJ (d) 126 kJ

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : Given,

P = 1 MPa = 1000 kPa

dQ = 76 kJ

$dW = P(V_2 - V_1)$

$= 1000(0.08 - 0.03)$

$= 1000\ (0.05)$

dW = 50 kJ

dQ = dU + dW

dU = dQ – dW

dU = 76 – 50

dU = 26 kJ

405. Total enthalpy of steam at the inlet of a nozzle is 2800 kJ while static enthalpy at the exit is 2555 kJ. What is the steam velocity at the exit if expansion is isentropic?

(a) 70 m/s (b) 245 m/s
(c) 450 m/s (d) 700 m/s

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : Given, $h_1 = 2800$ kJ, $h_2 = 2555$ kJ

$$V_2 = \sqrt{2(h_1 - h_2)}$$

$$V_2 = \sqrt{2(2800 - 2555) \times 1000}$$

$$= \sqrt{2 \times 245 \times 1000}$$

$V_2 = 700$ m/sec

406. During a certain compression process, 1 kJ of mechanical work input is supplied to 2 kg of a gas enclosed in a cylinder piston assembly and 400 J of heat is rejected to the cooling water being circulated in the jacket encasing the cylinder. This brings about a change in the specific internal energy by:

(a) –700 J kg^{-1} (b) 600 J kg^{-1}
(c) 300 J kg^{-1} (d) –300 J kg^{-1}

OPSC AEE 2015 PAPER - II

Ans. : (c)

Work input = 1000J

Rejected heat = 400J

mass = 2 kg.

first law of thermodynamics

$\delta Q = dU + \delta W$.

$dU = \delta Q - \delta W$.

dU = -400+1000

dU = 600J

$$\text{Specific internal energy} = \frac{\text{Internal energy}}{\text{mass}} = \frac{600}{2}$$

u = 300 J/Kg

($\delta \rightarrow$ show that heat and work both are inexact differential)

407. A system undergoes a process in which the heat transfer to the system is 30 KJ and the work done by the system is 35000 Nm. The change in internal energy of the system is

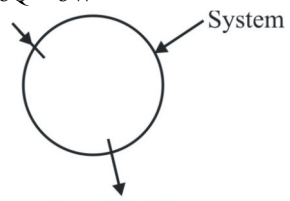
(a) +5 KJ (b) –5 KJ
(c) –10 KJ (d) + 10 KJ

TSPSC AEE 2015

Ans. : (b) According to first law of thermodynamic

$\delta Q = dU + \delta W$

$dU = \delta Q - \delta W$



dU = (30-35)

dU = –5 KJ.

408. First law of thermodynamics states that : (where $Q_{1\text{-}2}$ = Heat supplied, dU = Change in internal energy, and $W_{1\text{-}2}$ = Work done in heat units)

(a) $Q_{1\text{-}2} = dU + W_{1\text{-}2}$ (b) $Q_{1\text{-}2} = dU - W_{1\text{-}2}$
(c) $Q_{1\text{-}2} = dU/W_{1\text{-}2}$ (d) $Q_{1\text{-}2} = dU \times W_{1\text{-}2}$

NPCIL ET, 2015

Ans. (a) : $Q_{1\text{-}2} = dU + W_{1\text{-}2}$ – 1st Law of thermodynamics

409. In a given process of an ideal gas, $\delta W = 0$ and $\delta Q < 0$. Then for the gas

(a) the temperature will decrease
(b) the volume will increase
(c) the pressure will remain constant
(d) the temperature will increase

Haryana PSC Civil Services Pre, 2014

Ans. (a) : Given,

$\delta W = 0$ and $\delta Q < 0$

From first law of thermodynamics

$\delta Q = dU + \delta W$

$\delta Q = dU + 0$

$\because \delta Q < 0$ & $\delta Q = dU$

$dU < 0$

$m C_v (T_2 - T_1) < 0$

$\boxed{T_2 < T_1}$

Means temperature will decreases.

Search on Telegram @apna_pdf

410. An insulated 2 kg box falls from a balloon 3.5 km above the earth. The change in the internal energy of the box after it has hit the earth's surface will be :

(a) Zero (b) 70,000 kJ
(c) 68.6 kJ (d) 7 kJ

MPSC Poly. Lect. 2014

Ans. (c) : Change in internal energy = potential energy

$U = mgh$

$= 2 \times 9.81 \times 3.5 \times 10^3$

$= 68.67$ kJ

411. Which one of the following statements is not related to the first law of thermodynamics?

(a) Whenever energy is transformed form one to another, energy is always conserved
(b) Energy can neither be created nor destroyed
(c) The sum total of all energy remains constant
(d) Every process occurring in nature proceeds in the sense in which the sum of the entropies of all bodies taking part in the process is increased

UPRVUNL AE 2014

Ans. : (d) Entropy's law is not related to the first law of thermodynamic process. It is related to the second law of thermodynamic.

$$dQ = T.\, dS$$

• First law is related to energy conservation.

412. A sample of gas ($\gamma = 1.5$) is taken through an adiabatic process in which the volume is compressed from 1600 cm^3 to 400 cm^3. If initial pressure is 150 kPa, then how much will be the final pressure in the process?

(a) 1200 kPa (b) 1000 kPa
(c) 1100 kPa (d) 1400 kPa

ISRO Scientist/Engineer 24.05.2014

Ans. (a) : $\gamma = 1.5$

Adiabatic process = PV^γ = constant

$V_1 = 1600$ cm^3

$V_2 = 400$ cm^3

$P_1 = 150$ kPa

$P_2 = ?$

$$P_1V_1^\gamma = P_2V_2^\gamma$$

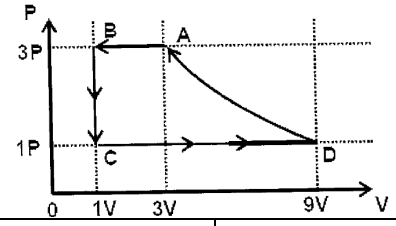
or $$P_2 = P_1\left(\frac{V_1}{V_2}\right)^\gamma$$

$$= 150\left(\frac{1600}{400}\right)^{1.5}$$

$$= 150 \times 4^{1.5}$$

$P_2 = 1200$ kPa

413. One mole of a monatomic gas is taken through a cycle ABCDA as shown in the P-V diagram. Column II give the characteristics involved in the cycle. Match A → B process with the processes given in Column II.



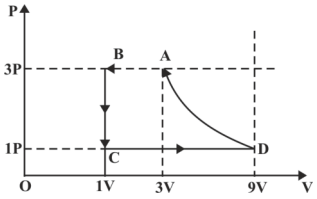
Column I	Column II
(A) Process A → B	(p) Internal energy decreases
(B) Process B → C	(q) Internal energy increases
(C) Process C → D	(r) Heat is lost
(D) Process D → A	(s) Heat is gained
	(t) Work is done on the gas

Process A → B signifies

(a) p,q (b) r,s
(c) p,r,t (d) q,t

ISRO Scientist/Engineer 24.05.2014

Ans. (c)



For process A → B

$$\frac{P_AV_A}{T_A} = \frac{P_BV_B}{T_B}$$

$P_A = P_B$ → At constant pressure

$$\frac{V_A}{T_A} = \frac{V_B}{T_B}$$

or $$\frac{T_B}{T_A} = \frac{V_B}{V_A} = \frac{1V}{3V} = \frac{1}{3}$$

or $$T_B = \frac{T_A}{3}$$

∵ $T_B < T_A$, so heat is 'lost'.

$$\Delta U = C_V \Delta T$$

$$= C_V(T_B - T_A) = -ve$$

So, here Internal energy decreases. As volume is compressed, work is done on the gas.

414. First law of thermodynamics is valid for

(a) all process
(b) reversible process only
(c) cyclic process only
(d) only cyclic process that are carried out reversibly

Haryana PSC Civil Services Pre, 2014

Ans. (a) First law of thermodynamics is based on energy conservation. It states that energy neither can be created nor destroyed. So, it is valid for all process.

Search on Telegram @apna_pdf

415. A company claims to have developed a revolutionary fan that consumes 25 W and delivers 0.8 kg/s of air at a velocity of 10 m/s. The claim has to be verified using appropriate law of thermodynamics. Which of the following combinations of conclusion and the law employed for the same is correct?

(a) Invalid – First law (b) Invalid – Second law
(c) Valid – First law (d) Valid – Second law

RPSC AEN Pre-2013

Ans. (a) : Invalid – First law

416. The steady flow energy equation of a perfect gas flowing through a nozzle with the initial and final velocities of V_1 and V_2 are given by

(a) $h_1 = h_2$ (b) $h_1 - h_2 = \frac{V_2^2 - V_1^2}{2}$

(c) $h_1 - h_2 = \frac{V_1^2 - V_2^2}{2}$ (d) $h_1 - h_2 = \frac{W_X}{m}$

TNPSC AE 2013

Ans. (b) : We know that SFEE,

$$m_1\left[h_1 + \frac{V_1^2}{2} + Z_1\right] + Q$$

$$= m_2\left[h_2 + \frac{V_2^2}{2} + Z_2\right] + W$$

For nozzle
We assume that
$Z_1 = Z_2$, $Q = 0$, $W = 0$
then we get

$$(h_1 - h_2) = \frac{V_2^2 - V_1^2}{2}$$

417. If H be the heat supplied to the system to do work W and change in internal energy as ΔU, then,

(a) $H = \Delta U + W$ (b) $\Delta U = H + W$
(c) $W = H + \Delta U$ (d) $H = W/\Delta U$

SJVN ET 2013

Ans. (a) : First Law of thermodynamics

$$\boxed{H = \Delta U + W}$$

where, H = Heat supplied
ΔU = Internal energy
W = work

418. A machine produces 100 kJ work by consuming 100 kJ heat. This machine will be called:-

(a) PMM - I (b) PMM - II
(c) PMM - III (d) None of the above

UKPSC AE-2013, Paper-II

Ans. (b) : PMM-II (perpectual motion machine of second kind) is one which converts all the heat input into work while working in a cycle. A PMM-II has an η_{th} of 1.

419. Air is compressed isothermally by performing work equal to 16 kJ upon it. The change in internal energy is

(a) –16 kJ (b) Zero
(c) 16 kJ (d) 32 kJ

UKPSC AE 2012 Paper–II

Ans. (b) For isothermal process,
$T = C$; $\Delta T = 0$
$\Delta U = mC_v\Delta T$
$\Delta U = 0$

420. General energy equation for flow process is

(a) $dQ = du + pdv$
(b) $dQ = dh - vdp$
(c) $du + d(pv) + d\left(\frac{v^2}{2}\right) + d[gz] + dQ + dW = 0$
(d) $dQ = Tds$

TNPSC ACF 2012

Ans. (c) : Energy equation for flow process

$$du + d(pv) + d\left(\frac{v^2}{2}\right) + d(gz) + dQ + dW = 0$$

421. The heat transfer, the work done and the change in internal energy are all zero in case of

(a) a rigid vessel containing steam at 150ºC left in the atmosphere which is at 25ºC
(b) 1 kg gas contained in an insulated cylinder expanding as the piston moves slowly outwards
(c) 1 kg of air flowing adiabatically from atmosphere into a previously evacuated bottle
(d) a rigid vessel containing ammonia gas connected through a valve to an evacuated rigid vessel, the vessel, the valve and the connecting pipes being well insulated and the valve being opened slowly

APPSC AEE 2012

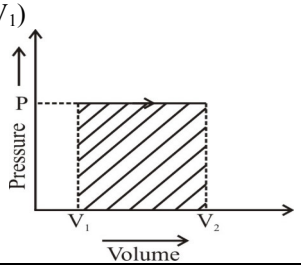
Ans. (d) :
(i) For a rigid vessel $\Delta V = 0$ then
Work done $dW = P\Delta V = 0$
(ii) Vessel are well insulated $(\Delta Q) = 0$
(iii) hence from first law of thermodynamics equation.
$dQ = dU + dW$
$0 = dU + o \Rightarrow dU = 0$

422. The work done in the expansion of a gas from volume V_1 to V_2 under constant pressure P is equal to

(a) Zero (b) $P(V_2 - V_1)$
(c) $P(V_2 + V_1)$ (d) $P/(V_2 - V_1)$

APPSC AEE 2012

Ans. (b) : Work done for non-flow process at constant pressure.
$W = PdV$
$W = P(V_2 - V_1)$



Search on Telegram @apna_pdf

423. Choose the correct alternative:

1. First law for a closed system undergoing a cycle $Q - W = \Delta E$
2. Two reversible adiabatic paths can not intersect each other.
3. If two fluids are mixed, the entropy of universe remains unchanged.
4. Clausius statement – Heat can flow from low to high temperature body without the aid of external work.
5. The efficiency of a reversible heat engine is independent of nature of working substance undergoing a cycle.

(a) All statements are true.
(b) Statements 2 and 5 are true.
(c) Statements 1, 3, 4 and 5 are true.
(d) Statements 1, 3 and 5 are true.

UKPSC AE 2012 Paper–II

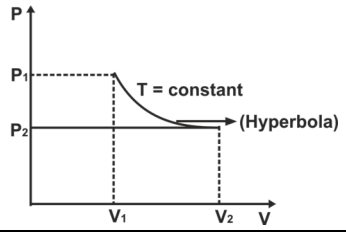
Ans. (b) : Statements 2 and 5 are true.

424. A gas is to expanded in a cylinder that its temperature remains constant. The resulting variation of pressure vs. volume is

(a) A parabola
(b) A hyperbola
(c) A straight line through origin
(d) None of these

ISRO Scientist/Engineer 2011

Ans. (b) : Temperature remain constant
PV = constant



425. Internal energy of an isolated system :

(a) Increases with addition on heat
(b) Increases with increase in mass of the system
(c) Remains same
(d) Increases with addition of work

OPSC Civil Services Pre. 2011

Ans. (c) : Internal energy of an isolated system remains same.
According to first law of thermodynamics
$\delta Q = dU + \delta W$
For isolated system
$\delta W = 0$
$\delta Q = 0$
$dU = 0$
Internal energy of perfect gas is only function of temperature only.

426. The identity $\delta Q = dU + PdV$ is valid for :

(a) Any process occurring in an open system
(b) Any process occurring in a closed system
(c) A quasi-static process without dissipation in a closed cycle
(d) Any process in any system

OPSC Civil Services Pre. 2011

Ans. (c) : $\delta Q = dU + PdV$
This equation is valid for closed system, quasi-static process without dissipation in a closed cycle and reversible process.

427. What is the following statement known as "Energy can neither be created nor destroyed but it can be transferred from one form to another?

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) Kinetic theory of gases

VIZAG STEEL MT 2011

Ans. (b) : First Law of Thermodynamics-
⇒ Energy can neither be created nor destroyed but can be converted from one form to other.
⇒ It states that whenever a closed system executes a cycle process, the algebraic sum of work transfer is proportional to algebraic sum of heat transfer.

$$(\Sigma W)_{cycle} = (\Sigma Q)_{cycle}$$

428. 10 kg of air at 800 kPa are heated at a constant pressure from 450 K to 680 K. The work required is nearest to :

(a) 524 kJ (b) 960 kJ
(c) 715 kJ (d) 660 kJ

J&K PSC Civil Services Pre, 2010

Ans. (d) : Given,
For air,

$$m = 10 \text{ kg}, R = 0.287 \frac{\text{kPa.m}^3}{\text{kg.K}}$$

$P = 800$ kPa
$T_i = 450$ K and $T_f = 680$ K
For constant pressure,
Work done (W) = $P\Delta V$
$= P(V_f - V_i)$
From,

$$\therefore T_i = \frac{PV_i}{mR}, \Delta T = \frac{P}{mR}(V_f - V_i)$$

$$(680 - 450) = \frac{800}{10 \times 0.287}(V_f - V_i)$$

$(V_f - V_i) = 0.8251 \text{ m}^3$
$\therefore$ Work done (W) = $P\Delta V = P(V_f - V_i)$
$= 800 (0.8251)$
$= 660.10$ kJ

429. An air compressor compresses air with an enthalpy of 100 kJ/kg to a pressure and temperature that have an enthalpy of 200 kJ/kg. If 50 kJ/kg of heat is lost from the compressor as the air passes through it, the power required for an air mass flow of 0.5 kg/s is :

(a) 25 kW (b) 50 kW
(c) 75 kW (d) 100 kW

UPSC JWM Advt. No.-52/2010

Search on Telegram @apna_pdf

Ans. (c) : SFEE : applying

$h_1 + q = h_2 + W$ (for negligible KE and PE)

$\Rightarrow W = (h_1 - h_2) + q = (100 - 200) + (-50)$

Compressor work (W) = – 150 KJ/kg

$\therefore$ Compressor Power (P) = mW

= 0.5kg/sec × 150 kJ/kg = 75 kW

430. Steam at a pressure of 6 bars (enthalpy 2988 kJ/kg) passes through a frictionless nozzle to a pressure of 4 bars (enthalpy 2888 kJ/kg). Neglecting velocity of approach, the final velocity of steam at exit of nozzle will be

(a) 447.2 m/s (b) 44.72 m/s

(c) 4.472 m/s (d) 4472 m/s

UPSC JWM Advt. No.-50/2010

Ans. (a) : Given,

$P_1 = 6$ bar, $h_1 = 2988$ kJ/kg, $h_2 = 2888$ kJ/kg

Using S.F.E.E. for nozzle –

$$h_1 = h_2 + \frac{v_2^2}{2}$$

$$v_2 = \sqrt{2\times(2988-2888)\times10^3} = \sqrt{2\times100\times10^5}$$

$$\boxed{v_2 = 447.2\,m/s}$$

431. An inventor claims to have constructed a device that rejects 300 kJ of heat to a single reservoir while absorbing 300 kJ of work during a single cycle of the device. This device violates

(a) only the first law of thermodynamics and no other laws

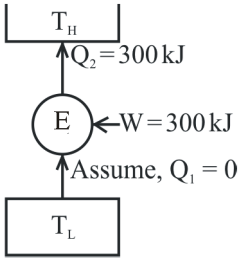
(b) only the second law of thermodynamics and no other laws

(c) both the first and the second law of thermodynamics

(d) neither the first nor the second law of thermodynamics

DRDO Scientists 2008

Ans. (a) : It is case of electric heater and it is possible without violating any law of thermodynamics.



432. One hundredth of a kilogram of air is compressed In a piston-cylinder device. At an instant of time when T= 400K, the rate at which work is being done on the air is 8.165 kW, and heat is being removed at a rate of 1.0 kW, the rate of temperature rise will be -

(a) 10 K/s (b) 100 K/s

(c) 1000 K/s (d) 10000 K/s

ISRO Scientist/Engineer 2006

Ans. (c) : Given, $m_{air} = \frac{1}{100} kg$

$\delta\dot{W} = -8.165$ kW

$\delta\dot{Q} = -1$ kW

According to first law of thermodynamics.

$$\delta\dot{Q} = d\dot{U} + \delta\dot{W}$$

$$-1 = \frac{mC_V dT}{t} - 8.165$$

$$\frac{mC_V dT}{t} = 7.165$$

So, $\frac{dT}{t} = \frac{7.165}{0.01\times0.718} \simeq 1000\,K/s$

For air $C_V = 0.718$ kJ/kg K

433. For an ideal gas, the change in enthalpy, dh is given by

(a) $C_v dT$ (b) $C_p dT$

(c) $\frac{C_p}{C_v} dT$ (d) $\frac{C_v}{C_p} dT$

WBPSC AE 2003

Ans. (b) : [P = C] for constant pressure.

$\because$ $\delta Q = dU + PdV$

$\delta Q = dU + d(PV)$

$= d(U + PV)$ $\because$ U+PV = h

$\delta Q = d(h)$ ...(i)

$\delta Q = mc_p dT$

$\boxed{dh = mc_p dT}$

or $[dh = C_p dT]$

Where, C_p = Heat capacity

3. Second Law of Thermodynamics

434. Carnot cycle consists of

(a) Two constant volume & two isentropic processes

(b) Two isothermal and two isentropic processes

(c) Two constant pressure and two isentropic processes

(d) One constant volume, one constant pressure and two isentropic processes

J & K PSC Screening, 2006
WBPSC AE 2003

Ans. (c) : Entropy– It is an important thermodynamic property of a working substance, which increases with the addition of heat and decreases with its removal. As a matter of fact, it is tedious to define the term entropy. But it is comparatively easy to define change of entropy of a working substance. Over small range of temperature, the increase or decrease of entropy, when multiplied by the absolute temperature gives the heat absorbed or rejected by the working substance. Mathematically, heat absorbed or rejected by the working substance.

$\delta Q = Tds$

T = Absolute temperature
ds = Increase or decrease in entropy.

436. Kelvin-Planck law deals with
(a) conservation of energy
(b) conservation of heat
(c) conservation of mass
(d) conversion of heat into work

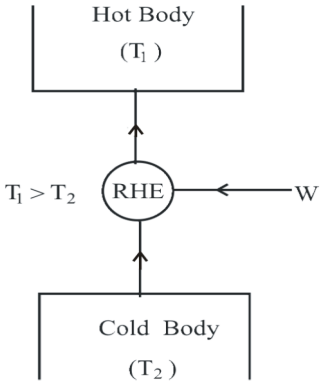
Ans. (b) : Clausius statement – It is impossible to transfer heat in a cyclic process from low temperature to high temperature without any work from external source.



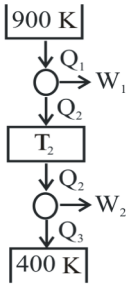
440. An engine operates between temperature limits of 900 K and T_2 and the other engine operates between T_2 and 400 K. For both engines to be equally efficient, T_2 should be equal to

(a) 600 K (b) 625 K
(c) 650 K (d) 700 K

BPSC AE Mains 2017 Paper - V

GPSC Lect. (Poly.) 07.12.2014
ISRO Scientist/Engineer 12.05.2013
UKPSC AE-2013, Paper-II, ESE 2010

Ans. : (a) : Given as,
$T_1 = 900$ K
$T_3 = 400$ K
If the efficiency are equal then we know that



$$T_2 = \sqrt{T_1 \times T_3}$$
$$T_2 = \sqrt{900 \times 400}$$
$$T_2 = 600\text{K}$$

441. Two Carnot heat engines are operating in series such that the heat sink of the first engine serves as the heat source of the second one. If the source temperature of the first engine is 1327°C, the sink temperature of the second engine is 127°C, and the thermal efficiency of both the engines are the same, the temperature of the intermediate reservoir is:

(a) 627°C (b) 410°C
(c) 577°C (d) 527°C

ISRO Scientist/Engineer (RAC) 22.04.2018
ISRO Scientist/Engineer 07.05.2017
Vizag Steel (MT) 2017, Punjab PSC (Lect.) 06.08.2017
OPSC AEE 2015 PAPER - II

Ans. (d) : Given,
$T_1 = 1327°C = 1600$ K
$T_3 = 127°C = 400$ K
If two engine connected in series and its thermal efficiency is same.
So, Intermediate temperature

$$T_2 = \sqrt{T_1 \times T_3}$$
$$= \sqrt{1600 \times 400} = 40 \times 20$$
$$= 800 \text{ K}$$
$$T_2 = 800 - 273$$
$$= 527°C$$

442. A solar energy based heat engine which receives 80 kJ of heat at 100°C and rejects 70 kJ of heat to the ambient at 30°C is to be designed. The thermal efficiency of the heat engine is :

(a) 70% (b) 1.88%
(c) 12.5% (d) Indeterminate

ISRO Scientist/Engineer (RAC) 22.04.2018

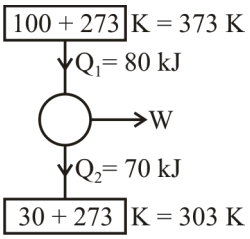
Ans. (c)



$$\eta_{actual} = \frac{W}{Q_s} \times 100$$

$$\eta_{actual} = \frac{80-70}{80} \times 100 = \frac{10}{80} \times 100$$

$$= 12.5\%$$

443. "It is impossible for a heat engine to produce net work in a complete cycle if it exchanges heat only with bodies at a single fixed temperature." This statement is known as:

(a) Clausius statement
(b) Kelvin-Plank statement
(c) Carnot statement
(d) None of the above

TSPSC Manager (Engg.) HMWSSB 12.11.2020
Punjab PSC SDE 12.02.2017
GPSC Asstt. Prof. (Prod.) 21.08.2016
WBPSC AE 2003

Ans. (b) : Kelvin-Plank statement-
It is impossible for a heat engine to produce net work in a complete cycle if it exchanges heat only with bodies at a single fixed temperature.

444. The efficiency of a Carnot engine depends on the

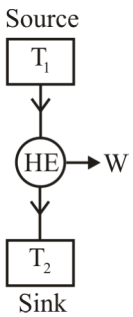
(a) Design substance
(b) Working substance
(c) Type of fuel fired
(d) Temperatures of source & sink

UPCL AE 29.08.2021
GPSC DEE, Class-2 (GWSSB) 04.07.2021
Rajasthan Nagar Nigam AE 2016, Shift-I
UKPSC AE 2012 Paper-II, TRB Asstt. Prof., 2012

Ans. (d) : The efficiency of a carnot engine depends on the temperature of source and sink.

$$\eta = \frac{T_1 - T_2}{T_1} = 1 - \frac{T_2}{T_1}$$

Carnot engine is reversible engine so, $\eta = f(T_1, T_2)$



445. Carnot cycle efficiency is maximum when

(a) initial temperature is 0K
(b) final temperature is 0K
(c) difference between initial and final temperature is 0K
(d) final temperature is 0^oC

JPSC AE PRE 2019, TNPSC AE 2018
WBPSC AE, 2017, TNPSC ACF 2012

Ans. (b) : We know that Carnot cycle efficiency depends on source and sink temperature limits,

$$\eta_c = 1 - \frac{T_L}{T_H}$$

If $T_L \to 0$ K then

$$(\eta_c)_{max} = 100\%$$

446. What will be the change on efficiency of a Carnot engine, if the temperature of the sink is decreased?

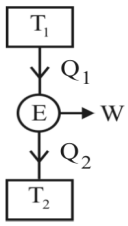
(a) It will decreases
(b) It will remain constant
(c) It will first increase and then decrease
(d) It will increases

Rajasthan Nagar Nigam AE 2016, Shift-I
APPSC AEE Mains 2016 Paper-III
MPPSC State Forest Service Exam, 2014

Ans. (d) : Carnot engine efficiency–

$$\eta = 1 - \frac{T_2}{T_1}$$

$T_2 \downarrow$, $\eta \uparrow$ (Assumed T_1 = constant)



447. A friction less heat engine can be 100 percent efficient only if its exhaust temperature is

(a) equal to its input temperature
(b) less than input temperature
(c) 0 K
(d) 0ºC

JPSC AE 2013 Paper-V
ISRO Scientist/Engineer 2012
UKPSC AE 2012 Paper–II

Ans. (c)

$$\eta = 1 - \frac{T_2}{T_1} \text{ (for frictionless engine)}$$

$\eta = 100\%$ (if, $T_2 = 0$ K)

448. If the thermal efficiency of Carnot heat engine is 50 percent, then coefficient of performance of a refrigerator working within the same temperature limit would be :

(a) 1 (b) 2
(c) 3 (d) 4

HPPSC Asstt. Prof. 18.09.2017
Kerala PSC AE 06.08.2015, *(KPSC AE. 2015)*

Search on Telegram @apna_pdf

Ans. (a) : Thermal efficiency of Carnot heat engine

$$\eta_c = \frac{Q_1 - Q_2}{Q_1} = \frac{T_H - T_L}{T_H} = 1 - \frac{T_L}{T_H} \quad ...(i)$$

Coefficient of performance (COP) of refrigerator

$$COP_R = \frac{T_L}{T_H - T_L} \quad ...(ii)$$

$$COP_R = \frac{T_L / T_H}{1 - T_L / - T_H} = \frac{T_L / T_H}{\eta_c} \quad \text{[from eq. (i)]}$$

from eqn. (i) $\left[1 - \eta_c = \frac{T_L}{T_H}\right] \leftarrow$ keep it above eqn

$$COP_R = \frac{T_L / T_H}{\eta_c} = \frac{1 - \eta_c}{\eta_c}$$

$$COP_R = \frac{1}{\eta_c} - 1$$

$$COP_R + 1 = \frac{1}{\eta_c}$$

$\because$ in question $\eta_c = 50\%$ $COP_R = ?$

$$0.5 = \frac{1}{COP_R + 1}$$

$$COP_R + 1 = 2$$

$$\boxed{COP_R = 1}$$

449. A reversible engine operates between temperatures 900 K & T_2 (T_2 < 900 K), & another reversible engine between T_2 & 400 K (T_2 > 400 K) in series. What is the value of T_2 if work output of both the engines are equal?

(a) 600 K (b) 625 K
(c) 650 K (d) 675 K

Nagaland PSC CTSE 2015 Paper-II
SJVN ET 2013, ESE 2005

Ans. (c) : Given,

$T_1 = 900$ K, $T_2 = 400$ K

Work output of both the engine are equal

$W_1 = W_2$

temperature difference should be equal

$900 - T_2 = T_2 - 400$

$2T_2 = 1300$

$T_2 = 650$ K

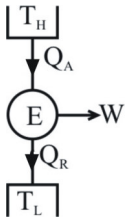
450. Three engines A, B and C operating on Carnot cycle respectively use air, steam and helium as the working fluid. If all the engines operate within the same high and low temperature limits. then which engine will have the highest efficiency?

(a) Engine A
(b) Engine B
(c) Engine C
(d) All engines will have the same efficiency

RPSC AE 2016, RPSC AEN Pre-2013
RPSC ACF-2011, ESE 2009

Ans. : (d)

Efficiency of Carnot cycle $(\eta) = \frac{T_H - T_L}{T_H}$



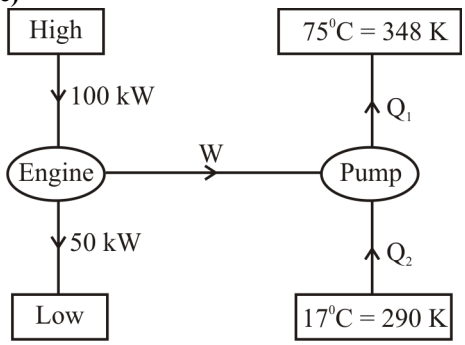
Efficiency of Carnot engines does not depend on the type of fuel use so engine A, B and C operating same high and low temperature limit then engine will have the same thermal efficiency.

451. An irreversible heat engine extracts heat from a high temperature source at a rate of 100 kW and rejects heat to a sink at a rate of 50 kW. the entire work output of the heat engine is used to drive a reversible heat pump operating between a set of independent isothermal heat reservoirs at 17°C and 75°C. The rate (in kW) at which the heat pump delivers heat to its high temperature sink is

(a) 50 (b) 250
(c) 300 (d) 360

GPSC ARTO Pre 30.12.2018
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012

Ans. (c)



$W = Q_1 - Q_2 = 100 - 50 = 50$ kW

$$(COP)_{pump} = \frac{348}{348 - 290} = \frac{Q_1}{W}$$

$$Q_1 = \frac{348 \times 50}{58}$$

$$\boxed{Q_1 = 300\,kW}$$

452. A reversible engine has ideal thermal efficiency of 30%. When it is used as refrigerating machine with all other conditions unchanged, the coefficient of performance will be

(a) 1.33 (b) 2.33
(c) 3.33 (d) 4.33

ISRO Scientist/Engineer (RAC) 07.05.2017
HPPSC Asstt. Prof. 18.09.2017
ESE 2013

Search on Telegram @apna_pdf

Ans. (b) : We know that for same temperature limt

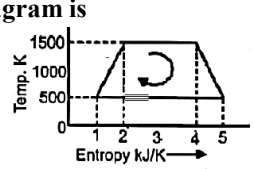
$$(COP)_{HP} = \frac{1}{\eta_C} = \frac{1}{0.3}$$

$$(COP)_{HP} = 3.33$$

$$(COP)_{ref} = (COP)_{HP} - 1$$

$$(COP)_{ref} = 3.33 - 1 = 2.33$$

453. The efficiency of a reversible cyclic process undergone by a substance as shown in the given diagram is



(a) 0.40 (b) 0.55
(c) 0.60 (d) 0.80

Nagaland PSC CTSE 2015 Paper-II, CSE Pre-1994

Ans. (c) : $\text{Efficiency} = \frac{\text{Area under 500 and 1500}}{\text{Area under 0 and 5}}$

$$= \frac{\frac{1}{2}\times\left[\{(5-1)+(4-2)\}\times(1500-500)\right]}{\frac{1}{2}\times\left[\{(5-1)+(4-2)\}\times(1500-500)\right]+(5-1)\times 500}$$

$$= \frac{3000}{5000} = 0.60$$

454. A carnot cycle refrigerator operates between 250 K and 300 K. Its coefficient of performance is

(a) 6.0 (b) 5.0
(c) 1.2 (d) 0.8

ISRO Scientist/Engineer 11.10.2015
VIZAG STEEL MT 10.06.2012

Ans. (b) : In carnot cycle,

$T_L = 250$ K, $T_H = 300$ K

$$(COP)_{Refrigerator} = \frac{T_L}{T_H - T_L}$$

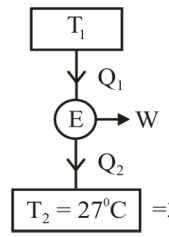
$$= \frac{250}{300-250} = \frac{250}{50} = 5$$

455. A Carnot engine operates between a source and sink. If 40% of heat is rejected at 27^0C, what will be the source temperature?

(a) 67^0C (b) 227^0C
(c) 477^0C (d) 757^0C

Assam PSC CCE Pre 2015, ESE 2009

Ans. (c)



The heat engine with source and sink is

$Q_2 = 0.4Q_1$

From carnot theorem for reversible engine -

$$\frac{Q_1}{T_1} = \frac{Q_2}{T_2}$$

$$\frac{Q_1}{T_1} = \frac{0.4Q_1}{300} \Rightarrow 0.4T_1 = 300$$

$$T_1 = \frac{300}{0.4}$$

$$= 750 \text{ K} = 477^0\text{C}$$

456. For a heat engine operating on Carnot cycle, the work output is 25% of heat rejected to the sink. The thermal efficiency of the engine would be :

(a) 10% (b) 20%
(c) 30% (d) 50%

RPSC AE 2016, RPSC ACF-2011

Ans. (b) : Given,

$$W_{out} = 25\% \text{ of } Q_R$$

$$W_{out} = \frac{25}{100}Q_R$$

$$W_{out} = \frac{1}{4}Q_R \quad \ldots(i)$$

we know, that

$$W = Q_S - Q_R$$

From (i) $\frac{1}{4}\times Q_R = Q_S - Q_R$

$$\frac{Q_R}{4} + Q_R = Q_S$$

$$Q_S = \frac{5}{4}Q_R \Rightarrow \frac{Q_R}{Q_S} = \frac{4}{5}$$

$$\eta_{Carnot} = 1 - \frac{Q_R}{Q_S}$$

$$= 1 - \frac{4}{5} \Rightarrow 1 - 0.8 = 0.20 = 20\%$$

457. The efficiency of a reversible heat engine depends on :

(a) the nature of the working fluid
(b) the quantity of the working fluid
(c) the temperature of the working fluid
(d) the phase of the working fluid

NLC GET 17.11.2020, Shift-II
RPSC IOF & Boiler 20.09.2017

Ans. (c) : The efficiency of reversible heat engine in which heat is received slowly at T_1 is found to be

$$\eta_{Rev} = \eta_{max} = 1 - \left(\frac{Q_2}{Q_1}\right)_{Rev} = 1 - \frac{T_2}{T_1}$$

$$\eta_{Rev} = \frac{T_1 - T_2}{T_1} \quad ; \eta_{rev} = f(T_1, T_2)$$

It is observed that as T_2 decreases and T_1 increases the efficiency of the reversible cycle increases.

Search on Telegram @apna_pdf

Since η is always less than unity.

T_2 is always greater than zero and positive since efficiency depends on operating temperature efficiency of all reversible heat engines operating between the same heat reservoirs are the same, the efficiency of the reversible heat engine, is independent of the nature or amount of the working substance undergoing the cycle.

458. One reversible heat engine operates between 1000 K and T K and another reversible heat engine operates between T K and 400 K. If both heat engines have same heat input and output, the value of T is

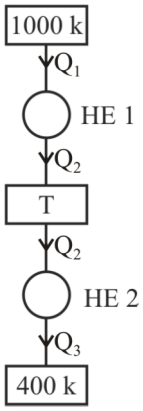
(a) 582.7 K (b) 632.5 K

(c) 682.8 K (d) 732.5 K

UPPSC AE 13.12.2020, Paper-2

ESE 2016

Ans. (b)



For both heat engines, have same heat input and output.

So, $T = \sqrt{T_1 T_2}$

$= \sqrt{(1000)(400)}$

$T = 632.5\ K$

459. A Carnot engine receiving heat at 400 K has an efficiency of 25%. The COP of a Carnot refrigerator working between the same temperature limits is :

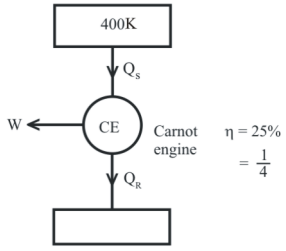
(a) 1 (b) 2

(c) 3 (d) 4

Vadodara Muncipal Corp. DEE, 2018

TSPSC AEE 2017

Ans. (c)



$$\eta_{HE} = \frac{1}{(COP)_{Heat\ pump}}$$

$$(COP)_{Heat\ Pump} = \frac{1}{\eta_{engine}}$$

$$= \frac{1}{1/4} = 4$$

$$(COP)_{Heat\ pump} = (COP)_{RE} + 1$$

$$4 = (COP)_{RE} + 1$$

$$\boxed{(COP)_{RE} = 4 - 1 = 3}$$

460. If the thermal efficiency of a Carnot engine is 1/5, the COP of a Carnot refrigerator is :

(a) 4 (b) 5

(c) 6 (d) 3

J&K PSC Civil Services Pre, 2010

UPSC JWM Advt. NO. - 52/2010

Ans. (a) : Given,

$$(COP)_{H.P} = \frac{1}{\eta} = 5$$

$$(COP)_R = (COP)_{H.P} - 1$$

$$(COP)_R = 5 - 1 = 4$$

461. An inventor claims that his heat engine has the following specifications :
Power developed : 50 kW
Fuel burned per hour : 3 kg
Heating value of fuel : 75000 kJ/kg
Temperature limits : 627^0C and 27^0C
This heat engine is

(a) reality (b) impossible

(c) costly (d) imaginary

RPSC IOF, 2020

TRB Asstt. Prof., 2012

CSE Pre-2002

Ans. (b) : Given,

Power (P) = 50kW

Fuel Burned /hr = 3 kg/hr

or Fuel Burned /sec = $\frac{3}{3600}$ kg/sec

Heating value of fuel = 75000 kJ/kg

Temperature limit = 627°C and 27°C

$$\eta_{Theorectical} = \frac{P}{Q \times m} = \frac{50}{\frac{3}{3600} \times 75000} = 0.8$$

$$\boxed{\eta_{Theorectical} = 80\%}$$

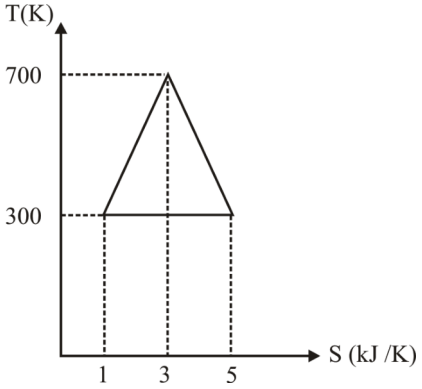
$$\eta_{ideal} = \left(1 - \frac{T_L}{T_H}\right) \times 100 = \left[1 - \frac{(27+273)}{(627+273)}\right] \times 100$$

$$= \boxed{\eta_{ideal} = 66.67\%}$$

$$\boxed{\eta_{Theorectical} > \eta_{ideal}}$$

Search on Telegram @apna_pdf

462. The thermal efficiency of the hypothetical cycle shown is



(a) 0.6 (b) 0.5
(c) 0.4 (d) 0.3

GPSC ARTO Pre 30.12.2018
ESE 2017

Ans. (c) : $Q_{rejected} = 300\,(5-1) = 300 \times 4 = 1200$ kJ

$$Q_{supplied} = \frac{1}{2}(700-300)(5-1) + 300(5-1)$$

$$= \frac{1}{2} \times 400 \times 4 + 1200$$

$$Q_{supp} = 2000\text{kJ}$$

$$\eta_{cycle} = 1 - \frac{Q_{rej}}{Q_{supp}} = 1 - \frac{1200}{2000} = 0.4$$

$$\boxed{\eta_{cycle} = 40\%}$$

463. According to the Clausius statement of second law of thermodynamics, the COP of a refrigerator is never

(a) ∞ (b) 1
(c) < 1 (d) > 1

Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (a) : According to the Clausius statement of second law of thermodynamics, the COP of a refrigerator is never be infinite (∞).

464. While deriving an expression for efficiency of a carnot cycle. Which one of the following is not a correct assumption?

(a) The cold body has infinite capacity
(b) The cylinder head is a perfect insulator
(c) The hot body has infinite capacity
(d) Both piston and cylinder are perfect insulators

UPRVUNL AE 21.08.2016
CSE Pre-2008

Ans. : (b) Assumption carnot cycle
(i) The gas in the cylinder is perfect gas.
(ii) The physical constants of gas in the engine cylinder are same as those at air at moderate temperature.
(iii) All the compression and expansion process are adiabaitc and they take place without any friction.
(iv) Cylinder head is a perfect diathermic.

465. A Carnot engine rejects 30% of absorbed heat to a sink at 30°C. The temperature of the heat source is

(a) 100°C (b) 433°C
(c) 737°C (d) 1010°C

UJVNL AE 2016
ISRO Scientist/Engineer 12.05.2013, ESE 2010

Ans. (c) : Given, Q_{rej} = 30% of $Q_{supp.}$

$$Q_{rej} = 0.3\ Q_{supp.}$$

$$\eta = 1 - \frac{Q_{rej}}{Q_{supp.}}$$

$$\eta = 1 - 0.3$$

$$\eta = 0.7$$

$$\eta = \left(1 - \frac{T_2}{T_1}\right)$$

So, $$0.7 = 1 - \frac{303}{T}$$

or $$\frac{303}{T} = 0.3$$

or $$T = 1010\ K$$

$$T = 1010 - 273$$

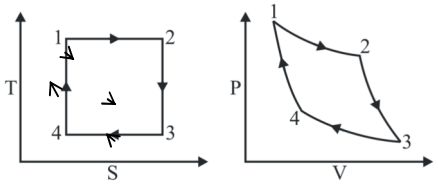
$$T = 737°C$$

466. The area of a p-v diagram for a Carnot cycle represents

(a) Heat supplied (b) Heat rejected
(c) Work done (d) Temperature drop

UPPSC AE 12.04.2016 Paper-II, TPSC AE 2015

Ans. : (c) The area on a P-V diagram for a Carnot cycle represents work done.



(i) Isothermal expansion:-

$$Q_{1-2} = P_1 V_1 \ln(V_2 / V_1)\ \text{[Heat supplied]}$$

(ii) Isentropic expansion:-

Decrease in internal energy = $\frac{mR(T_2 - T_3)}{\gamma - 1}$

(iii) Isothermal compression:-

$$Q_{3-4} = P_3 V_3 \ln(V_3 / V_4)$$

(iv) Isentropic compression:-

Increase in internal energy = $\frac{mR(T_1 - T_3)}{\gamma - 1}$

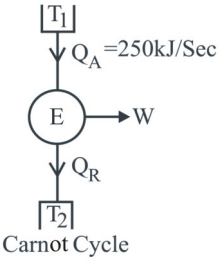
467. A heat engine is supplied with 250 kJ/s of heat at constant fixed temperature of 227°C. The heat is rejected at 27°C. The cycle is reversible, if the amount of heat rejected is

(a) 273 kJ/s (b) 200 kJ/s
(c) 180 kJ/s (d) 150 kJ/s

ISRO Scientist/Engineer (RAC) 22.04.2018
UPPSC AE 12.04.2016 Paper-II
ESE 2009, CSE Pre-1995

Search on Telegram @apna_pdf

Ans. : (d)



$T_1 = 227+273=500K$
$T_2 = 27+273=300K$
$Q_A = 250$ kW
Efficiency of heat engine

$$\eta_\varepsilon = \frac{T_1 - T_2}{T_1} = \frac{Q_A - Q_R}{Q_A}$$ (Because Cycle is Reversible)

$$0.4 = \frac{250 - Q_R}{250}$$

$$\boxed{Q_R = 150 kJ/Sec}$$

468. The efficiency of Carnot cycle may be highest :

(a) By increasing the source temperature
(b) By increasing sink temperature
(c) By increasing source temperature and decreasing sink temperature simultaneously
(d) By decreasing source temperature and increasing sink temperature simultaneously

GPSC Engineer, Class-II Pre-19.01.2020
APPSC IOF, 2009

Ans. (c) : $\eta_{carnot} = \frac{T_H - T_L}{T_H} \times 100\% = 1 - \frac{T_L}{T_H} \times 100\%$

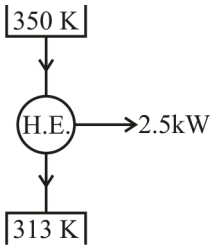
As T_H increases and T_L decreases, the $\frac{T_L}{T_H}$ decreases, and efficiency increases.

469. A solar collector receiving solar radiation at the rate of 0.6 kW/m^2 transforms it to the internal energy of a fluid at an overall efficiency of 50%. The fluid heated to 350 K is used to run a heat engine which rejects heat at 313 K. If the heat engine is to deliver 2.5 kW power, the minimum area of the solar collector required would be

(a) 8.33 m^2 (b) 16.66 m^2
(c) 39.68 m^2 (d) 79.36 m^2

Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2004, ESE 2016

Ans. (d) :



Internal energy of fluid after observing solar radiation

$= 0.6 \times \eta = 0.6 \times 0.5 = 0.3$ kW/m^2

$$\eta = 1 - \frac{T_2}{T_1} = \frac{2.5}{Q_1} = 1 - \frac{313}{350}$$

$Q_1 = 23.648$ kJ
$23.809 = 0.3 \times A$
$A = 78.82 \simeq 79$ m^2

470. The efficiency of carnot cycle when it operates between the temperature of 373 and 273 K is:

(a) 0.268 (b) 0.366
(c) 0.134 (d) 0.183

APPSC Poly Lect. Automobile Engg., 2020
CIL MT 27.02.2020

Ans. (a) : The efficiency of carnot cycle

$$\eta_{carnot\ cycle} = \frac{T_H - T_L}{T_H}$$

Given, $T_H = 373$ K
$T_L = 273$ K

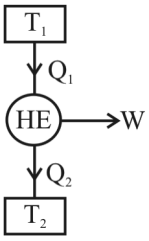
$$\eta_{carnot\ cycle} = \frac{373 - 273}{373}$$
$$= 0.268$$

471. An inventor claims a thermal engine operates between ocean layers at 27°C and 10°C. It produces 10 kW and discharges 9900 kJ/min. Such an engine is

(a) Impossible b) Reversible
(c) Possible (d) Probable

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (a) :



$T_1 = 27°C = 300$ K
$T_2 = 10°C = 283$ K
Maximum or **Carnot** efficiency

$$\eta_{max} = 1 - \frac{T_2}{T_1} = 1 - \frac{283}{300}$$
$$= 0.056 = 5.66\%$$

Actual efficiency,
$Q_s = W + Q_{rej.}$

$$Q_s = 10 + \frac{9900}{60} = 175 kW$$

$$\eta_a = \frac{W_{net}}{Q_s} = \frac{10}{175} = 5.71\%$$

Actual efficiency is more than the Carnot efficiency which is impossible.

Search on Telegram @apna_pdf

472. A heat engine is supplied with 2512kJ/min of heat at 650°C. Heat rejection with 900kJ/min takes place at 100°C. This type of heat engine is

(a) Ideal (b) Irreversible
(c) Impossible (d) Practical

GPSC Asstt. Director of Transport 05.03.2017
ESE 2012

Ans. (c) : Given, $T_1 = 373$ K, $T_2 = 923$ K

$Q_s = 2512$ kJ/min

$$\eta = 1 - \frac{Q_1}{Q_2} = 1 - \frac{T_1}{T_2}$$

$$\eta_a = 1 - \frac{900}{2512} = 64.17\%$$

$$\eta_{ideal} = 1 - \frac{373}{923} = 59.58\%$$

$\eta_a > \eta_{ideal}$

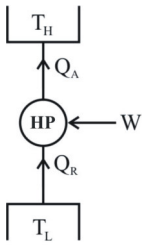
So, it is impossible.

473. A heat pump operating on Carnot cycle pump heat from a reservoir at 300 K to a reservoir at 600 K. The coefficient of performance is

(a) 1.5 (b) 0.5
(c) 2 (d) 1.0

TSPSC AEE 2017, MPPSC AE 2016

Ans. : (c)



$T_H = 600$K

$T_L = 300$K

$$(COP)_{HP} = \frac{T_H}{T_H - T_L}$$

$$(COP)_{HP} = \frac{600}{600 - 300} = 2$$

474. The efficiency of Carnot cycle is maximum for

(a) Reversible engine
(b) Gas engine
(c) Petrol engine
(d) Well lubricated engine

Vizag Steel (MT) 2017
Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (a) : In reversible engine efficiency of carnot cycle is maximum.

$\because \eta_{reversible} > \eta_{irreversible}$

Each process is reversible $\oint\left(\frac{dQ}{T}\right) = 0$

475. According to Kelvin-Planck's statement of second law of thermodynamics.

(a) It is impossible to construct an engine working on a cyclic process, whose sole purpose is to convert heat energy into work.
(b) It is possible to construct an engine working on a cyclic process, whose on a cyclic process, whose sole purpose is to convert heat energy into work.
(c) It is impossible to construct a device which operates in a cyclic process and produces no effect other than the transfer of heat from a cold body to a hot body.
(d) None of the above

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (a) : Second Law of Thermodynamics –

- **Kelvin Planck Statement–** It is impossible for a heat engine to produce net work in a complete cycle if it exchanges heat only with bodies at a single fixed temperature.
- **Clausius Statement –** It is impossible to construct a device which operating in a cycle will produce no effect other than the transfer of heat from cooler body to a hotter body.

476. A heat engine is provided with a heat input of 1800 kJ/min and the output from the engine is 9 kW. Thermal efficiency of the engine is _____.

(a) 66.66% (b) 30%
(c) 70% (d) 33.33%

VIZAG Steel MT 24.01.2021

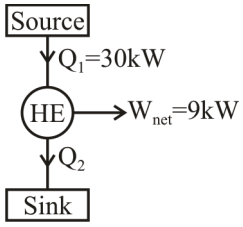
Ans. (b) : Given,

Heat input $(Q_1) = 1800$ kJ/min

$$= \frac{1800}{60} \text{kJ/sec}$$

$(Q_1) = 30$ kW

$W_{net} = 9$ kW



$\therefore$ Efficiency of heat engine $\eta_{HE} = \frac{W}{Q_1}$

$$= \frac{9}{30} \times 100 = 30\%$$

477. An engine operates between temperature limits of 900 K and T_2 and another between T_2 and 200 K. For both engine to have same efficiency, T_2 should be.

(a) 552 K (b) 320 K
(c) 424 K (d) 350 K

RPSC ACF & FRO, 26.02.2021

Search on Telegram @apna_pdf

Ans. (c) : If efficiency is same ($\eta_I = \eta_{II}$)

Intermediate temperature

$$T_2 = \sqrt{T_H T_L}$$

$$= \sqrt{900 \times 200}$$

$$\boxed{T_2 = 424.26K}$$

478. A Carnot Cycle operates between two temperature T_1 and T_2 ($T_1 > T_2$). If T_1 is increased by ΔT and T_2 is decreased by ΔT. The efficiency η_2 in the second case and the efficiency η_1 in the first case are related by :

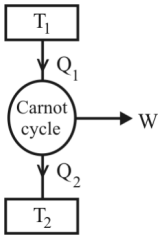
(a) $\eta_1 > \eta_2$ (b) $\eta_2 > \eta_1$

(c) $\eta_1 = \eta_2$ (d) Unpredictable

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) : Efficiency of Carnot cycle

$$\eta_1 = 1 - \frac{T_2}{T_1}$$



$$\eta_2 = 1 - \frac{(T_2 - \Delta T)}{(T_1 + \Delta T)}$$

$$\boxed{\eta \uparrow \;\; T_2 \downarrow \& T_1 \uparrow}$$

$$\boxed{\eta_2 > \eta_1}$$

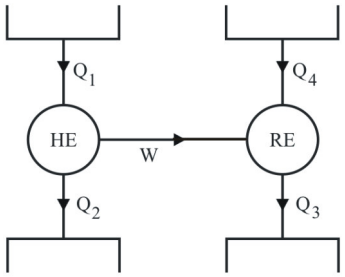
479. If an engine of 40% thermal efficiency drives a refrigerator having a coefficient of performance of 5, then the heat input to engine for each kJ of heat removed from the cold body of the refrigerator is :

(a) 0.50 kJ (b) 0.75 kJ

(c) 1 kJ (d) 1.25 kJ

RPSC ACF & FRO, 26.02.2021

Ans. (a) : Given,



$\eta_{HE} = 0.4$

$Q_4 = 1kJ$

$(COP)_{RE} = 5$

$$(COP)_{RE} = \frac{Q_4}{W} \qquad \eta = \frac{W}{Q_1}$$

$$5 = \frac{1}{0.4Q_1} \qquad W = 0.4Q_1$$

$$Q_1 = \frac{1}{0.4 \times 5}$$

$$\boxed{Q_1 = 0.5kJ}$$

480. Statement (I): A thermal energy reservoir is a system that always remains at constant temperature even though the heat is added to or removed from it.

Statement (II): A thermal reservoir that supplies heat energy is called sink and one that absorbs the heat energy is called source.

ESE 18.07.2021

Ans. (c) :

A thermal reservoir that supplies energy is termed as source and one that absorbs the heat energy is called sink.

481. An engine works on Carnot cycle. Initially it had efficiency of 40 percent. Keeping lower temperature fixed, higher temperature is raised by 10 percent. New efficiency will be:

(a) 35.35 percent (b) 30 percent

(c) 40 percent (d) 45.45 percent

AAI Jr. Executive 26.03.2021

Ans. (d) : $\eta_{carnot} = 1 - \frac{T_L}{T_H}$

$$0.4 = 1 - \frac{T_L}{T_H} \Rightarrow \frac{T_L}{T_H} = 1 - 0.4$$

$$= 0.6$$

$$T_L = 0.6\, T_H$$

$$(\eta_{carnot})_{New} = 1 - \frac{T_L}{(1.1T_H)}$$

$$(\eta_{carnot})_{New} = 1 - \left(\frac{0.6}{1.1}\right)$$

$= 45.45\%$

482. All reversible engines have _____ efficiencies.

(a) negative (b) positive

(c) zero (d) same

UPRVUNL AE 05.07.2021

Ans. (d) : All reversible engines have same efficiencies.

483. The coefficient of performance (COP) of a Carnot refrigerator is 5. If the refrigerator, operating between the same two thermal reservoirs, is used as a Carnot heat pump, the COP of the heat pump will be

(a) 4 (b) 5

(c) 6 (d) 8

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (c) : COP of heat pump

$COP_{HE} = 1 + COP_R$

$= 1 + 5$

$= 6$

Search on Telegram @apna_pdf

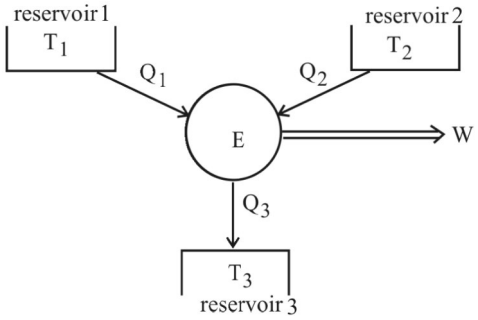
484. Which law of thermodynamics can be termed as law of degradation of energy?

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) Third law of thermodynamics

VIZAG Steel MT 24.01.2021
Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (c) : The second law of thermodynamic is termed as law of degradation of energy. This law states if energy is transferred to the system then whole energy cannot be converted to the work, some energy will move into the sink.

Study the given figure and the following problem statement in order to answer the question no. 485-487.



Consider the heat engine E shown in the figure to be a reversible one. If you are given that T_1 = 600 K, T_2 = 540 K and T_3 = 300 K and Q_1 and Q_2 are 100 kJ and 90 kJ respectively, answer the following question.

485. The heat rejected Q_3 is

(a) 190 kJ (b) 10 kJ
(c) 100 kJ (d) 90 kJ

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : $T_1 = 600$ K
$T_2 = 540$ K
$T_3 = 300$ K
$Q_1 = 100$ kJ
$Q_2 = 90$ kJ
Energy balance
$Q_1 + Q_2 = W + Q_3$
second law of thermodynamics (Clausius Inequality)

$$\frac{Q_1}{T_1}+\frac{Q_2}{T_2}-\frac{Q_3}{T_3}=0$$

$$\frac{100}{600}+\frac{90}{540}=\frac{Q_3}{300}$$

$Q_3 = 100$ kJ

486. The work output W is

(a) Zero (b) 90 kJ
(c) 100 kJ (d) 180 kJ

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : Energy balance $Q_1 + Q_2 = W + Q_3$
100 + 90 = W + 100
W = 90 kJ

487. The thermal efficiency of the cycle E is

(a) 18/19 (b) 10/19
(c) zero (d) 9/19

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) :

$$\text{Thermal efficiency} = \frac{W}{Q_1+Q_2} = \frac{90}{100+90} = \frac{9}{19}$$

488. What is the highest possible theoretical efficiency of a heat engine operating with a hot reservoir of furnace gives at 1500 K when the cooling water available is at 300 K?

(a) 60% (b) 80%
(c) 50% (d) 70%

VIZAG MT, 14.12.2020

Ans. (b) : Highest possible theoretical efficiency

$$\eta_{carnot} = 1-\frac{T_{sink}}{T_{source}}$$

$$= 1-\frac{300}{1500}$$

$$= 0.8$$

$$\boxed{\eta_{carnot} = 80\%}$$

489. The efficiency of Carnot engine is 25%. The efficiency is increased to 30% when the sink temperature is reduced by 20^0C . What will be the source temperature?

(a) 300 K (b) 400 K
(c) 500 K (d) 600 K

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given data : Efficiency (η_1) = 0.25
(η_2) = 30 % = 0.30
Let, T_1 = Source temperature
T_2 = Sink temperature

$$\eta_{max} = 1-\frac{T_2}{T_1}$$

$$0.25 = 1-\frac{T_2}{T_1} \quad \text{..... (1)}$$

when sink temperature reduce by 20^0C then –

$$0.30 = 1-\frac{(T_2-20)}{T_1} \quad \text{.....(2)}$$

Subtract equation (1) from equation (2)

$$\Rightarrow \frac{-(T_2-20)}{T_1}+\frac{T_2}{T_1} = 0.05$$

$$\Rightarrow \frac{-T_2+20+T_2}{T_1} = 0.05$$

$$\Rightarrow \frac{20}{T_1} = 0.05$$

$$\Rightarrow T_1 = \frac{20}{0.05} = \frac{2000}{5}$$

$\Rightarrow \boxed{T_1 = 400\,K}$ source temperature

Search on Telegram @apna_pdf

490. A heat engine is supplied with 1200 kW of heat at a constant temperature of 600 K and it rejects 700 kW of heat at 300 K. Which of the following is true for this heat engine?

(a) It is reversible cycle
(b) It is an irreversible cycle
(c) It is an impossible cycle
(d) The efficiency of this cycle is greater than 50%

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given data

Heat supplied (Q_s) = 1200 kW; $T_H = 600$ K

Heat rejected (Q_R) = 700 kW; $T_L = 300$ K

$$\eta_1 = \left(\frac{Q_s - Q_R}{Q_s}\right)\times 100$$

$$= \frac{500}{1200}\times 100$$

$$\eta_1 = 41.66\%$$

$$\eta_2 = \left(1 - \frac{T_L}{T_H}\right)\times 100$$

$$= 1 - \frac{300}{600} \times 100$$

$$= \frac{1}{2}\times 100 = 50\%$$

$\because \eta_1 \neq \eta_2$

Therefore, It is an irreversible cycle.

491. A reversible heat engine is operating between 800°C and 30°C. The least rate of heat rejection per kW of net output of the engine is:

(a) 0.6 kW
(b) 0.8 kW
(c) 0.2 kW
(d) 0.4 kW

NLC GET 17.11.2020, Shift-II

Ans. (d) : Given, $T_1 = 800°C$
$= 1073K$
$T_2 = 30°C$
$= 303K$
$W_{net} = 1$ kW

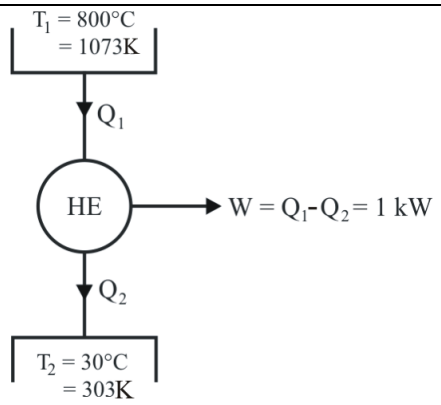
For reversible engine, the rate of heat rejection will be minimum

$$\eta_{max} = \eta_{Rev} = 1 - \frac{T_2}{T_1}$$

$$= 1 - \frac{303}{1073}$$

$$= 0.718$$

Now, $\frac{W_{net}}{Q_1} = \eta_{max} = 0.718$



$$Q_1 = \frac{1}{0.718}$$

$$= 1.392kW$$

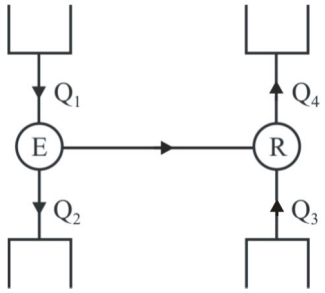
$$Q_2 = Q_1 - W_{net}$$

$$= 1.392 - 1$$

$$Q_2 = 0.392kW \approx 0.4kW$$

This is the least rate of heat rejection.

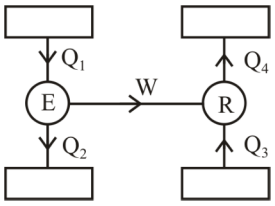
492. In the figure shown below, 'E' is the heat engine with efficiency of 0.4 and 'R' is the refrigerator, if $Q_2 + Q_4 = 3Q_1$, the COP of the refrigerator will be



(a) 3.0 (b) 4.5
(c) 5.0 (d) 5.5

UPPSC AE 13.12.2020, Paper-2, ESE 2014

Ans. (c) : Given,



$\eta_{HE} = 0.4$

$$\eta_{HE} = \frac{W}{Q_1} = 0.4$$

$$\boxed{W = 0.4Q_1}$$

$Q_1 - Q_2 = 0.4Q_1$

So, $Q_2 = 0.6\ Q_1$

$Q_2 + Q_4 = 3Q_1$

$0.6Q_1 + Q_4 = 3Q_1$

$$\boxed{Q_4 = 2.4Q_1}$$

Search on Telegram @apna_pdf

$$COP = \frac{Q_3}{W} = \frac{Q_4 - W}{W} = \frac{Q_4}{W} - 1$$
$$= \frac{2.4Q_1}{0.4Q_1} - 1$$
$$\boxed{COP = 5}$$

493. If a heat engine is receiving 900 kJ and operating at 60% efficiency, the heat rejected is:
(a) 160 kJ (b) 260 kJ
(c) 360 kJ (d) 540 kJ

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : Heat received $Q = 900$ kJ
$\eta = 60\% = 0.60$
$$\eta = \frac{W}{Q_1} \Rightarrow 0.60 = \frac{W}{900}$$
$W = 540$ kJ
$W = Q_1 - Q_2$
$Q_2 = 900 - 540$
$\Rightarrow$ $\boxed{Q_2 = 360\,kJ}$ heat rejection

494. A heat pump
(a) can be used as an air conditioner as well
(b) cannot be used as an air conditioner
(c) is a refrigerator operating in a reversed Carnot cycle
(d) a refrigerator requiring no energy

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : A heat pump can be used as air conditioner as well.
For same temperature limits,
$$(COP)_{HP} = 1 + (COP)_R = \frac{1}{\eta_{HE}}$$

495. 0.5 kg of air (ideal gas) executes a Carnot power cycle having a thermal efficiency of 50 percent. The heat transfer to the air during the isothermal expansion is 40 kJ. At the beginning of the isothermal expansion the pressure is 7 bar and the volume is 0.12 m^3. Determine the maximum and minimum temperature for the cycle in K.
(a) 292.7 K and 585.4 K
(b) 585.4 K and 292.7 K
(c) 192.3 K and 787.4 K
(d) 787.4 K and 192.3 K

RPSC IOF, 2020

Ans. (b) : The maximum and minimum temperature T_1 and T_2
$P_1V_1 = mRT_1$
$7\times10^5 \times 0.12 = 0.5 \times 287 \times T_1$
Maximum temperature
$T_1 = 585.4$ K
$$\eta_{cycle} = \frac{T_1 - T_2}{T_1}$$
$$0.5 = \frac{585.4 - T_2}{585.4}$$
Minimum temperature $T_2 = 292.7$K

496. Among the following, the low grade energy is :
(a) Water energy (b) Tidal energy
(c) Heat energy (d) Wind energy

NLC GET 17.11.2020, Shift-II

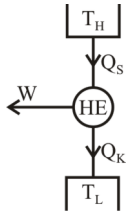
Ans. (c) : Examples of high grade energy are:
1. Mechanical work
2. Electrical work
3. Water power
4. Wind power
5. Tidal power

Examples of low grade energy are:
1. Heat or thermal energy
2. Heat derived from combustion of fossil fuels
3. Heat derived from nuclear fission or fusion

497. A heat engine is supplied heat at the rate of 1700 kJ/min and gives an output of 9 kW. The thermal efficiency will be around
(a) 31.76% (b) 35.76%
(c) 42.85% (d) 45.85%

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) :



$Q_s = 1700$ kJ/min
$$= \frac{1700}{60} kW = 28.33 kW$$
$W = 9$ kW
$$\eta = \frac{9}{\frac{1700}{60}} = 0.3176$$
$\eta = 31.76\%$

498. A Carnot cycle which operates between the temperatures of 400 K and 300 K. If 20000 kcal/hr of heat is supplied, the work output will be
(a) 3000 kcal/hr (b) 4000 kcal/hr
(c) 5000 kcal/hr (d) 6000 kcal/hr

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) : $$\eta = 1 - \frac{300}{400} = \frac{W_{output}}{20000}$$
$W_{output} = 5000$ kcal/hr.

499. The efficiency of Carnot Cycle may be increased by
(a) Increasing the highest temperature
(b) Decreasing the highest temperature
(c) Increasing the lowest temperature
(d) Decreasing the lowest temperature

RPSC IOF, 2020

Search on Telegram @apna_pdf

Ans. (a & d) : Efficiency of Carnot cycle between two (T_1 and T_2) temperature limit

$$\eta_c = 1 - \frac{T_2}{T_1}$$

Where, T_2 - lowest temperature

T_1- highest temperature

Efficiency may increased by lowering the lowest temperature and increase the highest temperature.

The efficiency of Carnot cycle is mainly depends upon lower temperature. because highest temperature is depending upon metallurgical property. so we cannot increase it beyond a limit.

500. If the COP of a Carnot refrigerator is 6, then the ratio of higher temperature to lower is :

(a) 6 : 1 (b) 3 : 2

(c) 4 : 3 (d) 7 : 6

BHEL ET 2019

Ans. (d) : Given - $(COP)_{Ref} = 6$

$$(COP)_{Ref} = \frac{T_L}{T_H - T_L}$$

$$6 = \frac{1}{\frac{T_H}{T_L} - 1}$$

$$\frac{T_H}{T_L} - 1 = \frac{1}{6}$$

$$\frac{T_H}{T_L} = \frac{1}{6} + 1$$

$$\boxed{\frac{T_H}{T_L} = \frac{7}{6}}$$

501. A thermal reservoir is a body of

(a) Small heat capacity

(b) Large heat capacity

(c) Infinite heat capacity

(d) Large work capacity

JPSC AE PRE 2019

Ans. (c) : Thermal Reservoir—It is a large body with infinite heat capacity which can supply or absorbs unlimited quantity of heat without appreciable change in its temperature.

Example—Atmosphere, ocean, river, industrial furnace, two phase mixture of liquid and vapour.

• It supplies heat then it is called a source.

• It absorbs heat then it is called a sink.

502. The statement "The efficiency of all reversible heat engines operating between the same temperature levels is the same" is known as:

(a) Corollary of Carnot theorem

(b) Zeroth law of thermodynamics

(c) First law of thermodynamics

(d) Third law of thermodynamics

SJVN ET 2019

Ans. (a) : The efficiency of all reversible heat engines operating between the same temperature level is the same is known as corollary of carnot theorem.

503. A heat engine using lake water at 12 °C as source and the surrounding atmosphere at 2°C as sink executes 1080 cycles per min. If the amount of heat drawn a per cycle is 57 J, then the output of the engine will be :

(a) 66 W (b) 46 W

(c) 56 W (d) 36 W

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (d) : Given,

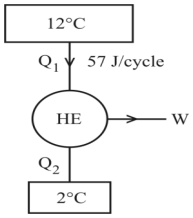
1080 cycles /min.

$Q_1 = 57 \times 1080$ J/min.

$= 61560$ J/min.

$Q_1 = 1026$ W

$$\eta = 1 - \frac{T_2}{T_1}$$



$$= 1 - \left(\frac{2+273}{12+273}\right)$$

$$\eta = 0.035$$

$$\eta = \frac{W}{Q_1}$$

$$W = \eta \times Q_1$$

$$= 0.035 \times 1026$$

$$\boxed{W = 36W}$$

504. In a Carnot cycle operating between 200°C and –20°C. If the system receives 90 kJ from the source then the net work done is :

(a) 38.65 kJ (b) 36.5 kJ

(c) 42.84 kJ (d) 62.54 kJ

HPPSC ADF 05.03.2019

Ans. (c) : $T_H = 200°C = 273 + 200 = 473$ K

$T_L = -20°C = 273 - 20 = 253$ K

$Q_s = 90$ kJ

$$\eta_{carnot} = \frac{W_{net}}{Q_s} = \frac{T_H - T_L}{T_H}$$

$$\frac{W_{net}}{90} = \frac{473 - 253}{473}$$

$$W_{net} = \frac{220}{473} \times 90$$

$$W_{net} = 41.8 \text{ kJ}$$

505. A heat engine receives 1 kW of heat transfer at 1200 K and gives out 600 W as work, with the rest as heat transfer to the ambient at 300 K. The second law efficiency of the engine is :

(a) 70% (b) 90%

(c) 80% (d) 60%

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (c) : Heat supplied (Q_S) = 1 kW

$W_{net} = 600$ W

$T_H = 1200$ K, $T_L = 300$ K

$$\eta_{Actual} = \frac{W_{net}}{Q_S} = \frac{600}{1000} = 0.60$$

$$\eta_{maximum} = \frac{T_H - T_L}{T_H} = 1 - \frac{T_L}{T_H}$$

$$= 1 - \frac{300}{1200} = 1 - 0.25$$

$$\eta_{maximum} = 0.75$$

Second law of efficiency of engine

$$\eta_{II} = \frac{\eta_{actual}}{\eta_{maximum}} = \frac{0.60}{0.75} \times 100 = 80\%$$

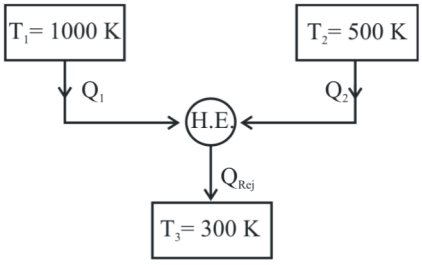
506. A heat engine receives half of its heat supply at 1000 K and remaining half at 500 K. Heat is rejected to the sink at 300 K. The maximum thermal efficiency of the heat engine will be:

(a) 55% (b) 10%

(c) 45% (d) 65%

SJVN ET 2019

Ans. (a) :



$Q_1 = Q_2 = Q/2$

From clausius inequality for reversible heat engine,

$\Delta S_{rev} = 0$

$$\frac{Q}{2000} + \frac{Q}{1000} - \frac{Q_R}{300} = 0$$

$$\frac{3Q}{2000} = \frac{Q_R}{300}$$

$$\frac{Q_R}{Q} = \frac{9}{20}$$

We know that,

$$\eta_{HE} = 1 - \frac{Q_R}{\left(\frac{Q}{2} + \frac{Q}{2}\right)}$$

$$= 1 - \frac{Q_R}{Q}$$

$$= 1 - \frac{9}{20} = 55\%$$

507. Consider the following statements:

1. The entropy of a pure crystalline substance at absolute zero temperature is zero.
2. The efficiency of a reversible heat engine is independent of the nature of the working substance and depends only on the temperature of the reservoirs between which it operates.
3. Carnot's theorem states that of all heat engines operating between a given constant temperature source and a given constant temperature sink, none has a higher efficiency than a reversible engine.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only

(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) : (i) The third law of thermodynamics defines the absolute zero of entropy. The entropy of a pure crystalline substance at absolute zero temperature is zero.

(ii) Efficiency of Carnot $= 1 - \frac{T_L}{T_H}$

Here, it is cleared that efficiency of Carnot engine depends upon the temperature of reservoirs. Working substance does not play any role in the efficiency of Carnot engine. Every heat engine works between two temperature limits and give some work out.

Carnot is a ideal case of engines that is not possible. No heat engine can be efficient as Carnot.

508. A source at a temperature of 500 K provides 1000 kJ of heat. The temperature of environment is 27°C. The maximum useful work (in kJ) that can be obtained from the heat source is

(a) 600 kJ (b) 500 kJ

(c) 400 kJ (d) 270 kJ

GPSC Executive Engineer 23.12.2018

Ans. (c) : $\eta = \frac{W_{max}}{Q_s}$

$$\eta = 1 - \frac{T_L}{T_H}$$

$$= 1 - \frac{300}{500}$$

$$= \frac{2}{5}$$

$$\frac{2}{5} = \frac{W_{max}}{Q_s}$$

$W_{max} = 400$ kJ

509. A reversible heat engine receives 2 kJ of heat from a reservoir at 1000 K and a certain amount of heat from a reservoir at 800 K. It rejects 1 kJ of heat to a reservoir at 400 K. The net work output (in kJ) of the cycle is

(a) 0.8 (b) 1.0

(c) 1.4 (d) 2.0

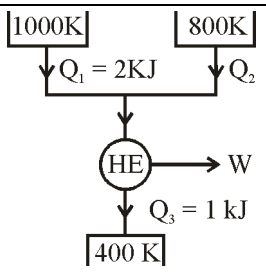
UJVNL AE 12.09.2021

GPSC Executive Engineer 23.12.2018

Ans. (c) : We know that for reversible heat engine

$\Delta S = 0$

Search on Telegram @apna_pdf



$$\frac{Q_3}{T_3}-\left(\frac{Q_1}{T_1}+\frac{Q_2}{T_2}\right)=0$$

$$\frac{1}{400}-\left(\frac{2}{1000}+\frac{Q_2}{800}\right)=0$$

$Q_2 = 0.4$

then $W = (Q_1 + Q_2) - Q_3$

$W = (2 + 0.4) - 1$

$= 1.4$ kJ

510. Compute the power required to drive a reversible refrigerator if 100 kJ/min is absorbed from the cold region and the isothermal process occurs at 40°C and -5°C.

(a) 17 kJ/min (b) 35 kJ/min

(c) 51 kJ/min (d) 25 kJ/min

GPSC ARTO Pre 30.12.2018

Ans. (a) : Given,

$Q_{absorbed} = 100$ kJ/min

$T_L = -5°C = 268$ K

$T_H = 40°C = 313$ K

$(COP)_{th} = (COP)_{act}$

$$\frac{T_L}{T_H - T_L} = \frac{Q_{absorbed}}{Power}$$

$$\frac{268}{313-268} = \frac{100}{P}$$

$$P = \frac{4500}{268} = 16.79$$

$$\boxed{P \approx 17\,kJ/min.}$$

511. An ideal Carnot engine operates between reservoirs at temperature 20 °C and 200 °C. If 10 kW of power is produced, the rate at which heat is rejected is approximately:

(a) 14.3 kJ/s (b) 12.3 kJ/s

(c) 15.3 kJ/s (d) 16.3 kJ/s

AAI Jr. Executive 29.11.2018

Ans. (d) : $T_1 = 20°C$

$T_1 = 20 + 273 = 293$ K

$T_2 = 200°C$

$T_2 = 200 + 273 = 473$ K

$W = 10$ kW

$Q_2 = ?$

$$W = Q_1\left(1-\frac{T_2}{T_1}\right)$$

$$10kW = Q_1\left(\frac{473-293}{473}\right)$$

$Q_1 = 26.27$ kW

$Q_2 = Q_1 - W = 16.27$ kW

512. A heat Engine gives an output of 3 kW when the input is 10000 joules/sec. The thermal efficiency of the engine is

(a) 30% (b) 20%

(c) 40% (d) 76.7%

ISRO Scientist/Engineer (RAC) 22.04.2018

CSE Pre-1995

Ans. (a) : $Q_{in} = 10$ kJ/s

$W_{output} = 3$ kW

$$\eta_{Therm} = \frac{W_{output}}{Q_{in}} = \frac{3}{10} = 0.3$$

$\eta_{Therm} = 30\%$

513. Which of the following devices complies with the Clausius statement of the second law of thermodynamics?

(a) Closed-cycle gas turbine

(b) Internal combustion engine

(c) Steam power plant

(d) Domestic refrigerator

ESE 2018

Ans. (d) : Clausius statement is related to refrigerator and heat pump not with heat engine.

514. A thermodynamic cycle is composed of four processes. The heat added and the work done in each process are as follows:

Process	Heat transfer (J)	Work done (J)
1- 2	0	50 (by the gas)
2 - 3	50 (from the gas)	0
3 - 4	0	20 (on the gas)
4 - 1	80 (to the gas)	0

The thermal efficiency of the cycle is

(a) 20.3% (b) 37.5%

(c) 40.3% (d) 62.5%

ESE 2018

Ans. (b) : Heat rejected $(Q_2) = 50$

Heat added $(Q_1) = 80$

Thermal efficiency of the cycle

$$\eta = 1 - \frac{Q_2}{Q_1}$$

$$= 1 - \frac{50}{80} = 37.5\%$$

515. Consider the following statements:

1. Heat pumps and air conditioners have the same mechanical components.
2. The same system can be used as heat pump in winter and as air conditioner in summer.
3. The capacity and efficiency of a heat pump fall significantly at high temperatures.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only

(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

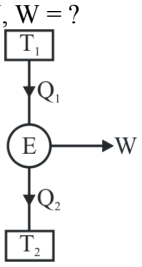
Search on Telegram @apna_pdf

Ans. (d) : Heat pumps and air conditioners have the same mechanical components.
Therefore it is not economical to have two separate systems to meet the heating and cooling requirements of a building. One system can be used as a heat pump in winter and an air conditioner in summer.
Heat pump is a device used to maintain the temperature of system higher than that of surroundings by supplying heat to system To evaluate the performance of a heat pump, COP is calculated. It is defined as the ratio of desired effect to external work supplied.
Note : The answer given by UPSC is option (b).

516. An engine works on the basis of Carnot cycle operating between temperatures of 800 K and 400 K. If the heat supplied is 100 kW, the output is
(a) 50 kW (b) 60 kW
(c) 70 kW (d) 80 kW

ESE 2018

Ans. (a) : Given,
$T_1 = 800$ K, $T_2 = 400$ K
$Q_1 = 100$ kW, $W = ?$



We know that

$$\eta = \frac{\text{Work output}}{\text{Heat supplied}}$$

$$\eta = \frac{W}{Q_1} = 1 - \frac{T_2}{T_1}$$

$$\frac{W}{100} = 1 - \frac{400}{800} = 0.5$$

$W = 50$ kW

517. If the temperature of the source is increased, the efficiency of the Carnot engine-
(a) decreases
(b) increases
(c) will be equal to the efficiency of a practical engine
(d) does not change

RPSC AE 2018

Ans. (b) : We know that the efficiency of Carnot engine.

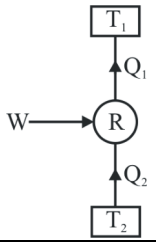
$$\eta_c = 1 - \frac{T_{sink}}{T_{source}}$$

If temperature of source T_{source} increase than $\eta_c \uparrow$

518. The coefficient of performance of a heat pump working on reversed Carnot cycle is 6. If this machine works as a refrigerator with work input of 10 kW, the refrigerating effect will be
(a) 35 kW (b) 40 kW
(c) 45 kW (d) 50 kW

ESE 2018

Ans. (d) : $(COP)_{HP} = 1 + (COP)_R$
$(COP)_R = 6 - 1 = 5$



$$(COP)_R = \frac{\text{Refrigerating effect } (R_e)}{\text{Work input}}$$

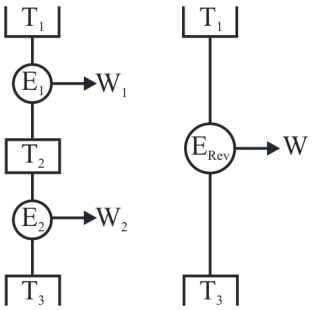
$$5 = \frac{R_e}{10}$$

$R_e = 50$ kW

519. Two reversible engines are connected in series between a heat source and a sink. The efficiencies of these engines are 60% and 50%, respectively. If these two engines are replaced by a single reversible engine, the efficiency of this engine will be
(a) 60% (b) 70%
(c) 80% (d) 90%

ESE 2018

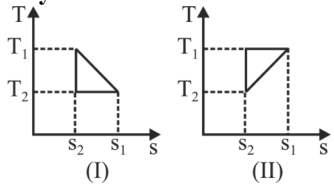
Ans. (c) : Given,
$\eta_1 = 0.6$
$\eta_2 = 0.5$



Overall efficiency of the combined engine

$\eta_0 = \eta_1 + \eta_2 - \eta_1 \cdot \eta_2$
$= (0.6 + 0.5) - (0.6 \times 0.5)$
$= 0.8$
$\Rightarrow 80\%$

520. What is the ratio of the efficiencies $\left(\frac{\eta_I}{\eta_{II}}\right)$ for the two cycles as shown in the T-s diagrams?



(a) $\frac{T_1 + T_2}{2T_1}$ (b) $\frac{T_1 + T_2}{2T_2}$
(c) $\frac{2T_2}{T_1 + T_2}$ (d) $\frac{2T_1}{T_1 + T_2}$

ESE 2018

Search on Telegram @apna_pdf

Ans. (d) : Work done is same in both the cycle but heat rejected is more in cycle-II when compared to cycle-I

$$\eta_I = \frac{\frac{1}{2}(T_1 - T_2)(S_1 - S_2)}{\frac{1}{2}(T_1 - T_2)(S_1 - S_2) + T_2(S_1 - S_2)}$$

$$= \frac{\frac{1}{2}(T_1 - T_2)}{\frac{1}{2}(T_1 - T_2) + T_2} = \frac{T_1 - T_2}{T_1 + T_2}$$

$$\eta_{II} = \frac{\frac{1}{2}(T_1 - T_2)(S_1 - S_2)}{T_1(S_1 - S_2)} = \frac{T_1 - T_2}{2T_1}$$

$$\frac{\eta_I}{\eta_{II}} = \frac{2T_1}{T_1 + T_2}$$

521. One reversible heat engine operates between 1600 K and T_2K and another reversible heat engine operates between T_2K and 400 K. If both the engines have the same heat input and output, then temperature T_2 is equal to

(a) 800 K (b) 1000 K
(c) 1200 K (d) 1400 K

Nagaland PSC (CTSE) 2018, Paper-II
ESE 1993

Ans. (a) : For same heat input and output

$$\eta_I = 1 - \frac{Q_2}{Q_1} = \eta_{II}$$

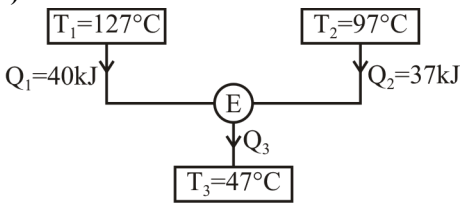
$$1 - \frac{T_2}{1600} = 1 - \frac{400}{T_2} \Rightarrow T_2\sqrt{1600 \times 400} = 800\,K$$

522. A reversible cycle receive 40 kJ of heat from one heat source at a temperature of 127°C and 37 kJ from another heat source at 97°C. The heat rejected (in kJ) to the heat sink at 47°C is

(a) 64 kJ (b) 320 kJ
(c) 640 kJ (d) 960 kJ

GPSC Executive Engineer 23.12.2018
GATE 2016

Ans. (a) :



$$\frac{Q_1}{T_1} + \frac{Q_2}{T_2} - \frac{Q_3}{T_3} = 0$$

$$\frac{40}{127 + 273} + \frac{37}{97 + 273} - \frac{Q_3}{47 + 273} = 0$$

$$\boxed{Q_3 = 64\,kJ}$$

523. A Scientist says that the efficiency of his heat engine, which works at source temperature 127°C and sink temperature 27°C is 26%, then

(a) It is impossible
(b) It is quite possible
(c) It is possible but less probable
(d) Data incomplete

GPSC EE Pre, 28.01.2017

Ans. (a) : Given,

$T_H = 127°C = 273 + 127$
$= 400K$
$T_L = 27ºC = 273 + 27$
$= 300K$
$\eta = 26\%$

We know that-

$$\eta_{carnot} = 1 - \frac{T_L}{T_H}$$

$$= 1 - \frac{300}{400} = 1 - \frac{3}{4}$$

$= 1 - 0.75$
$= 0.25$
$= 25\%$

Hence, given heat engine efficiency (η = 26%) is greater than (η_{carnot} = 25%). So, its impossible.

524. Choose the incorrect statement. The Second Law of Thermodynamics indicates that

(a) complete conversion of low grade energy into high grade energy is impossible
(b) heat and work are not completely interchangeable
(c) reversible and irreversible are two distinct processes
(d) it is possible to transfer heat from low temperature to high temperature if heat extracted is exactly equal to work delivered

Punjab PSC (Lect.) 06.08.2017

Ans. (d) : Second Law of Thermodynamics –

- **Kelvin Planck Statement–** It is impossible for a heat engine to produce net work in a complete cycle if it exchanges heat only with bodies at a single fixed temperature.
- **Clausius Statement –** It is impossible to construct a device which operating in a cycle will produce no effect other than the transfer of heat from cooler body to a hotter body.

525. An inventor claims that heat engine will develop 9 kW receiving 17500 J/s of heat while working between temperatures of 130°C and –40°C his claim

(a) Is not possible
(b) Is possible
(c) Cannot be judged
(d) Is possible with further improvements

GPSC Asstt. Director of Transport 05.03.2017

Ans. (a) : Given,

$T_1 = 130 + 273 = 403$ K
$T_2 = 273 - 40 = 233$ K
P = 9 kW,

Search on Telegram @apna_pdf

$Q_s = 17.5$ kW

$$\eta = \frac{P}{Q_s} = \frac{9}{17.5} = 0.514$$

$$\eta_c = \frac{T_1 - T_2}{T_1} = \frac{403 - 233}{403} = 0.421$$

$\eta > \eta_c$, Impossible violates second law.

526. An inventor states that his new conceptual engine, while operating between temperature limits of 377°C and 27°C, will reject 50% of heat absorbed from the source. What type of cycle will this engine have?

(a) Carnot cycle (b) Stirling cycle
(c) Impossible cycle (d) Possible cycle

GPSC Asstt. Director of Transport 05.03.2017
ESE 2012

Ans. (d) : Given,

$\eta_a = 50\% \rightarrow$ because 50% absorbed

$T_2 = 300$ K, $T_1 = 650$ K

$$\eta_c = \frac{T_1 - T_2}{T_1} = \frac{650 - 300}{650} \times 100$$

$\eta_c = 53.84\%$

So, $\eta_{actual} < \eta_{carnot}$ so, it is possible cycle.

527. For a given temperature T_1, as the difference between T_1 and T_2 increase, the COP of a carnot heat pump

(a) Increases
(b) Decreases
(c) Does not change
(d) First decrease, then increases

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : $COP_{HP} = \frac{T_H}{T_H - T_C} = \frac{T_1}{T_1 - T_2}$

$(T_1 - T_2)$ increases COP decreases for constant T_1.

528. What is the maximum rate that a heat pump which uses 1 kW of electric power can supply heat to a house at 27^0C when the outside temperature is 12^0C

(a) 50 J/s (b) 25 kJ/s
(c) 20 kJ/s (d) 30 J/s

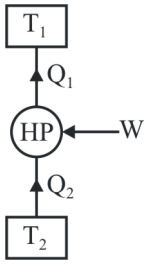
ISRO Scientist/Engineer 17.12.2017

Ans. (c) : Given,

W = 1 kW = 1 kJ/s

$T_1 = 27 + 273 = 300$ K

$T_2 = 12 + 273 = 285$ K



$$(COP)_{HP} = \frac{\text{Heating Effect}}{\text{Work Input}} = \frac{Q_1}{W} = \frac{Q_1}{Q_1 - Q_2} = \frac{T_1}{T_1 - T_2} = \frac{300}{300 - 285}$$

$(COP)_{HP} = 20$

$$\frac{Q_1}{W} = 20$$

$Q_1 = 20 \times W = 20 \times 1 = 20$ kJ/s

529. During January, at a location in Rohtang, winds at –6°C can be observed. Several meters below the ground, the temperature remains at 27°C. A scientist claims to have devised a power cycle exploiting this situation that has a thermal efficiency of 10%. Whether the claim is true?

(a) True (b) False
(c) Can't say (d) Insufficient data

ISRO Scientist/Engineer 07.05.2017

Ans. (a) : $\eta_{Ideal} = \frac{T_{max} - T_{min}}{T_{max}} = \frac{27 - (-6)}{(27 + 273)} = \frac{33}{300} \times 100 = 11\%$

$\eta_{scientist} = 10\% < \eta_{Ideal}$

Scientist claim is true since power cycle having 10% thermal efficiency is possible because Carnot efficiency is 11%.

530. Which one of the following statements is correct?

(a) A machine which violates Clausius statement will violate the first law of thermodynamics
(b) A machine which violates Kelvin-Plank statement will violate the first law of thermodynamics
(c) A machine which violates the second law of thermodynamics will violate the first law of thermodynamics
(d) A machine which violates Kelvin-Plank statement will violate the Clausius statement

UPSC JWM 2017

Ans. (d) : Kelvin Plank Statement- It is impossible for a heat engine to produced net work in a complete cycle if it exchange heat only with bodies at a single fixed temperature.

Clausius statement- It is impossible to construct an engine which operates in a cycle, transfer heat from cooler body to hotter body without any work input.

A machine which violated Kelvin plank statement will violate the clausius statement.

Search on Telegram @apna_pdf

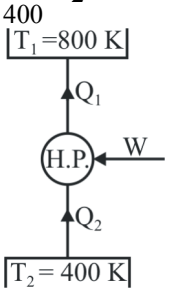
531. A heat pump operates between two heat reservoirs, one at 800 K and other at 400 K. What will be the coefficient of performance (COP) of the heat pump?

(a) 0.5 (b) 1.0
(c) 1.5 (d) 2.0
(e) 2.5

(CGPSC Polytechnic Lecturer 2017)

Ans. (d) : $[COP]_{H.P.} = \frac{T_1}{T_1 - T_2} = \frac{800}{800 - 400}$

$[COP]_{H.P.} = \frac{800}{400} = 2$



532. The efficiency (η) of a reversible heat engine receiving heat solely at T_1 and rejecting heat solely at T_2 is given by:

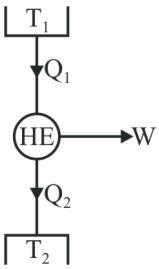
(a) $\eta = \frac{T_1 - T_2}{T_2}$ (b) $\eta = \frac{T_2 - T_1}{T_2}$
(c) $\eta = \frac{T_1 - T_2}{T_1}$ (d) $\eta = \frac{T_2 - T_1}{T_1}$
(e) $\eta = \frac{T_2 - T_1}{T_1^2}$

(CGPSC Polytechnic Lecturer 2017)

Ans. (c) : $\eta_{rev.} = \frac{W}{Q_1}$

$= \frac{Q_1 - Q_2}{Q_1}$

$\eta_{rev.} = 1 - \frac{Q_2}{Q_1}$



For reversible engine

$\frac{Q_1}{Q_2} = \frac{T_1}{T_2}$, So

$\boxed{\eta_{rev.} = 1 - \frac{T_2}{T_1}}$

$\boxed{\eta_{rev.} = \frac{T_1 - T_2}{T_1}}$

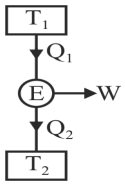
533. A heat engine working on the Carnot cycle receives heat at the rate of 50 kW from a source at 1300K and rejects it to a sink at 400K. The heat rejected is

(a) 20.3 kW (b) 15.4 kW
(c) 12.4 kW (d) 10.8 kW

ESE 2017

Ans. (b) : Given,

$T_1 = 1300$ K
$T_2 = 400$ K
$Q_1 = 50$ kW



Efficiency of engine

$\eta = \frac{\text{Work done}}{\text{Heat Supplied}}$

$\eta = \frac{W}{Q_1} = \frac{T_1 - T_2}{T_1}$ For carnot engine

$\frac{Q_1 - Q_2}{Q_1} = \frac{1300 - 400}{1300}$

$1 - \frac{Q_2}{Q_1} = \frac{9}{13} \Rightarrow \frac{Q_2}{Q_1} = 0.3076$

$Q_2 = 50 \times 0.3076$

$Q_2 = 15.38$ kW

534. A reversible heat engine rejects 80% of the heat supplied during a cycle of operation. If the engine is reversed and operates as a refrigerator, then its coefficient of performance shall be

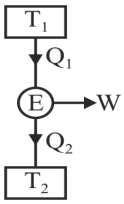
(a) 6 (b) 5
(c) 4 (d) 3

ESE 2017

Ans. (c) : Given,

$Q_2 = 0.8\ Q_1$

For heat engine



$Q_1 = W + Q_2$

$W = Q_1 - Q_2$

$W = 0.2\ Q_1$

$\eta_E = \frac{W}{Q_1}$, $\eta_E = \frac{0.2Q_1}{Q_1}$

$\eta_E = 0.2$

$1 + (COP)_R = \frac{1}{\eta_E}$

$(COP)_R = \frac{1}{0.2} - 1$, $(COP)_R = 4$

Search on Telegram @apna_pdf

535. A Carnot refrigeration cycle is used to estimate the energy requirement in an attempt to reduce the temperature of a specimen to absolute zero. Suppose that we want to remove 0.01 J of energy from the specimen when it is at 2×10^{-6} K. How much work is necessary if the high-temperature reservoir is at 20°C?

(a) 622 kJ (b) 864 kJ
(c) 1170 kJ (d) 1465 kJ

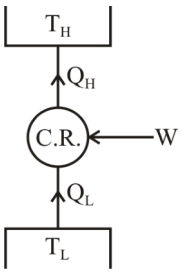
HPPSC Asstt. Prof. 20.11.2017

Ans. (d) : Given, $T_L = 2 \times 10^{-6}$ K

$T_H = 20°C = 293$ K

$Q_L = 0.01$ J

$W = ?$



$$COP = \frac{T_L}{T_H - T_L} = \frac{Q_L}{W}$$

$\therefore \quad T_H >>> T_L$

$$\frac{T_L}{T_H} = \frac{Q_L}{W}$$

$$W = \frac{Q_L}{T_L} \times T_H = \frac{0.01 \times 293}{2 \times 10^{-6}}$$

$W = 1465000$ J $= 1465$ kJ

536. A carnot engine receives 1200kJ and 3600kJ heat from reservoirs which are at 600 K and x K respectively and rejects heat of 3200 kJ to the sink which is at 400 K. Calculate x in Celsius.

(a) 800 (b) 600
(c) 427 (d) 327
(e) 227

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : From Clausius Inequality

For Reversible Process

$$\int \frac{dQ}{T} = 0$$

$$\frac{1200}{600} + \frac{3600}{x} - \frac{3200}{400} = 0$$

$x = 600$ K

$x = 600 - 273$

$x = 327°C$

537. A perfect heat engine works on the Carnot cycle between 1000^0 C and 200^0 C. The efficiency of the engine will be

(a) 80% (b) 60%
(c) 42.8% (d) 37.2%

WBPSC AE, 2017

Ans. (b) : $T_H = 1000$ °C

$= 1000 + 273 = 1273$ K

$T_L = 200°C = 200 + 273 = 473$ K

We know that,

$$\eta_{carnot} = 1 - \frac{T_L}{T_H}$$

$$= 1 - \frac{473}{1273}$$

$= 1 - 0.371$

$= 0.6284$

$\eta_{carnot} = 62.84\%$

538. A reversible engine receives heat from a reservoir at 727^0C and rejects heat at a temperature T_2. A second reversible engine operating on Carnot cycle receives heat rejected by the first engine and rejects heat to a sink at 27^0C. If work output from each of the engines is equal what is the value of temperature T_2?

(a) 775 K (b) 650 K
(c) 750 K (d) 625 K

UPRVUNL AE 21.08.2016

Ans. : (b) For Engine first–

$$\eta_1 = \frac{T_H - T_L}{T_H}$$

$$\eta_1 = \frac{1000 - T_2}{1000} = \frac{\text{work output}}{\text{Heat supplied}}$$

For Engine IInd –

$$\eta_2 = \frac{T_2 - 300}{T_2} = \frac{\text{work output}}{\text{Heat supplied}}$$

Both engine work output same

$1000 - T_2 = T_2 - 300$

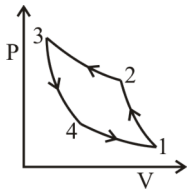
$T_2 = 650$ K

539. If the ratio of higher to lower absolute temperature is 1.5. Then COP of a heat pump working on reversed Carnot cycle will be

(a) 6 (b) 4
(c) 3 (d) 2

GPSC ARTO 01.05.2016

Ans. (c) :



For Carnot cycle 4 – 1 & 2 – 3 at constant temperature & 1 – 2 & 3 – 4 are isentropic process.

Highest temperature T_H, Lowest temperature = T_L

$T_H / T_L = 1.5$

$$\therefore \quad (COP)_{Heat\ pump} = \frac{T_H}{T_H - T_L} = \frac{T_H}{T_L(T_H/T_L - 1)}$$

$$\boxed{(COP)_{H.P} = \frac{1.5}{(1.5-1)} = 3}$$

Search on Telegram @apna_pdf

540. A heat engine is supplied heat at the rate of 1700 kJ/min and gives an output of 9 kW. The rate of heat rejection will be

(a) 17.33 kJ/sec (b) 18.33 kJ/sec
(c) 19.33 kJ/sec (d) 10.33 kJ/sec

GPSC ARTO 01.05.2016

Ans. (c) : Heat supplied $Q_s = 1700$ kJ/min

$$= \frac{1700}{60} = 28.33 \text{ kW}$$

Work output W = 9 kW

Work output $W = Q_S - Q_R$

$$\Rightarrow Q_R = Q_S - W = 28.33 - 9$$

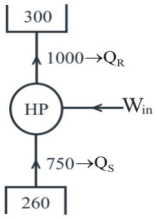
Heat rejection $\boxed{Q_R = 19.33 \text{ kW}}$

541. An industrial heat pump operates between the temperatures of 27°C and –13°C. The rates of heat addition and heat rejection are 750 W and 1000W respectively. The COP for the heat pump is :

(a) 7.5 (b) 6.5
(c) 4.0 (d) 3.0

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (c) : $W_{in} = Q_R - Q_S = 1000 - 750 = 250$ W



$$(COP)_{HP} = \frac{Q_R}{W_{in}}$$

$$= \frac{1000}{250}$$

$$(COP)_{HP} = 4$$

542. A heat engine works on a Carnot cycle with a heat sink at a temperature of 27°C. What would be the temperature of the heat at source if efficiency of the engine is 10%?

(a) 100°C (b) 90°C
(c) 60°C (d) 30°C

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : Given,

Sink temperature $(T_2) = 27 + 273 = 300$ K

We know that,

$$\eta_{\text{heat engine}} = 1 - \frac{T_2}{T_1} \qquad \text{(Reversible heat engine)}$$

$$10\% = \frac{10}{100} = 1 - \frac{300}{T_1}$$

$$T_1 = 333 \text{ K}$$

$$\boxed{T_1 = 60^0 \text{C}}$$

$\therefore$ Temperature of the heat at source 60°C.

543. A engine works on Carnot cycle between 727°C and 227°C. The efficiency of the engine is

(a) 50% (b) 75.4%
(c) 31.2% (d) 68.8%

ISRO Scientist/Engineer 03.07.2016

Ans. (a) $\eta = 1 - \frac{T_C}{T_H}$

$T_C = 227 + 273 = 500$ K

$T_H = 727 + 273 = 1000$ K

$$\eta = 1 - \frac{500}{1000}$$

$\eta = 0.5 = 50\%$

544. A heat engine working with a thermal efficiency of 35% receives 2 kW of heat from a furnace. The waste heat rejected from the engine is

(a) 0.7 kW (b) 0.35 kW
(c) 1.3 kW (d) 1.65 kW

ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Thermal efficiency = 35%

= 0.35

$Q_S = 2$ kW

$Q_R = ?$

$$\eta_{th} = 1 - \frac{Q_R}{Q_S}$$

$$0.35 = 1 - \frac{Q_R}{2 \times 10^3}$$

$$\frac{Q_R}{2} = 1 - 0.35$$

$Q_R = 2 \times 0.65$

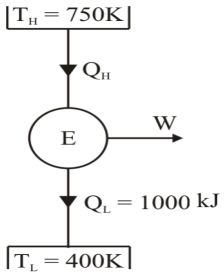
$Q_R = 1.3$ kW

545. If carnot engine rejects heat at temperature of 400 K and accepts at 750K. What shall be heat absorbed, if heat rejected is 1000 kJ.

(a) 946 kJ (b) 800 kJ
(c) 1875 kJ (d) 750 kJ

APPSC AEE Screening Test 2016

Ans. (c) :



For Carnot engine,

$\eta_{ideal} = \eta_{actual}$

$$1 - \frac{T_L}{T_H} = 1 - \frac{Q_L}{Q_H}$$

$$Q_H = \frac{1000 \times 750}{400}$$

$\boxed{Q_H = 1875 \text{ kJ}}$

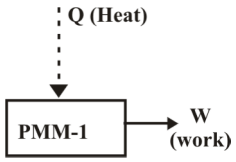
Search on Telegram @apna_pdf

546. The device that produces net work in a complete cycle by exchanging heat only with single thermal energy reservoir is known as:

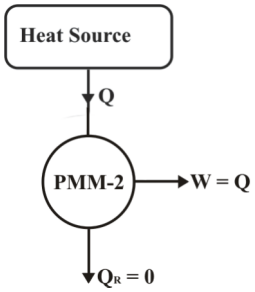
(a) PMM3 (b) Heat pump
(c) PMM2 (d) PMM1

UPRVUNL AE 07.10.2016

Ans. (c) : PMM-1—Perpetual motion machine of first kind does not exist because such machines violate the first law of thermodynamics such machines will produce the energy by itself and as we know that according to the law of energy conservation, energy could not be created or destroyed but could be converted from one form of energy to other form of energy.



PMM-2—Perpetual motion machines of second kind are those machines that violate the second law of thermodynamics because such machines will absorb continuously heat energy from a single thermal reservoir and will convert the absorbed heat energy completely into work energy.
Such machine will have 100% efficiency.



PMM-3—Perpetual motion machine of third kind of imaginary machine that has zero friction.

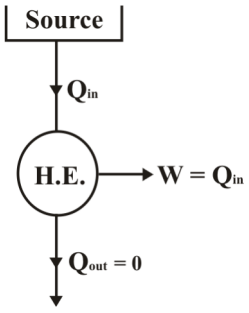
547. Perpetual motion machine of second kind (PMM-II) violates the

(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) Third law of thermodynamics

RPSC LECTURER 16.01.2016

Ans. (c) : Perpetual motion machine of second kind (PMM-II) violates the second law of thermodynamics.

$\eta_{HE} = 100\%$



548. What will be the thermal efficiency of heat engine if heat engine is supplied heat at the rate 30,000 J/s and gives out output of 9kW?

(a) 0.6 (b) 0.5
(c) 0.3 (d) 0.4

Rajasthan AE (Nagar Nigam) 2016 Shift-3
ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. (c) $\eta_{thermal} = \dfrac{\text{work output}}{\text{supplied heat}}$

Given, $W = 9\ kW = 9 \times 10^3$ J/sec
$Q_A = 30000$ J/sec

$$\eta_{thermal} = \frac{9\times10^3}{30000}$$

$$\boxed{\eta_{th} = 0.3}$$

549. Three carnot engines A, B and C having source temperatures of 750 K, 700 K and 650 K have sink temperatures respectively 400 K, 350 K and 300 K . Which engine is least efficient?

(a) Engine A (b) Engine B
(c) Engine C (d) none of these

RPSC ADE 2016

Ans. (a) :

$T_{(max)_A} = 750K$ $T_{(min)_A} = 400K$
$T_{(max)_B} = 700K$ $T_{(min)_B} = 350K$
$T_{(max)_C} = 650K$ $T_{(min)_C} = 300K$

$$\eta_A = \frac{T_{max} - T_{min}}{T_{max}} = \frac{350}{750} = 0.46 = 46\%$$

$$\eta_B = \frac{700-350}{700} = \frac{350}{700} = \frac{1}{2} = 50\%$$

$$\eta_C = \frac{650-300}{650} = \frac{350}{650} = \frac{7}{13} = 53\%$$

$\eta_C > \eta_B > \eta_A$
the least efficient engine is A.

550. Which of the following second-law statement is incorrect

(a) The entropy of an isolated system must remain constant or increase
(b) The entropy of a hot copper block decreases as it cools down
(c) If ice is melted in water in an insulated container, the net entropy decreases
(d) Work must be input if energy is transferred from a cold body to a hot body

HPPSC Asstt. Prof. 20.11.2017
RPSC VPITI 14.02.2016

Ans. (c) : We have $ds = \dfrac{dQ}{T} + s_{gen}$ (fixed mass entropy)

(i) For isolated/insulated system $\dfrac{dQ}{T} = 0$

$ds = s_{gen} > 0$ (always) Hence entropy always increases

Search on Telegram @apna_pdf

(ii) For closed system

$$\frac{dQ}{T} \Rightarrow \text{can be positive, negative or zero}$$

Hence $ds = \frac{dQ}{T} + s_{gen}$

Entropy can be positive, negative or zero.

551. An inventor claims to have developed a heat engine that receives 700 kJ of heat from a source at 500 K and produces 300 kJ of net work while rejecting the waste heat to a sink at 290 K. Which of the following is true?

(a) The claim made by inventor is false because such a heat engine violates first law of thermodynamics.

(b) The claim made by inventor is false because such a heat engine violates second law of thermodynamics.

(c) The heat engine can be possible only if all the processes are reversible.

(d) The invented engine does not violate any law so there is nothing new in the claim of the inventor.

GPSC Asstt. Prof. 28.08.2016

Ans. (b) : For a heat engine,

$$\eta_{ideal} = 1 - \frac{T_L}{T_H} = 1 - \frac{290}{500} = 1 - 0.58 = 0.42 \simeq 42\%$$

$$\eta_{actual} = 1 - \frac{Q_R}{Q_A} = 1 - \frac{300}{700} = 1 - 0.42 = 0.57 \simeq 57\%$$

$\eta_{reversible} < \eta_{cycle}$, which is not possible because it violates second law of thermodynamics.

552. Two cycles coupled in series have efficiencies 35% and 25% respectively. What is the overall efficiency?

(a) 42.5% (b) 51.25%

(c) 55% (d) 57.25%

(e) 60%

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (b) : As we know,

Overall efficiency $(\eta_0) = \eta_1 + \eta_2 - \eta_1 \times \eta_2$

$= 0.35 + 0.25 - (0.35 \times 0.25)$

$= 0.5125$

$\eta_0 = 51.25\%$

553. " All reversible heat engines operating between the same temperature have the same efficiency". This is :

(a) Rankine's theorem 2

(b) Carnot's theorem 2

(c) Brayton's theorem

(d) Sterling's theorem

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) Ist Theorem– The efficiency of an irreversible engine can not be more than a reversible engine operating b/w same temperature limits.

2nd Theorem – Efficiency of all reversible engines operating b/w same temperature limits is same.

554. Carnot cycle operates between the temperature of 1000 K and 500 K. The efficiency of the cycle is-

(a) 0.5 (b) 0.66

(c) 0.75 (d) 0.33

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (a) : Given $T_L = 500$ K, $T_H = 1000$ K

$$\eta_{carnot\ cycle} = 1 - \frac{T_L}{T_H} = 1 - \frac{500}{1000}$$

$$\boxed{\eta_{carnot\ cycle} = 0.5}$$

555. Efficiency of an engine is defined as

(a) output/ input

(b) output/ (output + losses)

(c) both A and B

(d) None of the above

VIZAG STEEL MT 2015

Ans. (c) $\eta_{engine} = \frac{output}{input}$

$\because$ input = output + losses

or $\eta_{engine} = \frac{output}{output + losses}$

or $\eta_{engine} = \frac{input - losses}{input}$

556. A manufacturer claims to have a heat engine capable of developing 15 kW by receiving heat input of 1700 kJ/min. and working between the temperature limits of 227°C and 27°C. His claim is:

(a) Justified

(b) Not possible

(c) May be possible with lot of sophistications

(d) Theoretically possible

NPCIL ET, 2015

Ans. (b) : Given- Output = 15 kW

Input = 1700 kJ/min

$= \frac{1700}{60}$ kJ/sec

$= 28.333$ kW

Higher Temperature (T_H) = 227°C = 273 + 227 = 500K

Lower Temperature (T_L) = 27°C = 273 + 27 = 300K

Ideal efficiency of heat engine $(\eta)_{ideal}$

$$= 1 - \frac{T_L}{T_H} = 1 - \frac{300}{400}$$

$= 0.4$

$$(\eta)_{Actual} = \frac{Output}{Input}$$

$$= \frac{15}{28.333}$$

$= 0.529$

Here, the actual efficiency is greater than ideal efficiency which is not possible.

Search on Telegram @apna_pdf

557. The work done in a Carnot heat engine cycle is given by

(a) $R \log r(T_1 - T_2)$ (b) $R \log_e r(T_1 - T_2)$

(c) $R.\log(T_1 - T_2)$ (d) $R \log_e(T_1 - T_2)$

TANGEDCO AE 2015

Ans. (b) : Carnot heat engine cycle consists of four process – Two isothermal and two isentropic process.

Work done during isothermal

$$W = P_1V_1 \ln\frac{V_2}{V_1} = RT_1 \ln\frac{V_2}{V_1}$$

Work done during isentropic

$$W = \frac{P_2V_2 - P_1V_1}{\gamma - 1} = \frac{R(T_2 - T_1)}{\gamma - 1}$$

Total work by the gas (including both isentropic & both isothermal process)

$$W = RT_1 \ln\frac{V_2}{V_1} + \frac{R(T_2 - T_1)}{\gamma - 1} + RT_2 \ln\frac{V_4}{v_3} + \frac{R(T_1 - T_2)}{\gamma - 1}$$

$$W = RT_1 \ln\frac{V_2}{V_1} + RT_2 \ln\frac{V_4}{V_3} \quad \text{——(I)}$$

Now– $TV^{\gamma-1} = C$

$$\frac{T_2}{T_1} = \left(\frac{V_2}{V_3}\right)^{\gamma-1} \quad \text{——(II)}$$

and

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_4}\right)^{\gamma-1} \quad \text{——(III)}$$

from equation (II) & (III)

$$\frac{V_2}{V_3} = \frac{V_1}{V_4}$$

$$\frac{V_2}{V_1} = \frac{V_3}{V_4} = \text{constant} = r \quad \text{——(IV)}$$

From equation (I) & (IV)

$$W = RT_1 \ln r + RT_2 \ln\frac{1}{r} = R \ln r(T_1 - T_2)$$

558. A reversible heat engine operating between hot and cold reservoirs delivers a work output of 74 kJ, while it rejects a heat of 86 kJ. The efficiency of this engine is

(a) 0.46 (b) 0.51

(c) 0.75 (d) 0.82

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : Given, $W_{net} = 74$ kJ, $Q_2 = 86$ kJ

$W_{net} = Q_1 - Q_2$

$74 = Q_1 - 86$

$Q_1 = 160$ kJ

$$\eta = \frac{W_{net}}{Q_1}$$

$$\eta = \frac{74}{160} = 0.46$$

559. Which one of the above hypothetical heat engine cycle represents maximum efficiency.

(a) 
(b) 
(c) 
(d) 
Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : Work done by all cases is same

$$= \frac{1}{2} \times (5-1) \times (700 - 300)$$

$= 800$ units

Heat input = Area of B-C - 5-1= $700 \times (5 - 1) = 2800$

Heat input

$$\left\{300 \times \left(\frac{5-1}{2}\right) + \frac{1}{2} \times \left(\frac{5-1}{2}\right)(700 - 300)\right\}$$

$= 1000$ units

Heat input for d is

$$\left\{300 \times (5-1) + \frac{1}{2} \times (5-1) \times (700 - 300)\right\}$$

$= 2000$

$\therefore$ Hypothetical heat engine cycle represents maximum efficiency when minimum heat input is case (b).

560. The heat to be supplied to a Carnot engine operating between 800 and 400 K and producing 100 kJ of work, is-

(a) 100 kJ (b) 200 kJ

(c) 300 kJ (d) 400 kJ

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (b) $\eta_c = 1 - \frac{T_L}{T_H} = \frac{W}{Q_S}$

$$= 1 - \frac{400}{800} = \frac{100}{Q_S} = \frac{1}{2}$$

$Q_S = 200$ kJ

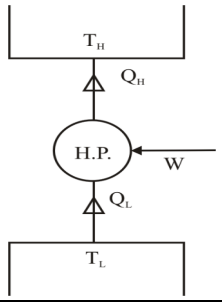
561. A house requires 60 M cal/hr in winter for heating. Heat pump absorbs heat from cold air outside and requires 8M cal/hr of work. the COP will be-

(a) 0.75 (b) 7.5

(c) 6.5 (d) 10

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (b)



Search on Telegram @apna_pdf

$Q_H = 60$ M cal/hr
$W = 8$ M cal/hr

$$(COP)_{H.P.} = \frac{60}{8} = 7.5$$

562. 300 kJ/s of heat is supplied at constant temperature of 500K to a heat engine. The heat rejection takes place at 300K. The following results are obtained (a) 210kJ (b) 180 kJ (c) 150kJ. Identify whether result is a reversible cycle, irreversible cycle or impossible cycle respectively-

(a) reversible/irreversible/impossible respectively
(b) irreversible/reversible/impossible respectively
(c) irreversible/impossible/reversible respectively.
(d) none of the above

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (b) According to Classious inequality

$$\oint \frac{\delta Q}{T} \le 0$$

(a) $+\frac{300}{500} - \frac{210}{300} < 0$ (Irreversible)

(b) $\frac{300}{500} - \frac{180}{300} = 0$ (Reversible)

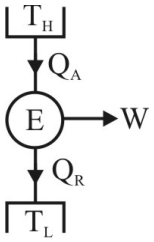
(c) $\frac{300}{500} - \frac{150}{300} > 0$ (Impossible)

563. A Carnot engine Working between 600K and 300K produces 200 KJ of work. The heat supplied is

(a) 200 KJ (b) 400KJ
(c) 2000J (d) 400 J

TSPSC AEE 2015

Ans. : (b)



$T_H = 600$ K
$T_L = 300$K
$W = 200$KJ

$$\eta_c = \frac{T_H - T_L}{T_H}$$

$$\eta_c = 0.5$$

$$\eta_c = \frac{\text{Work output}}{\text{heat supplied}}$$

$$0.5 = \frac{200}{Q_A}$$

$Q_A = 400$KJ

564. Two heat engines with efficiencies $\eta_1 = 0.8$ and $\eta_2 = 0.5$ are coupled together, then overall efficiency (η) of the system is :

(a) 0.65 (b) 0.95
(c) 0.70 (d) 0.90

KPSC ADF 2015

Ans. (d) : Given;
Efficiency of two heat engine :

$\eta_1 = 0.8$ and $\eta_2 = 0.5$

$\therefore$ overall efficiency of coupled engine (η_0)

$$= \eta_1 + \eta_2 - \eta_1 \times \eta_2$$

$$\Rightarrow \quad \eta_0 = 0.8 + 0.5 - (0.8 \times 0.5)$$

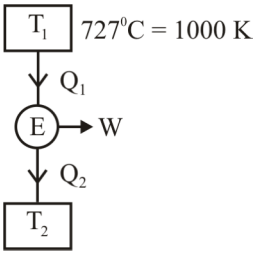
$$\boxed{\eta_0 = 0.90}$$

565. A Carnot cycle is having an efficiency of 0.75. If the temperature of high-temperature reservoir is 727^0C, what is the temperature of low-temperature reservoir?

(a) 23^0C (b) -23^0C
(c) 0^0C (d) 250^0C

Assam PSC CCE Pre 2015

Ans. (b) We know that,



$$\eta = \frac{T_1 - T_2}{T_1}$$

$$\frac{1000 - T_2}{1000} = 0.75$$

$750 = 1000 - T_2$

$T_2 = 250\text{K} = -23^0$C

566. The most efficient cycle is :

(a) Carnot Cycle
(b) Rankine Cycle
(c) Brayton Cycle
(d) Vapour Compression Cycle

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (a) : The most efficient cycle is Carnot cycle.

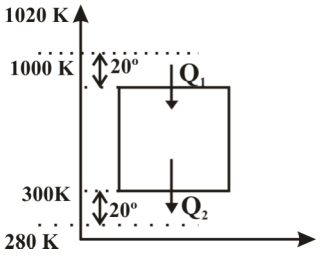
567. A Carnot cycle engine receives and rejects heat with a 20^0C temperature differential between itself and the thermal energy reservoirs. The expansion and compression processes have a pressure ratio of 50. For 1 kg of air as the working substance, cycle temperature limits of 1000 K and 300 K and T_0= 280 K, determine the second law efficiency.

(a) 0.935 (b) 0.945
(c) 0.955 (d) 0.965
(e) 0.975

CGPSC AE 26.04.2015 SHIFT-II

Search on Telegram @apna_pdf

Ans. (d)



$$\frac{W}{Q_1} = \frac{T_1 - T_2}{T_1} = \frac{(1000-300)}{1000} = 0.7$$

$$\boxed{W = Q_1 \times 0.7}$$

$$\frac{W_{max}}{Q_1} = \frac{(1020-280)}{1020}$$

$$W_{max} = 0.725\ Q_1$$

$$\eta_{II} = \frac{W}{W_{max}} = \frac{0.70 Q_1}{0.725\ Q_1}$$

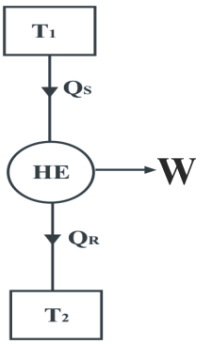
$$\boxed{\eta_{II} = 0.965}$$

568. A heat engine operates between a cold reservoir at temperature T_2 = 300K and a hot reservoir at Temperature T_1. It takes 200J of heat from the hot reservoir and deliver 120J of heat to the cold reservoir in a cycle. What will be the efficiency of the engine?

(a) 30% (b) 40%
(c) 60% (d) 20%

ISRO Scientist/Engineer 24.05.2014

Ans. (b) :



$Q_S = 200$ J
$Q_R = 120$ J
$T_2 = 300$ K

We know that,

$$\eta = \frac{W}{Q_S} = \frac{Q_S - Q_R}{Q_S}$$

$$= 1 - \frac{Q_R}{Q_S} = 1 - \frac{120}{200} = \frac{2}{5}$$

= 0.4 or 40%

569. The efficiency of carnot engine working between 800K and 400K is :

(a) 100% (b) 50%
(c) 0.5% (d) None of these

MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (b) : $\eta_{carnot} = 1 - \frac{T_2}{T_1}$

$$= 1 - \frac{400}{800}$$

$$= 1 - \frac{1}{2}$$

$$= \frac{1}{2}$$

$$\boxed{\eta_{carnot} = 50\%}$$

570. In a Carnot engine, when heat is supplied by a source :

(a) The temperature of the source decreases
(b) The temperature of the source remains constant
(c) The temperature of sink increases
(d) The temperature of both source and sink decreases

TNPSC AE (Industries) 09.06.2013

Ans. (b) : In a Carnot engine, when heat is supplied by a source the temperature of the source remains constant.

571. T_1 is high and T_2 is low temperature of a Carnot heat engine. Which is the most efficient way to increase efficiency?

(a) To increase T_1
(b) To decrease T_2
(c) To increase T_1 and T_2 both
(d) To decrease T_1 and T_2 both

UKPSC AE-2013, Paper-II

Ans. (b) : T_1 is high and T_2 is low temperature of a Carnot heat engine. The most efficient way to increase efficiency to decrease T_2.

572. A heat engine receives 1120 kJ of heat and rejects 840 kJ of heat while operating between two temperature limits of 560 K and 280 K. It indicates that the engine operates on the following cycle:-

(a) Reversible cycle
(b) Irreversible cycle
(c) Impossible cycle
(d) Unpredictable cycle

UKPSC AE-2013, Paper-II

Ans. (b) : Given as

$Q_s = 1120$ kJ, $Q_R = 840$ kJ
$T_1 = 560$ K, $T_2 = 280$ K

$$\eta_{ideal} = 1 - \frac{T_2}{T_1}$$

$$= 1 - \frac{280}{560}$$

$\eta_{ideal} = 0.50$

$$\eta_{actual} = \frac{W_{net}}{Q_s} = \frac{1120 - 840}{1120} = 0.25$$

$\eta_{actual} < \eta_{ideal}$

It indicates that the engine operates on the irreversible cycle.

Search on Telegram @apna_pdf

573. A heat engine developes 60 kW work having an efficiency of 60%, Amount of heat rejected will be:-

(a) 400 kW (b) 10 kW
(c) 40 kW (d) 20 kW

UKPSC AE-2013, Paper-II

Ans. (c) : Given as

$W = 60\ kW$

$\eta = 60\%$

$$\eta = \frac{W}{Q_{in}}$$

$$Q_{in} = \frac{60 \times 100}{60}$$

$$\boxed{Q_{in} = 100\,kW}$$

Then, $Q_R = Q_{in} - W$

$Q_R = 100 - 60$

$$\boxed{Q_R = 40\,kW}$$

574. A heat engine operates at 75% of the maximum possible efficiency. The ratio of the heat source temperature to the heat sink temperature (in Kelvin) is 5/3. The fraction of the heat supplied, that is converted to work is :

(a) 0.6 (b) 0.4
(c) 0.3 (d) 0.7

APGENCO AE 2012

Ans. (c) : Given, $\eta = 0.75$

$$\frac{T_1}{T_2} = \frac{5}{3}$$

$$\Rightarrow \quad \eta = 1 - \frac{T_2}{T_1} = 1 - \frac{3}{5}$$

$\eta = 0.4$

$$\eta = \frac{\text{Work done}}{\text{Heat supplied}}$$

Since the engines uses only 75% of maximum possible efficiency,

$$\eta = \frac{W}{Q_s}$$

$$0.75 \times 0.4 = \frac{W}{Q_s}$$

$W = 0.3\ Q_s$

575. Efficiency of Carnot engine with $T_1 = 200^0C$, $T_2 = 30^0C$ is–

(a) 85% (b) 36%
(c) 80% (d) 12%

TRB Asstt. Prof., 2012

Ans. (b) : $\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100$

Given, $T_1 = 200°C \Rightarrow 200 + 273 = 473\ K$

$T_2 = 30°C \Rightarrow 30 + 273 = 303\ K$

$$\eta = \left(1 - \frac{303}{473}\right) \times 100$$

$\eta = 35.94 \approx 36\%$

576. In a Carnot cycle, heat is transferred at

(a) constant pressure
(b) constant volume
(c) constant enthalpy
(d) constant temperature

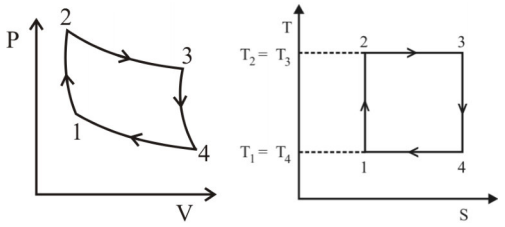
TRB Asstt. Prof., 2012

Ans. (d) : Carnot Cycle– It is an ideal cycle of work producing device.

It is not a practical working cycle because reversible adiabatic process is very fast and reversible isothermal process is very slow.

So it cannot takes place in one cycle.

Carnot consist of four process.



Process (1–2) = Reversible adiabatic compression
Process (2–3) = Reversible Isothermal heat addition
Process (3–4) = Reversible adiabatic Expansion.
Process (4–1) = Reversible Isothermal Heat Rejection.

577. An ideal engine absorbs heat at 127ºC and rejects at 77ºC. The efficiency is

(a) 13% (b) 39%
(c) 50% (d) 40%

ISRO Scientist/Engineer 2012

Ans. (a) : $T_1 = 127ºC$

$T_1 = 127 + 273 = 400K$

$T_2 = 77ºC$

$= 273 + 77 = 350K$

Efficiency $\eta = 1 - \frac{T_2}{T_1}$

$$= 1 - \frac{350}{400}$$

$\eta = 12.5\% = 13\%$

578. If maximum surface temperature of sea is 30 °C and temperature in depth is 4 °C, how much can be the maximum thermal efficiency of Ocean Thermal Conversion (OTEC) system?

(a) 8.58% (b) 13.3%
(c) 86.7% (d) none of the above

UKPSC AE 2012 Paper–II

Ans. (a) : $\eta = \frac{T_1 - T_2}{T_1} = \frac{30 - 4}{303} = \frac{26}{303} = 8.58\%$

579. Carnot cycle is not considered as a practical cycle because

(a) its p – V diagram is narrow
(b) its thermal efficiency is low
(c) heat addition takes place at high pressure
(d) heat rejection takes place at high temperature

UKPSC AE 2012 Paper–II

Search on Telegram @apna_pdf

Ans. (a) : Carnot cycle is not considered as a practical cycle because its p – V diagram is narrow.

580. An engine receives 15152 J/s of heat and produces 5 kW of power. The efficiency of the engine is

(a) 25% (b) 27.5%
(c) 30% (d) 33%

UKPSC AE 2012 Paper–II

Ans. (d) : Efficiency of engine

$$\eta = \frac{\text{Power}}{\text{heat supply}} = \frac{5}{15.152}$$

$$= 0.329 \simeq 33\%$$

581. An inventor claims to have developed an engine that takes in 105 MJ at a temperature of 400 K, rejects 42 MJ at a temperature of 200 K and delivers 15 kWh of mechanical work. Is this engine feasible ?

(a) Yes
(b) No
(c) The information given is not sufficient to find answer.
(d) May be or may not be depends upon several factors.

UKPSC AE 2012 Paper–II

Ans. (b) : $\eta_{ideal} = 1 - \frac{T_L}{T_H} = 1 - \frac{200}{400} = 0.5$

$$\eta_{actual} = 1 - \frac{Q_L}{Q_H} = 1 - \frac{42}{105} = 0.6$$

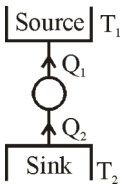
$\eta_{ideal} < \eta_{actual}$ not possible

582. If Q_1 is the heat transfer between hot temperature source & machine and Q_2 between cold temperature source & machine, then for heat pump, COP will be equal to

(a) $\frac{Q_1}{Q_1 - Q_2}$ (b) $\frac{Q_2}{Q_1 - Q_2}$
(c) $\frac{Q_1}{Q_2 - Q_1}$ (d) $\frac{Q_2}{Q_2 - Q_1}$

TNPSC ACF 2012

Ans. (a) :



$$(COP)_{HP} = \frac{Q_1}{Q_1 - Q_2}$$

$$(COP)_R = \frac{Q_2}{Q_1 - Q_2}$$

583. The Thermal efficiency of an engine which is supplied heat at the rate of 15,000 N.m/sec and gives an output of 4500 W, is

(a) 45% (b) 50%
(c) 30% (d) 33%

APPSC AEE Screening Test 2016
TNPSC ACF 2012

Ans. (c) : Q_S = 15000 Nm/sec = 1500 J/sec = 1500 W
W = 4500 W

$$\eta = \frac{W}{Q_s} = \frac{4500}{15000} = 30\%$$

584. A Carnot cycle having efficiency of 0.75. if the temperature of the high temperature reservoir is 727°C, what is the temperature of low temperature reservoir?

(a) 23°C (b) –23°C
(c) 0°C (d) 250°C

VIZAG STEEL MT 10.06.2012

Ans. (b) : Efficiency of carnet cycle (η) = 0.75

$T_H = T_{High} = 727°C$
$= 727 + 273$
$T_H = 1000$ K
$T_{Low} = T_L = ?$

$$\text{Efficiency } (\eta) = \frac{T_H - T_L}{T_H}$$

$$\Rightarrow 0.75 = \frac{1000 - T_L}{1000}$$

$\Rightarrow 750 = 1000 - T_2$
$\Rightarrow T_L = 1000 - 750 = 250$ K
$\Rightarrow T_L = 250 - 273$

$$\boxed{T_L = -23^0 C}$$

585. A Carnot engine produces 70 kW while operating between temperature limits of 927°C and 27°C. The heat rejected by the engine per second is :

(a) 10 kW (b) 20 kW
(c) 30 kW (d) 40 kW

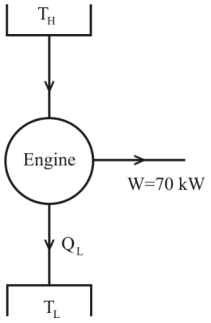
UPSC JWM Advt. No.-52/2010

Ans. (b) : Solution :

$T_H = 927°C + 273 = 1200$ K
$T_L = 27°C + 273 = 300$ K

$$\eta_{HE} = 1 - \frac{T_L}{T_H} = 1 - \frac{300}{1200} = 1 - \frac{1}{4}$$

$$\eta_{HE} = 3/4$$



also, $\eta_{HE} = \frac{Q_H - Q_L}{Q_H} = \frac{3}{4}$

$$\Rightarrow \frac{W}{Q_H} = \frac{3}{4}$$

Search on Telegram @apna_pdf

$$Q_H = W \times \frac{4}{3} = \frac{70 \times 4}{3} = \frac{280}{3}$$

$\therefore \quad Q_H - Q_L = 70$

$\Rightarrow \quad Q_L = Q_H - 70 = \frac{280}{3} - 70$

$$Q_L = \frac{70}{3}$$

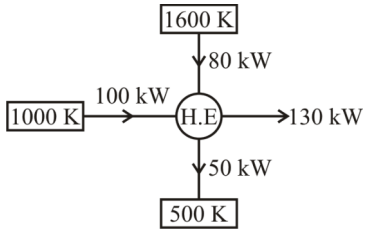
$\Rightarrow \quad \boxed{Q_L = 23.33\text{kW}} \approx 20\text{kW}$

586. An engineer claims to have developed an heat engine, which absorbs 100 kW of heat from a thermal reservoir at 1000 K, 80 kW of heat from another thermal reservoir at 1600 K, produces 130 kW of work output, and rejects heat to the thermal reservoir at 500 K. Which of the following statement(s) is (are) correct?

(a) This heat engine violates second law of thermodynamics
(b) The amount of heat rejected to the sink is 50 kW
(c) Cyclic integral of dQ/T is 0.05
(d) All of the above

APPSC IOF, 2009

Ans. (d) :



Heat rejected to sink = 100 + 80 – 130
= 50 kW

$$\oint \frac{\delta Q}{T} = \frac{100}{1000} + \frac{80}{1600} - \frac{50}{500} = 0.05$$

From Clausius inequality $\oint \frac{\delta Q}{T} \le 0$

But, here $\oint \frac{\delta Q}{T} > 0$ so violets the second law so all options are correct.

587. A heat engine is supplied with heat from a source at 1000 K and rejects heat to a sink at 300 K and this engine is operating with a thermal efficiency of 30%. The second law efficiency of this heat engine is :

(a) 60% (b) 43%
(c) 30% (d) 70%

APPSC IOF, 2009

Ans. (b) : Given, $T_1 = 1000\text{K}$, $T_2 = 300\text{K}$

$\eta_{actual} = 30\% = 0.30$

$$\eta_{carnot} = 1 - \frac{T_2}{T_1}$$

$$= 1 - \frac{300}{1000} = 1 - 0.30$$

$\eta_{carnot} = 0.70$

We know that,

$$\eta_{II} = \frac{\eta_{actual}}{\eta_{carnot}}$$

$$= \frac{0.3}{0.7}$$

$= 43\%$

588. The efficiency of a thermodynamic cycle cannot be unity due to which of the following reasons?

(a) Violates the first law of thermodynamics
(b) Violates the second law of thermodynamics
(c) Violates the third law of thermodynamics
(d) Violates the zeroth law of thermodynamics

UPSC JWM Adv. No-16/2009

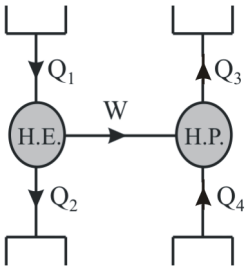
Ans. (b) : The efficiency of a thermodynamic cycle can not be unity because it violates the second law of thermodynamics.

589. A heat engine is used to drive a heat pump. The heat transfers from the heat engine and from the heat pump are used to heat the circulating water in a plant. The efficiency of the heat engine is 30% whereas the COP of the heat pump is 5. The heat transfer to the circulating water and the heat transfer to the engine bears a ratio of

(a) 0.7 (b) 0.8
(c) 1.5 (d) 2.2

DRDO Scientists 2009

Ans. (c) :



$$\frac{Q_3}{Q_1} = ?$$

$$\eta_{HE} = 0.3 = \frac{W}{Q_1}$$

$$(COP)_{HP} = 5 = \frac{Q_3}{W}$$

$$\frac{Q_3}{Q_1} = 5 \times 0.3 = 1.5$$

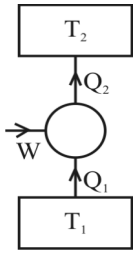
590. The COP of a Carnot heat pump operating between –3°C and 27°C is

(a) 10.0 (b) 9.0
(c) 0.111 (d) 0.10

DRDO Scientists 2008

Search on Telegram @apna_pdf

Ans. (a)



$T_1 = -3°C = 270\ K$

$T_2 = 27°C = 300\ K$

$$(COP)_{HP} = \frac{Q_2}{Q_2 - Q_1} = \frac{T_2}{T_2 - T_1} = \frac{300}{30} = 10$$

591. An inventor claims to have devised an engine that produces 2000 kJ of work while receiving 1900 kJ of heat from a single reservoir during a complete cycle of the engine. Such an engine would violate

(a) only the first law of thermodynamics and no other laws

(b) only the second law of thermodynamics and no other laws

(c) both the first and the second law of thermodynamics

(d) neither the first nor the second law of thermodynamics

DRDO Scientists 2008

Ans. (a) : An inventor claims to have developed an engine that produces 2000 kJ of work while receiving 1900 kJ, of heat. The proposed engine claims to produce more work in a cyclic process than that the amount of heat that is supplied. So it is in violation of the first law of thermodynamics.

$$\Delta U = Q - W$$

592. The efficiency η of any heat engine and efficiency η_R of a reversible heat engine operating between common heat source and heat sink are related as

(a) $\eta > \eta_R$ (b) $\eta < \eta_R$

(c) $\eta \geq \eta_R$ (d) $\eta \leq \eta_R$

ISRO Scientist/Engineer 2007

Ans. (d) : η = efficiency of any heat engine

η_R = Reversible heat engine

So, $\eta \leq \eta_R$

Any heat engine must also include reversible heat engine or Carnot engine

593. 300 kJ/sec of heat is applied at a constant fixed temperature of 290°C to a heat engine. The heat rejection takes place at 8.5°C. Then match the following :

Results obtained	Cycle
(a) 215kJ/sec are rejected	(1) reversible
(b) 150kJ/sec are rejected	(2) irreversible
(c) 75kJ/sec are rejected	(3) impossible

	A	B	C
(a)	1	2	3
(b)	2	1	3
(c)	3	2	1
(d)	1	3	2

ISRO Scientist/Engineer 2007

Ans. (b) : $Q_1 = 300$ kJ/sec

$T_1 = 290 + 273 = 563\ K$

$T_2 = 8.5 + 273 = 281.5\ K$

We know that,

$\int \frac{dQ}{T} = 0$ For reversible

$\int \frac{dQ}{T} < 0$ For irreversible

$\int \frac{dQ}{T} > 0$ Impossible

If $Q_2 = 215, Q_1 = 300$ kJ/sec

$$\frac{Q_1}{T_1} - \frac{Q_2}{T_2} = +\frac{300}{563} - \frac{215}{281.5} = -0.23$$ irreversible

When, $Q_2 = 150, Q_1 = 300$

$$\frac{Q_1}{T_1} - \frac{Q_2}{T_2} = +\frac{300}{563} - \frac{150}{281.5} = 0$$ reversible

When, $Q_2 = 75, Q_1 = 300$

$$\frac{Q_1}{T_1} - \frac{Q_2}{T_2} = \frac{300}{563} - \frac{75}{281.5} = 0.27 > 0$$ impossible

594. Which of the following is an irreversible cycle

(a) Carnot (b) Stirling

(c) All of the above (d) None of the above

J & K PSC Screening, 2006

Ans. (d) : Carnot and Stirling are reversible cycle.

595. If other factors are constant, with increase in the temperature of sink, the efficiency of Carnot engine

(a) increases

(b) remains same

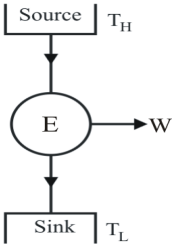
(c) decreases

(d) may increase or decrease

WBPSC AE 2003

Ans. (c) : $\downarrow \eta_{carnot} = \frac{T_H - T_L}{T_H} = 1 - \frac{T_L}{T_H} \uparrow$

If (T_L) increases then (η_c) of carnot engine decreases.



Search on Telegram @apna_pdf

4. Entropy

596. The condition for reversibility of a cycle is-

(a) Cyclic $\oint \frac{dQ}{T} < 0$ (b) Cyclic $\oint \frac{dQ}{T} > 0$

(c) Cyclic $\oint \frac{dQ}{T} = 0$ (d) None of these

TNPSC AE 2017
Nagaland PSC (CTSE) 2016, Paper-II
MPPSC AE 08.11.2015
UKPSC AE 2012 Paper–II
ISRO Scientist/Engineer 2006
WBPSC AE 2003

Ans. (c) : According to Clausius inequality–

$\oint \frac{dQ}{T} = 0$ Reversible cycle

$\oint \frac{dQ}{T} < 0$ Irreversible cycle

$\oint \frac{dQ}{T} > 0$ Impossible cycle

597. The value of $\oint \frac{dQ}{T}$ for an irreversible process is

(a) 0 (b) > 0
(c) < 0 (d) 1

RPSC IOF, 2020, Gujarat PSC AE 2019
JPSC AE PRE 2019, APPSC Poly. Lect. 2013
WBPSC AE, 2007, ESE 2011, 1994
GATE 1993

Ans. : (c) : $\oint \frac{dQ}{T} = 0$, the cycle is reversible

$\oint \frac{dQ}{T} < 0$, the cycle is irreversible and possible

$\oint \frac{dQ}{T} > 0$, the cycle is impossible.

598. An ideal gas of mass m and temperature T_1 undergoes a reversible isothermal process from an initial pressure P_1 to final pressure P_2. The heat loss during the process is Q. The entropy change ΔS of the gas is

(a) $mR\ell n\left(\frac{P_2}{P_1}\right)$ (b) $mR\ell n\left(\frac{P_1}{P_2}\right)$

(c) $mR\ell n\left(\frac{P_2}{P_1}\right) - \frac{Q}{T_r}$ (d) Zero

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
UPPSC AE 13.12.2020, Paper-2
OPSC AEE 2019 PAPER - II
BPSC AE Mains 2017 Paper - V
GATE 2012

Ans. (b) : Change in Entropy

$$S_2 - S_1 = C_p \ln\left(\frac{T_2}{T_1}\right) - mR \ln\left(\frac{P_2}{P_1}\right)$$

For Isothermal process

$$T_1 = T_2 = \text{constant}$$

$$S_2 - S_1 = -mR \ln\left(\frac{P_2}{P_1}\right)$$

$$\boxed{S_2 - S_1 = mR \ln\left(\frac{P_1}{P_2}\right)}$$

599. The increase in entropy of a system represents

(a) increase in availability of energy
(b) increase in temperature
(c) decrease in pressure
(d) degradation of energy

APGENCO AE, 2017
APPSC AEE MAINS 2016 PAPER-III
Assam PSC CCE Pre 2015
VIZAG STEEL MT 2011
CSE Pre-1994

Ans. (d) : Entropy is the measure of degree of disorderness. Increase in entropy of a system represents degradation of energy.

Entropy principle, $dS \geq \frac{dQ}{T}$

600. Area under T - S diagram represents

(a) heat transfer for reversible process
(b) heat transfer for irreversible process
(c) heat transfer for all process
(d) heat transfer for adiabatic process

Oil India Senior Officer 23.12.2020
HPPSC Asstt. Prof. 29.10.2016
UKPSC AE-2013, 2007 Paper-II
TNPSC AE 2013

Ans. (a) : For reversible process only,

$Q = \int Tds$

Hence, heat transfer for reversible process is represented by area under T-S curve.

601. The Heat transfer takes place due to

(a) Change of temperature
(b) Change in Entropy
(c) Change of pressure
(d) Mass transfer

CIL MT 27.02.2020, RPSC AE 2018
WBPSC AE, 2017
APPSC AEE Screening Test 2016

Ans. (b) : Heat transfer–

$\delta Q = Tds$

T – Absolute temperature
ds – Change in entropy

602. If the value of $\oint \frac{dQ}{T}$ is greater than zero, the nature of the thermodynamic cycle is

Search on Telegram @apna_pdf

(a) Reversible
(b) Irreversible
(c) Both reversible and irreversible
(d) Impossible

HPPSC AE 2018
TNPSC AE (Industries) 09.06.2013
UPSC JWM Adv. No-16/2009
ESE 1997

Ans. (d) : We know that Clausius inequality–

$$\oint \frac{dQ}{T} = 0 \quad [\text{Reversible cycle}]$$

$$\oint \frac{dQ}{T} < 0 \quad [\text{Irreversible cycle}]$$

$$\oint \frac{dQ}{T} > 0 \quad [\text{Impossible cycle}]$$

603. When two gases suddenly mix up with each other then resultant entropy of the system will:
(a) decrease
(b) remain same
(c) increase
(d) may increases of decrease depending upon the initial value

GPSC Engineer, Class-II Pre-19.01.2020
Kerala PSC AE (Irrigation) 05.04.2017
Kerala PSC Asstt. Prof. 27.09.2016
J&K PSC Civil Services Pre, 2013

Ans. (c) : Entropy increases when two gas mix with each other, but entropy doesn't increase when the two gases mixing are at same temperature. It is an irreversible process; can not separate them again after mixing up without external aid and changing the surroundings.
So the system prefers to be in the mixed up state than in the initial state. From second law we know that processes which increase entropy are favored over the opposite.

604. Which of the following processes is irreversible process
(a) Isothermal (b) Adiabatic
(c) Throttling (d) All of the above

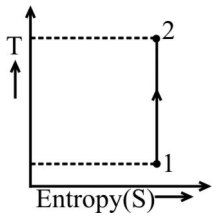
CGPSC AE 15.01.2021, WBPSC AE, 2017
Vizag Steel (MT) 2017

Ans. (c) :
Throttling process in which
- No change in enthalpy from state one to state two ($h_1 = h_2$)
- No work is done (W = 0)
- Process called isenthalpic
- Process is adiabatic (Q = 0)

605. The change in entropy is zero during ..... process.
(a) Polytropic (b) Adiabatic
(c) constant pressure (d) Hyperbolic

(HPPSC LECT. 2016), TNPSC AE 2014
UKPSC AE 2012 Paper–II

Ans. : (b)



In a reversible adiabatic process, no heat enters or leaves the gas
$\delta Q = 0$
$\delta S = 0$
Change of entropy during a reversible adiabatic process is zero. The reversible adiabatic on T-S graph is shown by a vertical straight line 1-2.

606. A system undergoes a state change from 1 to 2. According the second law of thermodynamics for the process to be feasible, the entropy change, S_2-S_1 of the system
(a) is positive or zero
(b) is negative or zero
(c) is zero
(d) can be positive, negative or zero

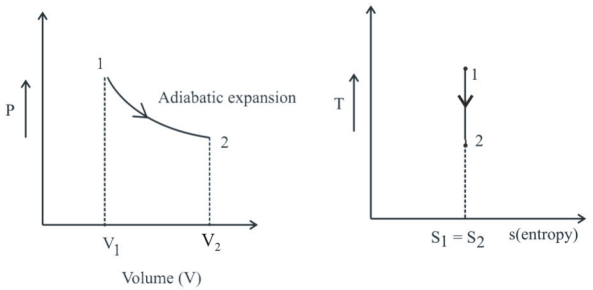
CGPSC Asstt. Workshop Supt., 17.07.2016
ISRO Scientist/Engineer 12.05.2013
GATE 1997

Ans. (d) : Entropy change $\Delta s \geq 0$ (for universe) but for system it can be (+ve), (-ve) or zero.
(Δs) universe ≥ 0
By second law of Thermodynamics.

607. During adiabatic expansion
(a) internal energy remains constant
(b) temperature remains constant
(c) entropy remains constant
(d) enthalpy remains constant

BPSC AE Mains 2017 Paper - V
TNPSC AE, 2008

Ans. (c) : During adiabatic expansion, entropy constant



608. The entropy may be expressed as a function of
(a) pressure and temperature
(b) temperature and volume
(c) heat and work
(d) All of the above

TNPSC AE 2014
APPSC Poly. Lect. 2013

Search on Telegram @apna_pdf

Ans. (a) : The entropy may be expressed as a function of pressure and temperature & also for volume.

$$\Delta s = C_p \ln\frac{T_2}{T_1} - R \ln\frac{P_2}{P_1}$$

$$\Delta s = C_v \ln\frac{T_2}{T_1} + R \ln\frac{V_2}{V_1}$$

Note-But the official answer key is given by commission TNPSC AE option is (a).

609. A process 'A' is irreversible and adiabatic process 'B' is reversible and adiabatic. The entropy change in process 'A' and process 'B', respectively are

(a) Zero and positive (b) Zero and negative
(c) Negative and zero (d) Positive and zero

Nagaland PSC (CTSE) 2016, Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (d) : If a process 'A' is irreversible and adiabatic process 'B' is reversible and adiabatic. The entropy change in process 'A' and process 'B', is positive and zero, respectively.

Process A $\rightarrow$ Irreversible and adiabatic $\rightarrow \Delta S > 0$ (positive)

Process B $\rightarrow$ Reversible and adiabatic $\rightarrow \Delta S = 0$ (zero)

610. The entropy of universe tends to

(a) become zero
(b) remain constant
(c) be maximum
(d) attain a certain finite minimum value

MPPSC AE 08.11.2015
TSPSC Managers, 2015

Ans. (c) : The entropy of universe increases and tends towards the maximum value.

According to the second law of thermodynamics, the total entropy of the system and its surroundings (universe) increases in a spontaneous process.

$$\Delta S_{uni} = \Delta S_{total} = \Delta S_{sys} + \Delta S_{surr}$$

$$\Delta S_{uni} > 0$$

Note-Option (a) is given by the commission.

611. For reversible adiabatic process, change in entropy is

(a) positive (b) negative
(c) zero (d) depends on pressure

UJVNL AE 12.09.2021
ISRO Scientist/Engineer (RAC) 07.05.2017
APPSC IOF, 2009

Ans. (c) : For reversible adiabatic process, change in entropy is zero.

We know that

$$\Delta S = \frac{\delta Q}{T} + \delta \dot{S}_{gen}$$

For adiabatic process, $\delta Q = 0$

and for reversible process, $\delta \dot{S}_{gen} = 0$

So, for reversible adiabatic process

$$\Delta S = 0$$

612. When a system undergoes a process such that $\int \frac{dQ}{T} = 0$ and $\Delta S > 0$, the process is :

(a) isothermal
(b) reversible adiabatic
(c) irreversible adiabatic
(d) isobaric

MPPSC AE 2016, CSE Pre-1999

Ans. : (c) $\int \frac{dQ}{T} = 0$ and $\Delta S > 0$

the process is irreversible adiabatic

i. $\Delta S > 0$ (Irreversible process)

ii. $\Delta S = 0$ (Reversible process)

iii. $\Delta S < 0$ (Not possible)

We know that,

$$\Delta S = \int \frac{\delta Q}{T} + \delta \dot{S}_{gen}$$

$\int \frac{\delta Q}{T}$ = change in entropy due to external heat exchange by the system

$\delta \dot{S}_{gen}$ = change in entropy due to irreversibility like friction, viscosity, etc

$\delta \dot{S}_{gen}$ = entropy generation is a path function & inexact differential.

613. In an experimental set-up, air flows between two stations P and Q adiabatically. The direction of flow depends on the pressure and temperature conditions maintained at P and Q. The conditions at station P are 150 kPa and 350 K. The temperature at station Q is 300 K. The following are the properties and relations pertaining to air:

C_p = 1.005 kJ/kgK
C_v = 0.718 kJ/kgK
R = 0.287 kJ/kgK

If the pressure at station Q is 50kPa, the change in entropy (SQ – SP) in kJ/kgK is

(a) – 0.155 (b) 0
(c) 0.160 (d) 0.355

GPSC Asstt. Director of Transport 05.03.2017
GATE 2011

Ans. (c) : Given, $P_1 = 150$ kPa, $T_1 = 350$ K

$P_2 = 50$ kPa, $T_2 = 300$ K

$$S_Q - S_P = C_v \ln\frac{T_2}{T_1} + R \ln\left[\frac{V_2}{V_1}\right]$$

$$\frac{V_2}{V_1} = \frac{P_1 T_2}{P_2 T_1} = 2.57$$

$S_Q - S_P = -0.1107 + 0.287 \ln(2.57)$

$= 0.16$ kJ/kgK

614. In an experimental set-up, air flows between two stations P and Q adiabatically. The direction of flow depends on the pressure and temperature conditions maintained at P and Q. The conditions at station P are 150 kPa and 350 K. The temperature at station Q is 300 K.

Search on Telegram @apna_pdf

The following are the properties and relations pertaining to air:
C_p = 1.005 kJ/kgK
C_v = 0.718 kJ/kgK
R = 0.287 kJ/kgK
If the air has to flow from station P to station Q, the maximum possible value of pressure in kPa at station Q is close to
(a) 50 (b) 87
(c) 128 (d) 150

GPSC Asstt. Director of Transport 05.03.2017
GATE 2011

Ans. (b) : Given, $\left[\gamma = \frac{C_P}{C_V} = 1.4\right]$

$$\frac{T_Q}{T_P} = \left(\frac{P_Q}{P_P}\right)^{\frac{\gamma-1}{\gamma}} \Rightarrow \frac{300}{350} = \left(\frac{P_Q}{150}\right)^{\frac{1.4-1}{1.4}}$$

P_Q = 87.45 kPa

615. In which one of the following processes is there an increase in entropy with no degradation of energy?
(a) Polytropic expansion
(b) Isothermal expansion
(c) Isochoric heat addition
(d) Isobaric heat addition

HPPSC Asstt. Prof. 18.09.2017
CSE Pre-1996

Ans. (b) : Isothermal expansion

616. A system of 100 kg mass undergoes a process in which its specific entropy increases from 0.3 kJ/kg K to 0.4k J/kg K. At the same time, the entropy of the surrounding decreases from 80 kJ/K to 75 kJ/K. The process is :
(a) Reversible and isothermal
(b) Irreversible
(c) Reversible only
(d) Isothermal only

GPSC ARTO Pre 30.12.2018
ESE 2017, 1997

Ans. (b) : $(dS)_{univ} = (dS)_{system} + (dS)_{surrounding}$
$= 100\,(0.4 - 0.3) + (75 - 80)$
$= 10 - 5$
$(dS)_{univ} = 5$
$(dS)_{univ} > 0 \Rightarrow$ the process is irreversible

617. In which of the following situations, the entropy change is negative?
(a) Air expands isothermally from 6 bar to 3 bar
(b) Air is compressed to half of its volume at constant pressure
(c) Air is supplied with heat at constant volume till its pressure is doubled
(d) Air expands adiabatically from 6 bar to 3 bar

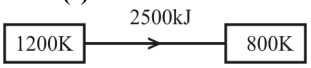
UPPSC AE 13.12.2020, Paper-2
ESE 2000

Ans. (b) : During compression process, as air is compressed to half its volume at constant pressure entropy change is negative.

618. Consider the following two processes.
(I) A heat source at 1200 K loses 2500 KJ of heat to sink at 800 K.
(II) A heat source at 800 K loses 2000 kJ of heat to sink at 500 K.
Which of the following statement is TRUE?
(a) Process (I) is more irreversible than Process (II)
(b) Process (II) is more irreversible than Process (I)
(c) Irreversibility associated in both the process is equal.
(d) Both the processes are reversible

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
GATE 2010

Ans. (b): Process-(I)

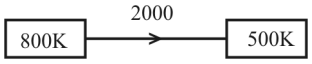


$I = T_0 \Delta S$
$I \propto \Delta S$

$$(\Delta S)_I = \left[-\frac{2500}{1200} + \frac{2500}{800}\right] = 1.04$$

$\boxed{(\Delta S)_I = 1.04}$

Process-(II)



$$(\Delta S)_{II} = \left[-\frac{2000}{800} + \frac{2000}{500}\right]$$

$\boxed{(\Delta S)_{II} = 1.5}$

$(\Delta S)_{II} > (\Delta S)_I$

Hence process (II) is more irreversible then

619. Ninety kilograms of ice at 0ºC are completely melted. Find the entropy change, in kJ/K, if T_2 = 0ºC. (Latent heat of fusion is 318.5 kJ/kg.K)
(a) 0 (b) 45
(c) 105 (d) 85

ISRO Scientist/Engineer (RAC) 12.01.2020
ISRO Scientist/Engineer 2011

Ans. (c) : mass, m = 90 kg
T = 0ºC = (0 + 273) K
= 273 K
Latent heat of fusion
l = 318.5 kJ/kgK

Entropy change $ds = \frac{ml}{T} = \frac{dQ}{T}$

$$= \frac{90 \times 318.5}{273}$$

= 105 kJ/K

Search on Telegram @apna_pdf

620. The change of entropy, when heat is absorbed by the gas, is

(a) positive (b) negative

(c) positive or negative (d) zero

TNPSC AE 2017, WBPSC AE 2008

Ans. (a) : The change of entropy, when heat is absorbed by the gas, is positive

We know that

$$\Delta S = \frac{\delta Q}{T} + \delta S_{gen}$$

then $\delta Q \uparrow \rightarrow \Delta S \uparrow$

621. Entropy generated (S_{gen}) can be taken as a criterion to indicate feasibility of process. Which of the following conditions are correct?

1. If $S_{gen} = 0$, then the process is a reversible process.

2. If $S_{gen} > 0$, then the process is an irreversible process.

3. If $S_{gen} < 0$, then the process is impossible.

Select the correct answer using the code given below:

(a) 1 and 2 only (b) 2 and 3 only

(c) 1 and 3 only (d) 1, 2 and 3

ESE 18.07.2021

Ans. (d) : All statements are correct-

- If $S_{gen} = 0$, then the process is a reversible process.
- If $S_{gen} > 0$, then the process is an irreversible process.
- If $S_{gen} < 0$, then the process is impossible.

622. Total energy of the universe

(a) is always increasing

(b) is always decreasing

(c) either increases or decreases

(d) is always constant

Assam PSC AE (IWT) 14.03.2021

Ans. (d) : The total amount of energy and matter in the universe remains constant, merely changing from one form to another. The first law of thermodynamics states that energy is always conserved, it can not be created or destroyed. In essence energy can be converted from one form into another.

623. When the potential gradient in a process is infinitesimal or zero, what will be the change in entropy of the universe?

(a) Entropy increases

(b) Entropy decreases

(c) No change in entropy

(d) None of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (c) : When the potential gradient in a process is infinitesimal or zero, then there is no change in the entropy of universe.

Note-Official answer is given as option (a).

624. One kilomole of an ideal gas is throttled from an initial pressure of 0.5 MPa to 0.1 MPa. The initial temperature is 300K. The entropy change of the universe is

(a) 13.38 kJ/K (b) 4014.3 kJ/K

(c) 0.0446 kJ/K (d) 0.0446 kJ/K

GATE, 1995

Ans. (a) Given,

M = 1 kilomole

As, $T_2 = T_1$ since ideal gas as for throttling (isenthelpic) process temperature remains constant,

$$\therefore \quad \Delta s = C_p l\,n\frac{T_2}{T_1} - R l\,n\frac{P_2}{P_1}$$

$$\Delta s = \frac{R}{M} l\,n\frac{0.1}{0.5}$$

$$= -\overline{R}\; l\,n\frac{1}{5}$$

$$\Delta s = 13.38\,kJ/K$$

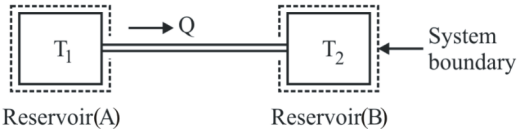
625. If heat of Q is transferred from high temperature reservoir at T_1 to the low temperature reservoir at T_2, then the entropy change of universe is :

(a) $\frac{T_1 - T_2}{T_1 T_2} Q$ (b) $\frac{T_1 - T_2}{T_1 / T_2} Q$

(c) $\frac{T_1 T_2}{T_1 - T_2} Q$ (d) $\frac{T_1 - T_2}{T_2 / T_1}$

NLC GET 17.11.2020, Shift-II

Ans. (a) : Heat Q be the rate of heat transfer reservoir at T_1 to the Flow temperature reservoir T_2



For reservoir A $\quad \Delta S_A = -\frac{Q}{T_1}$

It is negative because heat flows out of the reservoir

For reservoir B $\quad \Delta S_B = +\frac{Q}{T_2}$

It is positive because heat flows into the reservoir.

For isolated system at steady state,

$$S = S_A + S_B$$

$$(\Delta S)_{univ} = (\Delta S)_A + (\Delta S)_B$$

$$(\Delta S)_{universe} = -\frac{Q}{T_1} + \frac{Q}{T_2}$$

$$(\Delta S)_{universe} = Q\left[\frac{T_1 - T_2}{T_1 . T_2}\right]$$

$T_1 > T_2$ so $(\Delta S)_{univ}$ = +ve

So the process is irreversible and possible.

Search on Telegram @apna_pdf

626. Which of the following states, "It is impossible, by any means, to reduce any system to the absolute zero of temperature in a finite number of operations"?

(a) Kelvin - Planck's statement of II law
(b) Carnot Theorem
(c) Clausius statement of II law
(d) Fowler - Guggenheim Statement of III law

VIZAG MT, 14.12.2020

Ans. (d) : Fowler-Guggenheim Statement of III[rd] Law– It states that it is impossible, by any means, to reduce any system to the absolute zero temperature in a finite number of operations.

627. A mass of 5 kg of water at 293 K is turned completely to ice at 273 K. The entropy change in the process is

(a) 6.13479 kJ/K (b) –1.4847 kJ/K
(c) –7.6195 kJ/K (d) 8.3195 kJ/K

UPPSC AE 13.12.2020, Paper-2

Ans. (b) : Given,

Mass of water, m = 5 kg

$T_1 = 293$ K

$T_2 = 273$ K

$C_P = 4.2$ kJ/kg

Entropy change, $\Delta S = m C_p \ln\left(\frac{T_2}{T_1}\right)$

$= 5 \times 4.2 \ln\left(\frac{273}{293}\right)$

$= -1.484$ kJ/K

628. A perfect gas having $P_1 = 0.1$ N/mm^2, $V_1 = 0.18$m^3, $T_1 = 20^0$C is compressed to $\frac{1}{10}$ of its volume in an isothermal process. The change in entropy is

(a) – 141.45 J/K (b) 141.45 J/K
(c) – 4144.23 J/K (d) Zero

UPPSC AE 13.12.2020, Paper-2

Ans. (a) : Given,

$P_1 = 0.1$ N/mm^2

$V_1 = 0.18$ m^3

$T_1 = 20^0$C = 293 K

$V_2 = \frac{V_1}{10}$

Change in entropy

$\Delta S = mR \ln\left(\frac{V_2}{V_1}\right)$

$= \frac{P_1 V_1}{T_1} \ln\left(\frac{V_1}{10V_1}\right)$

$= \frac{0.1 \times 0.18}{213} \times \ln\left(\frac{1}{10}\right)$

$\boxed{\Delta S = -141.45 \text{ J/K}}$

629. If the entropy decreases in a process, the following statement is true

(a) the process is impossible
(b) the process is likely to be exothermic
(c) the process is likely to be endothermic
(d) the process cannot be irreversible

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : In exothermic process heat is removed from the system.

So, $\delta Q = -ve$

$dS = \frac{\delta Q}{T} = -ve$

$dS < 0 \Rightarrow S_2 - S_1 < 0 \Rightarrow S_2 < S_1$

630. When 7200 kJ of heat is transferred from 1000 K source to 500 K sink, the net change in entropy is about:

(a) +3 kK (b) +7 kJ
(c) –7 kJ (d) –3 kJ

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : Net change in entropy = $(\Delta S)_{source} + (\Delta S)_{sink}$

$= -\frac{7200}{1000} + \frac{7200}{500}$

$= -7.2 + 14.4$

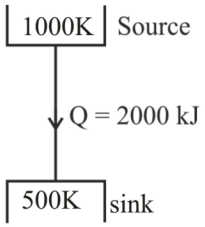
$(\Delta S)_{net} = +7.2$

631. A hot body at 1000 K transfers 2000 kJ of heat to a body at 500 K. Determine the net entropy change?

(a) +4 kJ/kg (b) –2 kJ/kg
(c) +2 kJ/kg (d) –4 kJ/kg

ISRO Scientist/Engineer 12.01.2020

Ans. (c) :



$\Delta S_{net} = \Delta S_{source} + \Delta S_{sink}$

$= \frac{-2000}{1000} + \frac{2000}{500} = -2 + 4$

$\Delta S_{net} = +2$ kJ/kg

632. Entropy of the system ..... with the addition of heat.

(a) increases
(b) decreases
(c) remains the same
(d) first increases and then decreases

APPSC Poly Lect. Automobile Engg., 2020

Ans. (a) : Entropy of the system increase with the addition of heat.

Heat addition to the system is positive i.e δQ is positive

Search on Telegram @apna_pdf

$$ds = \left(\frac{dQ}{T}\right)$$

$ds = +ve$

$ds > 0$

$S_2 - S_1 > 0$

$\boxed{S_2 > S_1}$

633. The entropy of 1 kg water (s_f) at any temperature T K in terms of specific heat of water (c_{pw}) can be expressed as :

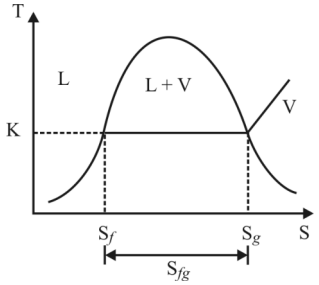
(a) $S_f = C_{pw} \log_e \frac{T}{273}$ (b) $S_f = C_{pw} \log_{10} \frac{273}{T}$

(c) $S_f = C_{pw} \log_{10} \frac{T}{273}$ (d) $S_f = C_{pw} \log_e \frac{273}{T}$

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (a) : We know that,

$ds = \int_{T_1}^{T_2} \frac{dQ}{T}$ (For Reversible system)



$T_1 = 0°C = 273\ K;\ \ T_2 = T\ K$

$(S_f) = \int_{T_1}^{T_2} \frac{mC_{pw}dT}{T}$

$\boxed{S_f = C_{pw} \log_e \frac{T}{273}}$

634. Which of the following represents the slope of constant pressure line on T-s diagram of an ideal gas? [where, C_p and C_v are specific heat of gas]

(a) $\frac{T}{C_P}$ (b) $\frac{T}{C_P^2}$

(c) $\frac{T}{C_v}$ (d) $\frac{T^2}{C_p}$

SJVN ET 2019

Ans. (a) : For unit mass, heat addition on during constant pressure process -

$\delta q = C_p dT$

$\frac{\delta q}{T} = C_p \frac{dT}{T}$

$ds = C_p \frac{dT}{T}$ or $\frac{dT}{ds} = \frac{T}{C_p}$

635. The entropy will usually increase when

1. **A molecule is broken into two or more smaller molecules.**
2. **A reaction occurs that results in an increase in the number of moles of gas.**
3. **Process is adiabatic**
4. **Process is reversible adiabatic**
5. **A liquid changes to a gas**

(a) 1, 2, 4 and 5 (b) 2, 3 and 5

(c) 1, 2, 3 and 5 (d) 1, 2 and 4

Gujarat PSC AE 2019

Ans. : (c) : The entropy will usually increase when-

- A molecule is broken into two or more smaller molecules.
- A reaction occurs that results in an increase in the number of moles of gas.
- Process is adiabatic.
- A liquid changes to a gas.

636. If 'T' refers to temperature and S refers to heat, then for a process from state 1 to state 2 heat transfer in a reversible process is given by

(a) $T_0 \times (S_2 - S_1)$ (b) $\frac{T_0}{(S_2 - S_1)}$

(c) $\frac{S_2 - S_1}{T_0}$ (d) $S_2(T_2 - T_1)$

TNPSC AE 2019

Ans. (a) : We know that

$\frac{\delta Q}{T} = \Delta S$ (for reversible process)

So heat maximum heat transfer

$\delta Q = T_0 \times (S_2 - S_1)$

637. Anything that generates entropy always.

(a) increases enthalpy

(b) decreases pressure

(c) decreases energy

(d) lowers chemical reaction

TNPSC AE 2018

Ans. (b) : Anything that generates entropy always decreases pressure.

638. The entropy of water at 0 K is assumed to be

(a) 1 JK^{-1} (b) -1 JK^{-1}

(c) 10 JK^{-1} (d) 0

ISRO Scientist/Engineer 22.04.2018

Ans. (d) : The entropy of water at 0 K is assumed to be zero.

639. A simple compressible substance inside a cylinder undergoes a change of state quasi-statistically, isothermally and at constant pressure of 1.5 MPa. If the enthalpy change for the system is 4000 kJ at 150°C, what is the corresponding change in its entropy?

(a) 9.45 kJ K^{-1} (b) 26.67 kJ K^{-1}

(c) 14.17 kJ K^{-1} (d) 0

ISRO Scientist/Engineer 22.04.2018

Ans. (a) : Firstly the substance is not ideal gas, so don't try to use formula for change in entropy for ideal gas. The situation is basically phase change as temperature is constant.

Search on Telegram @apna_pdf

We know that **dH = TdS + VdP**
At constant pressure dH = TdS (dP = 0)

$$dS = \frac{dH}{T}$$

The entropy change is given as –

$$dS = \frac{4000}{150+273}$$

dS = 9.45 kJ/K

640. The entropy __ in an irreversible cyclic process.
(a) remains constant (b) decreases
(c) increases (d) None of the above

Sikkim PSC (Under Secretary), 2017

Ans. (c) : The entropy increases in an irreversible process. $\boxed{\begin{matrix} dS > 0 \\ \frac{dQ}{T} < 0 \end{matrix}}$

641. 273 kg of ice at 0ºC is completely melts into water at 0ºC. Find the entropy change, in kJ/K. (Take Latent heat of fusion of ice = 335 kJ/kg)
(a) 0 (b) 335
(c) 91.5 (d) 0.335

GPSC EE Pre, 28.01.2017

Ans. (b) : Given,
m = 273 kg
T = 0ºC = 273 K
L = Q =Latent heat = 335 kJ/kg

$$\text{Change entropy (ds)} = \frac{mL}{T}$$

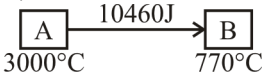
$$= 273 \times \frac{335}{273}$$

= 335 kJ/K

642. 10460 J of heat from a body of 3000°C is transferred to another body at 770°C. The change of entropy in this case is
(a) 3486 J/K (b) 35 J/K
(c) 11.6 J/K (d) 6.1 J/K

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : Given, T_A = 3000°C, T_B = 770°C
Heat transfer (ΔQ) = 10460 J



Entropy change for A,

$$\Delta s_1 = \frac{\Delta Q}{T_A} = \frac{-10460}{3000+273} = \frac{-10460}{3273}$$

$$= -3.19 \text{ J/k}$$

Entropy change for B, $\Delta s_2 = \frac{\Delta Q}{T_B} = \frac{10460}{770+273} = \frac{10460}{1043}$

= 10.02 J/K

Entropy change for system = $\Delta s_1 + \Delta s_2$
= –3.18 + 10.02
= 6.83 J/K

643. The entropy of a hot baked potato decreases as it cools.
(a) The above statement is correct
(b) The above statement is incorrect as it violates the increase in entropy principle
(c) Too less information to comment
(d) The above statement is incorrect as it violates second law of thermodynamics

ISRO Scientist/Engineer 07.05.2017

Ans. (a) : The entropy of a baked potato decreases as it cools. This statement is correct because with decrease in temperature, potato entropy decrease, but heat released into surroundings will increase the entropy of surrounding. So, as per entropy principle

$$(\Delta S)_{universe} \geq 0$$

where $(\Delta S)_{universe} = (\Delta S)_{system} + (\Delta S)_{surrounding}$

644. Entropy per unit mass is
(a) An extensive property
(b) An intensive property
(c) It may be intensive or extensive
(d) All of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : Entropy per unit mass, is specific entropy which is a intensive property. Intensive property are those which are independent of mass.

645. Entropy generation in closed system is:
(a) equal to zero for irreversible process
(b) less than zero for irreversible process
(c) greater than zero for reversible process
(d) greater than zero for irreversible process
(e) Less than zero for reversible process

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : For closed system
(a) For Reversible Process

S.No.	Conditioned	Change in Entropy
1.	Heat is Supplied to the system	Increases
2.	Heat Rejected by the system	Decreases
3.	Adiabatic Process	Constant

(b) For Irreversible Process.

S.No.	Conditioned	Change in Entropy
1.	Heat is supplied to the system	Increases
2.	Heat is rejected by the system	Increases, Decreases Remains Constant
3.	Adiabatic Process	Increases

- $(ds)_{rev} = \frac{dQ}{T}$
- $(ds)_{irrev} = \frac{dQ}{T} + (\delta s)_{generation}$.

Search on Telegram @apna_pdf

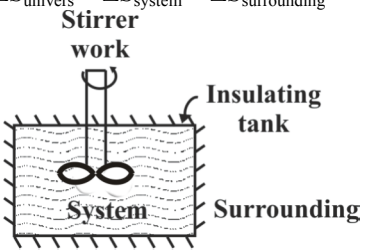
646. Stirrer work supplied to liquid in insulating chamber increases its temperature from T_1 to T_2. The change in entropy of universe will be: (where C_p = specific heat of liquid)

(a) $C_p \ln \frac{T_1}{T_2}$ (b) Zero

(c) Negative (d) $C_p \ln \frac{T_2}{T_1}$

UPRVUNL AE 07.10.2016

Ans. (d) : $\Delta S_{univers} = \Delta S_{system} + \Delta S_{surrounding}$



$$\Delta S_{system} = C_P \ln \frac{T_2}{T_1}$$

$\Delta S_{surrounding}$ = zero

$$\Delta S_{universe} = C_P \ln \frac{T_2}{T_1}$$

647. The entropy increase of the solid substance as it melts into liquid at 27°C (latent heat of fusion of substance = 400 kJ/kg)

(a) 14.8 kJ/kg-K (b) 120 MJ/kg-K

(c) 10.8 MJ/kg-K (d) 1.33 kJ/kg-K

RPSC LECTURER 16.01.2016

Ans. (d) :

$$\Delta S = \frac{\delta Q}{T} = \frac{L.H.F.}{T} = \frac{400}{300}$$

ΔS = 1.33 kJ/kg-K

648. During fusion, the entropy of the system:

(a) decreases (b) increases

(c) always remains constant (d) none of these

(HPPSC LECT. 2016)

Ans. : (b) During fusion, the entropy of the system increases.

649. When the air is throttled, there is an entropy increase. For 2 kg/s of air the entropy increase by 0.06 kW/K . The pressure ratio (final to initial state) is [for air, characteristic gas constant= 0.287 kJ/kgK]

(a) 0.9 (b) 1.0

(c) 0.8 (d) None of these

RPSC ADE 2016

Ans. (a) : Throttling process dH = 0 = m c_p (T_2-T_1)

or $T_1 = T_2$

$$S_2 - S_1 = m c_p \ln \frac{T_2}{T_1} - mR \ln \frac{P_1}{P_2} \text{ (for any process)}$$

0.06 = 0 + 2 × 0.287 ln (1/pressure ratio)

Pressure ratio = 0.9007

650. Entropy at absolute zero temperature is zero for:

(a) Glass fibre

(b) Natural perfect gas

(c) Imperfect and impure substance

(d) Perfect crystal

HPPSC Lect. (Auto) 23.04.2016

Ans. (d) : Entropy at absolute zero temperature is zero for perfect crystal.

Third law of thermodynamics states that the entropy of a system approach a constant value as the temperature approaches zero. At zero temperature the system must be in a state with minimum thermal energy.

651. A rigid insulated cylinder has two compartments separated by a thin membrane. While one compartment contains one kmol of nitrogen at certain temperature and pressure, the other contains one kmol of carbon dioxide at the same pressure and temperature. The membrane is ruptured and the two gases are allowed to mix. Assume that the gases behave as ideal gases. Calculate the increase in entropy of the contents of the cylinder. Universal gas constant is 8314.35/kmol-K.

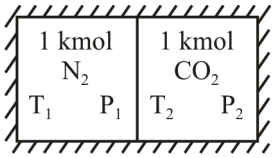
(a) 9.525 kJ/K (b) 10.525 kJ/K

(c) 11.525 kJ/K (d) 12.525 kJ/K

(e) 13.525 kJ/K

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) :



Irreversibility = $T_0 S_{gen}$

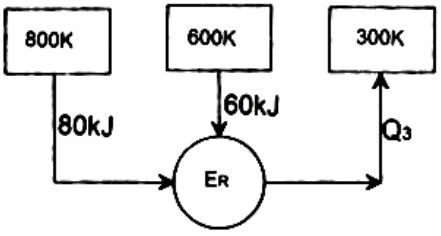
$$S_{gen} = \Delta S_{system}$$

$$= -R\left(n_1 \ln \frac{x_1}{x_2 + x_1} + n_2 \ln \frac{x_2}{x_1 + x_2}\right)$$

$$= -8.314\left[1 \ln\left(\frac{1}{2}\right) + 1 \ln\left(\frac{1}{2}\right)\right]$$

= –8.314 [2 × (–0.693)] = 11.525 kJ/K

652. Calculate the thermal efficiency of reversible heat engine shown in the figure below.



(a) 52% (b) 54%

(c) 57% (d) 61%

(e) 65%

CGPSC Asstt. Workshop Supt., 17.07.2016

Search on Telegram @apna_pdf

Ans. (c) : As we know,

$$Q_1 + Q_2 - Q_3 = W$$

So, $$\frac{Q_1}{800} + \frac{Q_2}{600} - \frac{Q_3}{300} = 0$$

$$\Rightarrow \quad \frac{80}{800} + \frac{60}{600} = \frac{Q_3}{300} \Rightarrow Q_3 = 60\,\text{kJ}$$

$$W = 80 + 60 - 60 = 80\ \text{kJ}$$

$$\eta = \frac{W}{Q_1 + Q_2} = \frac{80}{80 + 60} \times 100 = 57\%$$

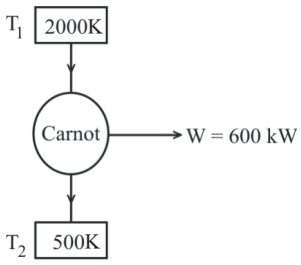
653. A carnot cycle operates between the temperature limits of 500 K and 2000 K and produces 600 kW of net power. The rate of entropy change of the working fluid during heat addition process is :

(a) 1.2 kJ/kg-K (b) 0.3 kJ/kg-K

(c) 2.5 kJ/kg-K (d) Data insufficient

GPSC Lect. (Auto) 16.10.2016

Ans. (*)



$$\eta = 1 - \frac{T_2}{T_1}$$

$$= 1 - \frac{500}{2000} = 1 - 0.25$$

$$\eta = 0.75$$

$$\eta = \frac{W}{Q_s}$$

$$Q_s = \frac{W}{\eta} = \frac{600}{0.75} = 800\text{kW}$$

Entropy during heat addition $= \frac{Q_s}{T_1} = \frac{800}{2000} = \frac{0.4\text{kW}}{\text{K}}$

$0.4\frac{\text{kW}}{\text{K}}$ will be correct answer.

Note-Official answer given by commission is (c).

654. Which of the following is a thermodynamic process where the entropy of the system remains constant throughout?

(a) Isentropic process (b) Isosceles process

(c) Isoclinic process (d) None of these

KPCL AE 2016

Ans. (a) : Entropy of the system remains constant (s = constant) is isentropic process.

655. Which of the following statements is FALSE?

(a) A mixture of an ideal gas also behaves as an ideal gas

(b) The enthalpy of an ideal gas is a function of temperature only

(c) The entropy of an ideal gas is a function of temperature only

(d) The temperature of an ideal gas always decreases during isentropic expansion

Nagaland PSC (CTSE) 2016, Paper-II

Haryana PSC Civil Services Pre, 2014

Ans. (c) : Entropy of an ideal gas is not a function of temperature. Enthalpy & internal energy is a function of temperature only.

656. 1 kg of water at room temperature is brought into contact with a high temperature thermal reservoir. The entropy change of the universe is :

(a) Equal to entropy change of the reservoir

(b) Equal to entropy change of water

(c) Equal to zero

(d) Always positive

HPPSC Asstt. Prof. 18.11.2016

ISRO Scientist/Engineer (RAC) 2013

GATE 2010

Ans. (d) : Entropy change of universe is always positive

$$(\Delta S)_{\text{universe}} = (\Delta S)_{\text{system}} + (\Delta S)_{\text{surrounding}} > 0$$

657. Which of the following is incorrect?

(a) Entropy is an extensive property

(b) Entropy depends on mass of the system

(c) Entropy of a system increases with absorption of heat

(d) All of the above

(e) None of these

CGPSC AE 16.10.2016

Ans. (e) : As we know, entropy is an extensive property it depends on the mass & entropy of a system increase with the absorption of heat. So (a), (b) & (c) are correct statements.

658. Which of the followings is correct statement?

(a) Entropy of isolated system always decreases

(b) Energy always degrades during the real process

(c) Energy always destroyed during the real process

(d) Heat transfer through a finite temperature difference is reversible process

UPRVUNL AE 07.10.2016

Ans. (b) : • Entropy of isolated system always increase or remain constant.

- Energy always degrades during the real process.
- Energy losses occur during the real process not destroyed.
- Heat transfer through a finite temperature difference is irreversible process.

Search on Telegram @apna_pdf

659. Which one of the following is incorrect with reference to Clausius inequality statement?

(a) For reversible process : $\Delta S = 0$
(b) For irreversible process : $\Delta S > 0$
(c) For impossible process : $\Delta S < 0$
(d) None of the above

TANGEDCO AE 2015

Ans. (d) :

660. An electric current of 1 amp flows through a resistor of 300 ohm, which is in contact with a reservoir at 300 K. At steady state, the rate of entropy generation of the universe is

(a) 1 W/K (b) 2 W/K
(c) 2 J/K (d) 1 J/K

Assam PSC CCE Pre 2015

Ans. (a) Given,
I = 1 amp, R = 300 Ohm, T = 300 K
We know that,

$$Q = I^2Rt$$
$$= 1 \times 300 \times 1$$
$$= 300 \text{ J}$$
$$(\Delta S)_{universe} = (\Delta S)_{system} + (\Delta S)_{surrounding}$$
$$= 0 + \frac{300}{300}$$
$$= 1 \text{ J/K}$$

So rate of entropy generation of universe is
$(\Delta s)_{universe} = 1$ J/sec K = 1 W/K

661. An electric motor of 15 kW is subjected to a braking test for 1/2 hour. The heat generated by the frictional forces in the process is transferred to the surroundings at 27°C. The resulting entropy change will be

(a) 90 kJ/K (b) 180 kJ/K
(c) 55.5 kJ/K (d) 1000 kJ/K

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : Given, Electric power (P) = 15 kW

$$t = \frac{1}{2}\text{hour} = 1800 \text{ second}$$
$$T = 27 + 273$$
$$T = 300 \text{ K}$$

Total energy supplied to electric motor

$$Q = Pt = 15 \times 1800 = 27000 \text{ kJ}$$
$$dS = \frac{dQ}{T} = \frac{15 \times 1800}{300} = 90 \text{ kJ/K}$$

Resulting entropy change will be,
dS = 90 kJ/K

662. The correct statement regarding entropy is that:

(a) Entropy is a path function
(b) Entropy can be obtained from a direct measurement of Q and T
(c) During a change of a state of a system, the entropy change is the same whether that change has occurred via a reversible process or an irreversible one
(d) Entropy of an isolated system is zero

OPSC AEE 2015 PAPER - II

Ans. : (c) Entropy:– During a change of a state of a system, the entropy change is the same whether that change has occurred via a reversible process or an irreversible one.
Clausies theorem:- The cyclic intergal of the quantity δQ/T for a reversible process in zero. This suggest that the quantity δQ/T is a point function and hence a property of the system.

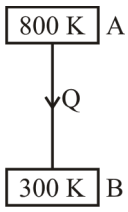
$$\int_1^2 \left(\frac{\delta Q}{T}\right)_{rev} = \int_1^2 dS = S_2 - S_1$$

663. Heat flows between two reservoirs having temperatures 800 K and 300 K, respectively. If the entropy change of the cold reservoir is 20 kJ/K, then what is the entropy change for the hot reservoir?

(a) −7.5 kJ/K (b) −5 kJ/K
(c) 5 kJ/K (d) 7.5 kJ/K

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) :



$$(ds)_B = \frac{Q}{T} = 20$$
$$= \frac{Q}{300} = 20$$
$$Q = 6000 \text{ kJ/K}$$
$$(ds)_A = -\frac{Q}{800} = -\frac{6000}{800} = -7.5$$
$$\boxed{(ds)_A = -7.5 \text{ kJ/K}}$$

664. Identify the effect on the entropy, when a closed system is undergoing an irreversible process.

(a) Entropy will rise
(b) Entropy remains constant
(c) Value of entropy will fall
(d) Can increase, decrease or remain constant

UPRVUNL AE 2014

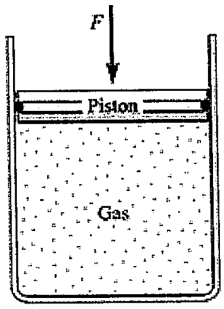
Ans. : (d) Close system, irreversible process

$$\frac{dQ}{T} \le 0 \qquad (dQ = T.\, dS)$$

It means, Entropy can increase, decrease or remains constant.

665. As shown in Fig. below, an ideal gas is confined to a cylinder by a piston. The piston is pushed down slowly so that the gas temperature remains at 27°C. During the compression, 900 J of work is done on the gas. Find the entropy change of the gas.

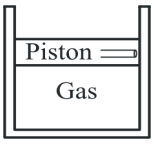
Search on Telegram @apna_pdf



(a) 3 J/K (b) –3 J/K
(c) –6 J/K (d) 6 J/K

ISRO Scientist/Engineer 24.05.2014

Ans. (b) :



Apply first law of thermodynamic process

$$\partial Q = dU + \partial W$$

$dU = 0$ ($\because$ T = Constant)

$$\partial Q = \partial W$$

$\partial Q = -900$ ($\because$ work is done on the gas)

$$dS = \frac{\partial Q}{T}$$

$$= -\frac{900}{300} = -3\ J/K$$

666. The change in entropy of the universe, when any irreversible process takes place is

(a) Positive (b) Zero
(c) Negative (d) Unity

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (a) : The change in entropy of the universe, when any irreversible process takes place is positive.

667. Third law of thermodynamics is:-

(a) An extension of second law
(b) An extension of first law
(c) An independent law of nature
(d) An extension of zeroth law

UKPSC AE-2013, Paper-II

Ans. (c) : Third law of thermodynamics is an independent law of nature.

668. Consider the relationship TdS = dU + pdV, between entropy (S), internal energy (U), pressure (p), temperature (T) and volume (V), which of the following statements is correct :

(a) it is a applicable only for a reversible process
(b) it is also valid for any ideal gas
(c) it holds good for any process reversible or irreversible
(d) none of these

PSPCL AE, 2012

Ans. (c) : Entropy equation Tds = dU + PdV.
holds for any reversible or irreversible process.

669. Air is compressed to half volume at constant pressure, then the change in entropy

(a) increase (b) decrease
(c) does not change (d) not predictable

ISRO Scientist/Engineer 2012

Ans. (b) : At constant pressure,
change entropy

$$s_2 - s_1 = c_p \ln\frac{T_2}{T_1} - R\ln\left(\frac{P_2}{P_1}\right)$$

$\therefore$ $P_2 = P_1$ = Constant pressure

And Let initial temperature = T_1

Then final temperature $T_2 = \frac{T_1}{2}$

$$\Delta s = c_p \ln\left(\frac{T_2}{T_1}\right) - R\ln\left(\frac{P_2}{P_1}\right)$$

$$= c_p \ln\left(\frac{T_2}{T_1}\right) - R\ln 1$$

$$= c_p \ln\left(\frac{1}{2}\right) - R\ln 1$$

$$= c_p \ln(0.5) - 0$$

$$= c_p \ln(0.5) = -0.693\, c_p.$$

So, Δs = - (Negative)

670. A heat engine transfers 15 kJ of heat to a thermal reservoir at 300 K. The change of entropy of the reservoir in the process is :

(a) $\Delta S_{reservoir} = -50\ JK^{-1}$
(b) $\Delta S_{reservoir} = +50\ JK^{-1}$
(c) $\Delta S_{reservoir} = +200\ KJ^{-1}$
(d) $\Delta S_{reservoir} = +4500\ kJ.K$

OPSC Civil Services Pre. 2011

Ans. (b) : Given as,
Q = 15 kJ
T = 300 K

$$\Delta S = \frac{Q}{T} = \frac{15000}{300}$$

ΔS reservoir = + 50 JK^{-1}

671. What is the property of a working substance which increases or decreases as the heat is supplied or removed in a reversible manner known as ?

(a) Enthalpy
(b) Internal energy
(c) Entropy
(d) External energy

VIZAG STEEL MT 2011

Ans. (c) : Entropy is the property of a working substance which increases or decreases as the heat is supplied or removed in a reversible manner.

Search on Telegram @apna_pdf

672. The entropy of a closed system can increased by

1. Heat transfer

2. Work transfer

3. Internal irreversibilities

Which of these statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only

(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (a) : All statements are correct.

673. When a system is in equilibrium, any conceivable change in entropy would be:

(a) Maximum (b) Zero

(c) Positive (d) Negative

UPSC JWM Adv. No-16/2009

Ans. (b) : When a system is in equilibrium state then change in entropy would be zero.

674. A certain amount of fluid at temperature T_1 is mixed with a equal amount of the same fluid at temperature T_2 is an insulated container. With total fluid as the system, consider the following statements:

(1) Energy of the system is conserved

(2) Entropy of the system is conserved

(3) Entropy of the system increases

(4) Entropy of the system decreases

Which of the following options is true?

(a) 1 and 2 (b) 1 and 3

(c) 1 and 4 (d) 1 only

DRDO Scientists 2009

Ans. (b) :

675. Carnot engine is irreversible due to

(a) friction between moving parts

(b) losses from working fluid in transit

(c) high speed

(d) both (A) and (B)

TNPSC AE, 2008

Ans. (d) : Carnot engine is irreversible due to –

- Friction between moving parts
- Losses from working fluid in transit

676. In a reversible cycle the entropy of the system

(a) increases

(b) decreases

(c) does not change

(d) first increases and then decreases

WBPSC AE 2008

Ans. (c) : For reversible process,

$$\frac{dQ}{T} = 0$$

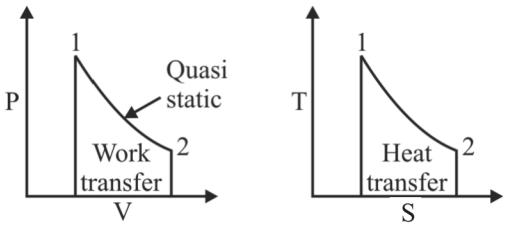
677. In case of reversible heat transfer, the integrating factor is given by:

(a) 1/P (b) 1/V

(c) 1/(PV) (d) 1/T

AAI Jr. Executive 29.11.2018

Ans. (d) :



$$W_{1-2} = \int_1^2 dW = \int_1^2 pdV$$

It is valid for a quasi-static or reversible process. The work transfer is equal to the integral of the product of the intensive property P and the differential change in the extensive property, dV just like displacement work, the heat transfer can also written as.

$$Q_{1-2} = \int_1^2 TdS = \int_1^2 dQ$$

$$dQ = TdS$$

$$dS = \frac{1}{T}dQ$$

$$\int_1^2 dS = \int_1^2 \frac{1}{T}dQ$$

Where $\frac{1}{T}$ is integrating factor.

678. A reversible Carnot engine operates between 27°C and 1527°C, and produces 400 kW of net power. The change of entropy of the working fluid during the heat addition process is

(a) 0.222 kW/K (b) 0.266 kW/K

(c) 0.288 kW/K (d) 0.299 kW/K

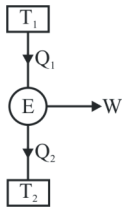
ESE 2018

Ans. (b) : Given,

$T_1 = 1527 + 273 = 1800$ K

$T_2 = 27 + 273 = 300$ K

W = 400 kW



Efficiency $\eta = \frac{W}{Q_1} = 1 - \frac{T_2}{T_1}$ (For Carnot engine)

$$\frac{W}{Q_1} = 1 - \frac{T_2}{T_1}$$

$$\frac{400}{Q_1} = 1 - \frac{300}{1800}$$

Heat input (Q_1) = 480 kW

Entropy change (ΔS) $= \frac{Q_1}{T_1} = \frac{480}{1800} = 0.266$ kW/K

Search on Telegram @apna_pdf

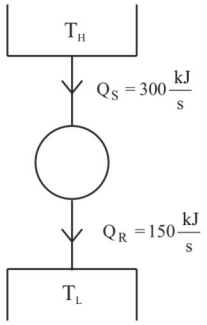
679. 300 kJ/s of heat is supplied at a constant fixed temperature of 290°C to a heat engine. 150 kJ/s of heat are rejected at 8.5 °C. Then the cycle is reported as

(a) Reversible (b) Irreversible
(c) Impossible (d) Random

TNPSC AE 2018

Ans. (a) : Given, $T_H = 290^oC = 563\ K$
$T_L = 8.5\ ^oC = 281.5\ K$

$$\Delta S = \frac{\delta Q_S}{T_H} + \frac{\delta Q_R}{T_L}$$



$$= \frac{300}{563} + \left(\frac{-150}{281.5}\right)$$

$\boxed{\Delta S = 0}$

It means the cycle is reversible

680. In Carnot cycle, the algebraic sum of the entropy changes for the cycle is

(a) Positive
(b) Negative
(c) Zero
(d) Depends on temperature of sink

MPPSC AE 08.11.2015
MPPSC State Forest Service Exam, 2014

Ans. (c) : Thermal efficiency $= 1 - \frac{Q_c}{Q_h} = 1 - \frac{T_c}{T_h}$

$$-\frac{Q_c}{Q_h} = -\frac{T_c}{T_h} \Rightarrow \frac{Q_c}{T_c} = \frac{Q_h}{T_h}$$

$$\frac{Q_c}{T_c} - \frac{Q_h}{T_h} = 0$$

So, $\oint \frac{dQ}{dT} = 0$

The algebraic sum of the entropy changes for the cycle is zero.

As entropy is a point function does not depend on the path.

681. Gas A at 1 MPa, 100°C and Gas B at 5 MPa, 100°C are mixed such that final temperature after mixing remains 100°C. The process is adiabatic. The entropy of the gases after mixing:-

(a) Will increase
(b) Will remain same
(c) Will decrease
(d) Cannot be calculated

UKPSC AE-2013, Paper-II

Ans. (b) : Entropy change while mixing of fluid,

$$\Delta S = 2mC\ln\left(\frac{T_1 + T_2}{2\sqrt{T_1 T_2}}\right) = 2mC\ln\left(\frac{2T}{2T}\right)$$

$\Delta S = 0$

682. A carnot engine operates between 327°C and 27°C. If the entropy change during heat addition is 1 kJ/K, the work produced by the engine is :

(a) 100 kJ (b) 200 kJ
(c) 300 kJ (d) 400 kJ

UPSC JWM Advt. No.-52/2010

Ans. (c) : Given, About Carnot engine-

$T_H = 327 + 273 = 600K, T_L = 27 + 273 = 300K$

Entropy change (ds) = 1 kJ/K

Let; W = Work produced by the engine.

$Q = Tds$

$$\eta_{carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{300}{600} = \frac{1}{2}$$

$$\therefore \quad \eta_{carnot} = \frac{W}{Q_H}$$

$\therefore$ $Tds = Q \Rightarrow Q_H = T_H.\ ds = 600 \times 1$

$\Rightarrow$ $Q_H = 600$ kJ

$$\therefore \quad \eta_{carnot} = \frac{W}{Q_H} \Rightarrow W = \eta_{carnot} \times Q_H$$

$W = \frac{1}{2} \times 600 \quad \Rightarrow \boxed{W = 300kJ}$

5. Availability and Irreversibility

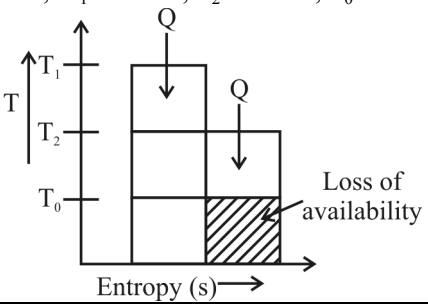
683. The loss of available energy associated with the transfer of 1000 kJ of heat from a constant temperature system at 600 K to another at 400 K, when the environmental temperature is 300 K is

(a) 166.67 kJ (b) 250.00 kJ
(c) 500.00 kJ (d) 750.00 kJ

UPPSC AE 13.12.2020, Paper II
MPPSC AE 2016
MPPSC AE 08.11.2015
MPSC Poly. Lect. 2014, ESE 2008, 2004

Ans. (b) : Given data,

$Q = 1000$ kJ, $T_1 = 600$ K, $T_2 = 400$ K, $T_0 = 300$ K



Search on Telegram @apna_pdf

Loss of available energy,

$I = T_0 (\Delta S_{uni})$;

$= T_0 [\Delta S_{sys} + \Delta S_{sur}]$;

Where, ΔS_{uni} = Change of entropy of universe.

ΔS_{sys} = Change of entropy of system

ΔS_{sur} = Change of entropy of surrounding

$$= T_0\left[\frac{-Q}{T_1}+\frac{Q}{T_2}\right]$$

$$= 300\left[\frac{-1000}{600}+\frac{1000}{400}\right]$$

$$= 300[-1.667+2.5] = 249.9\,\text{kJ}$$

$I \approx 250$ kJ

684. Availability of a system at any given stage is

(a) a property of the system

(b) the total energy of the system

(c) the maximum work obtainable as the system goes to dead state

(d) the maximum useful work obtainable as the system goes to dead state

GPSC Executive Engineer 23.12.2018
TSPSC AEE 2015
MPPSC AE 08.11.2015, GATE 2000

Ans. (d) : Availability of a system at any given stage is the maximum useful work obtainable as the system goes to dead state.

685. Availability function is expressed as

(a) $a = u + P_0v - T_0s$

(b) $a = u + P_0du - T_0ds$

(c) $a = du + P_0du - T_0ds$

(d) $a = u + P_0u + T_0s$

UJVNL AE 2016, RPSC AE 2016
RRB SSE 03.09.2015 Shift-I
WBPSC AE 2008, ESE 2002

Ans. (a) : Availability function,

For closed system, $\phi_{c.s} = u + P_0v - T_0s$

For open system, $\phi_{o.s} = h - T_0s$

686. In an irreversible process there is

(a) Heat loss (b) Heat gain

(c) No heat loss (d) No transfer of heat

MPPSC State Forest Service Exam, 2014
WBPSC AE 2008
UKPSC AE 2012, 2007 Paper–II

Ans. (a) : An irreversible process can be defined as a process in which the system and the surrounding do not return to their original condition once the process is initiated. In an irreversible process there is heat loss.

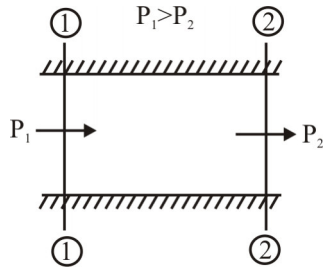
687. Pressure of steady and adiabatic flow of an ideal gas through pipe is reduced from P_1 to P_2. If T_0 = environment temperature, its irreversibility per unit mass flow rate is given by:

(a) $T_0 R \ln\left(\frac{P_1 - P_2}{P_2}\right)$ (b) $T_0 R \ln\left(\frac{P_1}{P_1 - P_2}\right)$

(c) $T_0 R \ln\frac{P_1}{P_2}$ (d) $T_0 R \ln\frac{P_2}{P_1}$

Oil India Limited Sr. Engineer (Production) 30.11.2019
UPRVUNL AE 07.10.2016

Ans. (c) :



Given,

Adiabatic flow of an ideal gas from P_1 to P_2

If T_0 = environment temperature.

$\therefore$ We know that

Irreversibility $(I) = T_0(\Delta S)_{univ.} = T_0[(\Delta S)_{system} + (\Delta S)_{surr}]$

For steady & adiabatic flow

$(\Delta S)_{surr} = 0$

$\therefore I = T_0 [(\Delta S)_{syst.}]$

For process. 1-2

$$(\Delta S)_{system} = R \ln\frac{P_1}{P_2}$$

$I = T_o (\Delta S)_{system}$

$$I = T_o R \ln\frac{P_1}{P_2}$$

688. Consider the following statements:

i. Slow heating of water from an electric heater.

ii. Isentropic expansion of air.

iii. Evaporation of a liquid from heat source at the evaporation temperature.

iv. Constant pressure heating of a gas by a constant temperature source.

Which of these processes is/are reversible?

(a) ii and iv (b) iv only

(c) iii and iv (d) ii and iii

Oil India Limited Sr. Engineer (Production) 30.11.2019
ESE 2010, 2005

Ans. (d) : A process is said to be reversible when system reversed to its initial condition without leaving any traces on surrounding i.e. both system and surrounding should return to their initial state at the end of process.

Slow and friction less processes considered as reversible process.

(i) Isentropic expansion of air is a reversible adiabatic process

(ii) Evaporation of liquid from a heat source at the evaporation temperature is also a reversible process because it very slow & initial condition can be restored.

Search on Telegram @apna_pdf

689. The pressure, temperature and velocity of air flowing in a pipe are 5 bar, 500 K and 50 m/s, respectively. The specific heats of air at constant pressure and at constant volume are 1.005 kJ/kgK and 0.718 kJ/kgK, respectively. Neglect potential energy. If the pressure and temperature of the surroundings are 1 bar and 300 K, respectively, the available energy in kJ/kg of the air stream is

(a) 170 (b) 187
(c) 191 (d) 213

GPSC Asstt. Director of Transport 05.03.2017
GATE 2013

Ans. (b) : Given,
For flow stream,
Available energy = $(h_2 - h_1) + K.E. - T_o(s_2 - s_1)$

$$= C_p(T_2 - T_1) + \frac{1}{2} \times V^2 + T_o\left[C_p \ln\frac{T_2}{T_1} - R\ln\frac{P_2}{P_1}\right]$$

$C_p = 1.005$, $C_v = 0.718$, $V = 50$ m/s
$P_1 = 1$ bar, $P_2 = 5$ bar, $T_2 = 500$ K, $T_1 = 300$ K
A.E. = 187 kJ/kg

690. A system is said to be in the dead state when it is in

(a) thermal equilibrium with the environment
(b) chemical equilibrium with the environment
(c) mechanical equilibrium with the environment
(d) thermodynamic equilibrium with the environment

TSPSC Manager (Engg.) HMWSSB 12.11.2020
NLCIL GET 17.11.2020, Shift-II

Ans. (d) : A system is said to be in the dead state when it is in thermodynamic equilibrium with the environment.

691. The maximum possible work a system delivers as it undergoes a reversible process from the specified initial state to the state of its environment, (dead state) is

(a) Entropy (b) Enthalpy
(c) Exergy (d) Energy

RPSC ACF & FRO, 26.02.2021
ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (c) : Exergy- Exergy or availability of a given system is defined as the maximum useful work that is obtainable in a process in which the system comes to equilibrium with its surroundings (dead state).

692. For a steady process, the conditions at stage 1 and stage 2 are, respectively, $h_1 = 300$ kJ/kg, $h_2 = 150$ kJ/kg, $S_1 = 1.25$ kJ/kg-K and $S_2 = 0.8$ kJ/kg-K. The availability at the ambient temperature 300 K will be

(a) 15 kJ/kg (b) 20 kJ/kg
(c) 25 kJ/kg (d) 35 kJ/kg

RPSC IOF, 2020, ESE 2017

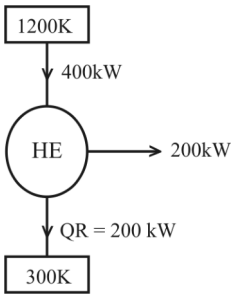
Ans. (a) :
Availability $\Psi = \Psi_1 - \Psi_2 = (h_1 - h_2) - T(S_1 - S_2)$
Given,
$h_1 = 300$ kJ/kg
$h_2 = 150$ kJ/kg
$S_1 = 1.25$ kJ/kg-K
$S_2 = 0.8$ kJ/kg-K
$T = 300$ K
$\Psi = \Psi_1 - \Psi_2$
$= (h_1 - h_2) - T(S_1 - S_2)$
$= (300 - 150) - 300(1.25 - 0.8)$
$\Psi = 15$ kJ/kg

693. A heat engine receives heat at the rate of 400 kW from a source at 1200 K and reject waste heat to a sink at 300 K. If power output from the engine is 200 kW. What is the reversible power and the irreversibility rate for the process?

(a) 200 kW; 100 kW (b) 300 kW; 200 kW
(c) 300 kW; 100 kW (d) 400 kW; 200 kW

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) :



$$\eta_{rev} = 1 - \frac{T_2}{T_1}$$

$$= 1 - \frac{300}{1200}$$

$$\eta_{rev} = 0.75$$

$$\eta_{rev} = \frac{W_{rev}}{Q_S}$$

$$W_{rev} = \eta_{rev} \times Q_S$$

$$= 0.75 \times 400$$

$$\boxed{W_{rev} = 300\text{kW}}$$

$$I_{rr} = W_{max} - W_{actual}$$

$$= 300 - 200$$

$$\boxed{I_{rr} = 100\text{ kW}}$$

694. Mechanical and fluid friction are some of the causes of _____

(a) irreversibility (b) decrease in efficiency
(c) Reversibility (d) thermal degradation

UPRVUNL AE 05.07.2021

Ans. (a) : Main cause of irreversibility-
→ Unrestricted expansion
→ Mechanical and fluid friction
→ Heat transfer with a finite temperature difference.

Search on Telegram @apna_pdf

695. Irreversibility caused by effects like turbulence and friction is known as

(a) Internal irreversibility
(b) Dissipative irreversibility
(c) External irreversibility
(d) None of these

Oil India Senior Officer 23.12.2020

Ans. (a) : Irreversibility caused by effects like turbulence and friction is known as Internal irreversibility.

696. Among the following which is NOT the reason for the irreversibility.

(a) Isothermal heat transfer
(b) Free expansion
(c) Paddle wheel work transfer
(d) Friction

NLC GET 17.11.2020, Shift-II

Ans. (a) : An irreversible process is a process that cannot return both the system and the surroundings to their original conditions. That is, the system and the surroundings could not return to their original conditions if the process was reversed. There are many factors that make a process irreversible. Five of the most common causes of irreversibility are–

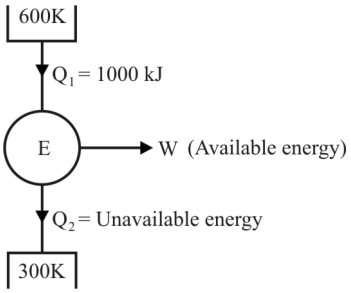
- Friction
- Unrestrained expansion of fluid
- Heat transfer through a finite temperature difference
- Mixing of two different substances
- Paddle wheel work transfer

697. The available energy of the source that can supply 1000 kJ at 600 K in the surrounding of 27°C

(a) 300 kJ (b) 1000 kJ
(c) 600 kJ (d) 500 kJ

NLC GET 17.11.2020, Shift-II

Ans. (d) : The maximum work output obtainable from a certain heat input in a cyclic heat engine is called available energy(AE).



$$W_{max} = \left(1 - \frac{T_2}{T_1}\right).Q_1$$

$$= \left[1 - \left(\frac{300}{600}\right)\right] \times 1000$$

$$W_{max} = 500kJ$$

698. A vapour while condensing at 420^{0}C, transfers heat to water evaporating at 250^{0}C. If ambient is at 35^{0}C, what fraction of available energy is lost in the process?

(a) 0.18 (b) 0.22
(c) 0.26 (d) 0.30

UPPSC AE 13.12.2020, Paper-2

Ans. (c) : Given,

$T_C = 420^0C$, $T_E = 250^0C$, $T_O = 35^0C$

$T_C = 693$ K, $T_E = 523$ K, $T_O = 308$ K

Fraction of available energy lost in process is given by

$$\Delta E = \frac{T_O(T_C - T_E)}{T_E(T_C - T_O)} = \frac{308(693-523)}{523(693-308)}$$

$$\boxed{\Delta E = 0.26}$$

699. Irreversibility in a system:

(a) reduces friction
(b) reduces temperature
(c) increases entropy
(d) increases pressure

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : An irreversible process increases the entropy of universe due to increase temperature and randomness of the molecules.

Because the entropy is a point function the change in entropy of the system is the same, whether the process is reversible or irreversible.

700. If a system has a available energy 949.2 kJ and change in availability energy 1319.2 kJ and Effectiveness ∈ is

(a) 71.9% (b) 50%
(c) 35.95% (d) 0

TNPSC AE 2019

Ans. (a) : Effectiveness (ε)- The effectiveness of system is the ratio of the usefull or actual work done to the maximum or reversible work.

$$\%\varepsilon = \frac{\text{Available energy}}{\text{change in available energy}}$$

$$\%\varepsilon = \frac{949.2}{1319.2} \times 100$$

$$\boxed{\%\varepsilon = 71.95\%}$$

701. The internal irreversibility of Rankine cycle is caused by

1. fluid friction, 2. throttling, 3. mixing

Select the correct answer using the code given below.

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2019

Ans. (d) : Internal irreversibility of Rankine cycle is caused by fluid friction, throttling and mixing.

702. A heat engine receives heat from a source at 1200 K at the rate of 500 kW and rejects the waste heat to a medium at 300 K. The power output of the heat engine is 180 kW. What will be the irreversibility of the system?

Search on Telegram @apna_pdf

(a) 195 kW (b) 340 kW
(c) 125 kW (d) 320 kW

SJVN ET 2019

Ans. (a) : Efficiency of Carnot Engine

$$\frac{\text{Carnot output}}{\text{Input}} = 1 - \frac{T_2}{T_1}$$

$$\text{Carnot output} = 500 \times \left(1 - \frac{300}{1200}\right) = 375 \text{ kW}$$

Irreversibility of system = Carnot output - actual output
= 375 – 180 = 195 kW

703. When 25 kg of water at 95°C is mixed with 35 kg of water at 35°C, the pressure being taken as constant at surrounding temperature of 15°C and C_p of water is 4.2 kJ/kg K, the decrease in available energy due to mixing will be nearly

(a) 270.5 kJ (b) 277.6 kJ
(c) 281.8 kJ (d) 288.7 kJ

ESE 2019

Ans. (c) : Given,
$m_1 = 25$ kg
$m_2 = 35$ kg
$T_0 = 15 + 273 = 288$ K
$T_1 = 95 + 273 = 368$ K
$T_2 = 35 + 273 = 308$ K

After mixing let T is the final temperature
Heat lost = Heat gained
$m_1 c_p (T_1 - T) = m_2 c_p (T - T_2)$
$25 (368 - T) = 35 (T - 308)$
$T = 333$ K

Entropy generation

$$\Delta S_{gen} = \Delta S_1 + \Delta S_2 = m_1 c_p \ln\left(\frac{T}{T_1}\right) + m_2 c_p \ln\left(\frac{T}{T_2}\right)$$

$$\Delta S_{gen} = 25 \times 4.2 \ln\left(\frac{333}{368}\right) + 35 \times 4.2 \ln\left(\frac{333}{308}\right)$$

$\Delta S_{gen} = 0.978$ kJ/k

Decrease in available energy due to mixing
Irreversibility = $T_0 \Delta S_{gen}$
= 288 × 0.978 = 281.8 kJ

704. Irreversibility of the process is equal to

(a) W_{max} - W (b) W - W_{max}
(c) W_{max} (d) W

TNPSC AE 2018

Ans. (a) : The actual work which a system does is always less than the idealized reversible work, and the difference between the two is called the irreversibility of the process.

$I = W_{max} - W$

This is also, referred as degradation, or dissipation.

705. Unavailable energy is the portion of energy that

(a) cannot be converted into work by turbine
(b) cannot be converted into work even by reversible heat engine
(c) cannot be converted into work by Rankine engine
(d) cannot be converted into work by a pump

TNPSC AE 2018

Ans. (b) : Unavailable energy is the portion of energy that cannot be converted into work even by reversible heat engine.

706. A heat reservoir is maintained at 927°C. If the ambient temperature is 27°C, the availability of heat from the reservoir is limited to

(a) 57% (b) 66%
(c) 75% (d) 88%

ESE 2018

Ans. (c) : Availability of heat $= 1 - \frac{T_2}{T_1}$

$$= 1 - \frac{300}{1200}$$

$= 0.75 = 75\%$

707. A hot reservoir at 900 K is brought into contact with the ambient at 300 K for a short time. During this period 9000 kJ of heat is lost by the hot reservoir. The total loss in availability due to this process is

(a) 2400 kJ (b) 1800 kJ
(c) 6000 kJ (d) 9000 kJ

GPSC Executive Engineer 23.12.2018
GATE 1995

Ans. (c) : Entropy change for hot reservoir (ΔS_h)

$$\Delta S_h = \frac{Q}{T} = \frac{-9000}{900} = -10 \text{ kJ/K}$$

Entropy change in cold reservoir $\Delta S_c = \frac{Q}{T} = \frac{+9000}{300}$

$$\Delta S_c = +30 \text{ kJ/k}$$

Loss in availability = $T_0 [\Delta S_c + \Delta S_h]$
$\Rightarrow$ Loss in availability = 300 (30–10)
= 6000 kJ.

708. One side of a wall is maintained at 400 K and the other at 300 K. The rate of heat transfer through the wall is 1000 W and the surrounding temperature is 25°C. Assuming no generation of heat within the wall, the irreversibility (in W) due to heat transfer through the wall is

(a) 0.833 (b) 248.23 W
(c) 20.825 W (d) 25.833 W

GPSC Executive Engineer 23.12.2018
GATE 2015 Set-3

Ans. (b) : Given,
Q = 1000W, $T_0 = 25 + 273 = 298$ K
Irreversibility I = $T_0 \Delta S_{universe}$
$\Delta S_{universe} = \Delta S_{sys} + \Delta S_{gen}$

$$\Delta S_{uni} = \Delta S_{sys} = \sum \frac{Q}{T} = Q\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

$$\Delta S_{uni} = 1000 \left(\frac{1}{300} - \frac{1}{400}\right) = 0.833 \text{ W/K}$$

$I = T_0 (\Delta S_{uni})$
$= 298 \times 0.833$
$= 248$ W

Search on Telegram @apna_pdf

709. Which one of the following represents unavailability?

(a) $T_0(\Delta S_0)$ (b) $T(\Delta S)$

(c) $T_0(\Delta S)$ (d) $T(\Delta S_0)$

TRB Polytechnic Lecturer 2017

Ans. (c) : Unavailability = $T_0(\Delta S)$

Where T_0 = environment temperature

$$(\Delta S)_{universe} = \left[(\Delta S)_{system} + (\Delta S)_{surrounding}\right]$$

710. Consider the following statements:
On heating an elastomer under tensile load, its shrinkage

1. maximizes the enthalpy
2. maximizes the entropy
3. minimizes the free energy
4. avoids breaking

Which of the above statements are correct?

(a) 1 and 2 (b) 2 and 3

(c) 3 and 4 (d) 1 and 4

ESE 2017

Ans. (b) : In heating elastomer under tensile load entropy get decrease because of only one possible microstate but by shrinkage entropy get increased because of many possible microstate.

The internal energy of an ideal gas is a function of temperature only.

By Helmholtz free energy equation

Available energy is given by

$A = U - Ts$

Where U = Internal energy

T = Temperature

s = Entropy

So, by increase in entropy free energy get reduced.

On heating an elastomer under tensile load, its shrinkage maximize the entropy and minimize the free energy.

711. The maximum work output from two finite bodies-one at temperature T_1 and the other at temperature T_2 is

(a) $W_{max} = C_p\left(\sqrt{T_1} - \sqrt{T_2}\right)^2$

(b) $W_{max} = C_p\left(\sqrt{T_1} + \sqrt{T_2}\right)^2$

(c) $W_{max} = C_p\left(\sqrt{T_1}\sqrt{T_2}\right)^{\frac{1}{2}}$

(d) $W_{max} = \frac{1}{2}C_p\left(\sqrt{T_1} - \sqrt{T_2}\right)^2$

BPSC AE Mains 2017 Paper - V

Ans : (a) : Maximum work output will be obtained when there will be no irreversibility.

We can extract work till both bodies reaches at same temperature let it be T_f.

Entropy change of body 1

$$= c_p \ell n \frac{T_f}{T_1}$$

Entropy change of body 2

$$= c_p \ell n \frac{T_f}{T_2}$$

For reversible process entropy change is zero, so

$$c_p \ell n \frac{T_f}{T_1} + c_p \ell n \frac{T_f}{T_2} = 0$$

$$\Rightarrow T_f = \sqrt{T_1 T_2}$$

Work done = (Energy given by body 1) – (Energy absorbed body 2)

$$= c_p(T_1 - T_f) - c_p(T_f - T_2)$$

$$= c_p(T_1 + T_2 - 2T_f)$$

$$= c_p(T_1 + T_2 - 2\sqrt{T_1 T_2})$$

$$= c_p(\sqrt{T_1} - \sqrt{T_2})^2$$

Note we have assumed $T_1 > T_2$.

We will get same answer for $T_2 > T_1$

712. An ideal gas is flowing through an insulated pipe at the rate of 3.3 kg/s. There is a pressure drop of 15% from the inlet to the outlet of the pipe. What is the rate of energy loss because of this pressure drop due to friction, given that R_{gas}=0.287 kJ/kg K and the reference temperature T_0 is 300K?

(a) 42.62 kW (b) 40.26 kW

(c) 38.14 kW (d) 35.13 kW

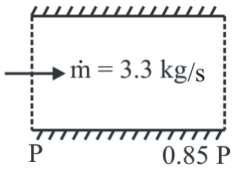
ESE 2017

Ans. (a) : Given,

R_{gas} = 0.287 kJ/kg K

$\dot{m}$ = 3.3 kg/s

T_0 = 300 K



$$\text{Change in entropy } (S_2 - S_1) = R\,\ell n\left(\frac{P_1}{P_2}\right)$$

$$= -R\,\ell n\left(\frac{P_2}{P_1}\right)$$

$$= -R\,\ell n\left(\frac{P_1 - \Delta P}{P_1}\right)$$

$$= -R\,\ell n\left(1 - \frac{\Delta P}{P_1}\right)$$

$$= \frac{R\Delta P}{P_1}$$

Change in entropy of surrounding $(\Delta S)_{surr} = 0$

Entropy generation $\Delta S_{gen} = (\Delta S)_{system} + (\Delta S)_{surr}$

$$= \dot{m}(S_2 - S_1) = \dot{m}R\frac{\Delta P}{P_1}$$

$$= 3.3 \times 0.287 \times \frac{0.15P_1}{P_1}$$

$$= 0.142065$$

Search on Telegram @apna_pdf

Rate of energy loss i.e. loss of availability
$= T_0 (\Delta S)_{gen}$
$= 300 \times 0.142065$
$= 42.619$ kW

713. Determine the available energy of furnace gas, C_p = 1.046 kJ/kg.K, when is cooled from 1260 K to 480 K at constant pressure. The surroundings are at 295 K.

(a) – 518.1 KJ/kg (b) 428.3 KJ/kg
(c) –1113.7 KJ/kg (d) None of these

RPSC ADE 2016

Ans. (a) : Given, $T_1 = 1260$ K, $T_2 = 480$ K, $T_0 = 295$ K
$C_p = 1.046$ kJ/kg-K

$Q = C_p \Delta T$
$= 1.046 (T_2 - T_1)$
$= 1.046 (480 - 1260)$
$= -815.88$ kJ/kg

Irreversibility,

$I = T_0 \Delta s$

$$= 295\left[C_p \ln\frac{T_2}{T_1}\right]$$

$$= 295\left[1.046 \ln\left(\frac{480}{1260}\right)\right]$$

$I = -297.77$ kJ/kg

Available energy,

$AE = Q - T_0 \Delta s$
$= -815.88 - (-297.77)$
$AE = -518.1$ kJ/kg

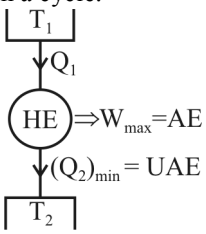
Note-The official answer given by commission is (d).

714. The minimum energy that has to be rejected to the sink (as per 2nd law of thermodynamics) is called?

(a) Minimum work
(b) Unavailable energy (UAE)
(c) Available energy (AE)
(d) Constant energy

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (b) : Available Energy (AE) or Exergy–It is the maximum amount of work that can be extracted from a certain heat input in a cycle.



Unavailable Energy (UAE)–It is the minimum amount of heat that has been rejected to the sink

$$\boxed{UAE = T_0 \Delta s}$$

$T_0 \rightarrow$ Ambient temperature

$\Delta s \rightarrow$ Change in entropy

The minimum energy that has to be rejected to the sink as per second law of thermodynamics is called unavailable energy.

715. Neglecting changes in kinetic energy and potential energy, for unit mass the availability in a non-flow process becomes $a=\varphi - \varphi_0$, where φ is the availability function of the

(a) Steady flow process system
(b) Closed system
(c) Isolated system
(d) Open system

Rajasthan Nagar Nigam AE 2016, Shift-II
ESE 1998

Ans. (b)

$$A = \left(H_1 + \frac{mu_1^2}{2} + mgz_1 - T_0 S_1\right) - \left[H_2 + \frac{mu_2^2}{2} + mgz_2 - T_0 S_L\right]$$

$$\boxed{A = \psi_1 - \psi_2} ----(I)$$

Where ψ is the energy (available it) function of a steady flow system.

Neglecting the change in kinetic energy and potential energy.

$$A = (U_1 + P_o V_1 - T_o S_1) - (U_2 + P_o V_2 - T_o S_2)$$

$$\boxed{A = \varphi_1 - \varphi_2} ----(II)$$

φ_1, φ_2 are energy availability/function

(II) is valid for only closed system.

716. Law of degradation of energy says that unavailable energy is gradually decreasing due to

(a) Increase in reversible processes
(b) Increase in irreversible processes
(c) Increase in unavailable energy
(d) None of these

UPPSC AE 12.04.2016 Paper-II

Ans : (a) Law of degradation of energy says that unavailable energy is gradually decreasing due to Increase in reversible processes.

Unavailable energy $= T_0 ds$

Availability $\left(W_{max}\right) = Q - T_o ds$

717. The irreversibility associated with the process is defined as

(a) Loss of qualitative energy
(b) Loss of energy
(c) Loss of enthalpy
(d) Loss of entropy

APPSC AEE Mains 2016 Paper-III

Ans. (a) : The irreversibility associated with the process is defined as loss of qualitative energy.

718. The exergy of the system will depend on

(a) Entropy generation
(b) Surrounding temperature
(c) Surrounding pressure
(d) All the given answers

APPSC AEE Mains 2016 Paper-III

Search on Telegram @apna_pdf

Ans. (d) : Exergy– Exergy is defined as the amount of work a system can perform when it is brought into thermodynamic equilibrium with its environment. It depends on entropy generation, pressure and temperature of surrounding.

719. Which of the following statement is incorrect ?

(a) The greater pressure difference in throttling the lesser the irreversibility

(b) The primary source of internal irreversibility in power is fluid friction in rotary machine

(c) The greater the irreversibility the greater the increase in adiabatic process

(d) The entropy of the universe in continuously on the increase

KPSC ADF 2015, ESE 1992

Ans. (a) : The greater pressure difference in throttling the lesser the irreversibility. This is incorrect statement. When pressure difference in throttling increases, irreversibility increases.

720. A system is working between 800 K and 400 K. If the heat supplied to the system is 200 kJ, then the unavailable energy is

(a) 150 kJ (b) 125 kJ

(c) 75 kJ (d) 100 kJ

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (d)

$$(W_{net})_{A.E} = Q_1\left(1-\frac{T_2}{T_1}\right)$$

Given

$Q = 200$ kJ

$T_1 = 800$ K

$T_2 = 400$ K

$$(W_{net})_{A.E.} = 200\left(1-\frac{400}{800}\right)$$

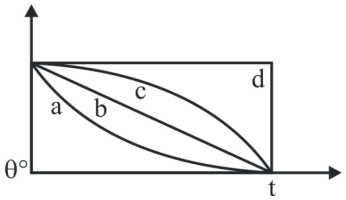
$= 100$ kJ

UAE = Q – A.E.

UAE = 200 – 100

UAE = 100 kJ.

721. A hot liquid is kept in a big room. Its temperature (θ) is plotted as a function of time (t), which of the following curve may represent the plot?



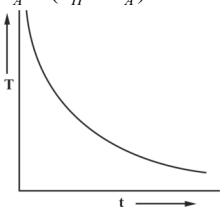
(a) Curve d (b) Curve b

(c) Curve c (d) Curve a

ISRO Scientist/Engineer 24.05.2014

Ans. (d) The graph drawn between the temperature of the body and time is known as cooling curve. The slope of the tangent to the curve at any point gives the rate of fall of temperature.

In general $T(t) = T_A + (T_H - T_A)e^{-kt}$



Where,

T(t) = temperature at time t

T_A = Ambient temperature

T_H = Temperature of hot object at time 0

k = position constant

t = time

722. Consider the following statements:

I. Availability is generally conserved.

II. Availability can either be negative or positive.

III. Availability is the maximum theoretical work obtainable.

IV. Availability can be destroyed in irreversibilities.

(a) III and IV are correct

(b) I and III are correct

(c) I and IV are correct

(d) II and IV are correct

APPSC Poly. Lect. 2013, ESE 1996

Ans. (a) : (i) Availability is defined as the maximum useful work that is obtainable in a process in which the system comes to equilibrium with its Surroundings.
(ii) Availability can be destroyed by irreversibilities.

723. Steam flows through an adiabatic steady flow turbine from state 1 to state 2. with respect to a base temperature T_0, the unavailable energy is

(a) $T_0 (I_1 - I_2)$

(b) $T_0 (S_1 - S_2)$

(c) $(I_1 - I_2) - T_0 (S_1 - S_2)$

(d) $I_2 + I_0 (S_1 - S_2)$

UKPSC AE 2012 Paper–II

Ans. (b) : $T_0 (S_1 - S_2)$

724. The loss in available energy associated with a given process is :

(a) $T_0\Delta S_{uni}$ (b) $Q - T_0\Delta S_{uni}$

(c) $Q + T_0\Delta S_{uni}$ (d) $T_0\Delta S_{system}$

APGENCO AE 2012

Ans. (a) : The loss of available energy

$= T_0 (\Delta S)_{universe}$

$= T_0 (S_{system} + S_{surrounding})$

725. The exergy of an isolated system in a process :

(a) can never increase

(b) can never decrease

(c) always remain constant

(d) always positive

J&K PSC Civil Services Pre, 2010

Search on Telegram @apna_pdf

Ans. (a) : It is the counter part of the entropy principle which states that the exergy of an isolated system can never increases.

726. Read the given information followed by a question and select the most appropriate option.

A heat source at 1000K loses 2500 kJ heat to a sink at:

(I) 500K

(II) 800K

In which case is the heat transfer more irreversible?

(a) Same in both (I) and (II)

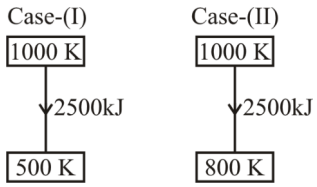
(b) Only (I)

(c) Cannot be predicted

(d) Only (II)

AAI Jr. Executive 26.03.2021

Ans. (b) :



$$(ds)_I = -\frac{2500}{1000} + \frac{2500}{500} = -2.5 + 5 = 2.5$$

$$(ds)_{II} = -\frac{2500}{1000} + \frac{2500}{800} = -2.5 + 3.125 = 0.625$$

$(ds)_I > (ds)_{II}$

In case(I) heat transfer is more irreversible.

727. A reversible engine is operating with temperature limits of 800 K and 300 K. If it takes 560 kJ of heat, then unavailable work would be:

(a) 175 kJ (b) 200 kJ

(c) 210 kJ (d) 150 kJ

AAI Jr. Executive 29.11.2018

Ans. (c) : For reversible engine

$$\frac{Q_1}{T_1} = \frac{Q_2}{T_2}$$

$$\frac{560}{800} = \frac{Q_2}{300}$$

$$Q_2 = 210 \text{ kJ}$$

Unavailable work = 210 kJ

728. In a reversible cycle, the source temperature is 227ºC and the sink temperature is 27ºC. The maximum available work for a heat input of 100 kJ will be

(a) 100 kJ (b) 60 kJ

(c) 40 kJ (d) 88 kJ

TSPSC AEE 2017

Ans. (c) : Maximum efficiency for 227ºC and 27ºC sources

$$\eta_{engine} = \frac{(227+273)-(27+273)}{(227+273)}$$

$$= \frac{200}{500} = \frac{2}{5}$$

$$= 0.4 = 40\%$$

So, maximum work available for a heat input

$$\eta = \frac{W}{Q}$$

$$W = \eta \times Q = 0.4 \times 100 \text{ kJ}$$

$$W = 40 \text{ kJ}$$

729. An ideal gas is throttled through an insulated pipe at the rate of 3 kg/s. There is a 10% pressure drop from an inlet to exit of the pipe. The values of R = 0.287 kJ/kgK and T_o = 300 K. The rate of energy loss for the pressure drop due to friction, will be nearly

(a) 34 kW (b) 30 kW

(c) 26 kW (d) 22 kW

ESE 2020

Ans. (c) : Due to throttling of an ideal gas, the process is isothermal so,

Change in entropy of gas,

$$\Delta S = -mR \ln\left(\frac{P_2}{P_1}\right)$$

$$\Delta S = -3 \times 0.287 \times \ln\left(\frac{0.9P_1}{P_1}\right)$$

$$\Delta S = 0.091 \text{ kW/K}$$

Rate of energy loss = $T_0 \Delta S = 300 \times 0.091$

$$= 27.21$$

$$\approx 26 \text{ kW}$$

730. 150 kJ of heat is transferred from a heat source of 527°C to a heat sink at 127°C. If the ambient temperature is 47°C, the loss of available energy during the process will be

(a) 40 kJ (b) 50 kJ

(c) 60 kJ (d) 70 kJ

UPSC JWM 2017

Ans. (c) : Loss of available energy = $T_0 \Delta S$

Ambient temperature T_0 = 47 + 273 = 320 K

and $\Delta S = \frac{Q_1}{T_1} - \frac{Q_1}{T_2}$

T_1 = 127 + 273 = 400 K

T_2 = 527 + 273 = 800 K

Q = 150 KJ

Loss of available energy = $T_0\left(\frac{Q_1}{T_1} - \frac{Q_2}{T_2}\right)$

Where $Q_1 = Q_2$,

$$= 320 \times 150\left(\frac{1}{400} - \frac{1}{800}\right)$$

$$= 60 \text{ kJ}$$

Search on Telegram @apna_pdf

731. The main cause of the irreversibility is

(a) Mechanical and Fluid Friction
(b) Unrestricted expansion
(c) Heat transfer with a finite temperature difference
(d) All of the above

UKPSC AE 2012 Paper–II

Ans. (d) : All of the above

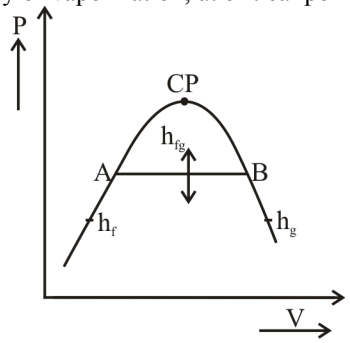
6. Properties of Pure Substances, Gases and Gas Mixture

732. The enthalpy of vaporization, at critical point is

(a) maximum (b) minimum
(c) zero (d) none of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021
TNPSC AE 2019, 2017
RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 18.09.2017
Rajasthan Nagar Nigam AE 2016, Shift-II
ESE 2008

Ans. (c) :
The enthalpy of vaporization, at critical point is zero



The line AB denotes enthalpy of vaporization. At critical point (CP), the length become zero so enthalpy of vaporization is zero.
Enthalpy of vaporization

$$h_{fg} = h_g - h_f$$

At critical point, the liquid and vapour have same properties, so

$$h_f = h_g$$

$$\boxed{h_{fg} = 0}$$

733. Constant pressure lines in the super-heated region of the Mollier diagram will have

(a) A positive slope
(b) A negative slope
(c) Zero slope
(d) Both positive and negative slope

RPSC Vice Principal ITI 2018
GPSC Executive Engineer 23.12.2018
Nagaland PSC CTSE 2015 Paper-II
HPPSC Asstt. Prof. 2014

Ans. (a) : Mollier diagram for a pure substance drawn on h-s coordinate.
According to Tds equation–

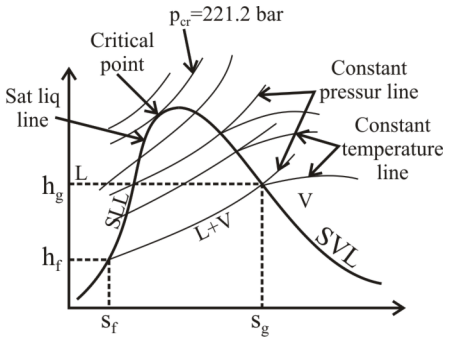
$$Tds = dh - vdp$$

$$T = \left(\frac{dh}{ds}\right) - v\left(\frac{dp}{ds}\right)$$

For constant pressure line $\left(\frac{dp}{ds}\right)_p = 0$

$$\boxed{T = \left(\frac{\partial h}{\partial s}\right)_p}$$

It is a positive slope which is equal to T(absolute temperature).
T is always positive, so slope will also be always positive.



734. Critical temperature is the temperature above which

(a) A gas will never liquify
(b) A gas will immediately liquify
(c) Water will evaporate
(d) Water will never evaporate

GPSC Executive Engineer 23.12.2018
Kerala PSC AE (Irrigation) 05.04.2017
HPPSC Asstt. Prof. 18.09.2017
RPSC VPITI 14.02.2016

Ans. (a) : The critical temperature of substance is the temperature above which vapour/gas of substance can not be liquified no matter what pressure is applied. Every substance has a critical temperature.

735. The value of compressibility factor (z) for an ideal gas may be :

1. less or more than one
2. equal to one
3. zero
4. less than zero

The correct value(s) is/are given by

(a) 1 and 2 (b) 1 and 4
(c) 2 only (d) 1 only

OPSC AEE 2019 PAPER - II
Nagaland PSC CTSE 2015 Paper-II
Kerala PSC Poly. Lect. 09.01.2014
ESE 2002

Ans. (c) : Compressibility Factor (z)–It is defined as the ratio of product PV and RT mathematically,

$$\boxed{z = \frac{PV}{nRT}}$$

For ideal gas, z = 1
For real gas, z > 1 or z < 1

Search on Telegram @apna_pdf

736. According to Dalton's law, the total pressure of the mixture of gases is equal to

(a) greater of the partial pressure of gases
(b) average of the partial pressure of gases
(c) Sum of the partial pressure of all
(d) Sum of the partial pressure of all divided by average molecular weight

TNPSC AE 2019
Kerala PSC AE (Irrigation) 05.04.2017
Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : According to Dalton's law, the total pressure of the mixture of gases is equal to sum of the partial pressure of all.

737. A standard vapour is compressed to half its volume without changing its temperature. The result is that

(a) All the vapour condenses to liquid
(b) Some of the liquid evaporates and the pressure does not change
(c) The pressure is double its initial value
(d) Some of the vapour condenses and the pressure does not change

TSPSC AEE 2017, APPSC Poly. Lect. 2013
ESE 1997

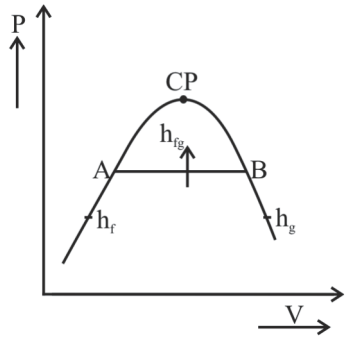
Ans. (d) : By compressing a standard vapour some of the vapour condenses and the pressure does not change.

738. The latent heat of steam with increase of pressure ..... .

(a) remains same
(b) increases
(c) decreases
(d) behaves unpredictably

GWSSB DEE 07.07.2016
UKPSC AE 2007 Paper -II
ESE 2002

Ans. (c) : The latent heat of steam with increase of pressure decreases.



739. Mixture of Ice and Water form a

(a) Closed System
(b) Heterogeneous system
(c) Isolated System
(d) Open system

WBPSC AE, 2017
Rajasthan AE (Nagar Nigam) 2016 Shift-3
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (b) : Homogeneous System–When a system consisting of a single phase is called a homogeneous system.
Example–Dry air.
Heterogeneous System–While a system consisting of more than one phase is known as a heterogeneous system.
Example–Mixture of ice and water, humid air steam-water mixture.
Phase–A quantity of matter homogeneous throughout in chemical composition and physical structure is called a phase.
Every substance can exist in any one of the three phase, i.e. solid, liquid and gas.

740. The equation PV = mRT is essentially valid for

(a) Perfect gas (b) Real gas
(c) Monoatomic gas (d) Mixture of gases

UJVNL AE 2016, (KPSC AE 2015)
TNPSC ACF 2012

Ans. : (a) The equation PV = mRT is essentially valid for perfect gas.
The equation PV = mRT may also be expressed in another form

$$P = \frac{m}{V}RT$$

$$\boxed{P = \rho RT}$$

741. In throttling of fluid the following property remains unchanged before and after throttling:

(a) temperature
(b) entropy
(c) enthalpy
(d) both (b) and (c) above

(CGPSC Polytechnic Lecturer 2017)
WBPSC AE, 2007

Ans. (c) : During throttling enthalpy is constant it is also known as isenthalpic process. It is an irreversible adiabatic process.

742. The ideal gas laws can be applied, with least error, to

(a) Boiling water
(b) Wet steam
(c) Dry saturated steam
(d) Superheated steam

WBPSC AE, 2017, GPSC AE 26.07.2015

Ans. (d) : The dry superheated steam behaves as ideal gas and follows ideal gas laws.

743. Wet clothes are hung on a clothesline outdoors in sub-zero weather. After a day, the clothes are brought into the house and observed to be dry. The process of drying is best explained as

(a) vaporization (b) sublimation
(c) melting (d) condensation

Rajasthan Nagar Nigam AE 2016, Shift-II
ISRO Scientist/Engineer 11.10.2015

Search on Telegram @apna_pdf

Ans. (b) : On cold days, the wet clothes dry due to the water in the clothes that freezes, then sublimates, to create water vapour that escapes the clothes, therefore drying it.

744. Reduced pressure is

(a) always less than atmospheric pressure
(b) always unity
(c) an index of molecular position of a gas
(d) dimensionless

TRB Poly. Lect., 2012, ESE 2011

Ans. (d) Reduced pressure (P_r) is defined as the ratio of the actual pressure of the system to the critical pressure of the system. It is a dimensionless quantity.

745. For a pure substance at its triple point, the number of degrees of freedom is

(a) 0 (b) 1
(c) 2 (d) None of these

GPSC Executive Engineer 23.12.2018
Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (a) : Gibb's phase rule is given by,

$$P + F = C + 2$$

For pure substance (C) = 1
At triple point (P) = 3

$$3 + F = 1 + 2$$

$$\boxed{F = 0}$$

746. Super heated vapours behave:

(a) Exactly as a gas
(b) As steam
(c) As ordinary vapour
(d) Approximately as a gas

SJVN ET 2013, TRB Asstt. Prof., 2012

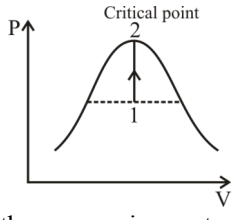
Ans. (d) : Superheated vapours behave approximately as a gas.

747. If a pure substance contained in a rigid vessel passes through the critical state on heating, its initial state should be

(a) sub-cooled water (b) saturated water
(c) wet steam (d) saturated steam

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-1998

Ans. (c)



In a rigid vessel the process is constant volume process initial state is wet state (wet steam).

748. Dryness fraction of steam expressed in terms of mass of dry steam (m_s) in steam and mass of water particle (m_w) in steam is define as :

(a) $m_s/(m_s + m_w)$ (b) $m_s/(m_s - m_w)$
(c) $m_w/(m_s + m_w)$ (d) none of the above

GPSC Lect. (Auto) 16.10.2016
TNPSC AE 2019, 2014

Ans. (a) : $$\text{Dryness fraction} = \frac{m_s}{m_s + m_w}$$

m_s = mass of dry steam
m_w = mass of water particle

749. Saturated liquid at high-pressure P_1 having enthalpy of saturated liquid 1000 kJ/kg is throttled to a lower pressure P_2. At pressure P_2, enthalpy of saturated liquid and that of the saturated vapour are 800 and 2800 kJ/kg respectively. The dryness fraction of vapour, after throttling process is :

(a) 0.1 (b) 0.5
(c) 18/28 (d) 0.8

RPSC ADE 2016, ESE 2003

Ans. (a) : In process of throttling, enthalpy remains constant

$$h_1 = h_2 = h_{f_2} + x\left(h_{g_2} - h_{f_2}\right)$$

If dryness fraction is x

$$1000 = 800 + x(2800 - 800)$$

$$x = 0.1$$

750. The total volume of a mixture of gases is equal to the sum of the volumes that would be occupied by each component at the mixture temperature T and pressure P applicable to ideal gases is:

(a) Dalton's law (b) Avogadro's law
(c) Amagat's law (d) Kelvin's law

HPPSC Asstt. Prof. 29.10.2016
HPPSC AE (PWD) 10.09.2016

Ans. (c) : Amagat's law– Amagat's law assumes that the volumes of the component gases (again at the same temperature and pressure) are additive, the interactions of the different gases are the same as the average interactions of the component.

$$V_{min} = \sum_{i}^{k} V_i = V_1 + V_2 + V_3 + \ldots\ldots\ldots\ldots + V_k$$

751. In thermodynamics, pure substance is the one which :

(a) Behaves like a perfect gas
(b) Consists of only a single chemical species
(c) Has no dissolved impurities
(d) Has a number of chemical species but has constant composition

Kerala PSC Asstt. Prof. 27.09.2016
APPSC AEE MAINS 2016 PAPER-III

Ans. (d) : Thermodynamic, pure substance is the one which has a number of chemical species but has constant composition.

Pure Substance–

- A substance that has a fixed chemical composition throughout is called a pure substance i.e. water, nitrogen, helium and CO_2.

Search on Telegram @apna_pdf

- Substance which are mixture of various elements or compounds also qualifies as pure substances as long as mixture is homogeneous.

Properties of Pure Substance–

- A pure substance is a material with homogenous and invariable composition.
- Pure substances can have multiple phases, an ice water mixture is still a pure substance but an air-steam is not a pure substance.

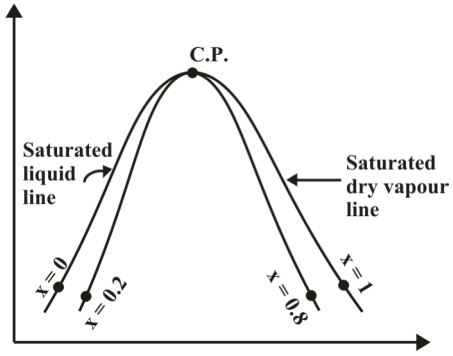
752. For dry saturated vapour, the value of dryness fraction will be

(a) 1.0 (b) 0.75
(c) 0.5 (d) 0

RPSC Lecturer 16.01.2016
TNPSC AE (Industries) 09.06.2013

Ans. (a) : Dryness fraction (x)

$$= \frac{\text{Mass of vapour}}{\text{Mass of vapour + Mass of liquid}}$$



$$x = \frac{m_v}{m_L + m_v}$$

at saturated vapour line

$m_L = 0$

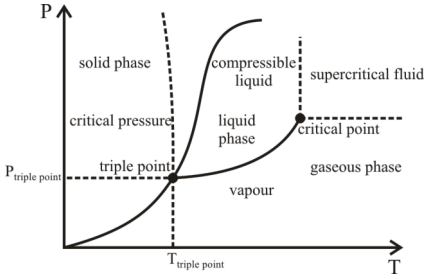
$$x = \frac{m_v}{m_v + 0} = 1$$

753. No substance can exist in the liquid phase in stable equilibrium

(a) at temperature below the triple point temperature
(b) at pressure below the triple point pressure
(c) at pressure above the triple point pressure
(d) at temperature above the triple point temperature

GPSC EE Pre, 28.01.2017, ESE 2012

Ans. (b) : About to three phase equilibrium



- No substance can exist in the liquid phase in stable equilibrium at pressure below the triple point pressure.
- The same can be said for temperature for substance that contract on freezing.
- Substances at high pressure can exist in the liquid phase at temperature below the triple point temperature.

754. Critical point of water refers to the state in which-

(a) Liquid and solid coexist
(b) Solid and liquid coexist
(c) Liquid and vapour coexist
(d) All the three coexist

NPCIL ET, 2015
UKPSC AE 2012 Paper–II

Ans. (c) : Critical point of water refers to state in which-liquid and vapour co exist.
Critical point is point where liquid directly converts into vapour and triple point of water is the point where three phase exist. i.e. solid, liquid and gas.

755. No liquid can exist as a liquid at

(a) 0°C temperature (b) 200°C temperature
(c) Zero pressure (d) Zero viscosity

Nagaland PSC CTSE 2017 Paper-2
APPSC AEE Mains 2016 Paper-III

Ans. (c) : No liquid can exist as a liquid at zero pressure:-
Generally absolute zero pressure is the point where there exist a minimum temperature i.e. zero. That can be possible only when molecular momentum of system become zero. There should not be any motion of particles so there is no collision of particles, kinetic energy nullifies and the temperature becomes zero.

756. If 'h' refers total heat, T refers to temperature, then in the throttling process,

(a) $h_1^2 = h_2$ (b) $h_1 = h_2$
(c) $h_1 = h_2 + \frac{h_{fg}}{T_s}$ (d) $h_2 = h_1 + \frac{h_{fg}}{T_s}$

GPSC DEE, Class-2 (GWSSB) 04.07.2021
TNPSC AE 2019

Ans. (b) : The throttling process is a constant enthalpy process.

$h_1 = h_2$

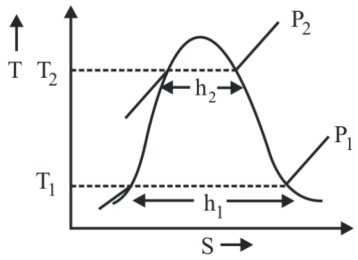
757. With the increase in pressure -

(a) The boiling point of water decreases and enthalpy of evaporation increases.
(b) The boiling point of water increases and enthalpy of evaporation decreases
(c) Both the boiling point of water and enthalpy of evaporation decreases.
(d) Both the boiling point of water and enthalpy of evaporation increases

RPSC ACF & FRO, 26.02.2021
TNPSC AE 2014

Search on Telegram @apna_pdf

Ans. (b) : With the increase in pressure the boiling point of water increases and enthalpy of evaporation decreases



$P_2 > P_1$
$T_2 > T_1$
$h_2 < h_1$

758. Consider the following statements :
When dry saturated steam is throttled from a higher pressure to a lower pressure, the :
(1) Pressure decreases and the volume increases.
(2) Temperature decrease and the steam becomes super heated.
(3) Temperature and the dryness fraction increases.
(4) Entropy increases without any change in Enthalpy.
Which of these statements are correct?
(a) (1) & (4) (b) (1), (2) & (4)
(c) (1) & (3) (d) (2) & (4)

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
ESE 2000

Ans. (b) : When dry saturated steam is throttled from a higher pressure to lower pressure, the
(1) Pressure decreased and volume increases
(2) Without any change in enthalpy.
(3) Dryness fraction increases.

759. Which of the following laws is applicable for the behavior of a perfect gas?
(a) Boyle's law (b) Charles' law
(c) Gay-Lussac law (d) all of the above

APGCL AM, 2021
Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) :
Boyle's Law : It states that the pressure exerted by a gas (of a given mass, kept at a constant temperature) is inversely proportional to the volume occupied by it.

$$P_1V_1 = P_2V_2$$

Charles Law : It states that the volume of an ideal gas is directly proportional to the absolute temperature at constant pressure.

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Gay-Lussac's Law : The pressure of given mass of gas varies directly with the absolute temperature of the gas, when the volume is kept constant.

760. If a pure substance is below the triple point temperature, the solid on being heated will only
(a) temperature remain constant
(b) liquify
(c) vapourize or sublimate
(d) have its temperature increase

UPPSC AE 13.12.2020, Paper-2
ESE 2013

Ans. (c) : If a pure substance is below the triple point temperature, the solid on being heated will only vapourize or sublimate.

761. Highest ratio of specific heat is possible for?
(a) Argon (b) Helium
(c) Hydrogen (d) Air

ISRO Scientist/Engineer 12.01.2020
J&K PSC Civil Services Pre, 2010

Ans. (a,b) :

Gas	Ratio of specific heat	Examples
Mono atomic	$\gamma = 1.667$	He, Ar, Neon
Diatomic	$\gamma = 1.4$	O_2, N_2, H_2, Air
Tri-atomic	$\gamma = 1.33$	O_3

762. The specific heat of a gas remains constant at all temperatures and pressures is discussed in:
(a) Joule's Law (b) Boyle's Law
(c) Charles' Law (d) Regnault's Law

CIL MT 27.02.2020, TSPSC AEE 2015

Ans. (d) : Regnault's law states that the specific heat capacity of a gas at constant pressure (C_P) and specific heat capacity of a gas at constant volume (C_V) do not change with change in pressure and temperature.
According to this law, C_P and C_V values of gas remain constant.

763. The slope drawn on sublimation curve on P-T diagram for all substances gives _____ value.
(a) infinite (b) zero
(c) negative (d) positive

RPSC ACF & FRO, 26.02.2021
AAI Jr. Executive 29.11.2018

Ans. (d)
1. Slope of sublimation curve for all substances is positive.
2. Slope of fusion curve for most of substances is positive but for water it is negative.
3. Those substances whose triple point pressure lies above atmospheric pressure will directly sublimate.

764. In Vander Waals equation of state the two constant are determined from the behaviour of substance at :
(a) Saturated point (b) Triple point
(c) Critical point (d) Never determined.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Search on Telegram @apna_pdf

Ans. (c) : Vander Waals equation-

$$\left(P+\frac{a}{V^2}\right)(V-b)=RT$$

Force of Cohesion $=\frac{a}{V^2}$

Volume of molecules = b
(Co- volume)

where $a=3P_cV_c^2$ and $b=\frac{V_c}{3}$

Critical pressure $(P_c)=\frac{a}{27b^2}$

Critical Volume $(V_c)=3b$

Critical temperature $(T_c)=\frac{8a}{27bR}$

765. The triple point temperature for water is

(a) 0°K (b) 0°C
(c) 0.01°C (d) 0.1°C

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (c) : 0.01 °C (273.16 K, 32.01 °F)

766. The specific heat at constant pressure is _____ that of specific heat at constant volume.

(a) equal to (b) less than
(c) more than (d) None of these

RPSC ACF & FRO, 26.02.2021

Ans. (c) : The specific heat at constant pressure is more than that of specific heat at constant volume.

$C_p > C_v$

$C_p - C_v = R$

$C_p = R + C_v$

$\frac{C_p}{C_v}=\gamma$

$C_p = \gamma C_v$

C_p is greater than C_v because when a gas is heated at constant volume, no external work is done. So, heat supplied is consumed only in increasing the internal energy of gas.
But if gas is heated at constant pressure, external work is done as well as increasing the internal energy of gas.

767. The enthalpy of dry saturated steam ___ with the increase in pressure.

(a) decreases (b) increases
(c) remains constant (d) All of these

RPSC ACF & FRO, 26.02.2021

Ans. (a) : The enthalpy of dry saturated steam decrease with the increase in pressure.

768. Which combination of the following statements is correct?

P. A gas cools upon expansion only when its Joule-Thomson coefficient is positive in the temperature range of expansion.

Q. For a system undergoing a process, its entropy remains constant only when the process is reversible.

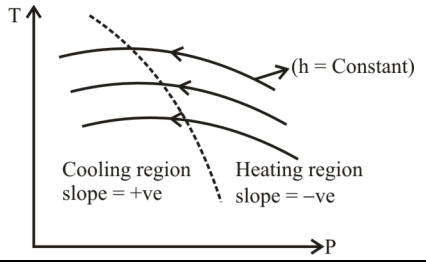
R. the work done by a closed system in an adiabatic process is a point function.

S. A liquid expands upon freezing when the slope of its fusion curve on Pressure Temperature diagram is negative.

(a) R and S (b) P and Q
(c) Q, R and S (d) P, Q and R

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : For a system undergoing a process, its entropy remains constant in two possible conditions.
(i) Reversible and adiabatic.
(ii) Irreversible and non-adiabatic.
But in irreversible and non-adiabatic process, the entropy generation and entropy generates by surrounding is equal in magnitude and opposite in direction.
Q statement is incorrect.

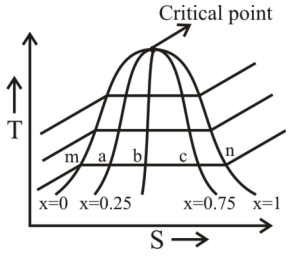


769. The dryness (x) fraction of superheated steam is taken as

(a) x = 0 (b) x = 0.9
(c) x = 0.999 (d) x = 1

Assam PSC AE (IWT) 14.03.2021

Ans. (d) :



The value of x varies between zero and one. For saturated water, when water just starts boiling, x = 0, and for saturated vapour when vaporisation is complete, x = 1. For which the vapour is said to be dry saturated. Point m indicate the saturated liquid state with x = 0 and point n indicate the saturated vapour state with x = 1 the line mn indicating the transition from liquid to vapour.

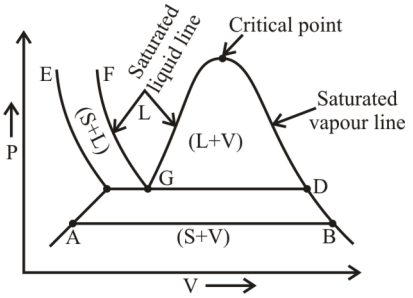
770. What is the state at which saturated liquid line with respect to vaporization and saturated vapor line on p-v diagram of pure substance made called?

(a) Saturation state
(b) Critical state
(c) Vaporization state
(d) Superheated vapor state

Assam PSC AE (IWT) 14.03.2021

Search on Telegram @apna_pdf

Ans. (b)



The point at which the saturated liquid line with respect to vapourisation and saturated vapour on a P-V diagram of a pure substance is called critical point.

The temperature, pressure and specific volume corresponding to the critical point are termed as critical properties.

771. In throttling calorimeter, the thermodynamic process used to throttle the wet steam is _____.

(a) constant volume process
(b) process with constant specific heat
(c) constant entropy process
(d) constant enthalpy process

VIZAG Steel MT 24.01.2021

Ans. (d) : In throttling process,
Enthalpy (h) = Constant

772. The state of a simple compressible pure substance can be fixed by specifying

(a) one independent property.
(b) two independent properties.
(c) three independent properties.
(d) four independent properties.

ESE 18.07.2021

Ans. (b) : The state of pure substance of a given mass can be fixed by specifying two independent intensive properties provided the system is in equilibrium. This is known as 2-properties rule.

Temperature and specific volume, for example, are always independent properties, and together they can fix the state of a simple compressible system.

773. A vessel has two compartments. First compartment contains 2 kg of dry saturated steam at 7 bar [$v_{g@7bar}$= 0.27 m^3/kg] and second compartment contains 1 kg of steam of dryness fraction of 0.8 at 3.5 bar [$v_{g@3.5bar}$= 0.55 m^3/kg]. After the partition is removed, the pressure of the mixture is found to be 5 bar [$v_{g@5bar}$ = 0.37 m^3/kg]. Neglecting the volume of water, what will be specific volume of mixture?

(a) 0.281 m^3/kg (b) 0.326 m^3/kg
(c) 0.462 m^3/kg (d) 0.521 m^3/kg

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given,
$m_1 = 2$ kg
$x_1 = 1$
$P_1 = 7 \text{ bar} = 7 \times 10^5 \text{ N/m}^2$
v_{g_1} at 7 bar = 0.27 m^3/kg
$m_2 = 1$ kg
$x = 0.8$
$P_2 = 3.5 \text{ bar} = 3.5 \times 10^5 \text{ N/m}^2$
v_{g_2} at 3.5 bar = 0.55 m^3/kg
After mixing
$P_m = 5$ bar
V_g at 5 bar = 0.37 m^3/kg
$v_m = ?$
We know total mass (m) = $m_1 + m_2$ = 1+2 = 3kg
Neglecting volume of water

$$V_m = \frac{m_1\left(x_1 v_{g_1}\right) + m_2\left(x_2 v_{g_2}\right)}{m}$$

$$= \frac{2\times(1\times 0.27)+1\times(0.8\times 0.55)}{3}$$

$$= 0.3267 \text{ m}^3/\text{kg}$$

774. The pressure and temperature of mixture of 4 kg O_2 and 6 kg N_2 are 4 bar and 27^0C. What will be the value of molecular weight of mixture?

(a) 40.67 (b) 39.87
(c) 29.47 (d) None of the above

UPPSC AE 13.12.2020, Paper-2

Ans. (c) : Given,
mass of O_2 = 4 kg
mass of N_2 = 6 kg
Molecular weight of mixture,

$$\Rightarrow \frac{m_{o_2}\times\left(M_{wt}\right)_{o_2} + m_{N_2}\times\left(M_{wt}\right)_{N_2}}{m_{o_2} + m_{N_2}}$$

$$\Rightarrow \frac{(4\times 32)+(6\times 28)}{4+6}$$

$$\Rightarrow 29.6$$

775. According to the state postulate, the number of independent properties required to determine the state of a system containing a pure substance, with two of its phases in equilibrium, is

(a) 1 (b) 2
(c) 3 (d) zero

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : The number of properties required to fixed the state of a system is given by the state postulate. The slope of a simple compressible system is completely specified by two independent, intensive properties.

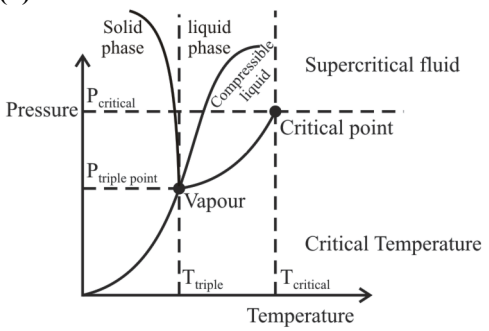
776. Ice, when heated, directly sublimates into water vapour without going through liquid phase when

(a) temperature is lower than critical temperature
(b) pressure is lower than critical pressure
(c) temperature is lower than triple point temperature
(d) pressure is lower than triple point pressure

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Search on Telegram @apna_pdf

Ans. (d)



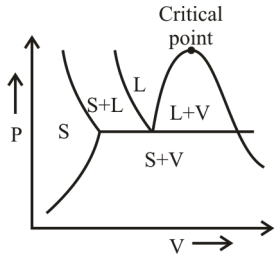
On decreasing temperature below triple point it solidifies while decreasing pressure below triple point it changes directly into vapour state i.e. sublimation.

777. In the P-V diagram for water, the horizontal portion of an isothermal line indication

(a) solid phase
(b) vapour phase
(c) phase change from solid to liquid or liquid to vapour
(d) liquid phase

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) :



778. When a material solidify due to latent heat of fusion is known as:

(a) Thermometry (b) Super cooling
(c) Under cooling (d) Thermal arrest

CIL MT 27.02.2020

Ans. (d) : • The cooling curve formed when a material is solidified due to latent heat of fusion is called as thermal arrest.

• Thermometry is the process of measuring temperature.

• Subcooling or undercooling is the process of lowering the boiling point.

779. If the value of a gas constant is 0.1 kJ/kg.K and specific heat at constant volume is 0.2 kJ/kg.K, the specific heat ratio will be:

(a) 1.5 (b) 1.1
(c) 3.3 (d) 2.5

NLCIL GET 17.11.2020, Shift-II

Ans. (a) : Given, $C_v = 0.2$ kJ/kgK

$R = 0.1$ kJ/kgK

We know that,

$C_p - C_v = R$

$C_p = 0.1 + 0.2$

$C_p = 0.3$

Ratio of specific heat

$$\frac{C_p}{C_v} = \gamma = \frac{0.3}{0.2}$$

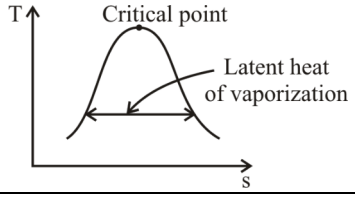
$$\boxed{\frac{C_p}{C_v} = 1.5}$$

780. At critical pressure

(a) the entropy of a substance is zero
(b) the latent heat of vaporization is zero
(c) saturated vapour becomes a gas
(d) a real gas obeys ideal gas laws

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (b) : At critical pressure the latent heat of vaporization is zero.



781. Gas laws are least valid in the cases of

(a) mono atomic gases (b) polyatomic gases
(c) vapours (d) gas mixtures

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : Gas laws are least valid in the case of vapours.

782. Critical point of water is

(a) 22.06 kPa (b) 22.06 MPa
(c) 22.06 atm (d) 22.06 bar

ISRO Scientist/Engineer 12.01.2020

Ans. (b) : $\Rightarrow$ Critical pressure of water = 220.6 bar
= 22.06 MPa
$\Rightarrow$ Critical temperature of water = 374ºC

783. In a shower mixer, cold water at 27 deg C, flowing at 5 kg/min is mixed with hot water at 77 deg C flowing at 15 kg/min. The exit temperature of the mixture is

(a) 45.4 deg C (b) 64.5 deg C
(c) 34.5 deg C (d) 68.4 deg C

ISRO Scientist/Engineer 12.01.2020

Ans. (b) : For steady state,
The rate of enthalpy entering the mixture
= The rate of enthalpy leaving mixture
$(5\times C_{pw}\times 27) + (15\times C_{pw}\times 77) = (5+15)\times C_{pw}\times (T_{exit})_{mixture}$
$(T_{exit})_{mixture} = 64.5$ºC

784. When a liquid and its vapour are in equilibrium at a certain pressure and temperature, then which of the following is required to identify the saturation state?

(a) Pressure
(b) Temperature
(c) Pressure or temperature
(d) Both (a) and (b)

MECON MT 2019

Search on Telegram @apna_pdf

Ans. (c) : When a liquid and its vapour are in equilibrium at a certain pressure and temperature, only the pressure or the temperature is sufficient to identify the saturation state.

785. In a single component system, the maximum number of phases that can coexist together in equilibrium is _____.

(a) 5 (b) 2
(c) 3 (d) 4

VIZAG MT, 14.12.2020

Ans. (c) : At triple point single component exist in three phases. (DOF) at triple point = 0.

786. Triple point of a substance

(a) Occurs in a mixture of two or more gases
(b) Is the point where three phases exists together
(c) Occurs in sublimation
(d) None of the above

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (b) : Triple point of a substance is the point where three phases (solid, liquid & gas) exist together.
Triple point of water = 0.01°C = 273.16 K

787. For sublimation process which of the following are equilibrium?

(a) Solid and liquid phase
(b) Solid and vapour phases
(c) Solid, liquid and vapour phases
(d) None of the above

HPPSC ADF 05.03.2019

Ans. (b) : For sublimation process- Solid directly converted into vapour phase.

788. Nitrogen at an initial state of 10 bar, 1m^3 and 300 K is expanded isothermally to final value of 2m^3. The p-v-T relation is $(p + a/v^2)\, v = RT$, where a > 0. The final pressure;

(a) Will be slightly less than 5 bar
(b) Will be slightly more than 5 bar
(c) Will be exactly 5 bar
(d) Cannot be ascertained in absence of value of a.

HPPSC ADF 05.03.2019
GATE 2005

Ans. (b) : Given,

$P_1 = 10$ bar, $V_2 = 2\ m^3$
$V_1 = 1\ m^3$, $T = 300$ k

$$\left(P+\frac{a}{V^2}\right)(V) = RT$$

[According to Vanderwall's equation]

$$\left(P+\frac{a}{V^2}\right)V = \text{Constant} \Rightarrow$$

$$\left(P_1+\frac{a}{V_1^2}\right)V_1 = \left(P_2+\frac{a}{V_2^2}\right)V_2 \Rightarrow \left(10+\frac{a}{1^2}\right)1 = \left(P_2+\frac{a}{2^2}\right)2$$

$$\Rightarrow \frac{10+a}{2} = P_2+\frac{a}{4} \Rightarrow 5+\frac{a}{2} = P_2+\frac{a}{4}$$

$$\Rightarrow 5+\frac{a}{4} = P_2 \text{ and } a > 0 \text{ is given}$$

$\therefore$ The value of P_2 should be slightly greater than 5 bar

789. On Mollier chart a flow though a turbine is represented by:

(a) Horizontal line
(b) Vertical line
(c) Curved line convex up
(d) Curved line concave up

HPPSC ADF 05.03.2019

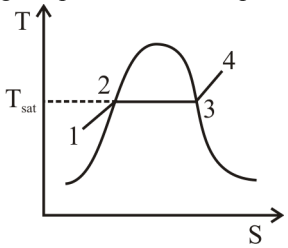
Ans. (b) : On Mollier chart a flow through, a turbine is represented by vertical straight line because isentropic expansion in turbine.

790. Saturated state of pure substance (water) is a:

(a) State from which a change of phase may occur without a change in pressure or temperature
(b) State from which a change of phase occur with a change in pressure of temperature.
(c) State from which a change of phase may occur without a change in pressure and temperature.
(d) State from which a change of phase may occur with a change in pressure and temperature

Oil India Limited Sr. Engineer (Production) 30.11.2019

Ans. (c) : Saturated state of pure substance (water) is the state from which change of phase may occur without a change in pressure and temperature.



On T-S diagram horizontal line 2-3 represent saturation state of pure substance through pressure and temperature not varies.

791. Which of the following options can always be approximated to be an ideal gas?

(a) Highly superheated vapour
(b) Dry saturated vapour
(c) Supercritical fluid
(d) Saturated vapour

BHEL ET 2019

Ans. (a) : Assumption of Ideal gas-

- Intermolecular force should be negligible
- Volume occupied by the molecular should be negligible compared to container volume.
- Water vapour mixed with air is considered as ideal gas.
- Steam should never be considered as ideal gas unless mentioned.
- Steam is the special term given to the gases form of water only when present at high temperature.

Search on Telegram @apna_pdf

792. Pick the correct statement about pure substances.

(a) A mixture of liquid air and gaseous air is a pure substances.
(b) A mixture of ice and liquid water is not a pure substance.
(c) A mixture of two or more phases of pure substances is not a pure substance even though the chemical composition of all the phases is the same throughout.
(d) A mixture of two or more phases of pure substance is still a pure substance as long as the chemical composition of all the phases is the same throughout.

BHEL ET 2019

Ans. (d) : Pure substance– A mixture of two or more phases of pure substance is still a pure substance as long as the chemical composition of all the phases is the same throughout.

793. Water vapour can be considered as Ideal Gas.

(a) Never (b) Always
(c) At high pressure (d) At low pressure

OPSC AEE 2019 PAPER-II

Ans. (d) : At very low pressure and high temperature all gases and vapour approaches to ideal gas behaviour.

794. Specific heat of mono atomic gases:

(a) Increase with temperature rise
(b) Decrease with temperature rise
(c) Does not depends on change in temperature
(d) None of these

OPSC AEE 2019 PAPER - II

Ans. (c) : Specific heat for mono atomic ideal gas is $\frac{5R}{2}$ and for diatomic ideal gas is $\frac{7R}{2}$

795. Calculate the dryness fraction of steam which has 1.5 kg of water in suspension with 50 kg of steam

(a) 0.971 (b) 1
(c) 0 (d) 0.485

TNPSC AE 2019

Ans. (a) : Data Given

$m_w = 1.5$ kg, $m_v = 50$ kg

$$\text{Dryness fraction (x)} = \frac{m_v}{m_w + m_v}$$

$$x = \frac{50}{1.5 + 50} = 0.971$$

796. On Mollier chart, slope of an isobar on h-s diagram is equal to: [where T = absolute temperature]

(a) T^4 (b) T^2
(c) T (d) T^3

SJVN ET 2019

Ans. (c) : dh = Tds + vdP, For constant pressure/ isobaric process

dP = 0

So, dh = Tds

$$\text{or } \left.\frac{dh}{ds}\right|_p = T$$

797. An ideal gas having the weight of 20 N/m^3 at the temperature of 27°C and pressure of 0.206 N/mm^2 (abs). The gas constant will be [Consider g = 9.81 m/s^2]

(a) 912 kJ/kg-K (b) 0.912 kJ/kg-K
(c) 0.4251 kJ/kg-K (d) 425.1 kJ/kg-K

SJVN ET 2019

Ans. (c) : PV = mRT

$$\frac{0.206}{10^{-6}} \times 1 = \frac{20}{9.81} \times R \times 300 \text{ or}$$

R = 425.1 J/kgK

= 0.4251 kJ/kgK

798. A gas mixture consists of 3 kg of O_2, 5kg of N_2 and 12 kg of CH_4. The mass fraction and mole fraction of O_2 are

(a) 0.25 and 0.125 (b) 0.15 and 0.092
(c) 0.25 and 0.092 (d) 0.15 and 0.125

ESE 2019

Ans. (b) : Mass fraction of $O_2 = \frac{m_{O_2}}{m_{O_2} + m_{N_2} + m_{CH_4}}$

$$= \frac{3}{3+5+12} = 0.15$$

Mole fraction of $O_2 = \frac{n_{O_2}}{n_{O_2} + n_{N_2} + n_{CH_4}}$

$$= \frac{\left(\frac{3}{32}\right)}{\left(\frac{3}{32}\right) + \left(\frac{5}{28}\right) + \left(\frac{12}{6}\right)}$$

= 0.092

799. What is the lowest pressure at which water can exist in liquid phase in stable equilibrium?

(a) 101.325 kPa (b) 0.311 kPa
(c) 22.06 kpa (d) 0.611 kPa

BHEL ET 2019

Ans. (d) : The lowest pressure at which water can exist in liquid phase in stable equilibrium of 0.611 kPa.

800. The statement that molecular weight of all gases occupy the same volume is known as-

(a) Avogardo's hypothesis
(b) Gas law
(c) Dalton's law
(d) Thermodynamics law

RPSC AE 2018

Ans. (a) : The statement that molecular weight of all gases occupy the same volume is known as Avogardo's hypothesis.

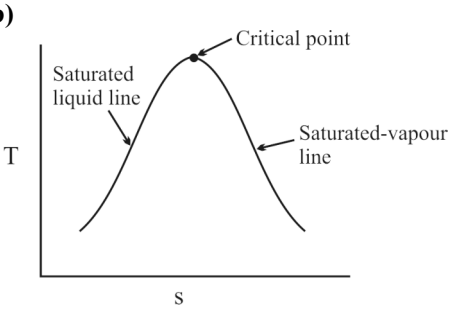
801. The point that connects the saturated-liquid line to the saturated-vapour line is called the

(a) triple point
(b) critical point
(c) superheated point
(d) compressed liquid point

RPSC Vice Principal ITI 2018

Search on Telegram @apna_pdf

Ans. (b)



The properties of liquid and vapour are identical at critical point.

802. The value of characteristics constant of oxygen would be

(a) 0.412 kJ/kg-K (b) 0.262 kJ/kg-K
(c) 1.004 kJ/kg-K (d) 0.624 kJ/kg-K

TNPSC AE 2018

Ans. (b) : The value of characteristics constant of oxygen would be 0.262 kJ/kg-K.

803. It is desired to store 28 kg of nitrogen at 14 MPa pressure and 27°C in a cylinder. Assuming that nitrogen behaves like an ideal gas, determine the size of the cylinder.

(a) 0.01782 m^3 (b) 0.1782 m^3
(c) 1.782 m^3 (d) 17.82 m^3

RPSC AE 2018

Ans. (b) : Data given:

m = 28 kg, P = 14 MPa, T = 27°C = 300 K

Ideal gas equation

$PV = mRT$

where

$$R = \frac{\bar{R}}{M}$$

molecular weight (M) for

$N_2 = 28$

$\bar{R}$ (Universal gas constant)

= 8.314 kJ/k-m K

$$R = \frac{8.314}{28} = 0.2969\ kJ/K\,kg$$

then,

$$V = \frac{28 \times 0.2969 \times 300}{14 \times 1000}$$

$V = 0.178157\ m^3$

804. Which of the following law governs the isothermal process

(a) Boyle's Law (b) Charle's law
(c) Joule's law (d) Gay Lussac's law

HPPSC AE 2018

Ans. (a) : Boyle's law governs the isothermal process.

T = Constant

$P_1V_1 = P_2V_2$ = Constant

Charle's Law – P = Constant

$$\frac{V_1}{T_1} = \frac{V_2}{T_2} = \text{Constant}$$

Gay Lussac's Law – Gay Lussac's Law states that the pressure of a given mass of a gas varies directly with absolute temperature of the gas when the volume is kept constant.

$$\frac{P_1}{T_1} = \frac{P_2}{T_2} = \text{Constant}$$

805. Which one of the following substances has constant specific heat at all pressures and temperature?

(a) Mono-atomic gas (b) Di-atomic gas
(c) Tri-atomic gas (d) Poly-atomic gas

ESE 2018

Ans. (a) : The specific heats, c_p and c_v vary with the temperature, the variation being different for each gas. For monoatomic gases, such as He, Ne, Ar and most metallic vapours, specific heats are constant.

806. According to kinetic theory of gases, the kinetic energy of translation of a molecule is proportional to

(a) T (b) $\sqrt{T}$
(c) 1/T (d) $1/\sqrt{T}$

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : According to kinetic theory of gases, the kinetic energy of translation of a molecule is proportional to temperature (T).

Kinetic energy, $K.E. = \frac{3}{2}\frac{R}{N_A} \times T \Rightarrow K.E. \propto T$

Where, R = Gas constant

N_A = Avogardro's number

807. The ratio of molar specific heats for monoatomic gas is

(a) 1 (b) 1.4
(c) 1.67 (d) 1.87

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The ratio of the specific heats $\gamma = C_P/C_V$ is a factor in adiabatic engine processes. This ratio $\gamma = 1.66$ air, which is predominantly a diatomic gas.

808. If a_1 and a_2 are the dryness fractions obtained in separating calorimeter and throttling calorimeter respectively, then the actual dryness fraction of steam will be:

(a) $(a_1 + a_2)/2$ (b) $(a_1a_2)/2$
(c) $a_1 + a_2$ (d) a_1a_2

AAI Jr. Executive 29.11.2018

Ans. (d) : The separating calorimeter when used to alone does not give a very accurate result because we have to assume that all the water is separated out from the steam while passing through the calorimeter which is not the case also the throttling calorimeter is only able to measure the dryness fraction of steam in the steam gets superheated after throttling the actual dryness fraction of steam.

Actual dryness fraction (x_{actual}) = $a_1 \times a_2$

Search on Telegram @apna_pdf

809. The ..... states that change of internal energy of a perfect gas is directly proportional to the change of temperature

(a) Boyle's law (b) Charles's law
(c) Gay-Lussac law (d) Joule's law

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Joule's First law – A physical law expressing the relationship between the heat generated and current flowing through a conductor.

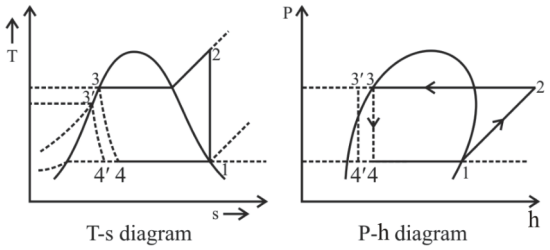
Joule's second law – This law states that change of internal energy of a perfect gas is directly proportional to the change of temperature and independent of its volume and pressure.

810. On cooling some amount of liquid water, its saturation temperature was observed to be lower for a given pressure of the liquid water. This liquid water is said to be

(a) sub cooled liquid
(b) saturated liquid
(c) compressed liquid
(d) superheated vapour

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (a) : The term subcooling refers to a liquid existing at a temperature below its normal boiling part.



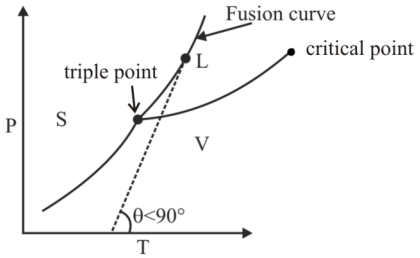
Subcooling 1-2-3-3'-4'-4-1

811. During melting the volume of pure substance other than water :

(a) Decreases
(b) Increases
(c) Remains constant
(d) First increases and then decreases

TRB Polytechnic Lecturer 2017

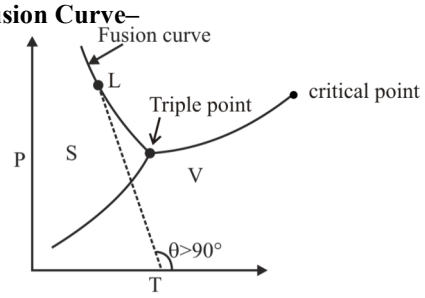
Ans. (b) : General Substance Fusion Curve–



$$\left(\frac{\partial P}{\partial T}\right)_{\text{General substance}} = +ve$$

Liquids → Solids [Contract]
Solid → Liquid [Expands]

H_2O Fusion Curve–



$$\left(\frac{\partial P}{\partial T}\right)_{H_2O} = -ve$$

Solid → Liquid [Contracts]
Liquid → Solid [Expands]

812. The temperature of an ideal gas always decreases during

(a) Isobaric expansion
(b) Isothermal expansion
(c) Adiabatic expansion
(d) Isentropic expansion

Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : The temperature of an ideal gas always decreasing during isentropic expansion.

813. Statement (I): A homogeneous mixture of gases that do not react within themselves can be treated as a pure substance.
Statement (II): Flue gases can be treated as a homogeneous mixture of gases.

ESE 2017

Ans. (b) : The composition of pure substance is invariable and same through out the sample i.e. constituents of pure substance do not react themselves. Hence statement-I is definition of pure substance and statement-II is example, so both are true.

814. What is the degree of freedom at critical point of water (pure substance)?

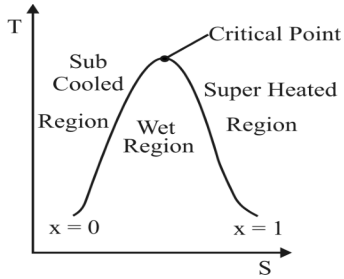
(a) 1 (b) 2
(c) 0 (d) 4

CGPSC ARTO & TSI 07.01.2017

Ans. (c) : Critical point :-It is the intersection point of saturated liquid line and saturated vapour line. or It is a point above which the liquid directly flash off into the vapour.

- At the critical point the degree of freedom is zero.

At the Critical point
$P + F = C + 1$ (Not = C + 2)
$2 + F = 1 + 1$
$\boxed{F = 0}$



Search on Telegram @apna_pdf

- At the critical point

Water Temperature (T_c) = 374ºC

And Pressure (P_c) = 221.2 bar

- At the critical point enthalpy all vaporisation (latent heat) will be zero
- On increasing the pressures of liquid the boiling point increases and latent heat decreases.

Degree of freedom (F)	Conditioned
0	At critical Point
2	Sub-Cooled Region
1	Wet Region
2	Super Heated Region

815. According to Avogadro's law

(a) the product of the gas constant and the molecular mass of an ideal gas is constant.

(b) the sum of partial pressure of the mixture of two gases is the sum of the two.

(c) equal volume of all gases, at the same temperature and pressure, contain equal number of molecules.

(d) All of the above

Karnataka PSC AE, 10.09.2017

Ans. (c) : Avogadro's law state that equal volumes of all gases at the same temperature and pressure, contain equal, number of molecules.

816. In the particular case of water, the sublimation curve is called the

(a) frost line (b) streak line

(c) ice line (d) steam line

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (a) : In the particular case of water the sublimation curve is called frost line. The vaporization curve is called steam line.

The fusion curve is called the ice line.

817. It is not possible to liquify hydrogen by application of pressure, at normal room temperatures, because

(a) It has high thermal conductivity

(b) It is a diatomic molecule

(c) Its critical temperature is lower than the room temperature

(d) It forms water under pressure

GPSC Asstt. Director of Transport 05.03.2017

Ans. (c) : Critical temperature of a substance is the temperature above which vapour of the substance cannot be liquified, No matter how much pressure is applied, critical temperature of Hydrogen is –239.95°C, So, it is impossible to liquify hydrogen at room temperature.

818. In steam tables, the entropy is shown as zero for

(a) Saturated vapour at atmospheric pressure

(b) Saturated liquid at atmospheric pressure

(c) Saturated vapour at 0°C

(d) Saturated liquid at 0°C

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : In steam tables, the entropy is shown as zero for, a saturated liquid at 0°C ≈ 0.01°C.

819. All gases have compressibility factor of nearly unity

(a) At very high temperatures and pressures

(b) At very low pressures approaching zero

(c) Near the critical point

(d) Above the critical point

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Compressibility factor [z] also known as compression factor, is a correction factor which describes the deviation of a real gas from ideal gas,

For ideal gas 'z' = 1.

$$z = \frac{PV}{RT}$$

From above for, z is nearly unity at very low pressure approaching zero.

820. Most of the gases exhibit drop in temperature upon expansion. However, this may not be true in case of

(a) carbon dioxide (b) oxygen

(c) hydrogen (d) helium

BPSC AE Mains 2017 Paper - V

Ans. (c) : In thermodynamics, the- Joule-Thomson (also known as the Joule-Kelvin effect or Kelvin-Joule effect) describes the temperature change of real gas or liquid when it is forced through a value or porous plug while keeping it insulated so that no heat is exchanged with the environment. This procedure is called a throttling process or Joule-Thomson process. At room temperature, all gases except hydrogen, helium, and neon gives heating effect upon expansion by the Joule-Thomson process when being throttled through an orifice, there are three gases experience the same effect but only at lower temperature.

Note-Option (c&d) both are correct. But official answer is (c).

821. If the dryness fraction of a sample by throttling calorimeter is 0.8 and that by separating calorimeter is also 0.8, then the actual dryness fraction of sample will be taken as

(a) 0.8 (b) $\sqrt{0.8}$

(c) 0.64 (d) 0.5

BPSC AE Mains 2017 Paper - V

UPPSC AE 12.04.2016 Paper-II

Ans. (c) : x_1 = Dryness fraction of steam considering separating calorimeter.

x_2 = Dryness fraction of steam entering the throttling calorimeter.

$x = x_1x_2$

Actual dryness fraction of steam in the sample

$x = 0.8 \times 0.8$

$= 0.64$

822. The value of dryness fraction at critical point for water-steam phase transformation may be

(a) 0 (b) 1

(c) either 0 or 1 (d) all of these

TNPSC AE 2017

Search on Telegram @apna_pdf

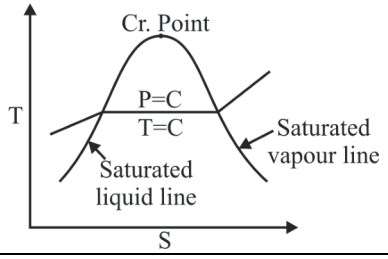
Ans. (d) : The value of dryness fraction at critical point for water-steam phase transformation is undefined.

823. A Saturation state of pure substance (water) is a:

(a) State from which a change of phase may occur with a change in pressure or temperature.
(b) State from which a change of phase may occur with a change in pressure and temperature.
(c) State from which a change of phase may occur with a change in pressure and volume.
(d) State from which a change of phase may occur without a change in pressure and temperature.
(e) State from which a change of phase may occur without a change in pressure or temperature.

(CGPSC Polytechnic Lecturer 2017)

Ans. (d) : Saturation State–A saturation state of pure substance (water) is a state from which a change of phase may occur without a change in pressure and temperature.



824. Universal gas constant is defined as equal to product of the molecular weight of the gas and

(a) specific heat at constant pressure
(b) specific heat at constant volume
(c) ratio of two specific heat
(d) gas constant

WBPSC AE, 2017

Ans. (d) : The ideal gas constant is given by
$PV = nRT$
$\rightarrow$ The universal gas constant or molar constant (R_u) of gas is the product of the specific gas constant (R) and the molecular mass of the gas (M)
$\because R_u = MR$ $[R_u = 8.314$ kJ/kg- mol.K$]$

825. Consider the following statements for a throttling process.

1. It is an adiabatic process
2. There is no work transfer in the process
3. Entropy increases in throttling process

Which of these statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

GPSC Asstt. Director of Transport 05.03.2017

Ans. (a) : Throttling process, is an adiabatic process and have no work transfer in the process and entropy increases in this due to heat transfer.

826. Volume of 1 kg of dry steam is known as :

(a) Total volume (b) Saturated volume
(c) Specific volume (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (c)

$$\text{Specific volume}(v) = \frac{\text{Volume of steam}}{\text{Mass of steam}} (m^3/kg)$$

827. The process of superheating follows :

(a) Reynold's law
(b) Stefan-Boltzmann's law
(c) Charles's law
(d) Ernst law

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : The process of superheating follow Charle's law.
According to Charles's law (P = Constant)

$$\frac{V}{T} = \text{constant}$$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

828. Sublimation is the process of

(a) Changing from gas state to solid state
(b) Changing from solid state to gas state
(c) Changing from liquid to vapour state
(d) Existence of solids, liquids and gases simultaneously

APPSC AEE Mains 2016 Paper-III

Ans. (b) : Sublimation– when a solid turns into a gas without first becoming liquid, that's sublimation.

829. Ideal gas equation may be written as [where, P = absolute pressure, v = specific volume, R = characteristic gas constant, T = absolute temperature, m = mass of gas, n = number of moles of gas, Z = compressibility factor]:

(a) Pv = nRT (b) Pv = ZRT
(c) Pv = mRT (d) Pv = RT

UPRVUNL AE 07.10.2016

Ans. (d) : Compressibility factor $Z = \frac{Pv}{RT}$
For ideal gas Z = 1
Then, $\boxed{Pv = RT}$

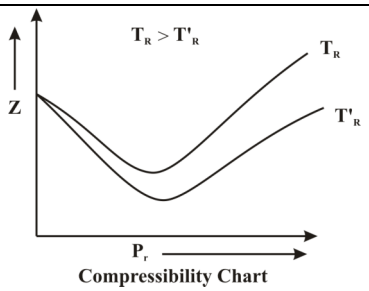
830. Generalized compressibility chart is drawn between:

(a) Reduced pressure (P_r) on y-axis and reduced temperature (T_r) on x-axis
(b) Compressibility factor (Z) on y-axis and reduced temperature (T_r) on x-axis
(c) Compressibility factor (Z) on y-axis and reduced pressure (P_r) on x-axis
(d) Compressibility factor (Z) on x-axis and reduced pressure (P_r) on y-axis

UPRVUNL AE 07.10.2016

Ans. (c) : Generalized compressibility chart is drawn between compressibility factor (Z) on y-axis and reduced pressure (P_r) on x-axis.

Search on Telegram @apna_pdf



Compressibility Chart

$$Z = \frac{PV_{actual}}{RT}$$

$$Z = \frac{V_{actual}}{V_{ideal}}$$

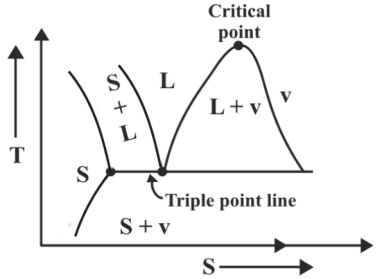
Z = 1 - for ideal gas
Z > 1 - less compressible
Z < 1 - more compressible

831. Which of the following is true statement for phase diagram of pure substance?

(a) Sublimation curve, fusion curve and vaporization curve meets at critical point
(b) Extreme points of vaporization curve are triple point and critical point
(c) Extreme points of fusion curve are triple point and critical point
(d) Fusion curve for water has positive slope

UPRVUNL AE 07.10.2016

Ans. (b) : In phase diagram of pure substance, extreme points of vaporization curve are triple point and critical points.



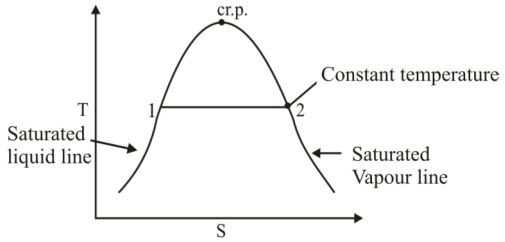
- Fusion curve for water has negative slope.

832. If the degree of saturation of air is zero, the air is said to be

(a) superheated air (b) unsaturated air
(c) saturated air (d) atmospheric air

APPSC AEE Mains 2016 Paper-III

Ans. (c) : If the degree of saturation of air is zero, the air is said to be saturated air.



We know that degree of saturation (DOS) = $(T_1 - T_2)$
When, $T_1 = T_2$
then, DOS = 0
It means air is said to be saturated air.

833. What do you mean by antifreeze chemicals?

(a) Substance that will not affect the freezing point of water
(b) Substance that evaporates the water
(c) Substance that lowers the freezing point of water
(d) Substance that increases freezing point of water

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : An antifreeze is an additive which lowers the freezing point of water based liquid. An antifreeze mixture is used to achieve freezing point depression for cold environments common antifreeze increase the boiling point of the liquid allowing higher coolant temperature.

834. Consider the liquid vapour saturation curve of a pure substance on the P-T diagram. The magnitude to the slope of the tangent line to this curve at temperature T (in Kelvin) is

(a) Proportion of the enthalpy of vaporization at that temperature
(b) Proportional to the square of temperature T
(c) Proportional to the temperature T
(d) Proportional to the volume change at the temperature

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Liquid on vapour saturation of a pure substance on the P-T diagram. The magnitude of the slope of the tangent line to this curve at temperature T (in Kelvin) is proportional of the enthalpy of vaporization at the temperature.

835. The mass of vapour in the system divided by the total system mass (the mass of vapour plus the mass of liquid) is defined as:

(a) Quantity (b) Quality
(c) Mass mix ratio (d) Vapour mix ratio

HPPSC AE (PWD) 10.09.2016

Ans. (b) : The mass of vapour in the system divided by the system mass is known as quality. It is also known as dryness fraction of steam.
Quality (x) can be calculated by

$$x = \frac{m_{vapour}}{m_{total}} = \frac{m_{vapour}}{m_{vapour} + m_{liquid}}$$

836. The correct sequence of the decreasing order of the value of characteristic gas constants given is

(a) hydrogen, nitrogen, air, carbon dioxide
(b) carbon dioxide, hydrogen, nitrogen, air
(c) air, nitrogen, carbon dioxide, hydrogen
(d) nitrogen, air, hydrogen, carbon dioxide
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (a) : We know that –
Gas characteristic constant

$$(R) = \frac{\bar{R}}{M}$$

Search on Telegram @apna_pdf

M = molecular weight

For Hydrogen, M = 1

$(R)_{H_2} = \bar{R}$

For Nitrogen, m = 14

$$(R)_{N_2} = \frac{\bar{R}}{14}$$

For air, M = 28

$$(R)_{air} = \frac{\bar{R}}{28}$$

For carbon dioxide , M = 44

$$(R)_{CO_2} = \frac{\bar{R}}{44}$$

837. In a coupled separating and throttling calorimeter. 0.89 is the dryness fraction of steam in the separating unit and 0.93 is the dryness fraction in the throtting unit. What is the approximate value of the dryness fraction of the steam sample?

(a) 0.93 (b) 0.89

(c) 0.91 (d) 0.83

UPRVUNL AE 21.08.2016

Ans. : (d) Separating calorimeter dryness fraction $(x_1) = 0.89$

throttling calorimeter dryness fraction $(x_2) = 0.93$

Approximate value of dryness fraction $(x) = x_1 \times x_2$

$x = 0.89 \times 0.93$

$x = 0.8277$

$x = 0.83$

838. The temperature above which vapour of the substance CANNOT be liquified, no matter how much pressure is applied is called

(a) Absolute Temperature

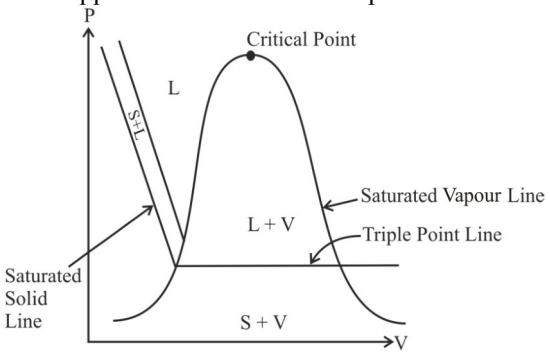
(b) Critical Temperature

(c) Equilibrium Temperature

(d) Osmotic Temperature

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : The temperature above which vapour of substance can not be liquified no matter how much pressure applied is called critical temperature.



$P_{critical\ point} = 221.1$ bar

$T_{critical\ point} = 374^0C$

839. If one kg of steam sample contains 0.8kg of dry steam, then what will be it's dryness fraction?

(a) 0.6 (b) 1

(c) 0.8 (d) 0.2

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (c) : Dryness fraction $x = \frac{m_g}{m_g + m_\ell}$

Where m_g = mass of actual dry stream

m_ℓ = mass of water in steam

Given,

$m_g = 0.8$ kg

$m_\ell = 1 - 0.8 = 0.2$

then $x = \frac{m_g}{m_g + m_\ell} = \frac{0.8}{0.8 + 0.2}$

$x = 0.8$

840. The amount of heat absorbed when 1 kg of saturated liquid water boils at pressure P is Q_1. The amount of heat released when 1 kg of saturated water vapour condenses at same pressure P is Q_2, then

(a) $Q_1 = Q_2$ for all values of P

(b) $Q_1 > Q_2$ for all values of P

(c) $Q_1 < Q_2$ for all values of P

(d) $Q_1 > Q_2$ or $Q_1 < Q_2$ depends upon value of Pressure P.

GPSC Asstt. Prof. 28.08.2016

Ans. (a) : For a same saturated pressure, the heat released and absorbed is same, from one state/phase to another.

$Q_1 \rightarrow$ heat absorbed

$Q_2 \rightarrow$ heat released

$Q_1 = Q_2$ at same pressure

841. In the Unary Phase diagram of water, the point at which ice, water and water vapour coexist in equilibrium, the degrees of freedom are :

(a) 0 (b) 1

(c) 2 (d) 3

KPSC ADF 2015

Ans. (a) : $P + F = C + 2$

$3 + F = 1 + 2$

$F = 0$

The point (Triple point) at which ice, water and water vapour coexist in equilibrium, the degree of freedom is zero.

842. Select the correct statement as per Charles's law.

(a) PV = Constant, if T is kept constant.

(b) $\frac{V}{T}$ = constant, if P is kept constant.

(c) $\frac{P}{V}$ = constant, if T is kept constant.

(d) $\frac{T}{P}$ = constant, if T is kept constant.

TSPSC AEE 2015

Ans. (b) : Charles's law:- The volume of a given mass of a perfect Gas varies directly as its absolute temperature, when the absolute pressure remains constant

Search on Telegram @apna_pdf

$V \propto T$

$\frac{V}{T} = \text{costant}$

$\boxed{\frac{V_1}{T_1} = \frac{V_2}{T_2} = \frac{V_3}{T_3} = \text{constant}}$

843. Which of the following gasses will have the maximum value of gas constant R

(a) nitrogen (b) carbon dioxide
(c) sulpher dioxide (d) oxygen

TSPSC AEE 2015

Ans. (a) :

Element	Molecular weight (M)
Nitrogen (N_2)	28
Carbon Dioxide (CO_2)	44
Sulpher Dioxide (SO_2)	64
Oxygen (O_2)	32

$$\text{gas constant } R = \frac{\bar{R}}{M}$$

$$\boxed{R \propto \frac{1}{M}}$$

So, Nitrogen gas will have the maximum value of gas constant because its molecular weight is 28.

844. The process of converting ice directly to steam is called?

(a) Equivalent evaporation
(b) Sublimation
(c) Condensation
(d) Critical evaporation

TSPSC Managers, 2015

Ans. (b) : The process of converting ice directly to steam is called sublimation process.

845. To convert volumetric analysis to gravimetric analysis, the relative volume of each constituent of the flue gases is-

(a) multiplied by its molecular weight
(b) divided by its molecular weight
(c) multiplied by its density
(d) multiplied by its specific weight

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (a) To convert volumetric analysis to gravimetric analysis, the relative volume of each constituent of the flue gases is multiplied by its molecular weight

846. The dryness fraction of steam within a turbine is not allowed to fall below

(a) 0.95 (b) 0.50
(c) 0.99 (d) 0.90

GPSC AE 26.07.2015

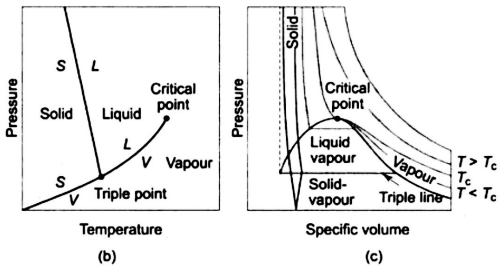
Ans. (d) :

847. A pure substance cannot remain in liquid phase if it is below the

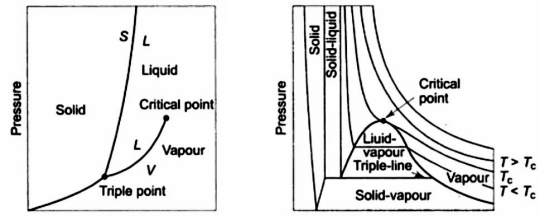
(a) critical state
(b) triple point
(c) saturated liquid line
(d) saturated vapour line

Assam PSC CCE Pre 2015

Ans. (b) : According to given diagram graph for a substance that expands on freezing and substance that contracts on freezing. A pure substance cannot remain in liquid phase if it is below the triple point.



p–v–T surface and projections for a substance that expands on freezing
(a) Three-dimensional view (b) Phase diagram (c) p-v diagram



p–v–T surface and projections for a substance that contracts on freezing
(a) Three-dimensional view (b) Phase diagram (c) p-v diagram

848. During addition of latent heat, for a wet steam, there is change in :

(a) temperature only
(b) temperature & pressure
(c) phase only
(d) temperature & phase

KPSC ADF 2015

Ans. (c) : During addition of latent heat for a wet steam, there is change in phase only and at constant temperature and pressure.

849. Which of the following expands in volume upon freezing?

(a) Mercury (b) Alcohol
(c) Water (d) Chloroform

Assam PSC CCE Pre 2015

Ans. (c) : Water expands in volume upon freezing.

850. Sensible heat is the heat required to -

(a) change liquid into vapour
(b) increase the temperature of a liquid or vapour
(c) none of three mentioned here.
(d) change vapour into liquid

GWSSB AAE, 27.12.2015

Ans. (b) : Sensible heat refers to the amount of energy needed to increase or decrease the temperature of some substances, independent of phase change.

851. For steam

(a) The critical temperature is 221.2°C and critical pressure is 374.15 bar
(b) The critical temperature is 374.15°C and critical pressure is 221.2 bar

Search on Telegram @apna_pdf

(c) The critical temperature is 221.2°C and critical pressure is 221.2 bar
(d) The critical temperature is 374.15°C and critical pressure is 374.15 bar

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : At critical point, Critical temperature (T_{cr}) = 374.15°C, Specific volume (v_{cr}) = 0.003155 m^3/kg
Critical pressure (P_{cr}) = 221.2 bar.

852. The conversion of water from 40°C to steam at 200°C at a pressure of bar is best represented as

(a) 
(b) 
(c) 
(d)

Nagaland PSC CTSE 2015 Paper-II
ESE 1994

Ans. (a) :

853. Dryness fraction is the ratio of :
(a) mass of dry steam to the mass of water vapour in suspension
(b) mass of water vapour in suspension to the mass of water vapour and mass of dry steam
(c) mass of dry steam to the mass of dry steam and mass of water vapour in suspension
(d) mass of water vapour in suspension to the mass of dry steam

Kerala PSC AE 06.08.2015

Ans. (c) : Dryness fraction- The term dryness fraction is related with the cut steam. It is defined as the ratio of 'mass of dry steam to the sum of mass of dry steam and mass of water vapour is suspension.

$$x = \frac{m_s}{m_s + m_w}$$

Where, x = dryness fraction
m_s = mass of steam
m_w = mass of water

854. Which one of the following statements is correct?
(a) Pressure and temperature are independent during phase change
(b) An isothermal line is also a constant pressure line in the wet vapour region
(c) Entropy decreases during evaporation
(d) The term dryness fraction is used to specify the fraction by mass of liquid in a mixture of liquid and vapour

Nagaland PSC CTSE 2015 Paper-II
ESE 1994

Ans. (b) :

855. A system comprising of a single phase, is known as
(a) Open system
(b) Closed system
(c) Homogeneous system
(d) Heterogeneous system

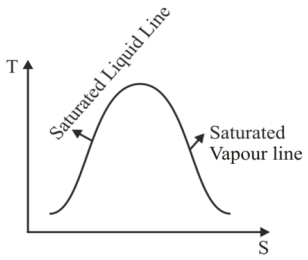
MPPSC State Forest Service Exam, 2014

Ans. (c) : A system comprising a single phase is called a homogeneous system.

856. A state of a pure substance at which a phase change ends or begins is called
(a) Critical state (b) Saturated state
(c) Triple point (d) Gibb's state

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (b) : The saturated state is a state where phase change begins or ends.



- A saturated liquid line where any further addition of energy will cause a small portion of the liquid to convert to vapour.
- Similarly a saturated vapour line, further heating will result superheated vapour state.

857. The heating of a gas at constant pressure is governed by
(a) Boyle's law (b) Charles's law
(c) Gay-Lussac law (d) Joule's law

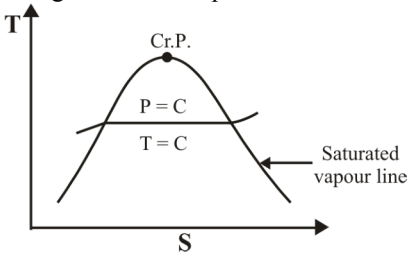
TNPSC AE 2014

Ans. (b) : Charles's Law– The heating of a gas at constant pressure.
Boyle's Law– The heating of a gas at constant temperature.
Gay-Lussac Law– The heating of a gas at constant volume.

858. The heating of wet steam at constant temperature till it becomes dry saturated is similar to that of heating at a
(a) constant volume (b) constant pressure
(c) constant entropy (d) constant enthalpy

TNPSC AE 2014

Ans. (b) : The heating of wet steam at constant temperature till it becomes dry saturated is similar to that of heating at a constant pressure.



Search on Telegram @apna_pdf

859. The kinetic energy lost in friction is transformed into heat which tends to
(a) cool or condense the steam
(b) dry or superheat the steam
(c) increase the pressure of the steam
(d) reduce the dryness fraction
(e) decrease the specific volume of steam

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : The kinetic energy lost in friction is transformed into heat which tends to dry or superheat the steam.

860. Which of the following can be regarded as gas so that gas law could be applicable within the commonly encountered temperature limits ?
(a) O_2, N_2, steam, CO_2
(b) O_2, N_2, water vapour
(c) SO_2, NH_3, CO_2, moisture
(d) O_2, N_2, H_2, air

J&K PSC Civil Services Pre, 2013

Ans. (d) :

861. Water boils when its vapour pressure :
(a) equals that of the surroundings
(b) equals 760 mm of mercury
(c) equals to atmospheric pressure
(d) equals the pressure of water in the container

J&K PSC Civil Services Pre, 2013

Ans. (c) : Any liquid is in an open container and exposed to normal atmospheric pressure, the liquid boils when its saturated vapour pressure becomes equal to 1 atmospheric pressure.

862. When the fuel is burned and water is release in the liquid phase, the heating value of fuel is called
(a) higher heating value
(b) lower heating value
(c) enthalpy of formation
(d) None the above

JPSC AE 2013 Paper-V

Ans. (a) : higher heating value

863. The ratio of $\frac{PV}{RT}$ is
(a) Equations of state
(b) Compressibility factor
(c) Reduced properties
(d) Critical compressibility factor

TNPSC AE 2013

Ans. (b) : Compressibility factor (Z)– Compressibility factor is also known as the compression factor or the gas deviation factor, is a correction factor which describe the deviation of a real gas from ideal gas behaviour. It is simply defined as the ratio of the molar volume of a gas to the molar volume of an ideal gas at the same temperature and pressure.

$$Z = \frac{PV}{RT}$$

For ideal gas $\rightarrow$ $Z = 1$

864. A certain gas has C_p value of 1968 J/kgK and C_v value of 1507 J/kgK. The value of R is
(a) 0.461 KJ/kgK (b) 1307 J/kgK
(c) 1 (d) 461 KJ/kgK

TNPSC AE 2013

Ans. (a) : We know that-
Mayer's formula is given as-
$C_p - C_V = R$
$1968 - 1507 = R$
$R = 461$ J/kgK
$R = 0.461$ kJ/kgK

865. RMS velocity of hydrogen gas at NTP is:
(a) 526 m/s (b) 932 m/s
(c) 1356 m/s (d) 1839 m/s

SJVN ET 2013

Ans. (d) : RMS velocity of hydrogen gas at NTP is 1839 m/s.

866. Triple point and critical point pressure of carbon dioxide are:-
(a) 4.58mm Hg and 221.2 bar respectively
(b) 5.18 bar and 221.2 bar respectively
(c) 1 bar and 50 bar respectively
(d) 5.18 bar and 73.8 bar respectively

UKPSC AE-2013, Paper-II

Ans. (d) : Triple point and critical point pressure of carbon dioxide are 5.18 bar and 73.8 bar respectively.

867. Which one of the following is weaker than hydrogen bonds?
(a) Ionic bond (b) Vander Waals bond
(c) Covalent bond (d) Metallic bond

UKPSC AE-2013, Paper-I

Ans. (b) : Vander waals bond is weaker than hydrogen bonds.

868. Which water becomes ice very fast when it is kept inside the freezer ?
(a) Warm water (b) Cold water
(c) Water with salt (d) Water with ethanol

TNPSC AE (Industries) 09.06.2013

Ans. (a) : Warm water becomes ice very fast when it is kept inside the freezer and it is called Mpemba effect.

869. Mollier chart is drawn between
(a) temperature and pressure
(b) temperature and entropy
(c) enthalpy and entropy
(d) pressure and enthalpy

TRB Poly. Lect., 2012

Ans. (c) : Mollier chart is drawn between enthalpy (h) & entropy (s)

870. Under thermal equilibrium, flow of steam is
(a) isentropic (b) adiabatic
(c) hyperbolic (d) polytropic

BPSC AE 2012 Paper - V

Ans. : (a) : Under thermal equilibrium, flow of steam is isentropic.

Search on Telegram @apna_pdf

871. Critical pressure of a liquid is the pressure
(a) above which liquid will remain liquid
(b) above which liquid will become gas
(c) above which liquid becomes vapour
(d) above which liquid becomes solid

BPSC AE 2012 Paper - V

Ans : (c) : Critical pressure of a liquid is the pressure above which liquid becomes vapour.

872. A perfect gas obeys
(a) Boyle's law only
(b) Charles law only
(c) Boyle's Charles' laws both
(d) none of these

TNPSC ACF 2012

Ans. (c) : A perfect gas obeys Boyle's and Charles's law Boyle's Law- Robert Boyle states that at constant temperature, the pressure P and gas varies inverse with its volume or $\boxed{PV = K}$.

Charles Law- Charles statics that at constant pressure, the volume of gas is directly proportional to its absolute temperature T.

873. Gases have
(a) only one value of specific heat
(b) two values of specific heat
(c) three values of specific heat
(d) no values of specific heat

TNPSC ACF 2012

Ans. (b) : Gases have two value of specific heat C_P and C_V. C_P is always greater than C_V.

$\boxed{C_P > C_V}$

874. Steam has a specific saturation temperature at
(a) each volume (b) each pressure
(c) each enthalpy (d) each entropy

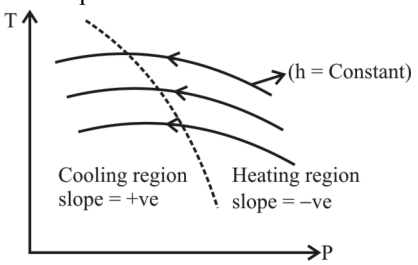
TRB Poly. Lect., 2012

Ans. (b) : Steam has a specific saturation temperature at each atmospheric pressure. Saturation state exist when the air is holding the maximum amount of water vapour possible at the existing temperature and pressure. When DPT and air temperature are equal, the air is said to be saturated.

875. When wet steam is throttled to a low pressure, its temperature
(a) Increases (b) Does not change
(c) Gets halved (d) Decreases

APGENCO AE 2012

Ans. (d) : When wet steam is throttled valve to a low pressure, its temperature decreases.



876. Which is a single phase system ?
(a) Mixture of water and alcohol
(b) Mixture of oil and water
(c) Liquid water, ice and water vapour
(d) Water and ice

OPSC Civil Services Pre. 2011

Ans. (a) : Single phase system is mixture of water and alcohol.

877. A fluid behave as an ideal gas provided it is at:
(a) High Temperature and Pressure
(b) High Temperature and Moderate Pressure
(c) Low Temperature and Pressure
(d) High Temperature and Low Pressure

OPSC Civil Services Pre. 2011

Ans. (d) : A real gases obeys perfect gas law at high temperature and low pressure.
- Inter molecular attraction between molecules are negligible.
- Volume occupied by molecules as compared to total volume is negligible.

878. Match the following :

1. Empirical temperature	**a. Path function**
2. Polarization	**b. Permeable to heat transfer**
3. Heat transfer	**c. Mechanical equivalent of heat**
4. Joule's experiment	**d. Isotherm**
5. Diathermic	**e. Dipole moment**

(a) 1–d, 2–a, 3–e, 4–c, 5–b
(b) 1–d, 2–e, 3–a, 4–c, 5–b
(c) 1–d, 2–b, 3–a, 4–c, 5–e
(d) 1–d, 2–c, 3–b, 4–a, 5–e

OPSC Civil Services Pre. 2011

Ans. (b) :

1. Empirical temperature	Isotherm
2. Polarization	Dipole moment
3. Heat transfer	Path function
4. Joule's experiment	Mechanical equivalent of heat
5. Diathermic	Permeable to heat transfer

879. For real gases $C_P = C_V$ at :
(a) Critical temperature
(b) Triple point
(c) Absolute zero temperature
(d) All temperature

J&K PSC Civil Services Pre, 2010

Ans. (c) : The heat capacity depends on the nature, size and the composition or the substance in the system.
The equation for heat capacity is as follows–

$$Q = nC\Delta T$$

Where Q is the heat supplied
n is the no. of moles
C is the molar heat capacity
ΔT is the change in temperature
We know that C_P is the heat capacity at constant pressure. C_P is the amount of heat absorbed or released by unit mass of a substance with change in temperature at constant pressure. The change in temperature causes a change in the enthalpy of the system.

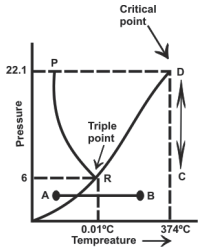
Search on Telegram @apna_pdf

We know that C_V is the heat capacity at constant volume. C_V is the amount of heat absorbed or released by unit mass of a substance at constant volume.
The value of C_P is always greater than C_V.
But at absolute zero temperature
$C_P = C_V$

880. The critical point and triple point data for water are, T_c = 374ºC, P_c = 22.1 MPa, T_T = 0.01ºC, P_T = 0.6 kPa indicate the phase change that will occur in following cases,

(i) Ice at 0.5 kPa is heated isobarically

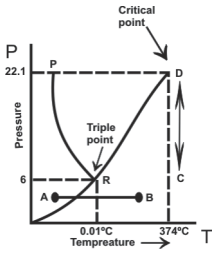
(ii) Water vapour at 400ºC is compressed isothermally



(a) (i) along AB, (ii) along CD
(b) (i) along CD, (ii) along AB
(c) (i) along OD, (ii) along PR
(d) (i) along RD, (ii) along OR

ISRO Scientist/Engineer 2009

Ans. (a) : T_c = 374ºC, P_c = 22.1 kPa, T_T = 0.01ºC, P_T = 0.6 kPa



(I) Ice at 0.5 kPa is heated Isobarically i.e. at constant pressure with 0.5 kPa.
Heat Isobarically represented from P-T diagram along (AB)
(II) Water vapour at 400ºC i.e. water vapour region got after critical point temperature alone 370ºC.
Its represented from P-T diagram (along-CD).

881. The magnitude of which one of the following quantity does not indicate the departure of a real gas from the ideal gas behavior:

(a) Compressibility factor
(b) Joule-Kelvin coefficient
(c) Fugacity
(d) Entropy

UPSC JWM Adv. No-16/2009

Ans. (c) : The magnitude of the Fugacity does not indicate the departure of a real gas from the ideal gas behavior.

882. In order to determine the quality of wet steam by a separating and throttling calorimeter, the steam should be throttled such that the final state is :

(a) Saturated vapour only
(b) Superheated vapour only
(c) At a pressure higher than the original pressure
(d) A mixture of saturated liquid and saturated vapour

UPSC JWM Adv. No-16/2009, ESE 2015

Ans. (b) In order to determine the quality of wet steam by a separating and throttling calorimeter, the steam should be throttled such that the final state is Superheated vapour only.

883. A pressure-cooker contains water at 100ºC with liquid volume being one-tenth of vapour volume. At 100ºC, the specific volume for saturated liquid and saturated vapour are 0.001 m^3/kg and 1.6 m^3/kg, respectively. The dryness fraction for the mixture is

(a) $\frac{1}{160}$ (b) $\frac{1}{161}$
(c) $\frac{160}{161}$ (d) 1

DRDO Scientists 2009

Ans. (b) : $v_f + v_g = v, \quad v_f = \frac{v_g}{10}$

$\therefore \quad v_g = \frac{10v}{11}, \; v_f = \frac{v}{11}$

$x = \frac{m_g}{m_l + m_g}, \; m_g = \frac{10}{11} \times \frac{v}{1.6\text{kg}}$

$m_l = \frac{1}{11} \times \frac{v}{0.001}\text{kg}$

$x = \frac{\frac{10}{1.6}}{\frac{10}{1.6} + 1000} = \frac{100}{16100} = \frac{1}{161}$

884. Which one of the following remains constant for a system undergoing phase change like melting or vaporization?

(a) Enthalpy (b) Entropy
(c) Volume (d) Gibbs function

UPSC JWM Adv. No-16/2009

Ans. (d) : Since the Gibbs function depends naturally on the Thermodynamic variables p and T and since common phase transitions occurs at a constant p and T, thus, the molar/specific Gibbs function tends to be a constant during the phase change.

885. In the Vander Waal's gas equation $\left(p + \frac{a}{V^2}\right)(v - b) = RT$ the constant 'a' is introduced to compensate for

Search on Telegram @apna_pdf

(a) Reduction in specific volume
(b) Inter-molecular forces
(c) Reduction in specific heat
(d) All of the above

ISRO Scientist/Engineer 2009

Ans. (b) : Vender Waal's gas equation

$$\left(P+\frac{a}{V^2}\right)(V-b)=RT$$

where a = Account for intermolecular force
b = Volume occupied by the gas

886. For water boiling at constant pressure of 1 bar, the specific heat is
(a) zero
(b) very small but positive
(c) negative
(d) infinitely large

DRDO Scientists 2008

Ans. (d) : For water boiling at constant pressure of 1 bar, the specific heat is infinitely large during boiling, pressure and temperature will not change.

$$C_p=\frac{dQ}{dT}$$

$$dT=0 \Rightarrow C_p=\infty$$

887. For pure water the triple point temperature is
(a) 273 K (b) 273.16 K
(c) 273.1 K (d) 273.2 K

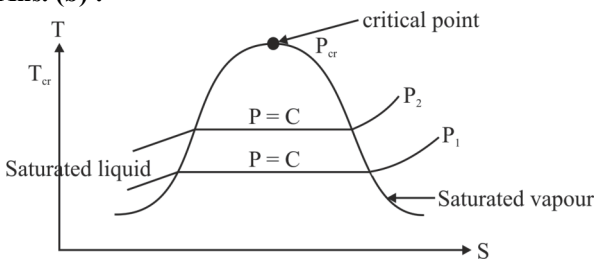
WBPSC AE, 2007

Ans. (b) :

888. Which of the given statements is true?
(a) At the critical point, all the three phases of water coexist in equilibrium.
(b) At the critical point, saturated liquid and saturated vapour phases are identical
(c) At the triple point, all the phases of water coexist in non-equilibrium
(d) At the triple point, saturated liquid and saturated vapour phases are identical.

BHEL ET 2019

Ans. (b) :



- Critical point is a point where saturated liquid and saturated vapour curve meet.
- At critical point a liquid directly flash into vapour.
- At critical point latent heat of vapourization is zero.

889. The equation $\left\{P+\frac{a}{V^2}\right\}(V-b)=RT$ is known as
(a) perfect gas equation
(b) Maxwell's equation
(c) kinetic theory of gases equation
(d) Vander walls equation

BPSC Poly. Lect. 2016
VIZAG STEEL MT 2015
J & K PSC Civil Services Pre, 2013
UKPSC AE 2012 Paper–II
TNPSC ACF 2012
ISRO Scientist/Engineer 2007

Ans : (d) Vander walls equation

$$=\left\{P+\frac{a}{V^2}\right\}(V-b)=RT$$

The ideal gas law treats that the molecules of a gas as point particles with perfectly elastic collisions. This works well for dilute gases in many experimental circumstances. But gas molecules are not point masses, and there are circumstances where the properties of the molecules have an experimentally measurable effect. A modification of the ideal gas law as proposed by Johannes D. van der Waals in 1873 to take into account molecular size and molecular interaction forces. It is usually referred to as the Vander Walls equation of state.

890. The volume of a perfect gas varies directly as its absolute temperature when the absolute pressure remains constant. This law is called
(a) Charles Law (b) Joule's Law
(c) Gay Lussac Law (d) Boyle's Law

VIZAG Steel MT 24.01.2021, Shift-I
TNPSC AE (Industries) 09.06.2013

Ans. (a) : Charles's law states that the volume of a gas is directly proportional to its absolute temperature assuming the quantity of gas and pressure remains constant.

$$\boxed{\frac{V_1}{T_1}=\frac{V_2}{T_2}}$$

891. Isothermal compressibility of an ideal gas in
(a) $\frac{nR}{VP}$ (b) $\frac{nRT}{VP^2}$
(c) $\frac{nR}{VP^2}$ (d) $\frac{nRT}{VP}$

ISRO Scientist/Engineer 17.12.2017

Ans. (b) : Isothermal compressibility

$$=-\frac{1}{V}\frac{\partial V}{\partial P}\Big|_{T=C} \qquad =-\frac{1}{V}\frac{\partial}{\partial P}\left(\frac{nRT}{P}\right)$$

$$=-\frac{1}{V}\left(-\frac{nRT}{P^2}\right) \qquad =\frac{nRT}{VP^2}$$

892. For a perfect gas, according to Boyle's law
(a) PV = constant, if T is kept constant
(b) V/T= constant, if P is kept constant
(c) P/T = constant, if V is kept constant
(d) T/P = constant, if V is kept constant

GMB AAE 25.06.2017

Search on Telegram @apna_pdf

Ans. (a) : Boyles law – At constant temperature pressure is inversely proportional to its volume.

Mathematically– $P \propto \frac{1}{V}$

$P = \frac{k}{V}$

$PV = k$ where k is a constant.

$\boxed{PV = \text{constant}}$

7. Thermodynamic Relations

893. Joule-Thomson coefficient is defined as :

(a) $\left(\frac{\partial T}{\partial P}\right)_h$ (b) $\left(\frac{\partial H}{\partial P}\right)_T$

(c) $\left(\frac{\partial H}{\partial T}\right)_P$ (d) $\left(\frac{\partial P}{\partial T}\right)_h$

Oil India Limited Sr. Engineer (Drilling) 30.11.2019
SJVN ET 2019
CGPSC Poly. Lect. 22.05.2016
BPSC AE Mains 2017 Paper - V
MPPSC AE 2016
Vizag Steel MT (Re-Exam) 24.11.2013
ESE 2012, 1995

Ans : (a) Joule Thomson co-efficient:-
The change in temperature with drop in pressure at constant enthalpy is termed as Joule-Thomson coefficient (μ).

$$\mu = \left(\frac{\partial T}{\partial P}\right)_h$$

It varies with both the temperature and pressure of the gas.
* Joule Thomson coefficient for an ideal gas is zero.

894. Which relationship defines Gibbs free energy G:

(a) G = H + TS (b) G = H - TS
(c) G = U + TS (d) F = U + TS

Kerala PSC AM 09.08.2021
Kerala PSC AE (Irrigation) 05.04.2017
APPSC AEE Mains 2016 Paper-III
SJVN ET 2013
OPSC Civil Services Pre 2006
ESE 1999

Ans. (b) : Gibbs free energy–In thermodynamics, the Gibb's free energy is a thermodynamic potential that can be used to calculate the maximum reversible work that may be performed by a thermodynamic system of a constant temperature and pressure Gibbs free energy.
G = H – TS.

895. Joule-Thomson coefficient for an ideal gas is

(a) higher than zero (b) less than zero
(c) zero (d) 1

GPSC Asstt. Director of Transport 05.03.2017
ISRO Scientist/Engineer 03.07.2016
CGPSC AE 16.10.2016, APPSC AEE 2012
DRDO Scientists 2009, WBPSC AE, 2007

Ans. (c) : Joule-Thomson coefficient $(\mu) = \left(\frac{\partial T}{\partial P}\right)_h$

h = Constant

For ideal gas $\boxed{\mu = 0}$

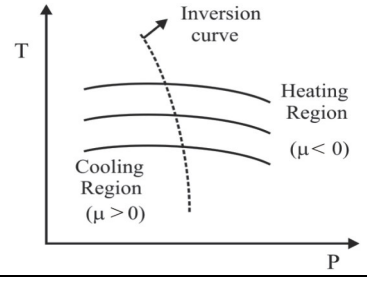
Note : Cooling region, μ = (+ve)
Heating region, μ = (–ve)

896. A gas having a negative Joule-Thomson effect ($\mu < 0$), when throttled will :

(a) Become cooler
(b) Become warmer
(c) Remain in the same temperature
(d) Become Cooler or warmer depending upon the type of gas

Gujarat PSC AE 2019
GPSC ARTO Pre 30.12.2018
TANGEDCO AE 2015
ISRO Scientist/Engineer 11.10.2015
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012

Ans. (b) : A gas having negative Joule-Thomson effect ($\mu < 0$)
When throttled will become warmer.



897. The Helmholtz function F is defined as

(a) F = H + TS (b) F = H – TS
(c) F = U + TS (d) F = U – TS

HPCL Engineer 12.08.2021 Shift-II
OPSC AEE 2019 Paper - II
Nagaland PSC CTSE 2015 Paper-II
Kerala PSC Poly. Lect. 09.01.2014
BPSC AE 2012 Paper - V, ESE 2007

Ans. (d) : Helmholtz function = F
F = U – TS
The difference in Helmholtz function gives maximum work in closed system.
Gibbs function (G)
G = H – TS
The difference in Gibbs function gives maximum work in open system.

898. A substance whose Joule- Thomson coefficient is negative, is throttled to a lower pressure. During this process

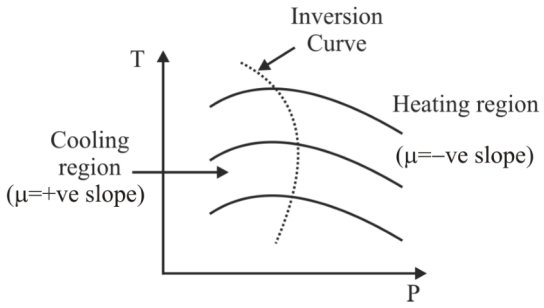
(a) the entropy of the substance will decrease
(b) the entropy of the substance will remain constant
(c) the temperature of the substance will decrease
(d) the temperature of the substance will increase

UPPSC AE 13.12.2020, Paper-2

Search on Telegram @apna_pdf

GPSC ARTO Pre-30.12.2018
VIZAG Steel MT 18.08.2013
VIZAG Steel MT 10.06.2012
GATE 2001

Ans. (d) Joule- Thomson coefficient, $= \left(\frac{\partial T}{\partial P}\right)_h = \mu$



During heating region, Joule-Thomson coefficient is negative, the temperature of the substance will increase.

899. A positive value of Joule-Thomson coefficient of a fluid means

(a) temperature drops during throttling
(b) temperature remains constant during throtting
(c) temperature rises during throttling
(d) none of these

OPSC AEE 2019 Paper - II
HPPSC Asstt. Prof. 18.11.2016
ISRO Scientist/Engineer 12.05.2013
GATE 2002

Ans. (a) : Joule - Thomson coefficient

$$\mu_J = \left(\frac{\partial T}{\partial P}\right)_h$$

$\mu_J = +ve$ or $\mu > 0$

It means temperature drop during throttling.

$\mu_J < 0$ for heating region

900. The equation which perfectly represents Gibbs Phase Rule for a process where the pressure is also a variable is expressed as :

(a) F = P – C + 2 (b) F = C + P – 1
(c) F = P – C – 1 (d) F = C – P + 2

BHEL ET 2019
OPSC AEE 2019 Paper-I
GPSC Lect. (Auto) 16.10.2016
ESE 2001, 1999

Ans. (d) : Gibbs phase rule-

$$P + F = C + 2$$

or $\boxed{F = C - P + 2}$

P = Number of phase
C = Number of chemical components
n = number of non-compositional variable (i.e. n=2)
h = 2 i.e., pressure and temperature
F = Degree of freedom

901. The specific heat relation is

(a) $C_P - C_V = \frac{vT\beta^2}{k}$ (b) $C_P - C_V = \frac{vTk}{\beta^2}$

(c) $C_P - C_V = \frac{pTk}{\beta^2}$ (d) $C_P - C_V = \frac{v^2T\beta}{k}$

JPSC AE 2013 Paper-V
ESE 2003, CSE PRE 1998

Ans. (a) :

$$C_P - C_V = -T\left(\frac{\partial V}{\partial T}\right)_P^2 \left(\frac{\partial V}{\partial T}\right)_T$$

$$\beta = \frac{1}{V}\left(\frac{\partial V}{\partial T}\right)_P$$

$$K_T = -\frac{1}{V}\left(\frac{\partial V}{\partial T}\right)_T$$

We get,

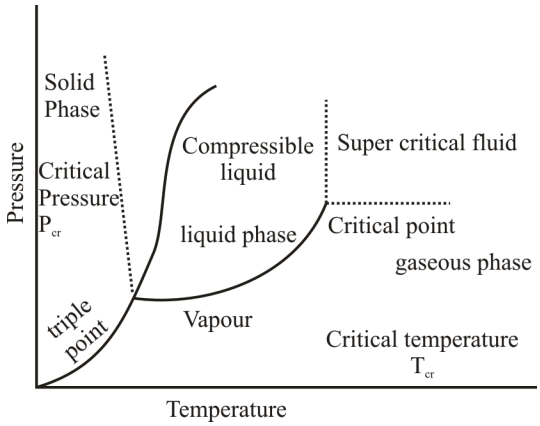
$$C_P - C_V = \frac{Tv\beta^2}{k_T}$$

902. The slope of curve is given by the Clausius-Clapeyron on:

(a) P-T plot (b) ρ-T plot
(c) V-T plot (d) s-T plot

AAI Jr. Executive 29.11.2018
BPSC AE Mains 2017 Paper - V
RPSC Lect. (Tech. Edu. Dept.) 2011
ESE 1999

Ans. (a) :



Clausius-Clapeyron equation

$$\frac{dP}{dT} = \frac{s_g - s_f}{v_g - v_f} \quad , \; v_g >>> v_f$$

$$\frac{s_g - s_f}{v_g} = \frac{L.H.}{T_s.v_g} = \frac{h_{fg}}{T_s.v_g}$$

or $\frac{dP}{dT} = \frac{(L.H.)P_s}{R.T_s^2}$

Search on Telegram @apna_pdf

903. The pressure 'p' of an ideal gas and its mean kinetic energy E per unit volume are related by the relation

(a) $p = \frac{4}{3}E$ (b) $p = \frac{3E}{2}$

(c) $p = \frac{E}{3}$ (d) $p = \frac{2E}{3}$

ISRO Scientist/Engineer 22.04.2018
Nagaland PSC CTSE 2015 Paper II
ISRO Scientist/Engineer 11.10.2015

Ans. (d) : We know that,

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

rms = 'root mean square'

M = Molar mass

$E_{avg.}$ is the "Average kinetic energy" of each 'molecule'.

$$E_{avg.} = \frac{1}{2}mV_{rms}^2$$

Where, $m = \frac{M}{\text{Avogadro no.}}$

$$= \frac{M}{N_A}$$

$$E_{avg.} = \frac{1}{2}\frac{M}{N_A} \times \frac{3RT}{M} = \frac{3}{2}\frac{RT}{N_A}$$

$PV = nRT$

$\therefore \quad RT = \frac{PV}{n}$

$$E_{avg.} = \frac{3}{2N_A} \cdot \frac{PV}{n}$$

$$\frac{E_{avg.}}{V} = \frac{3}{2}\frac{P}{nN_A}$$

nN_A = Total number of molecules

$$\frac{E_{avg.} \times nN_A}{V} = \frac{3}{2}P$$

$\therefore \quad E = \frac{3}{2}P$

or $\boxed{P = \frac{2}{3}E}$

904. Which one of the following parameter is significant to ascertain chemical equilibrium of a system?

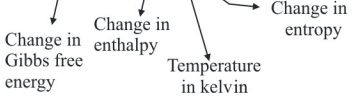
(a) Clapeyron of equation
(b) Maxwell relation
(c) Gibb's function
(d) Helmholts function

BPSC AE Mains 2017 Paper - V
Kerala PSC AE 06.08.2015
Kerala PSC Poly. Lect. 09.01.2014

Ans. (c) : Gibb's function–Gibb's energy, or free enthalpy is a quantity that is used to measure the maximum amount of work done in a thermodynamic system when the temperature and pressure are kept constant. Gibbs free energy is denoted symbol G :

$$\boxed{G = H - Ts}$$

$$\boxed{\Delta G = \Delta H - T\Delta S}$$



905. The thermodynamic parameters are

I. Temperature II. Specific volume
III. Pressure IV. Enthalpy
V. Entropy

The Clapeyron equation of state relationship between.

(a) I and II (b) II, III and V
(c) III, IV and V (d) I, II, III and IV

APPSC Poly. Lect. 2013, ESE 1997

Ans. (d) : Clapeyron's eq^n. of state relationship b/w

$$\frac{dP}{dT} = \frac{\left(h_g - h_f\right)}{T_{sat}\left(v_g - v_f\right)}$$

$v_g >>> v_f$

i) Pressure
ii) Temperature
iii) Enthalpy
iv) Specific volume

906. The slope of constant pressure curve on enthalpy-entropy diagram gives:

(a) Density (b) Specific volume
(c) Absolute temperature (d) Entropy

UPRVUNL AE 07.10.2016
UKPSC AE 2012 Paper–II

Ans. (c) : We know that

$Tds = dh - VdP$

If P = constant

$Tds = dh$

$$\boxed{\left(\frac{dh}{ds}\right)_P = T}$$

An enthalpy-entropy chart also known as h-s or Mollier diagram.

907. Consider the following statements

(1) Availability is the maximum theoretical work obtainable
(2) Clapeyron's equation for dry saturated steam is given by $\left(v_s - v_f\right) = \frac{dT_s}{dP}\left(\frac{h_s - h_f}{T_s}\right)$
(3) A gas can have any temperature at a given pressure unlike a vapour, which has a fixed temperature at a given pressure.
(4) Joule Thomson coefficient is expressed as $\mu = \left(\frac{\partial s}{\partial P}\right)_h$ of these statements :

(a) 1, 2, 3 are correct
(b) 1, 3 and 4 are correct
(c) 2 and 3 are correct
(d) 1, 2, and 4 are correct

MPPSC AE 2016, ESE 2001

Search on Telegram @apna_pdf

Ans. : (a)
i. Clapeyron's equation for dry saturated steam is

$$v_s - v_f = \frac{dT_s}{dP}\left(\frac{h_s - h_f}{T_s}\right)$$

ii. Joule Thomson coefficient (μ)

$$\mu = \left(\frac{\partial T}{\partial P}\right)_h$$

iii. The availability of a given system is defined as the max. Useful work that is obtainable in a process in which the system comes to equilibrium with its surrounding.

908. Which of the following Maxwell relation is INCORRECT?

(a) $\left(\frac{\partial T}{\partial V}\right)_s = -\left(\frac{\partial P}{\partial s}\right)_V$ (b) $\left(\frac{\partial T}{\partial P}\right)_s = \left(\frac{\partial V}{\partial s}\right)_P$

(c) $\left(\frac{\partial P}{\partial T}\right)_V = \left(\frac{\partial s}{\partial V}\right)_T$ (d) $\left(\frac{\partial V}{\partial T}\right)_P = \left(\frac{\partial P}{\partial s}\right)_T$

APPSC Poly Lect. 13.03.2020
SJVN ET 2019

Ans. (d) : Maxwell Equations–There are four Maxwell equations which are applicable for any substances.

(1) $\left(\frac{\partial T}{\partial V}\right)_s = -\left(\frac{\partial P}{\partial s}\right)_V$

(2) $\left(\frac{\partial T}{\partial P}\right)_s = \left(\frac{\partial V}{\partial s}\right)_P$

(3) $\left(\frac{\partial P}{\partial T}\right)_V = \left(\frac{\partial s}{\partial V}\right)_T$

(4) $\left(\frac{\partial V}{\partial T}\right)_P = -\left(\frac{\partial s}{\partial P}\right)_T$

$\left(\frac{\partial V}{\partial T}\right)_P = \left(\frac{\partial P}{\partial s}\right)_T$ is incorrect regarding to Maxwell equation.

909. The value of compressibility factor, Z at the critical state of a Vander Waal's gas is

(a) 3.735 (b) 0.735
(c) 3.375 (d) 0.375

UPPSC AE 13.12.2020, Paper-2
UKPSC AE 2012 Paper II

Ans. (d) : The value of compressibility factor, Z at critical state of Vander waal's equation is

$$Z = \frac{P_c V_c}{RT_c} = \frac{3}{8} = 0.375$$

910. The 'specific heat at constant pressure' is defined as :

(a) $T\,(\partial s/\partial T)_P$ (b) $(\partial h/\partial T)_P$
(c) Both (a) and (b) (d) None of the above

OPSC Civil Services Pre, 2011
APPSC IOF, 2009

Ans. (c) : The specific heat at constant pressure is defined as :

$$c_P = \left.\frac{\partial h}{\partial T}\right|_P,\ c_P = T\left(\frac{\partial s}{\partial T}\right)_P, c_v = T\left(\frac{\partial s}{\partial T}\right)_v$$

911. Gibb's function is expressed as

(a) (u +pv + Ts) (b) (u + pv – Tds)
(c) (u + pdv –Tds) (d) (u + pv – sdT)

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b)

912. The value of the compressibility of an ideal fluid is

(a) zero
(b) unity
(c) infinity
(d) more than that of a real fluid

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : In thermodynamic and fluid mechanics compressibility (also known as the coefficient of compressibility or isothermal compressibility) is a measure of relative volume change of fluid or solid as response to a pressure change. The value of compressibility of an ideal fluid is zero.

913. Latent heat of vaporization of water can be calculated from the p-T data of water using the following equation.

(a) Third law of thermodynamics
(b) Clausius - Clapeyron equation
(c) Kelvin-Planck statement of second law of thermodynamics
(d) Clausis statement of second law of thermodynamics

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : Clausius Clapeyron equation gives the latent heat of vaporization from pressure and temperature data.

$$\frac{dp}{dT} = \frac{h_{fg}}{T(V_g - V_f)}$$

914. Which of the following can be used to determine the variation of saturation pressure with temperature along phase boundaries?

(a) Joule-Thomson relation
(b) Carnot equation
(c) Rankine- Hougoniot's relation
(d) Clausius- Clapeyron relation

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : Clausius Clapeyron Equation-

$$\frac{dP}{dT} = \frac{h_g - h_f}{T_{sat}(v_g - v_f)} = \frac{(\text{Latent heat}) \times P_{sat}}{RT_{sat}^2} = \frac{(h_g - h_f)P_{sat}}{RT_{sat}^2}$$

$\Rightarrow$ Clausius Clapeyron equation is used to determine enthalpy change associated with phase change (Latent heat) using pressure temperature and volume. It may also be used to predict the boiling temperature.

Search on Telegram @apna_pdf

915. Which one of the following properties remains unchanged for a real gas during Joule-Thomson process

(a) Temperature (b) Enthalpy
(c) Entropy (d) Pressure

TNPSC AE 2019

Ans. (b) : Enthalpy properties remains unchanged for a real gas during Joule-Thomson process.

$$\left(\frac{\partial T}{\partial P}\right)_{h=const.} = \mu$$

916. In a single-component condensed system, if degree of freedom is zero, maximum number of phases that can co-exist_____

(a) 0 (b) 1
(c) 2 (d) 3

OPSC AEE 2019 Paper-I

Ans : (d) : By using Gibb's phase rule

$P + F = C + 2$

$P + 0 = 1 + 2$

$\boxed{P = 3}$

917. The difference between two specific heats $C_P - C_V = R/J$. This relation is valid for:

(a) Any gas (b) Perfect gas
(c) Ideal gas (d) Pure gas

GPSC ARTO Pre 30.12.2018

Ans. (*) : When the gas is heated at constant pressure, these is increase in internal energy and piston moves outward and work is performed by gas.

$$dQ' = dQ + \frac{dW}{J}$$

Where $\frac{dW}{J}$ is the heat equivalent of the work

$$C_p dT = C_v dT + \frac{PdV}{J}$$

$$C_p dT = C_v dT + \frac{RdT}{J}$$

$$C_p = C_v + \frac{R}{J}$$

$$\boxed{C_p - C_v = \frac{R}{J}}$$

This relation is valid for ideal gas and perfect gas both.

918. The equation of state

$$pv = RT\left(B_0 + \frac{B_1}{v} + \frac{B_2}{v^2} + \frac{B_3}{v^3}\right)$$ **is known as**

(a) Vander wall's equation
(b) Benedict-Webb-Rubin equation
(c) Gibbs equation
(d) Virial equation

TNPSC AE 2018
CSE Pre-2005

Ans. (d) : Virial equation,

$$pv = RT\left(B_0 + \frac{B_1}{v} + \frac{B_2}{v^2} + \frac{B_3}{v^3}\right)$$

The virial equation of state is valid for gases at low density only.

919. The relationship $(dT/dP)_h = 0$ holds good for

(a) An ideal gas at any state
(b) A real gas at any state
(c) Any gas at its critical state
(d) Any gas at its inversion point

GPSC Executive Engineer 23.12.2018
GATE 1993

Ans. (a & d) :

920. Specific heat at constant pressure is given by

(a) $\left(\frac{\partial s}{\partial t}\right)_p$ (b) $\left(\frac{\partial v}{\partial t}\right)_p$
(c) $\left(\frac{\partial h}{\partial t}\right)_p$ (d) $\left(\frac{\partial v}{\partial t}\right)_p$

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Specific heat at constant pressure is given by $\left(\frac{\partial h}{\partial t}\right)_p$, Specific heat at constant pressure represents the heat supplied to a unit mass of the system to raise its temperature through 1K, keeping the pressure constant.

921. Which one is not a Maxwell equation

(a) $\left(\frac{\partial V}{\partial S}\right)_p = \left(\frac{\partial T}{\partial p}\right)_S$ (b) $\left(\frac{\partial V}{\partial T}\right)_p = -\left(\frac{\partial S}{\partial p}\right)_T$
(c) $\left(\frac{\partial T}{\partial V}\right)_s = -\left(\frac{\partial p}{\partial S}\right)_V$ (d) $\left(\frac{\partial P}{\partial T}\right)_p = \left(\frac{\partial S}{\partial V}\right)_T$

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : $\left(\frac{\partial P}{\partial T}\right)_p = \left(\frac{\partial S}{\partial V}\right)_T$ is not a Maxwell equation among the given option.

922. ..... equation of state for a gas is an improvement of the ideal gas law.

(a) Beattie-Bridgeman (b) Dalton
(c) Clausius (d) Vander Waals

HPPSC AE (PWD) 10.09.2016

Ans. (d) : Vander Waals Equation- The Vander Waals equation is an equation of state that corrects for two properties of real gases. The excluded volume of gas particle and attractive force between gas molecules.

$$\left(P + \frac{n^2 a}{V^2}\right)(V - nb) = n\bar{R}T$$

Where
P = pressure (atm)
n = number of moles (mol)
$\bar{R}$ = 8.3145 J/mole-K (universal gas constant)
V = volume
T = temperature (K)
a and b = constant

Search on Telegram @apna_pdf

923. A car tube contains air at 200 kPa pressure in the cold night of temperature (–10°C). During the day time, the volume of the tube is found to be increased by 9.5%. Find out day temperature and change in pressure.

(a) 15°C, 219 kPa (b) 15°C, 210 kPa
(c) 19°C, 219 kPa (d) 19°C, 210 kPa
(e) None of these

CGPSC AE 16.10.2016

Ans. (a) : $P_1 = 200$ kPa, $T_1 = 263$ K, $T_2 = ?$

$V_2 = 1.095\ V_1$

$PV = nRT$

$$\Rightarrow \quad \frac{PV}{T} = \text{Constant}$$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{P_1}{P_2} = \frac{T_1}{T_2}\left(\frac{V_2}{V_1}\right)$$

(By Hit & trial method, check option 'a').

For $T_2 \Rightarrow P_2V_2 = nRT_2$

$T_2 = 298$ K $= 15°C$

$\Rightarrow \quad P_2 = 200 + 19 = 219$ kPa

924. Clapeyron equation represents the dependence of

(a) pressure on temperature
(b) saturation pressure on saturation temperature
(c) vapor pressure on temperature
(d) entropy generation on temperature

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : According to Maxwells equation (3rd relationship)

$$\left(\frac{\partial P}{\partial T}\right)_V = \left(\frac{\partial S}{\partial V}\right)_T$$

When saturated liquid convert to saturated vapour of constant temperature and pressure, during the evaporation the pressure and temperature is independent of volume.

$$\left(\frac{dP}{dT}\right)_{sat.} = \frac{S_g - S_f}{V_g - V_f} = \frac{S_{fg}}{V_{fg}}$$

but $S_g - S_f = \frac{h_{fg}}{T}$

$$\boxed{\left(\frac{dP}{dT}\right)_{sat.} = \frac{h_{fg}}{T\left(V_g - V_f\right)}}$$

This is Clausis-Clapeyron equation. So this equation represents the dependence of saturation pressure on saturation temperature. Clapeyron equation provides relationship between temperature, specific, volume, pressure and enthalpy.

925. Match List-I with List-II and select the correct answer :

List-I		List-II
A.	Bottle filling of gas	1. Absolute zero temperature
B.	Nernst-Simon statement	2. Variable flow
C.	Joule-Thomson effect	3. Quasi-static path
D.	$\int pdV$	4. Isenthalpic process
		5. Dissipative effect
		6. Low grade energy
		7. Process and temperature during phase change

	A	B	C	D
(a)	6	5	4	3
(c)	2	5	7	4

	A	B	C	D
(b)	2	1	4	3
(d)	6	1	7	4

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) :

	List-I		List-II
A.	Bottle filling of gas	2.	Variable flow
B.	Nernst-Simon statement	1.	Absolute zero temperature
C.	Joule-Thomson effect	4.	Isenthalpic process
D.	$\int pdV$	3.	Quasi-static path

926. For a perfect gas match list I with list II:

List I	List II
(A) Isobaric thermal expansion coefficient	**(1) 0**
(B) Isothermal compressibility	**(2) ∞**
(C) Isentropic compressibility	**(3) 1/v**
(D) Joule - Thomson coefficient	**(4) 1/T**
	(5) 1/p
	(6) $1/\gamma p$

(a) A-4, B-3, C-2, D-1 (b) A-1, B-2, C-4, D-6
(c) A-4, B-5, C-6, D-1 (d) A-3, B-4, C-6, D-5

ISRO Scientist/Engineer 12.05.2013

Ans. (c) :

(A) Isobaric thermal expansion coefficient – 1/T
(B) Isothermal compressibility – 1/p
(C) Isentropic compressibility – $1/\gamma p$
(D) Joule - Thomson coefficient – 0

927. The maximum work, that can be obtained from a system during a given process in which the initial and final temperatures of the system are equal to the surrounding temperature, is equal to the decrease in :

(a) Internal energy
(b) Helmholtz Free energy
(c) Gibbs Free energy
(d) Enthalpy

APGENCO AE 2012

Search on Telegram @apna_pdf

Ans. (b) The Helmholtz free energy is a thermodynamic potential that measures the useful work obtainable from a closed thermodynamic system at a constant temperature (isothermal).
The Gibbs free energy or free enthalpy is most commonly used as a measure of thermodynamic potential (especially in chemistry) when it is convenient for applications that occur at constant pressure.

928. The expression indicating Y as a thermodynamic property is :

(a) $Y = XZdZ + \frac{1}{2}Z^2dX$

(b) $Y = XZ^2dZ + Z^2dX$

(c) $Y = pdv - vdp$

(d) $Y = p^2dv + vdp$

OPSC Civil Services Pre. 2011

Ans. (a) : $Y = XZdZ + \frac{1}{2}Z^2dX$

929. $\left(\frac{\partial P}{\partial V}\right)_T \left(\frac{\partial V}{\partial T}\right)_P \left(\frac{\partial T}{\partial P}\right)_V$ **is equal to**

(a) zero (b) 1

(c) –1 (d) Infinity

ISRO Scientist/Engineer 2008

Ans. (c) : We know that

$PV = mRT$

$PV = RT$

$P = \left(\frac{RT}{V}\right); \quad \left(\frac{\partial P}{\partial V}\right)_T = -\frac{RT}{V^2}$

$V = \left(\frac{RT}{P}\right); \quad \left(\frac{\partial V}{\partial T}\right)_P = \frac{R}{P}$

$P = \frac{PV}{R}; \quad \left(\frac{\partial T}{\partial P}\right)_V = \frac{V}{R}$

$\left(\frac{\partial P}{\partial v}\right)_T \times \left(\frac{\partial V}{\partial T}\right)_P \times \left(\frac{\partial T}{\partial P}\right)_V = -\frac{RT}{V^2} \times \frac{R}{P} \times \frac{V}{R}$

$= -\frac{RT}{PV}$

$\because \quad PV = RT$

$= -1$

930. The state of a real gas if changed from pressure P_1, temperature T_1 to pressure P_2 temperature T_2. The change in enthalpy, h_2-h_1, is given by

(a) $\int_{T_2}^{T_1} C_p dT$

(b) $\int_{T_1}^{T_2} C_P\, dT + \int_{T_1}^{T_2} \left(\frac{\partial V}{\partial p}\right)_T dp$

(c) $\int_{T_1}^{T_2} C_v\, dT + \int_{P_1}^{P_2} \left[V - T\left(\frac{\partial V}{\partial p}\right)_p\right] dp$

(d) $\int_{T_1}^{T_2} C_p\, dT + \int_{P_1}^{P_2} \left[V - T\left(\frac{dV}{dT}\right)_p\right] dp$

ISRO Scientist/Engineer 2006

Ans. (c) : The change in enthalpy,

$h_2\text{-}h_1 = \int_{T_1}^{T_2} C_v\, dT + \int_{P_1}^{P_2} \left[V - T\left(\frac{\partial V}{\partial p}\right)_p\right] dp$

931. The Joule-Thomson effect is not exhibited by

(a) ideal gases (b) real gases

(c) carbon dioxide (d) refrigerant vapours

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : Joule-Thomson Coefficient– The temperature behaviour of the fluid during the throttling (h = constant) process is described by the Joule-Thomson coefficient,

$\mu = \left(\frac{\partial T}{\partial P}\right)_h = \frac{1}{C_P}\left[T\left(\frac{\partial V}{\partial T}\right)_P - V\right]$

For ideal gas, $\mu_{ideal\ gas} = 0$

- This coefficient is positive in cooling region and negative in heating region. It is zero on the inversion curve.

932. The Gibbs free-energy function is a property comprising:

(a) Pressure, volume and temperature

(b) Enthalpy, temperature and entropy

(c) Temperature, pressure and enthalpy

(d) Volume, enthalpy and entropy

HPPSC Asstt. Prof. 18.09.2017

Ans. (b) :

933. For a refrigerant being used in a vapour compression refrigeration system, the Joule-Thomson coefficient should be

(a) positive (b) negative

(c) zero (d) infinity

Haryana PSC Civil Services Pre, 2014

Ans. (b) : In refrigeration the desired effect is cooling but refrigerant gets heat from the refrigerated room. So, for heating of refrigerant–

$\boxed{\mu_j < 0}$

$\boxed{\mu_j = \left(\frac{\partial T}{\partial P}\right)_h}$

μ_j – Joule Thomson coefficient

$\mu_j > 0 \rightarrow$ Cooling

$\mu_j < 0 \rightarrow$ Heating

$\mu_j = 0 \rightarrow$ for Ideal gas

934. When a real gas follows Joule Thomson expansion process, the temperature

(a) always increases

(b) always decreases

(c) remains same

(d) may increase or decrease

(e) becomes zero

CGPSC AE 26.04.2015 SHIFT-II

Search on Telegram @apna_pdf

Ans. (d) : When a real gas follows Joule Thomson expansion process, the temperature may increase or decrease.

Joule- Thomson coefficient (μ)- Joule- Thomson Coefficient (μ) is defined as the ratio of the temperature change to the pressure drop, and is expressed in terms of the thermal expansion coefficient. The Joule - Thomson Coefficient will be zero at a point called Inversion point for all real gases, Expansion of most real gases causes cooling when the joule-Thomson coefficient is positive and the gas temperature is below the Inversion temperature. However, at atmosphere pressure, as the inversion temperature for hydrogen is low and hence hydrogen will warm during a Joule- Thomson expansion at room temperature. Since there is no change of temperature when an ideal gas expands through throttling device, a non-zero Joule-Thomson coefficient refers to a real gas.

935. For achieving the cooling effect by Joule-Kelvin, expansion the initial temperature of gas must be below the

(a) Boiling point temperature
(b) Freezing point temperature
(c) Maximum inversion temperature
(d) Saturation temperature

TNPSC AE 2013

Ans. (c) : For achieving the cooling effect by Joule-Kelvin, expansion the initial temperature of gas must be below the maximum inversion temperature.

936. Joule-Thomson process is

(a) Throttling process (b) Heating process
(c) Compression process (d) Expansion process

Gujarat PSC AE 2019

Ans : (a) : $\boxed{\mu = \left(\frac{\partial T}{\partial P}\right)_h}$ constant enthalpy 'h' process.

937. The change in specific volume during vaporization of a refrigerant is 0.035 m^3/kg. The slope of the saturation curve on a 'pressure-temperature' diagram at 20°C is 17.69 kPa/K. The enthalpy of vaporization of the refrigerant is:

(a) 9.99 kJ/kg (b) 181.5 kJ/kg
(c) 45.37 kJ/kg (d) 99.44 kJ/kg

APPSC IOF, 2009

Ans. (b) : $\left(\frac{dP}{dT}\right) = \frac{h_{fg}}{T \times V_{fg}}$

$(17.69) \times (273 + 20) \times 0.035 = h_{fg}$

$\boxed{h_{fg} = 181.5\,kJ/kg}$

938. When an ideal gas undergoes Joule-Kelvin expansion its :

(a) Temperature decreases
(b) Temperature increases
(c) Temperature does not change
(d) Pressure increases

UPSC JWM Adv. No-16/2009

Ans. (c) : When an ideal gas undergoes Joule-Kelvin expansion i.e., throttling, there is no change in temperature. For an ideal gas, the value of Joule-Kelvin coefficient (μ) comes out to be zero.

Hence, $\boxed{\mu = \left(\frac{dT}{dP}\right)_h = 0}$

939. For an ideal gas, the slope of the constant-volume line in the T-s diagram is

(a) higher than the slope of the constant pressure line
(b) lower than the slope of the constant pressure line
(c) equal to the slope of the constant pressure line
(d) equal to the slope of the constant temperature line

DRDO Scientists 2009

Ans. (a) : $\left(\frac{dT}{dS}\right)_v = \frac{T}{C_V}$

$\left(\frac{dT}{dS}\right)_p = \frac{T}{C_p}$

Since, $C_p > C_v$

$\left(\frac{dT}{dS}\right)_v > \left(\frac{dT}{dS}\right)_p$

Hence, For an ideal gas, the slope of the constant-volume line in the T-s diagram is higher than the slope of the constant pressure line.

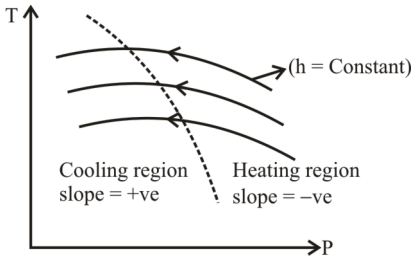
940. Region inside the inversion curve is represented by : (where μ is Joule - Kelvin coefficient)

(a) Cooling region, $\mu < 0$
(b) Heating region, $\mu > 0$
(c) Cooling region, $\mu > 0$
(d) Heating region, $\mu < 0$

UPRVUNL AE 07.10.2016

Ans. (c) : Joule - Kelvin coefficient (μ)

$\mu = \left(\frac{\partial T}{\partial P}\right)_h$



For ideal gas

$\mu = 0$

Search on Telegram @apna_pdf

02.

Power Plant Engineering

1. Steam Power Plant

1. In the thermal power plant, the deaerator is used mainly to

(a) remove air from condenser
(b) increase firewater temperature
(c) reduce steam pressure
(d) remove dissolved gases from the feed water

Assam PSC AE (PHED), 18.10.2020
RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017
MPPSC AE 2016, GPSC AE 26.07.2015
OPSC Civil Services Pre 2006

Ans. (d) : Presence of dissolved gases like O_2 and CO_2 in water makes water corrosive the solubility of these gases in water decreases with increase in temperature and becomes zero at saturation temperature.
The deaerator is used mainly to remove dissolved gases from the feed water.

2. Which of the following is not a boiler mounting?

(a) Fusible plug (b) Blowdown valve
(c) Water level indicator (d) Preheater

VIZAG STEEL MT 24.01.2021, Shift-II
RPSC IOF, 2020, SJVN ET 2019
RPSC AE 2018, 2016, HPPSC Lect. 2016
UJVNL AE 2016

Ans. (d) : Boiler Mounting-
(i) Water level indicator
(ii) Pressure gauge
(iii) Safety valve
(iv) Steam stop valve
(v) Blow off -cock
(vi) Feed check valve
(vii) Fusible plug
(viii) A man hole
(ix) Mud holes or slight holes

Boiler accessories
(i) Feed pump
(ii) Superheater
(iii) Economiser (Feed Water Preheater)
(iv) Air Preheater
(v) Injector
(vi) Steam separator
(vii) Steam strap

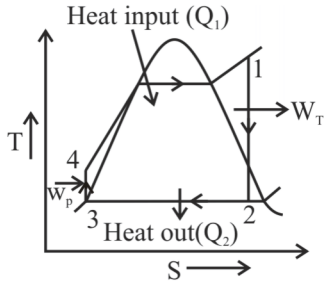
So, Preheater is not boiler mountings it is boiler accessories.

3. In a steam power plant the ratio of isentropic heat drop in the prime mover to the amount of heat supplied per unit mass of steam is known as

(a) Stage efficiency (b) Degree of reaction
(c) Rankine efficiency (d) Relative efficiency

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017
RPSC Lect. (Tech. Edu. Dept.) 2011
RPSC AE GWD, 2011
UKPSC AE 2007 Paper -II, ESE 2000

Ans. (c) :



So, Rankine efficiency, is the ratio, of net work done to net heat transfer.

$$\eta_{rankine} = \frac{W_T - W_P}{Q_1}$$

$$= \frac{(h_1 - h_2) - (h_4 - h_3)}{(h_1 - h_4)}$$

If pump work neglected then,

$$\eta_{rankine} = \frac{h_1 - h_2}{h_1 - h_4}$$

4. An economizer in a steam generator performs the function of :

(a) Preheating the combustion air
(b) Preheating the feed water
(c) Preheating the input fuel
(d) Raising the temperature of steam

ESE 2020
Jharkhand Urja Vikas Nigam Ltd. AE 2017
HPPSC Asstt. Prof. 18.11.2016
MPPSC State Forest Service Exam, 2014
RPSC ACF-2011, GATE 1989

Ans. (b) : Economiser–It is placed in the path of the flue gases in between the exit from the boiler and entry of the chimney. It's function is preheating the feed water.

Search on Telegram @apna_pdf

5. In high pressure natural circulation boilers, the flue gas flow through the following boiler accessories.

1. Superheater
2. Air heater
3. Economiser
4. ID fan

The correct sequence of the flow of flue gases through these boiler accessories is :

(a) 1, 3, 4, 2 (b) 3, 1, 4, 2
(c) 3, 1, 2, 4 (d) 1, 3, 2, 4

RPSC ACF & FRO, 26.02.2021
RPSC IOF & Boiler 20.09.2017
Nagaland PSC CTSE 2015 Paper-II
APPSC IOF, 2009, ESE 1997

Ans. (d) : Superheater → Economiser → Air preheater → ID Fan

6. Which of the following are fire tube boilers

(a) Cochran (b) Lancashire
(c) Locomotive (d) All of these

Nagaland PSC CTSE 2017 Paper-2
J&K PSC Civil Services Pre, 2013
UKPSC AE 2007 Paper-II, ESE 2005

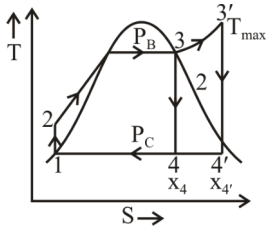
Ans. (d) : Cochran, Lancashire, Locomotive all are fire tube boilers. Fire tube boiler are internally fire tube boilers.

7. The efficiency of superheat Rankine cycle is higher than that of simple Rankine cycle because.

(a) the enthalpy of main steam is higher for superheat cycle
(b) the mean temperature of heat addition is higher for superheat cycle
(c) the temperature of steam in the condenser is high
(d) the quality of steam in the condenser is low.

RPSC ACF & FRO, 26.02.2021, ESE 2019
GPSC Executive Engineer 23.12.2018
RPSC Vice Principal ITI 2018
TSPSC Managers, 2015, GATE 2002

Ans. (b) :



- W_P-Constant
- W_T-↑, W_{net}-↑, η-↑, x-↑, Moisture-↓

The efficiency of superheat Rankine cycle is higher than that of simple Rankine cycle because the mean temperature of heat addition is higher for superheat cycle.

8. Which of the following is a water-tube boiler?

(a) Cochran boiler
(b) Babcock and Wilcox boiler
(c) Lancashire boiler
(d) Locomotive boiler

APPSC Poly Lect. 13.03.2020
GMB AAE 25.06.2017
Nagaland PSC (CTSE) 2016, Paper-II
MPPSC State Forest Service Exam, 2014

Ans. (b) : Water tube boiler– In water tube steam boiler the water is contained inside the tube which are surrounded by flames and hot gases from outside.

	Water Tube Boiler		Fire Tube Boiler
(1)	Babcock and Wilcox boiler	(1)	Cochran boiler
(2)	Stirling boiler	(2)	Lancashire boiler
(3)	Lamont boiler	(3)	Locomotive boiler
(4)	Benson boiler		

9. Which one of the following sequences indicates the correct order for flue gas flow in the steam power plant layout?

(a) Superheater, Economiser, Air preheater.
(b) Economiser, Air preheater, Superheater.
(c) Air preheater, Economiser, Superheater.
(d) Economiser, Superheater, Air preheater.

RPSC ACF & FRO, 26.02.2021
RPSC IOF, 2020
OPSC AEE 2015 Paper - II, ESE 2001

Ans. (a) : Sequence of flue gases flow in steam power plant →
Super heater → Economiser → Air preheater.

10. Which of the following is a fire tube boiler?

(a) Lancashire boiler
(b) Babcock and Wilcox boiler
(c) Both of the above
(d) none of the above

JPSC AE, 10.04.2021, Paper-I
Punjab PSC SDE 12.02.2017
Nagaland PSC (CTSE) 2016, Paper-II
UKPSC AE 2007 Paper -II

Ans. (a) : Fire tube Boiler –
- Cochran Boiler
- Lancashire Boiler
- Cornish Boiler
- Scotch marine Boiler
- Locomotive Boiler

Water tube steam Boilers–
- Babcock and Wilcox
- Stirling Boiler
- La-mont Boiler
- Benson Boiler
- Yarrow Boiler
- Loeffler Boiler

11. In steam power cycle, reheat factor is usually in the range:

(a) 1.02 to 1.05 (b) 1.12 to 1.15
(c) 1.5 to 1.8 (d) 1.9 to 2.1

JPSC AE, 10.04.2021, Paper-I
HPPSC Asstt. Prof. 2014, ESE 2004

Ans. (a) : In steam power cycle, reheat factor is usually in the range of 1.02 to 1.05.

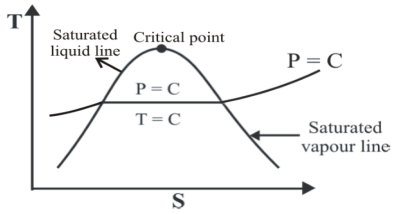
Search on Telegram @apna_pdf

12. Steam super heating is done at constant

(a) Pressure (b) Mass flow rate
(c) Entropy (d) Temperature

HPPSC AE 2018, TNPSC AE 2014
J & K PSC Screening, 2006

Ans. (a) : Steam super heating is done at constant pressure.



Degree of super heat = $(T_{superheat} - T_{saturated\ vapour})$

13. In steam power cycle, the process of removing non-condensable gases is called

(a) scavenging process
(b) deaeration process
(c) exhaust process
(d) condensation process

HPPSC Asstt. Prof. 18.09.2017
GPSC ARTO 01.05.2016
ESE 2019, 1996, GATE 1992

Ans. (b) : The removal of dissolved gases from boiler feedwater is an essential process in a steam system. The presence of dissolved oxygen in feedwater causes rapid localized corrosion in boiler tubes. This mechanical process is known as deaeration and will increase the life of a steam system dramatically.

14. In a boiler, feed water supplied per hour is 205 kg while coal fired per hour is 23 kg. The net enthalpy rise per kg of water is 145 kJ. If the calorific value of coal is 2050 kJ/kg, then boiler efficiency will be

(a) 56% (b) 75%
(c) 48% (d) 63%

ISRO Scientist/Engineer (RAC) 22.04.2018
ISRO Scientist/Engineer (RAC) 07.05.2017
GPSC Lect. (Poly.) 07.12.2014
VIZAG STEEL MT 2011

Ans. (d) : Heat generated by coal per hour is given by

$$Q = 2050 \times 23 \text{ kJ/hr}$$

If total heat generated will be used completely to increase the enthalpy of water.

Then per kg increase in enthalpy of water is

$$\Delta h = \frac{2050 \times 23}{205} = 230 \text{ kJ/kg}$$

Actual increase in enthalpy is given as 145 kJ/kg

So efficiency of boiler is

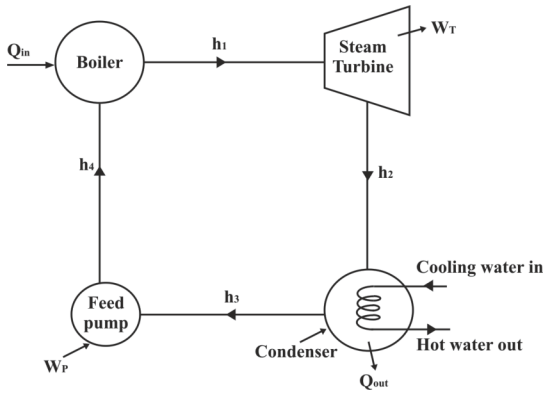
$$\eta = \frac{145}{230} = 0.63 = 63\%$$

15. Thermal power plant works on

(a) Carnot cycle (b) Joule cycle
(c) Rankine cycle (d) Brayton cycle

ISRO Scientist/Engineer (RAC) 07.05.2017
Rajasthan Nagar Nigam AE 2016, Shift-II
ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Thermal power plant works on Rankine cycle.



Heat supply to Boiler — $Q_{in} = h_1 - h_4$
Heat rejected from condenser — $Q_{out} = h_2 - h_3$
Turbine Work — $W_T = h_1 - h_2$
Pump Work — $W_P = h_4 - h_3$
Network — $W_{net} = W_T - W_P$

16. A device which is used to drain off water from steam pipes without escape of steam is called

(a) Steam separator
(b) Steam trap
(c) Pressure reducing valve
(d) Injectors

RPSC IOF, 2020, GPSC AE 26.07.2015
ESE 2002

Ans. (b) : Steam trap are used in such applications to ensure that steam is not wasted. Steam trap is a device which is used to drain off water from steam pipes without escape of steam.

17. Principle purpose of installing Electrostatic Precipitators is

(a) To reduce operating load on induced draft fan
(b) To reduce flue gas flow through stack
(c) To reduce stack emission of suspended particulate matters
(d) To improve balance draught control in fluctuating boiler load

Haryana PSC AE (PHED) 04.09.2020, Paper-I
Rajasthan AE (Nagar Nigam) 2016 Shift-3
OPSC Civil Services Pre 2006

Ans. (c) : Electrostatic precipitator collect dust in flue gas produced by boiler.
To reduce stack emission of suspended particulate matters.

18. An air preheater is installed

(a) before the economiser
(b) before the superheater
(c) between the economiser and chimney
(d) none of these

Sikkim PSC (Under Secretary), 2017
Assam PSC CCE Pre 2015
GPSC Lect. (Poly.) 07.12.2014
ESE 1992

Search on Telegram @apna_pdf

Ans. (c) : Boiler → Preheater → economizer → air preheater → chimney
So that exhaust air from the economizer will transfer it's heat from to the air preheater. The heated air in the air preheater is fed to the furnace. This will improve burning of fuel.

19. Which is not a boiler accessory?
(a) Economiser (b) Fusible plug
(c) Superheater (d) Air Preheater

VIZAG MT, 14.12.2020
Mizoram PSC AE/SDO 2014, Paper-I
SJVN ET 2013

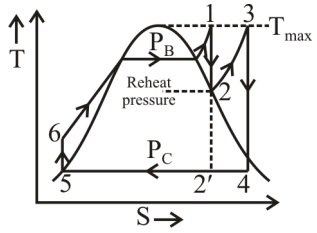
Ans. (b) : Boiler mountings-
(i) Two safety valves.
(ii) Two water level indicators
(iii) A pressure gauge
(iv) A steam stop valves
(v) A feed check valves
(vi) A blow off cock
(vii) An attachment for inspectors test gauge
(viii) A main hole
(ix) Mud holes or sight holes

Boiler accessories-
(i) Feed pumps
(ii) Injector
(iii) Economiser
(iv) Air pre heater
(v) Super heater
(vi) Steam separator
(vii) Steam trap

20. Reheating of Rankine Cycle will
(a) not alter turbine efficiency
(b) improve the steam quality
(c) decrease the nozzle and blade efficiency
(d) decrease the turbine efficiency

TNPSC AE 2018, TRB Poly. Lect. 2017
Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : Reheating of Rankine cycle will improve the steam quality.



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net}\uparrow}$
- x-↑, ↓errosion of turbine blade

21. The draught in locomotive boiler is produced by
(a) Chimney (b) Centrifugal fan
(c) Steam jet (d) Locomotion
(e) None of the above

RPSC ACF & FRO, 26.02.2021
CGPSC Poly. Lect. 22.05.2016, ESE 2003

Ans. (c) : In a locomotive boiler, the draught is produced by a steam jet.
Steam jet draught is classified as– (a) induced steam jet, (b) forced steam jet
(a) Induced steam jet– The draught produced by a steam jet issuing from a nozzle placed in the chimney.
(b) Forced steam jet– The draught produced by a steam jet issuing from a nozzle placed in the ashpit under the fire grate of the furnace.

22. The values of enthalpy of steam at inlet and outlet of a steam turbine in a Rankine cycle are 2800 kJ/kg and 1800 kJ/kg respectively. Neglecting pump work, the specific steam consumption in kg/kW-hour is :
(a) 3.60 (b) 0.36
(c) 0.06 (d) 0.01

ISRO Scientist/Engineer (RAC), 10.03.2019
TSPSC AEE 2017
GPSC Asstt. Director of Transport 05.03.2017
VIZAG Steel MT 10.06.2012, GATE 2011

Ans. (a) : Given,
$h_1 = 2800$ kJ/kg & $h_2 = 1800$ kJ/kg
$W_{net} = h_1 - h_2$

$$\text{specific steam consumption} = \frac{3600}{W_{net}} kg/kW\text{-}hr$$

$$= \frac{3600}{2800-1800}$$
$= 3.6$ kg/kWh

23. Benson boiler is the one of the high pressure boiler having :
(a) no drum
(b) three drums
(c) one drum
(d) one water drum and one steam drum

RPSC IOF & Boiler 20.09.2017
APPSC IOF, 2009, ESE 1999

Ans. (a) : Benson boiler is a high pressure drum-less, super critical, water tube boiler with forced circulation.

24. Steam coming out of whistle of pressure cooker.
(a) wet vapour (b) superheated vapour
(c) ideal gas (d) Dry saturated vapour

GWSSB AAE, 27.12.2015
VIZAG Steel MT (Re-Exam) 24.11.2013
UKPSC AE 2012 Paper–II

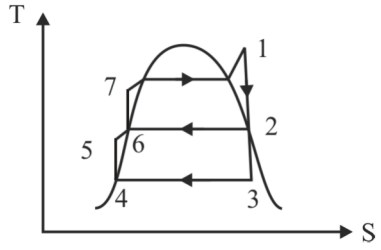
Ans. (a) : In pressure cooker there is always mixture of steam and water so quality of steam is wet vapour.

25. In a Rankine cycle, regeneration results in higher efficiency because
(a) Pressure inside the boiler increases
(b) Heat is added before steam enters the low pressure turbine
(c) Average temperature of heat addition in the boiler increases
(d) Total work delivered by the turbine increases

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
UPPSC AE 13.12.2020, Paper-II
GPSC ARTO Pre 30.12.2018

Search on Telegram @apna_pdf

Ans. (c)



In Rankine cycle, regeneration results in higher efficiency because mean temperature of heat addition in boiler increases

26. Reheat factor is defined as the :

(a) ratio of cumulative enthalpy drop to isentropic enthalpy drop
(b) product of cumulative entropy drop to isentropic enthalpy drop
(c) ratio of isentropic enthalpy drop to cumulative enthalpy drop
(d) sum of isentropic and cumulative enthalpy drops

CGPSC AE 15.01.2021, APGENCO AE 2017
CGPSC AE 16.10.2016

Ans. (a) : $\text{Reheat factor} = \dfrac{\text{Cumulative Enthalpy drop}}{\text{Isentropic Enthalpy drop}}$

27. The device used to heat feed water by utilizing the heat of the exhaust flue gases before leaving through the chimney is called:

(a) Super heater (b) Economizer
(c) Air preheater (d) Evaporator

ISRO Scientist/Engineer (RAC), 10.03.2019
ESE 1999

Ans. (b) : Economizer– Economiser is a boiler accessories which is used to heat feed water by utilizing the heat of flue gases.

28. Overall efficiency of a thermal power plant is equal to :

(a) Rankine cycle efficiency
(b) Carnot cycle efficiency
(c) Regenerative cycle efficiency
(d) Boiler efficiency × turbine efficiency × generator efficiency

RPSC AE 2016, RPSC ACF-2011

Ans. (d) : $\eta_{overall} = \eta_{boiler} \times \eta_{turbine} \times \eta_{generator}$

29. Load factor of a power station is usually :

(a) equal to unity (b) less than unity
(c) more than unity (d) zero

RPSC AE 2016, RPSC ACF-2011

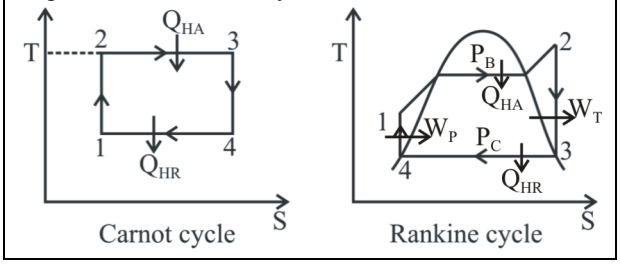
Ans. (b) : Load factor of a power station is defined as average load to maximum demand. Load factor of a power station is generally less than unity.

30. The thermal efficiency of an ideal Rankine cycle is less than that of Carnot cycle operating between the same maximum and minimum temperature limits because :

(a) Heat addition does not takes place at constant temperature
(b) The expansion process is not reversible and adiabatic
(c) Heat rejections does not take place at constant temperature
(d) The compression process is not reversible and adiabatic.

TSPSC Managers, 2015, APGENCO AE 2012

Ans. (a) : The thermal efficiency of an ideal Rankine cycle is less than that of carnot cycle operating between the same maximum and minimum temperature limit because heat addition does not take place at constant temperature in Rankine cycle.



31. Rankine cycle efficiency of a steam power plant may be in the range of

(a) 15 to 20% (b) 35 to 45%
(c) 70 to 80% (d) 90 to 95%

APPSC Poly. Lect. 2013
UKPSC AE 2007 Paper-II

Ans. (b) : Rankine cycle efficiency of a steam power plant may be in the range of 35 to 45%.

32. Which of the following boiler accessories utilizes the waste heat of flue gases to heat the feed water?

(a) Water preheater (b) Economiser
(c) Feed heater (d) Superheater

Punjab PSC (Lect.) 06.08.2017
RPSC AEN Pre-2013

Ans. (b) : In boilers, economiser are heat exchanger devices that heat fluids, usually water, but not normally beyond the boiling point of that fluid. They are a device fitted to boiler which saves energy utilizes the waste heat of flue gases to heat the feed water.

33. Cooling tower is used to :

(a) cool the space or room
(b) cool the hot water coming from the condenser
(c) freeze the water
(d) increase the pressure of water

APPSC Poly Lect. 13.03.2020
GWSSB AAE, 27.12.2015

Ans. (b) : Cooling tower is used to cool the hot water which coming from the condenser.

34. The draught which a chimney produces is called-

(a) Induced draught (b) Natural draught
(c) Forced draught (d) Balanced draught

NPCIL ET, 2015, TNPSC AE 2014

Ans. (b) : Draught produced by chimney is called natural draught.

Search on Telegram @apna_pdf

35. In fire tube boilers, pressure is limited to

(a) 16 bar (b) 32 bar
(c) 48 bar (d) 64 bar

Nagaland PSC CTSE 2017 Paper-2
Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : In fire-tube boiler, pressure is limited to 16 bar.

36. Attempering is

(a) reduction of steam pressure
(b) reduction of steam temperature
(c) discharge of flue gases at certain height
(d) conditioning of disposable fluids for minimum pollution

Nagaland PSC CTSE 2015 Paper-II
OPSC Civil Services Pre. 2011

Ans. (b) : Attempering is reduction of steam temperature.

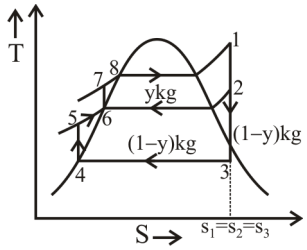
37. Consider an actual regenerative Rankine cycle with one open feed water heater. For each kg steam entering the turbine. If m kg steam with a specific enthalpy of h_1 is bleed from the turbine and the specific enthalpy of liquid water entering the heater is h_2, then h_3 specific enthalpy of saturated liquid leaving the heater is equal to -

(a) $mh_1 - (h_2 - h_1)$ (b) $h_1 - m\ (h_2 - h_1)$
(c) $h_2 - m\ (h_2 - h_1)$ (d) $mh_2 - (h_2 - h_1)$

CGPSC Asstt. Workshop Supt., 17.07.2016
TSGENCO AE 14.11.2015
GATE 1997

Ans. (c) : Open feed water heater (OFWH)

$$h_3 \times 1 = mh_1 + (1-m)h_2$$
$$= mh_1 + h_2 - mh_2$$
$$h_3 = h_2 - m(h_2 - h_1)$$



38. In a steam power plant, feed water heater is a heat exchanger to preheat feed water by:

(a) live steam from steam generator
(b) hot air from air preheater
(c) hot flue gases coming out of the boiler
(d) extracting steam from turbine

Nagaland PSC CTSE 2015 Paper-II
HPPSC Asstt. Prof. 2014

Ans. (d) : Feed water heaters are heat exchangers designed to preheat feed water by means of condensing the extract steam from turbine.
A feed water, heater, is a power plant component used to pre-heat water delivered to a steam generating boiler.

39. Equivalence evaporation is defined as

(a) the ratio of heat actually used in producing steam to the heat liberated in the furnace
(b) the amount of water evaporated in kg per kg of coal burnt
(c) evaporation of water from and at 100ºC into dry saturated steam
(d) evaporation of 15.653 kg of water per hour from and at 100ºC

OPSC AEE 2019 PAPER - II
BPSC AE Mains 2017 Paper - V

Ans. : (c) : Equivalent Evaporation– It is the amount of water evaporated from feed water at 100°C at normal atmospheric pressure (1.01 bar). It is usually written as "from at 100°C".
Mathematically equivalent evaporation from and at 100°C.

$$E = \frac{m_c\left(h - h_{f_1}\right)}{2257}$$

Where,
m_C = Mass of water actually evaporated or steam produced in kg/hr or kg/kg of fuel burnt.
h = Total heat of steam in kJ/kg of steam and
h_{f_1} = Sensible heat of feed water in kJ/kg of steam.

40. The ratio of energy produced by a power plant to the installed capacity of plant is called as:

(a) Load factor (b) Use factor
(c) Average load factor (d) Demand factor

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Ans. : (b) : Plant use factor- It is the ratio of energy produced in a given time to maximum possible energy that could be produced during actual number of hours of operation.

$$\text{Plant use factors} = \frac{\text{Annual Production of energy}}{\text{Operational hours in year} \times \text{Capacity of plant}}$$

41. In a power plant, the efficiency of the electric generator, turbine, boiler, cycle and the overall plant are 0.97, 0.95, 0.92, 0.42 and 0.33 respectively. In the generated electricity, the auxiliaries will consume nearly

(a) 7.3% (b) 6.5%
(c) 5.7% (d) 4.9%

ESE 2020, 2019

Ans. (a) :

$$\eta_{overall} = \eta_{boiler} \times \eta_{turbine} \times \eta_{cycle} \times \eta_{generator} \times \eta_{auxiliaries}$$
$$0.33 = 0.92 \times 0.95 \times 0.42 \times 0.97 \times \eta_a$$
$$\eta_{aux} = \frac{0.33}{0.92 \times 0.95 \times 0.42 \times 0.97} = 0.9267$$

Power consumed (%) = $1 - \eta_a = 1 - 0.9267$
$= 0.0733$
$= 7.33\%$

42. The efficiency of chimney is approximately

(a) 80% (b) 40%
(c) 20% (d) 0.25%

(KPSC AE 2015), TNPSC AE 2014

Ans. (d) : The efficiency of chimney is approximately 0.25%

Search on Telegram @apna_pdf

43. Induced draught fans of a large steam power plant has

(a) forward curved blade
(b) backward curved blade
(c) radial blade
(d) double curved blade
(e) straight blade

CGPSC AE 26.04.2015 Shift-II, ESE 1996

Ans. (a) : Induced draught fans of a large steam power plant has forward curved blade.

44. Fusible plug is fitted in a boiler to

(a) extinguish fire in case of low water level
(b) prevent leakage of steam from boiler
(c) allow passage of only super heated steam from the boiler
(d) keep the boiler pressure within the prescribed limits

(KPSC AE 2015), TSPSC AEE 2015

Ans. : (a) Fusible plug is fitted in a boiler to extinguish fire in case of low water level. Fusible plug:- It is fitted to the crown plate of the furnace of the fire box. Its object is to put off the fire in the furnace of the boiler when the level of water in the boiler falls to an unsafe limit and thus avoids the explosion which may take place due to overheating of the furnace plate.

45. For the safety of a steam boiler the number of safety valves fitted are

(a) One (b) Two
(c) three (d) Four

RPSC AE 2016, RPSC ACF-2011

Ans. : (b) For the safety of a steam boiler the number of safety valves and water level indicator fitted are two.
These are the devices attached to the steam chest for preventing explosions due to excessive internal pressure of steam. The following are the four types of safety valves.
(i) Lever safety valve (ii) Dead weight safety valve (iii) High steam and low water safety valve (iv) spring loaded safety valve.

46. Match list-I with list-II select the correct answer using the codes given below the list:

List -I	**List -II**
(a) Lancashire	1. High pressure water tube
(b) Cornish	2. Horizontal double fire tube
(c) La-mont	3. Vertical multiple fire tube
(d) Cochran	4. Low pressure inclined water tube
	5. Horizontal single fire tube

Code :

	A	**B**	**C**	**D**
(a)	2	5	1	3
(b)	2	4	3	1
(c)	1	5	2	3
(d)	5	4	1	3

UJVNL AE 2016, ESE 1999

Ans. (a) :

List -I	**List -II**
Lancashire	Horizontal double fire tube
Cornish	Horizontal single fire tube
La-mont	High pressure water tube
Cochran	Vertical multiple fire tube

47. Size of boiler tubes is specified by

(a) Mean diameter and thickness
(b) Outside diameter and thickness
(c) Insider diameter and thickness
(d) Outside diameter and inside diameter

Nagaland PSC CTSE 2017 Paper-2
GWSSB AAE, 27.12.2015

Ans. (b) : Size of boiler tubes is specified by outside diameter and thickness.

48. Thermal efficiency of steam turbine can be increased by :

(a) Reheating
(b) Regeneration
(c) Increasing the inlet pressure
(d) All of the above

MPPSC AE 08.11.2015
APGENCO AE 2012

Ans. (d) : Thermal efficiency of steam turbine can be increase by–
– Reheating
– Regeneration
– Inlet pressure (P_1)↑ increasing

49. In a glass tube type water indicator for a boiler, one end of the tube is connected to water space and the other end is connected to

(a) water space also (b) chimney
(c) steam space (d) superheater

Sikkim PSC (Under Secretary), 2017
GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : The water of the boiler comes into the glass tube through the lower tube and the steam through the upper tube. The water then stands in the glass tube at the same level as in the boiler. Two cocks are used to control the passage of between the boiler and the glass tube while the third cock is used to discharge some of the water from inside the boiler to see whether the gauge is in proper order or not. The glass tube is protected by means of a cover, made of specially toughened glass, which will prevent any accident that may happen due to breaking of glass tube. It is used for ordinary boiler.

50. A device used to increase the temperature of saturated steam without raising its pressure, is called

(a) blow of cock (b) fusible plug
(c) superheater (d) stop value

OPSC AEE 2019 PAPER - II
Sikkim PSC (Under Secretary), 2017
TNPSC ACF 2012

Ans. (c) : • A device used to increase the temperature of saturated steam with out raising it's pressure is called superheater.

- Superheater is a boiler accessory used to increase the steam temperature without effecting it's pressure. This is done by double heating of steam.
- In superheater gases is passes over the super heater tube and remainder will pass directly to the bottom tube.

Search on Telegram @apna_pdf

51. The equivalent evaporation rate (kg/hr) of a boiler producing 2000 kg/hr of steam with enthalpy content of 2426 kJ/kg from feed water at temperature 40 deg. C (liquid enthalpy = 168 kJ/kg and enthalpy of vaporization of water at 100 deg. C = 2258 kJ/kg) is :

(a) 2000 (b) 2249
(c) 1658 (d) 1649

ISRO Scientist/Engineer (RAC), 10.03.2019
GPSC ARTO 01.05.2016, GATE 1993

Ans. (a) : Given,
mass of steam (m) = 2000 kg/hr.
$h_1 = 2426$ kJ/kg
$t_1 = 40°C$
$h_{feed} = 168$ kJ/kg

$$\left(h_{fg}\right)_{water}|_{100°C} = 2258\,kJ/kg$$

Equivalent evaporation $\dfrac{\left(h_1 - h_{feed}\right)}{h_{fg}} \times m$

$$= \frac{2000(2426-168)}{2258}$$

= 2000 kg/hr.

52. A pump handling a liquid raises its pressure from 1 bar to 30 bar. Take the density of the liquid as 990 kg/m^3. The isentropic specific work done by the pump in kJ/kg is

(a) 0.10 (b) 0.30
(c) 2.50 (d) 2.93

VIZAG STEEL MT 18.08.2013, GATE 2011

Ans. (d) : $P_1 = 1$ bar, $P_2 = 30$ bar, $\rho = 990$ kg/m^3

Isentropic specific work (w) $= \dfrac{\Delta P}{\rho} = \dfrac{(30-1)}{990} \times 100$

done by pump $\boxed{w = 2.93\ kJ/kg}$

53. In a pulverized-fuel-fired large power boiler, the heat transfer from the burning fuel to the walls of the furnace is

(a) by conduction only
(b) by convection only
(c) by conduction and convection
(d) predominantly by radiation

VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 1999

Ans. (d) : Predominantly by radiation

54. Economizer in the boiler heats the

(a) steam (b) air
(c) feed water (d) coal

Assam PSC AE (IWT) 14.03.2021
TNPSC AE (Industries) 09.06.2013

Ans. (c) : A common application of economizers in steam power plants is to capture the waste heat from boiler flue gases and transfer it to the boiler feed water. This raises the temperature of the boiler feed water, lowering the needed energy input, in turn reducing the firing rates needed for the rated boiler output.

55. De-aeration of feed water is carried out because it reduces :

(a) cavitation of boiler feed pumps
(b) corrosion caused by oxygen
(c) heat transfer coefficient
(d) pH value of water

HPPSC W.S. Poly. 2016
J&K PSC Civil Services Pre, 2013

Ans. (b) : De-aeration is the process to remove dissolved gases (particularly oxygen) in feed water to reduce corrosion caused by oxygen.

56. Water (C_p = 4 kJ/kgK) is fed a boiler at 30°C, the enthalpy of vaporization at atmospheric pressure in the boiler is 2400 kJ/kg; the steam coming from the boiler is 90% dry. What is the net heat supplied in the boiler?

(a) 2160 kJ/kg (b) 24 kJ/kg
(c) 2440 kJ/kg (d) 2280 kJ/kg

HPPSC Asstt. Prof. 2014
ISRO Scientist/Engineer (RAC) 12.01.2020
ESE 2009

Ans. (c) : Heat supplied for a substance undergoing phase change of $Q = m[C_p dT + x \cdot h_{fg}]$
$= 1[4 \times (100 - 30) + 0.9 \times 2400]$
$= 280 + 2160$
$= 2440$ kJ/kg

57. Consider the following statements:

1. **Fusible plug is a device used to put off fire in the furnace of the boiler when the level of water in the boiler fails to an unsafe limit.**
2. **Super heater is a device used to increase the temperature of saturated steam without raising its pressure.**
3. **An economizer decreases the steam raising capacity of boiler.**

Which of the above statements is/are correct?

(a) 1 and 2 (b) 2 and 3
(c) 1 only (d) 1, 2 and 3

UPRVUNL AE 21.08.2016, CSE Pre-2005

Ans. : (a)
- Super heater is a device used to increase the temperature of saturated steam without raising its pressure.
- Fusible plug is a device used to put off fire in the furnace of the boiler when the level of water in the boiler fails to an unsafe limit.

58. The efficiency of regenerative rankine cycle is higher than simple rankine cycle because

(a) total work delivered by the turbine increases
(b) heat is added before steam enters the low pressure turbine
(c) average temperature of heat addition in the boiler increases
(d) total work delivered by the turbine decreases
(e) pressure inside the boiler increases

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
CGPSC AE 26.04.2015 Shift-II, GATE 2003

Ans. (c) : The efficiency of regenerative Rankine cycle is higher than simple Rankine because average temperature of heat addition in the boiler increase.

Search on Telegram @apna_pdf

59. Which of the following is the boiler accessory?

(a) Blow - off cock
(b) Pressure gauge
(c) Water level indicator
(d) Economiser

APPSC Poly Lect. 13.03.2020
TSPSC AEE 2015

Ans. : (d) Boiler Accessory– Boiler Accessory are those device which increase the efficiency of the boiler.

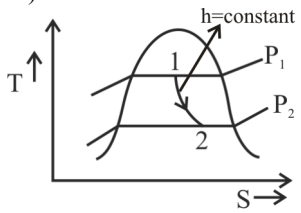
(i) Superheater (ii) Economiser
(iii) Air Preheater (iv) Feed pump.
(v) Injector (vi) Steam Separator
(vii) Steam Trap

60. When wet steam flows through a throttle valve and remains wet at exit:

(a) its temperature and quality increases
(b) its temperature decreases but quality increases
(c) its temperature increases but quality decreases
(d) its temperature and quality decreases

HPPSC Asstt. Prof. 2014
GATE 1996

Ans. (b) : Throttling is a perfect example of isenthalpic process. So, when wet steam flows through a throttle valve and remains wet at exit then its temperature decreases, entropy increases and quality of steam (dryness fraction) increases.



Note-Answer (b) is correct. but in Himachal PSC, (d) is given as correct answer.

61. Which one of the following boiler accessories does not need 'flue-gas' for its operation?

(a) Economizer (b) Preheater
(c) Injector (d) Super heater

Vizag Steel MT (Re-Exam) 24.11.2013
ESE 2007

Ans. (c) : Economiser, preheater and superheater are boiler accessories. They need 'flue gas' to their operation so that they can increase the efficiency.

62. Which device is used in thermal power plants to reduce level of pollution ?

(a) induced draft fan (b) precipitator
(c) chimney (d) pulveriser

GWSSB DEE 07.07.2016
J&K PSC Civil Services Pre, 2013

Ans. (b) : Induced fan – Provide negative pressure in the furnace.
Precipitator -device for removing dust from gas/smoke.
Chimney – Ventilation structure that isolates hot toxic exhaust gases or smoke from human living areas.
Pulveriser – Device used to crush the coal.

63. For a given set a operating pressure limits of a Rankine cycle, the highest efficiency occurs for

(a) saturated cycle (b) super heated cycle
(c) reheat cycle (d) regenerative cycle

TRB Poly. Lect., 2012, GATE 1994

Ans. (d) : For a given set of operating pressure limits of a Rankine cycle the highest efficiency occurs for regenerative cycle. In regenerative rankine cycle thermal efficiency is increased since the mean temperature of heat addition to the cycle is increased.

64. In steam power station, the choice of high temperature steam is for

(a) increasing the efficiency of boiler
(b) increasing the efficiency of turbine
(c) increasing the efficiency of condenser
(d) increasing the overall efficiency

RPSC AE 2016, RPSC ACF-2011

Ans. (d) : The binary vapor cycle is the combination of two cycle. One operates in the high temperature region, another operates in the low temperature. Thus the plant efficiency improvement in thermal power. Use of steam for heating of boiler feed water.

65. Presence of moisture in fuel oil would

(a) keep the burner tips cool
(b) aid in proper combustion
(c) cause sputtering, possibly extinguishing flame
(d) clean the nozzles

RPSC IOF, 2020, BPSC AE 2012 Paper - V

Ans. (c) : Presence of moisture in fuel oil would because sputtering, possibly extinguishing flame.

66. The boiler mounting used to empty the boiler drum when necessary for cleaning, inspection and repair is _____.

(a) Blow off cock (b) safety valve
(c) steam stop valve (d) fusible plug

VIZAG STEEL MT 24.01.2021, Shift-II, Shift-I

Ans. (a) : The boiler mounting used to empty the boiler drum when necessary for cleaning, inspection and repair is blow off cork.
Boiler mountings are a safety equipment installed for safe boiler operations and efficient working.

67. A high pressure drumless water tube steam boiler using forced circulation is _____.

(a) Benson Boiler
(b) La Mont Boiler
(c) Babcock and Wilcox Boiler
(d) Loeffler Boiler

VIZAG STEEL MT 24.01.2021, Shift-II, Shift-I

Ans. (a) : Benson Boiler–

- Benson boiler is high pressure drumless supercritical, water tube steam boiler with forced circulation.
- The bubbles do not form because at supercritical pressure the density of water and steam becomes the same.

Search on Telegram @apna_pdf

68. _____ **can be measured only by throttling calorimeter.**

(a) Dryness fraction of high- pressure stream
(b) Very high dryness fraction of up to 0.98
(c) Dryness fraction of low pressure stream
(d) Very low dryness fraction of up to 0.4

UPRVUNL AE 05.07.2021

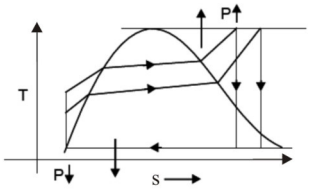
Ans. (b) :

69. **The efficiency of any cycle increases with**

(a) the decrease of maximum pressure and the constant of exhaust pressure.
(b) the decrease of maximum pressure and the decrease of exhaust pressure.
(c) the increase of maximum pressure and the decrease of exhaust pressure
(d) the increase of maximum pressure and the constant of exhaust pressure

ESE 18.07.2021

Ans. (c) :



When the maximum pressure increases and decreases the exhaust pressure then mean temperature of heat addition increases and mean temperature of heat rejection decreases. Thus, efficiency of cycle increase.

70. **In a power plant, the efficiencies of the electric generator, turbine (mechanical), boiler, cycle and the overall plant are 0.97, 0.95, 0.92, 0.42 and 0.33, respectively. What is the efficiency of auxiliaries?**

(a) 98.14% (b) 92.68%
(c) 83.41% (d) 75.14%

ESE 18.07.2021

Ans. (b) : Given,

$\eta_g = 0.97$, $\eta_m = 0.95$, $\eta_{boiler} = 0.92$

$\eta_{isen} = 0.42$, $\eta_{overall} = 0.33$,

$$\eta_{overall} = \eta_g \times \eta_m \times \eta_{boiler} \times \eta_{aux}$$

$$\eta_{aux} = \frac{0.33}{0.97 \times 0.95 \times 0.92 \times 0.42}$$

$$\approx 92.68\%$$

71. **Consider the following statements for analysis of steam cycles:**

(1) A steam power plant continuously converts the energy stored in fossil fuels or fissile fuels into shaft work.
(2) Steam power plants work on Brayton cycle
(3) In supercritical steam cycle, steam is generated in a 'once-through' boiler at a pressure above the critical point of 27.5 bar.
(4) Deaerator is used for the purpose of deaerating the feedwater

Which of the above statements are correct?

(a) 2 and 3 only (b) 1 and 3 only
(c) 1 and 4 only (d) 2 and 4 only

ESE 18.07.2021

Ans. (c) :

- Steam power plant works on Rankine cycle.
- A steam power plant continuously converts the energy stored in fossil fuels or fissile fuels into shaft work.
- Deaeratar is used for the purpose of removal of air (deaerating) the feed water entering to the boiler.
- Critical point of water is 22.12 MPa or 220 bar and 373.14°C.

72. **Consider the following statements for fluidized bed boilers:**

(a) Fluidized bed boilers produce steam from fossil and waste fuels by using a technique called fluidized bed combustion
(b) Cyclone separators are gas cleaning devices that utilize the centrifugal force created by a spinning gas stream to separate particles from a gas.
(c) In a pressurized fluidized bed boiler, the combustion process takes place in a pressurized environment resulting in a compact furnace and improved combustion efficiency.

Which of the above statements are correct?

(a) 1 and 2 only (b) 2 and 3 only
(c) 1 and 3 only (d) 1, 2 and 3

ESE 18.07.2021

Ans. (d) : All statements are correct as per their definition.

73. **In a closed feed water heater used in a regenerative cycle, the temperature of the feed water leaving a heater must be:**

(a) lesser than the saturation temperature at the steam extraction pressure.
(b) higher than the saturation temperature at the steam extraction pressure.
(c) equal to the saturation temperature at the steam extraction pressure.
(d) equal to or higher than the saturation temperature at the steam extraction pressure.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : In a closed feed water heater used in a regenerative cycle, the temperature of the feed water leaving a heater must be lesser than the saturation temperature at the steam extraction pressure.

Their difference is known as terminal temperature difference of heater.

74. **A good steam power plant having a Rankine cycle may have efficiency in the range of _____.**

(a) 35-45 percent (b) 70–80 percent
(c) 5–20 percent (d) 90-95 percent

UPRVUNL AE 05.07.2021
UKPSC AE 2007 Paper -II

Ans. (a) : A good steam power plant having a Rankine cycle may have efficiency in the range of 35-45 percent.

Search on Telegram @apna_pdf

75. The thermal efficiency of Rankine cycle is increased by

(a) Decreasing the pressure and volume at which mass is added to the cycle
(b) Decreasing the temperature at which mass is added to the cycle
(c) Increasing the average temperature at which heat is added to the cycle
(d) Increasing the pressure and volume at which is added to the cycle

HPPSC Workshop Suptd. 08.07.02021

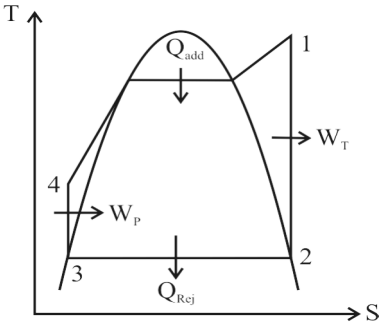
Ans. (c) : The thermal efficiency of Rankine cycle is increased by increasing the average temperature at which heat is added to the cycle.

76. Rankine cycle comprises

(a) Two isentropic processes and two constant volume processes
(b) Two isentropic processes and two constant pressure processes
(c) Two isothermal processes and two constant pressure processes
(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b)



Process 1-2 Isentropic expansion.
Process 2-3 Constant pressure heat rejection.
Process 3-4 Pump work.
Process 4-1 Constant pressure heat addition.

77. The capacity of steam plant is expressed in terms of steam rate. Its units will be

(a) kg/h (b) kg/kWh
(c) kWh/kJ (d) kW/kg

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) : Steam Rate $= \frac{3600}{W_{net}}\left(\frac{kg}{KWh}\right)$

78. With increase of mean temperature of heat addition, the efficiency of Rankine vapour power cycle will

(a) decrease
(b) independent of mean temperature of heat addition
(c) increase
(d) none of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

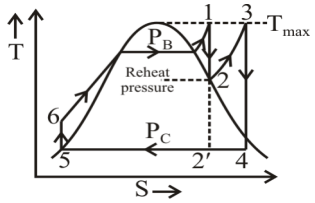
Ans. (c) : $\uparrow \eta = 1 - \frac{T_L}{T_{MA}\uparrow}\downarrow$

79. With reheating the rankine cycle efficiency will

(a) increase depending on maximum pressure
(b) decrease depending on minimum pressure
(c) no change
(d) may increase or decrease depending on mean temperature of heat addition

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) :



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net}\uparrow}$
- x-↑, ↓ errosion of turbine blade

80. The ratio of thermal power discharged to environment to electrical power output is called

(a) collector efficiency
(b) particulate efficiency
(c) pollution efficiency
(d) Thermal discharge index

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : Thermal discharge index

81. The tariff method which charges the consumer according to his maximum demand and energy consumption is

(a) Hopkinson demand rate method
(b) Doherty rate method
(c) Wright demand rate method
(d) Block meter rate

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Hopkinson rate is most common method of pricing electricity for industrial use. It consist of an energy charge for total kilowatt hour consumption plus an additional demand charge based on maximum usage by the plant during any quarterly hour period during the month.

82. The maximum demand of a power station is 96000 kW and the load is seven intervals of 6 hrs, 2 hrs, 4 hrs, 2 hrs, 4hrs, 4 hrs, 2 hrs each measured in MW was 48,60,72,60, 84, 96 and 48. The load factor will be

(a) 0.71 (b) 0.6
(c) 0.8 (d) 0.54

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Given, Load and time–

Time(hr)	6	2	4	2	4	4	2
Load(MW)	48	60	72	60	84	96	48

Energy generated = 48 × 6 + 60 × 2 + 72 × 4 + 60 × 2 + 84 × 4 + 96 × 4 + 48 × 2

Search on Telegram @apna_pdf

$= 1632$ MWh

$$\text{Load factor} = \frac{\text{Average load}}{\text{Peak load}}$$

$$\text{Average load} = \frac{1632}{24} = 68\,\text{MW}$$

Maximum demand = 96000 kW = 96 MW

$$\text{Load factor} = \frac{68}{96} = 0.71$$

83. Which of the following statements are correct regarding the Rankine cycle?
For a given set of operating pressure limits of a Rankine cycle, superheating the steam beyond the saturation temperature at the boiler pressure will result in:
(1) an increase in the moisture content of steam leaving the turbine
(2) an increase in thermal efficiency of the Rankine cycle
(3) an increase in the mean temperature of heat addition
(4) a decrease in the amount of heat rejected in the condenser
(a) (1) and (4) (b) (3) and (4)
(c) (1) and (2) (d) (2) and (3)

AAI Jr. Executive 26.03.2021

Ans. (d) : For a given set of operating pressure limits of a Rankine cycle, superheating the steam beyond the saturation temperature at the boiler pressure result in–
(a) Decrease in the moisture content and increases quality of steam leaving the turbine.
(b) Increase in thermal efficiency of rankine cycle.
(c) An increase in mean temperature of heat addition.

84. Which one of the boiler is not a high pressure boiler?
(a) Velox boiler (b) Lamont boiler
(c) Cochran boiler (d) Loeffler boiler

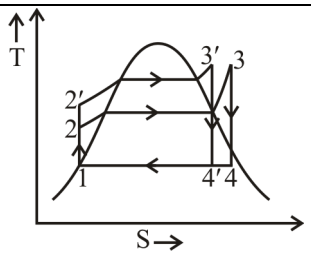
VIZAG STEEL MT 24.01.2021, Shift-II

Ans. (c) : A boiler is called a high pressure boiler when it operates with a steam pressure above 80 bar. e.g. Velox boiler, Lamont boiler, Loeffler boiler.

85. As the boiler pressure increases :
(a) the heat absorbed in the evaporator increases.
(b) the friction of the total heat absorbed in the superheater increases
(c) the latent heat of vaporization increases
(d) for the given superheated steam temperature, the quality of steam at turbine exhaust decreases.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : As the boiler pressure increases for the given superheated steam temperature the quality of steam at turbine exhaust decreases.
As the boiler pressure increases mean temperature of heat addition increases due to which efficiency of rankine cycle increases but at turbine exhaust quality of steam decreases to avoid this reheat cycle is adopted. Quality of steam should not be below 85% to avoid corrosion of turbine blade.



- W_P-↑
- W_T-↑↑, W_{net}-↑, η-↑, x-↓, Moisture-↑
- ↓Errosion of turbine blade

$$x(\text{dryness fraction}) = \frac{m_v}{m_v + m_a}$$

86. Which type of Power Plant is preferred as peak load type ?
(a) Nuclear (b) Gas
(c) Hydraulic (d) Thermal

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) : A list of the most popular peak load power plants–
- Gas
- Solar
- Wind turbines
- Diesel generators

Other, base load power plant are–
1. Coal, 2. Nuclear, 3. Hydroelectric, 4. Geothermal

87. Power plant has load factor as 0.6, capacity factor as 0.4, maximum demand as 20 MW. The average load and reserve capacity over and above peak load is :
(a) 30 MW, 12 MW (b) 30 MW, 10 MW
(c) 12 MW, 20 MW (d) 12 MW, 10 MW

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : Given,
Load factor = 0.6
Capacity factor = 0.4
Maximum demand = 20 MW

$$\text{Load factor} = \frac{\text{Average load}}{\text{Maximum demand}}$$

Average load = Maximum demand × Load factor
$= 20 \times 0.6$
$= 12$ MW

$$\text{Plant capacity} = \frac{\text{Average load}}{\text{Capacity factor}} = \frac{12}{0.4} = 30\,\text{MW}$$

Reserve capacity = Plant capacity – Maximum demand
$= 30 - 20 = 10$ MW

88. Compared to conventional sources of power such as thermal plants, the cost of wind power is :
(a) 100 times (b) 10 times
(c) comparable (d) 1/10 times

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : Compared to conventional sources of power such as thermal plants, the cost of wind power is 1/10 times.

Search on Telegram @apna_pdf

89. A thermal power plant of 100 MW capacity uses coal of 25 MJ/kg colorific value. If thermal efficiency of power plant is 40% and generator efficiency is 90%. What will be approximate coal consumption per hr when plant run at full load?

(a) 11.11 tons/hr (b) 11.11 kg/hr
(c) 40.0 tons/hr (d) 40.0 kg/hr

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) : Given,
Plant capacity = 100 MW
Coal calorific value = 25 MJ/kg

$$\eta_{th} = 40\%$$
$$\eta_g = 90\%$$
$$\eta_0 = 0.40 \times 0.90$$
$$\eta_0 = 0.36$$
$$\eta_0 = \frac{100\text{MW}}{25 \times \dot{m}}$$
$$\dot{m} = \frac{100}{25 \times 0.36}$$
$$\dot{m} = 11.11\,\text{kg/sec}$$
$$\dot{m} = \frac{11.11}{1000} \times 3600\,\text{tons/hr}$$
$$\boxed{\dot{m} = 40\,\text{tons/hr}}$$

90. Compared to a conventional steam plant, the temperature and pressure in a geothermal plant are:

(a) comparable (b) much higher
(c) higher (d) lower

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : In geothermal power plant pressure and temperature is low as compare to conventional steam power plant.

91. Which is not a correct option for thermo-electric solar power system?

(a) Tower type solar plant
(b) Concentrator collector solar plant
(c) Flat plate collector solar plant
(d) Photo –voltaic solar plant

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : Correct statements for thermo solar power systems,
- Concentrator collector solar plant
- Flat plate collector solar plant
- Photovoltaic solar plant

92. Compared to a conventional steam plant, the efficiency of geothermal plant is :

(a) very high (b) higher
(c) comparable (d) lower

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : The thermal efficiency of geothermal electric station is low, around 7-10%, because geothermal fluids are at low temperature compared with steam from boilers.

93. The expression $\Delta h = v\Delta p$ is utilised by which component of the steam power plant cycle?

(a) Boiler (b) Turbine
(c) Condenser (d) Pump

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

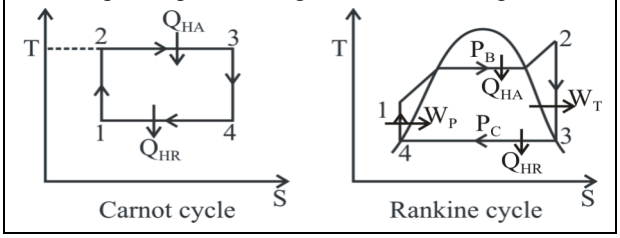
Ans. (d) : The expression $\Delta h = v\Delta p$ is utilised in pump of steam power plant.

94. Carnot cycle is different from Rankine Cycle in steam power plant during the following process:

(a) Heat Addition (b) Expansion Work
(c) Heat Rejection (d) Pump Work

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : Carnot cycle is different from Rankine Cycle in steam power plant during the heat addition process.

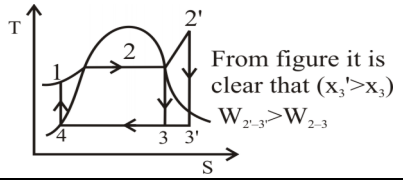


95. Which one of the following modifications of the simple ideal Rankine cycle increases the thermal efficiency and reduces the moisture content of the steam at the turbine outlet?

(a) Increasing the turbine inlet temperature
(b) Increasing the boiler pressure
(c) Decreasing the boiler pressure
(d) Decreasing the condenser pressure

Assam Engg. College AP/Lect. 18.01.2021

Ans. (a) : As temperature at inlet of turbine increases then thermal efficiency increases and moisture content reduces.



96. Cornish boiler is

(a) Fire tube boiler (b) High pressure boiler
(c) Water tube boiler (d) Locomotive boiler

JPSC AE, 10.04.2021, Paper-I

Ans. (a) : Cornish boiler is type of fire tube boiler.

Fire Tube Boiler	**Water Tube Boiler**
Locomotive	Babcock & Wilcox
Cornish	LaMont
Cochran	Velox
Lancashire	Benson

97. In locomotive boiler, the maximum pressure is of the order of

(a) 5 kg/cm^2 (b) 10 kgf/cm^2
(c) 20 kgf/cm^2 (d) 100 kgf/cm^2

JPSC AE, 10.04.2021, Paper-I

Ans. (c) : In locomotive boiler, the maximum pressure is of the order of 20 kgf/cm^2.

Search on Telegram @apna_pdf

98. Which of the following as referred to steam boiler are defined as mountings?

(a) Superheater (b) Economiser
(c) Preheater (d) Fusible plug

JPSC AE, 10.04.2021, Paper-I

Ans. (d) : Fusible plug

Boiler mountings – are safety device

- Water level indicator
- Pressure gauge
- Safety valve
- Fusible plug
- Blow off cock
- Feed check valve

Boiler accessories – for enhancing the performance

- Injector
- Economiser
- Air preheater
- Superheater
- Steam separator
- Steam trap

99. The work output from the turbine in a Rankine cycle is given by the change of ____ between inlet and outlet.

(a) Temperature (b) Entropy
(c) internal energy (d) enthalpy

UPRVUNL AE 05.07.2021

Ans. (d) : The work output from the turbine in a Rankine cycle is given by the change of enthalpy between inlet and outlet.

100. If the mass of a total steam-water mixture is 55 kg and the steam vapour is 5 kg, then the dryness fraction is:

(a) 0.09 (b) 0.10
(c) 0.08 (d) 0.06

NLCIL GET 17.11.2020, Shift-II

Ans. (a) : Dryness fraction $x = \frac{m_v}{m_\ell + m_v}$

Mass of vapour $m_v = 5$ kg

Mass of mixture $(m_\ell + m_v) = 55$ kg

So $\boxed{x = \frac{5}{55} = 0.09}$

101. In a solar tower power system, each mirror is mounted on a system called

(a) Regenerator (b) Linear Fresnel
(c) Dish (d) Heliostat

ESE 2020

Ans. (d) : Heliostat

102. The partial vacuum created by the fan in the furnace and flues, draws the products of the combustion from the main flue and allows them to pass up to the chimney. Such a draught is called

(a) Balanced draught (b) Forced draught
(c) Induced draught (d) Artificial draught

ESE 2020

Ans. (c) Induced draught

103. The higher power requirements for compression in a steam power plant working on Carnot vapour cycle

(a) Increases the plant efficiency as well as work ratio
(b) Reduces the plant efficiency as well as work ratio
(c) Does not affect the plant efficiency as well as work ratio
(d) Increases the plant efficiency and reduces work ratio

ESE 2020

Ans. (b) : Reduces the plant efficiency as well as work ratio.

104. Reheating should be carried out

(a) before the HP steam is first introduced to the turbine
(b) before the LP steam is drained to the condenser
(c) at an optimum pressure
(d) at any stage, pressure does not matter

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : Reheating should be carried out at an optimum pressure.

105. A steam ejector which removes air and other non-condensable gases from the condenser is known as

(a) Wet air pump (b) Dry air pump
(c) Centrifugal pump (d) Circulating pump

ESE 2020

Ans. (b) : Dry air pumps are used to remove air and other non-condensable gases.

106. The process of abstracting steam at a certain section of the turbine and subsequently using it for heating feed water supplied to the boiler is called

(a) Reheating (b) Regeneration
(c) Bleeding (d) Binary vapour cycle

ESE 2020

Ans. (b) : Regeneration
Note : As per UPSC (c) is correct answer.

107. The actual thermal efficiency of a cycle is ..... the air standard efficiency

(a) equal to (b) less than
(c) more than (d) not comparable to

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : It happens due to various irreversibilities in real engine that hinder then to achieve efficiency because before draw a p-v curve of air standard cycle we assume that all processes are internally reversible and working fluid is an ideal gas. But in actual practice in every operation in real engine have finite losses like heat losses friction losses pumping losses, losses at inlet and outlet valves. Time losses because fuel take little bit time to ignite so actual efficiency differs from an ideal one.

108. The India Boilers Act _____ was enacted with the objective to provide mainly for the safety of life and property of persons from the danger of explosions of steam boilers and for achieving uniformity in registration and inspection during operation and maintenance of boilers in India.

Search on Telegram @apna_pdf

(a) 1903 (b) 1914
(c) 1918 (d) 1923

RPSC IOF, 2020

Ans. (d) : The Indian boilers act 1923.

109. Out of the following impurities generally found in water, which one requires special consideration in case of very high pressure boiler?

(a) Hydrogen (b) Ammonia
(c) Silica (d) Dissolved salt

RPSC IOF, 2020

Ans. (c) : Silica requires special consideration in case of very high pressure boilers.

110. Locomotive boiler is a

(a) Single tube, horizontal, internally fired and stationary boiler
(b) Single tube, vertical, externally fired and stationary boiler
(c) Multi-tubular, horizontal, internally fired and mobile boiler
(d) Multi-tubular, horizontal, externally fired and stationary boiler

RPSC IOF, 2020

Ans. (c) : Locomotive boilers is multi tubular, horizontal internally fired and stationary boiler. Locomotive boiler is a type of boiler that is used to heat up the water and create steam from this water. This boiler sits horizontally just like Lancashire boiler and Cornish boiler.

111. A turbine generator unit has output of 150 MW and efficiency of 0.80. Calculate energy supplied per hour by steam generator.

(a) 675×10^9 J (b) 576×10^9 J
(c) 605×10^9 J (d) 705×10^9 J

RPSC IOF, 2020

Ans. (a) : Given,

Output = 150 MW

$= 150 \times 10^6 \times 3600$ J/hour

$\eta_T = 0.80$

$$\eta_T = \frac{\text{output}}{\text{energy supplied/h}}$$

$$0.80 = \frac{150\times10^6\times3600\,\text{J/h}}{\text{energy supplied per hour}}$$

Energy supplied per hour $= 6.75 \times 10^{11}$ J

$= 675 \times 10^9$ J

112. In most steam power plants, closed feed water heaters are favoured, but one open heater is used

(a) To reduce cost
(b) To achieve better heat transfer
(c) To provide high feed water temperature
(d) To deareate the feed water by removing the dissolved gas

RPSC IOF, 2020

Ans. (d) : Open feed water heater works as a dearator. To deareate the feed water by removing the dissolved gas.

113. These tubes in a natural circulation water tube boiler are smaller in number and bigger in diameter

(a) Downcomers
(b) Risers
(c) Both downcomers and risers
(d) Superheaters

RPSC IOF, 2020

Ans. (a) : Downcomers- A pipe to conduct something downwards. These tubes in a natural circulation water tube boiler are smaller in number and bigger in diameter.

114. A boiler evaporates 4 kg of water per kg of coal into dry steam at 10 bar (h_g = 2776.2 kJ/kg). The feed water temperature is 32°C (h_{fg} = 134 kJ/kg). The factor of evaporation is _____.

(a) 1.17 (b) 2.34
(c) 1.76 (d) 0.59

VIZAG MT, 14.12.2020

Ans. (a) : m = 4 kg

$h_g = 2776.2$ kJ/kg

$h_{fg} = 134$ kJ/kg

$$\text{Factor of evaporation } (F_e) = \frac{h_g - h_{fg}}{2257}$$

$$= \frac{2776.2 - 134}{2257}$$

$$\boxed{F_e = 1.17}$$

115. Which one is NOT a reason behind the fact that the ideal regenerative cycle is practically not possible?

(a) The reversible heat transfer takes infinite time
(b) It is mechanically impossible to exchange heat in the turbine
(c) The moisture content in the turbine will be high
(d) The steam specific volume will be too high

UPPSC AE 13.12.2020, Paper-2

Ans. (d) : The ideal regenerative cycle is practically not possible because–

(i) The moisture content in the turbine will be high. So, erosion of turbine blade takes place.
(ii) It is mechanically impossible to exchange heat in the turbine
(iii) The reversible heat transfer takes infinite time.

116. If η_1 and η_2 are the thermal efficiencies of two individual power plants. When they are coupled in series, the overall thermal efficiency η_O of the combined plant is given by

(a) $\eta_O = \eta_1\eta_2$ (b) $\eta_O = \eta_1 + \eta_2$
(c) $\eta_O = \eta_1 + \eta_2 - \eta_1\eta_2$ (d) $\eta_O = \dfrac{\eta_1 + \eta_2}{\eta_1\eta_2}$

UPPSC AE 13.12.2020, Paper-2

Ans. (c) : η_1 and η_2 are the thermal efficiencies of two individual power plants,

$$\boxed{(\eta_O)_{\text{series}} = \eta_1 + \eta_2 - \eta_1\eta_2}$$

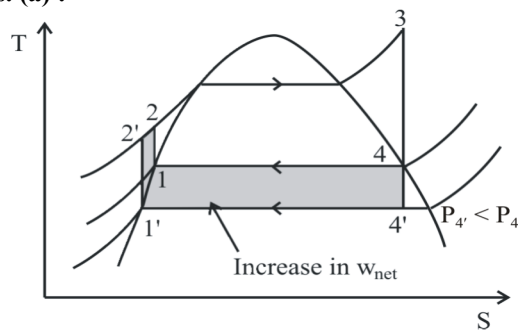
Search on Telegram @apna_pdf

117. Keeping all other parameters constant, if the temperature of the condenser of a Rankine cycle is decreased, the cycle efficiency :

(a) increase
(b) remains constant
(c) decreases
(d) cannot be determined from above inputs

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) :



(1) $W_T\uparrow$, $W_P\uparrow$, $W_{net}\uparrow$
(2) $W_{net}\uparrow = \uparrow W_T - W_P\uparrow$, $Q_S\uparrow$, Q_R (Cannot say)
(3) $\eta\uparrow$

$$\eta_{th} = \frac{W_{net}}{Q_{in}}$$

Lowering the operating pressure of the condenser lowers the temperature, at which heat is rejected. The overall effect of lowering the condenser pressure is an increase in thermal efficiency of the cycle and efficiency portion shows the amount of increase in work output.

118. The refrigeration cycle differs from reversed Rankine cycle in the following process

(a) condensation (b) expansion
(c) evaporation (d) compression

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : In refrigeration cycle, throttling is done at constant enthalpy where as in reversed Rankine cycle expansion is done in turbine of constant entropy.

119. Furnaces of most pulverized-coal-fired thermal power plant boiler are

(a) induced draught furnaces
(b) Natural draught furnaces
(c) Forced draught furnaces
(d) Balanced draught furnaces

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Force draft fan are used to regulate proper combustion and maximize efficiency of the fuel.

120. Induced draft fans typically are centrifugal fans with

(a) Radial vanes
(b) Backward vanes
(c) Forward curved vanes
(d) None of the above

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Induced draft fans typically are centrifugal fans forward curved vanes.

121. In forced circulation boilers, about 90% of water is recirculated without evaporation. The circulation ratio is

(a) 0.1 (b) 0.9
(c) 9 (d) 10

RPSC IOF, 2020

Ans. (d) :

$$\text{Circulation ratio} = \frac{\text{Flow rate of saturated steam in downcomers}}{\text{Flow rate of steam released from drum}}$$

$$= \frac{m_g + m_p}{m_g} \Rightarrow \frac{1}{\frac{m_g}{m_g + m_p}} \quad .....(i)$$

$$= \frac{1}{TDF}$$

Given,

$m_g = 0.1 \rightarrow$ Mass of stream released from drum

$m_\ell = 0.9 \rightarrow$ Mass of liquid at riser exit

TDF – Top dryness fraction

From equation (i) –

$$CR = \frac{0.1 + 0.9}{0.1} = 10$$

122. Which of the following is true for steam condenser?

(a) Exhaust steam and cooling water do not come in direct contact in jet condenser
(b) Exhaust steam and cooling water come in direct contact and mixed together in surface condenser
(c) Evaporative condenser is a type of jet condenser
(d) Evaporative condenser is a type of surface condenser

APPSC Poly Lect. 13.03.2020

Ans. (d) : Evaporative condenser is a type of surface condenser.

123. Net-work from a steam turbine is 1000 kW boiler supplies 2800 kJ/kg of steam, and cooling water in condenser takes 2100 kJ/kg of steam. Neglecting the pump work, the steam flow rate should be

(a) 0.357 kg/s (b) 0.476 kg/s
(c) 1.428 kg/s (d) 1.678 kg/s

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Turbine work = Heat supplied in the boiler – heat rejected to the condenser (If pump work is neglected)

$\dot{m}$ = mass flow rate of steam

$1000 = 2800 \times \dot{m} - 2100 \times \dot{m} = 700\,\dot{m}$

$\dot{m} = 1.428$ kg/sec

124. Steam rate is defined as [where Q = Heat input to cycle (kW), W_{net} = shaft output (kW)]

(a) $\frac{1}{W_{net}}(kg/kWh)$ (b) $\frac{3600(Q)}{W_{net}}(kJ/kWh)$

(c) $\frac{Q}{W_{net}}(kJ/kWh)$ (d) $\frac{3600}{W_{net}}(kg/kWh)$

SJVN ET 2019

Search on Telegram @apna_pdf

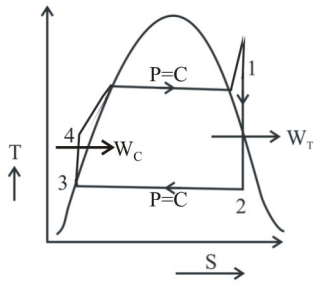
Ans. (d) : $\frac{3600}{W_{net}}(kg/kWh)$

125. If enthalpy of steam at the entry and exit of steam turbine is respectively 3000 kJ/kg and 2000 kJ/kg, if pump work is ignored, what will be the specific steam consumption?

(a) 3.60 kg/kW.hr (b) 3.60 kg/kW.s
(c) 0.360 kg/kW.s (d) Insufficient data

OPSC AEE 2019 PAPER - II

Ans : (a) : Given,
$h_1 = 3000$ kJ/kg
$h_2 = 2000$ kJ/kg



Net output from turbine

$W_T = h_1 - h_2$
$= 3000 - 2000$
$= 1000$ kJ/kg

So,
Specific Steam Consumption (SSC) in kg/kW.hr

$$SSC = \frac{3600}{W_T} = \frac{3600}{1000} = 3.6 \text{ kg/kW.hr}$$

126. For an ideal turbine enthalpy of gas at entry and exit is 3,000 kJ/kg and 2,500 kJ/kg respectively and having velocity 200 m/s and 100 m/s respectively at entry and exit. If mass flow rate of gas is 30 kg/s, the approximate power output of turbine is:

(a) 16 MW (b) 15 MW
(c) 15.5 MW (d) Insufficient data

OPSC AEE 2019 PAPER- II

Ans : (c) : Given,
$h_1 = 3000$ kJ/kg
$h_2 = 2500$ kJ/kg
$v_1 = 200$ m/s
$v_2 = 100$ m/s
$m = 30$ kg/s
Applying SFEE between inlet and outlet, power output of turbine,

$$h_1 + \frac{v_1^2}{2000} + \frac{gz_1}{1000} + q = h_2 + \frac{v_2^2}{2000} + \frac{gz_2}{1000} + w$$

$[\because z_1 = z_2, q = 0]$

$$3000 + \frac{200^2}{2000} = 2500 + \frac{100^2}{2000} + w$$

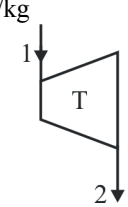
$w = 515$ kJ/kg
$P = mw$
$= 30 \times 515$
$= 15.45$ MW
≈ 15.5 MW

127. In a steam turbine with steam flow rate of 1 kg/s, inlet velocity of steam of 100 m/s, exit velocity of steam of 150 m/s, enthalpy at inlet of 2900 kJ/kg, enthalpy at outlet of 1600 kJ/kg, the power available from the turbine will be nearly

(a) 1575.5 kW (b) 1481.6 kW
(c) 1387.7 kW (d) 1293.8 kW

ESE 2019

Ans. (d) : Given,
$\dot{m} = 1$ kg/s
$c_1 = 100$ m/s
$c_2 = 150$ m/s
$h_1 = 2900$ kJ/kg
$h_2 = 1600$ kJ/kg



From steady flow energy equation

$$\dot{m}\left[h_1 + \frac{c_1^2}{2} + gz_1\right] + \dot{q} = \dot{m}\left[h_2 + \frac{c_2^2}{2} + gz_2\right] + \dot{W}_T$$

We assume that
$z_1 = z_2$, No heat transfer take place $\dot{q} = 0$

$$\dot{m}\left[h_1 + \frac{c_1^2}{2}\right] = \dot{m}\left[h_2 + \frac{c_2^2}{2}\right] + \dot{W}_T$$

$$\dot{m}\left(h_1 + \frac{c_1^2}{2000}\right) = \dot{m}\left(h_2 + \frac{c_2^2}{2000}\right) + \dot{W}_T$$

$$1\left(2900 + \frac{(100)^2}{2000}\right) = 1\left(1600 + \frac{(150)^2}{2000}\right) + \dot{W}_T$$

$\dot{W}_T = 1293.75$ kW

128. The efficiency of the vapour power Rankine cycle can be increased by

1. **increasing the temperature of the working fluid at which heat is added**
2. **increasing the pressure of the working fluid at which heat is added**
3. **decreasing the temperature of the working fluid at which heat is rejected**

Which of these statements is/are correct?

(a) 2 and 3 (b) 1 alone
(c) 1 and 2 (d) 1, 2 and 3

Gujarat PSC AE 2019, ESE 1999

Ans. : (d) : The efficiency of the vapour power Rankine cycle can be increased by-

(i) Increasing the temperature of working fluid, the mean temperature of heat addition increases and heat transfer irreversibility reduces. This results in improved efficiency.

Search on Telegram @apna_pdf

(ii) Since in Rankine cycle, there is phase change during heat addition or rejection. So by increasing pressure of fluid during heat addition, the temperature also increases and efficiency increases.
(iii) Reducing temperature of heat rejection will also increases the efficiency of cycle. These points are clear by

$$\eta = 1 - \frac{T_{\text{rejection (mean)}}}{T_{\text{addition (mean)}}}$$

129. Reheat cycle is essential in a steam power plant to
(a) utilize the heat of flue gases
(b) heat the feed water on its way to boiler
(c) increase the plant efficiency
(d) to reduce the moisture content at the low pressure stages of turbines so that erosion and corrosion problems can be eliminated

Gujarat PSC AE 2019

Ans. : (d) : To reduce the moisture content at the low pressure stages of turbines so that erosion and corrosion problems can be eliminated

130. Draught in a boiler is important for:
(a) Removing combustible gases from boiler
(b) For proper combustion of fuel
(c) Both (A) and (B)
(d) None of these

OPSC AEE 2019 PAPER - II

Ans. : (c) : Draught in a boiler is important for
- Removing combustible gases from boiler
- For proper combustion of fuel.

To discharge these gases to the atmosphere through the chimney.

131. On a boiler one end of the water indicator (Glass Tube Type) is connected to water space in boiler and other end is connected to:
(a) Open to atmosphere
(b) Steam space of boiler
(c) Superheater
(d) Another part of water space

OPSC AEE 2019 PAPER - II

Ans. : (b) : On a boiler one end of the water indicator (glass tube type) is connected to water space in boiler and other end is connected to steam space of boiler.

132. A steam jet issuing from a nozzle placed under the fire grate, in the ash pit of the furnace is used to produce which type of draught?
(a) Natural (b) Induced
(c) Forced (d) None of the options

OPSC AEE 2019 PAPER-II

Ans. : (c) : Forced steam jet draught- When the steam jet issuing from a nozzle is placed in the ash pit under the fire grate of the furnace, it is then known as forced steam jet draught.

133. In a locomotive and marine boilers the safety valve used are mainly:
(a) Leaver operated safety valve
(b) High steam and low water safety valve
(c) Spring loaded safety valve
(d) Dead weight safety valve

OPSC AEE 2019 PAPER - II

Ans. : (c) : In a locomotive and marine boilers the safety valve used are mainly spring loaded safety valve.

134. Low grade waste heat in bottoming cycle of cogeneration is used for:
(a) Feed water heating (b) Processing
(c) Power generation (d) Not for any use

OPSC AEE 2019 PAPER - II

Ans. : (a) : Low grade waste heat in bottoming cycle of cogeneration is used for feed water heating.

135. The following is (are) ash handling system(s).
(a) Hydraulic system (b) Pneumatic system
(c) Steam jet system (d) All of these

OPSC AEE 2019 PAPER - II

Ans. : (d) : In thermal power plants, an ash handling system is used to collect and dispose off discharged ash. Once it has been cooled down to a manageable temperature. It is used in various industries like construction, cement plants and other allied industries.
Ash handling system in power plant –
- Hydraulic system
- Pneumatic system
- Steam jet system

136. In a thermal power plant feed water heater is used to pre heat the feed water by:
(a) Hot gases from boiler furnace
(b) Steam from boiler
(c) Hot air from air pre heater
(d) Turbine exhaust steam

OPSC AEE 2019 PAPER - II

Ans. : (d) : In a thermal power plant feed water heater is used to pre heat the feed water by turbine exhaust steam.

137. Complete the sentence : "The function of the _____ is to increase the temperature for air before it enters the furnace".
(a) Air preheater (b) Super heater
(c) Injector (d) Economizer

SJVN ET 2019

Ans. (a) : Air preheater is to increase the temperature for air before it enters the furnace.

138. Steam enters a condenser at 35° C [$P_{\text{sat}@35^{o}C}$ = 42.21 mm of Hg]. Barometer reading is 760 mm of Hg and vacuum of 690 mm Hg is recorded in the condenser. The vacuum efficiency will be given by:
(a) 86.01% (b) 82.30%
(c) 96.10% (d) 80.23%

SJVN ET 2019

Ans. (c)

$$\text{Vacuum efficiency} = \frac{\text{Actual vacuum}}{\text{Barometer} - \text{Absolute pressure of steam}}$$

P_{Actual} = 690 mm Hg
$P_{\text{Barometer}}$ = 760 mm Hg
P_{Steam} = 42.21 mm Hg

$$\eta_{\text{vacuum}} = \frac{690}{760 - 42.21} = \frac{690}{717.79} = 96.10\%$$

Search on Telegram @apna_pdf

139. Rankine cycle efficiency for a power plant is

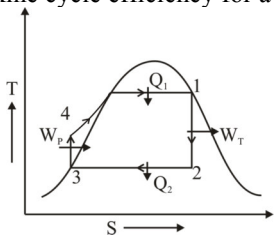
Q_1 - heat transferred to the working fluid
Q_2 - heat rejected from the working fluid
W_T - work transferred from the working fluid
W_P - work transferred into the working fluid

(a) $\eta = \dfrac{W_T - W_P}{Q_1}$ (b) $\eta = \dfrac{Q_2}{W_T - W_P}$

(c) $\eta = W_T - W_P$ (d) $\eta = \dfrac{Q_2 - Q_1}{W_T}$

TNPSC AE 2019

Ans. (a) : Rankine cycle efficiency for a power plant.



$$\eta_R = \frac{W_{net}}{Q_{supplied}}$$

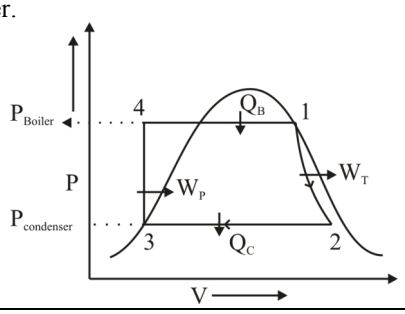
$$\eta_R = \frac{W_T - W_P}{Q_1}$$

140. At ideal condition of vapour power cycle heat rejection at reversible constant pressure occurs at

(a) turbine (b) pump
(c) condenser (d) boiler

TNPSC AE 2019

Ans. (c) : At ideal condition of vapour power cycle heat rejection at reversible constant pressure occurs at condenser.



141. Which of the following statements is/are correct regarding superheater in boilers?

1. It is heat exchanger in which heat is transformed to the saturated steam to increase its temperature.
2. It raises the overall efficiency.
3. It reduces turbine internal efficiency.

Select the correct answer using the code given below.

(a) 1 and 2 (b) 1 and 3
(c) 2 and 3 (d) 1 only

ESE 2019

Ans. (a) : The superheater is a heat exchanger in which heat is transferred to the saturated steam to increase its temperature. It raises the overall efficiency. It reduces the moisture content in last stages of the turbine and thus increases the turbine internal efficiency.

142. A 2 kg of steam occupying 0.3 m^3 at 15 bar is expanded according to the law $pv^{1.3}$ = constant to a pressure of 1.5 bar. The work done during the expansion will be

(a) 602.9 kJ (b) 606.7 kJ
(c) 612.5 kJ (d) 618.3 kJ

ESE 2019

Ans. (d) : Given,

$m = 2$ kg
$V_1 = 0.3\ m^3$
$P_1 = 15$ bar $= 1500$ kPa
$P_2 = 1.5$ bar $= 150$ kPa

$$P_1V_1^{1.3} = P_2V_2^{1.3}$$

$$V_2 = V_1\left(\frac{P_1}{P_2}\right)^{\frac{1}{1.3}}$$

$$= 0.3\left(\frac{15}{1.5}\right)^{\frac{1}{1.3}}$$

$$= 1.7634\ m^3$$

$$W = \frac{P_1V_1 - P_2V_2}{n-1} = \frac{(1500\times 0.3) - (150\times 1.763)}{1.3-1}$$

$$= 618.5\ kJ$$

143. A boiler is having a chimney of 35 m height. The draught produced in terms of water column is 20 mm. The temperature of flue gas inside the chimney is 365°C and that of air outside the chimney is 32°C. The mass of air used will be nearly

(a) 10.3 kg/kg of fuel (b) 12.5 kg/kg of fuel
(c) 14.7 kg/kg of fuel (d) 16.9 kg/kg of fuel

ESE 2019

Ans. (d) : Given, $h_w = 20$ mm $= 0.02$ m

$T_a = 273 + 32 = 305$ K
$T_g = 365 + 273 = 638$ K

$$h_w = 353\,H\left[\frac{1}{T_a} - \frac{1}{T_g}\frac{M_a+1}{M_a}\right]$$

$$0.02 = 353\times 35\left[\frac{1}{305} - \frac{1}{638}\left(\frac{M_a+1}{M_a}\right)\right]$$

$$\frac{0.02}{353\times 35} = \frac{1}{305} - \frac{1}{638}\left(\frac{M_a+1}{M_a}\right)$$

$$\frac{M_a+1}{M_a} = 1.059$$

$M_a = 16.9$ kg/kg of fuel

144. A frictionless piston cylinder device contains 5 kg of steam at 400 kPa and 200°C. The heat is now transferred to the steam until the temperature reaches 250°C. If the piston is not attached to a shaft, its mass is constant and by taking the values of specific volume v_1 as 0.53434 m^3/kg and v_2 as 0.59520 m^3/kg the work done by the steam during this process is

(a) 121.7 kJ (b) 137.5 kJ
(c) 153.3 kJ (d) 189.1 kJ

ESE 2019

Search on Telegram @apna_pdf

Ans. (a) : Given,

$m = 5$ kg $\quad V_1 = 0.53434\ m^3/kg$

$P = 400$ kPa $\quad V_2 = 0.59520\ m^3/kg$

$T_1 = 200°C \quad T_2 = 250°C$

Since the weight of the piston and the atmosphere pressure are constant,

So assuming it is a constant pressure process

Work done $W = P(V_2 - V_1)$

$= mP(V_2 - V_1)$

$= 400 \times 10^3 \times 5\ (0.59520 - 0.53434)$

$= 121.72$ kJ

145. 5 kg steam expands in a piston cylinder device from a pressure of 5 bar and 700^0 C (h = 3925.97 kJ/kg, s = 8.5892 kJ/kg-K, u = 3477.52 kJ/kg) to a pressure and temperature of 3 bar and 600^0 C (h = 3703.20 kJ/kg, s = 8.5892 kJ/kg-K, u = 3300.79 kJ/kg). If the process is reversible and adiabatic, the total work (kJ) for the process will be:

(a) 883.65 (b) 88.365

(c) 558.8 (d) 55.88

BHEL ET 2019

Ans. (a) : Mass of the steam (m) = 5 kg

$u_1 = 3477.52$ kJ/kg

$u_2 = 3300.79$ kJ/kg

For reversible and adiabatic process–

$Q = 0$

From non flow equation–

$Q = (u_2 - u_1) + W$

$U = m \times u$

$W = m(u_1 - u_2)$

$W = 5 \times (3477.52 - 3300.79)$

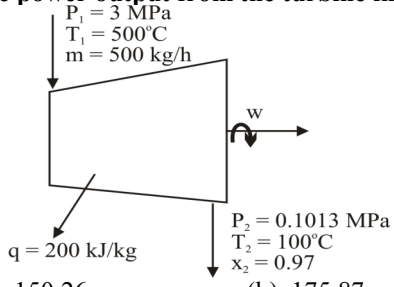
$W = 883.65$ kJ

146. Steam flows through a turbine as shown in the figure. The walls of the turbine are not insulated, so that there is heat transfer through the walls as shown. The properties of steam are as given below :

P = 3 MPa. T = 500 ^{0}C (h = 3456.48 kJ/kg, s = 7.2337 kJ/kg-K)

P = 0.1013 MPa, T = 100 ^{0}C (h_f = 419.1 kJ/kg. h_g = 2676 kJ/kg)

The power output from the turbine in kW is :



(a) 150.26 (b) 175.87

(c) 90.03 (d) 125.76

BHEL ET 2019

Ans. (c) : $h_f = 491.1$ kJ/kg, $h_g = 2676$ kJ/kg

$\dot{m} = 500\ kg/hr$

$= \frac{500}{3600}$

$\dot{m} = 0.139\ kg/sec$

$q = -200$ kJ/kg

Enthalpy at point –

$h_2 = h_f + x_2(h_g - h_f) = 491.1 + 0.9\ (2676 - 491.1)$

$= 2610.45$

From steady flow energy equation –

$(h_1 + q) = (h_2 + w)$

$(3456.48 - 200) = 2610.45 + w$

$w = 646.03$ kJ/kg

Work done in kW –

$\dot{w} = w \times \dot{m} = 646.03 \times 0.139$

$\boxed{\dot{w} = 89.79\ kW}$

147. A pump handling a liquid raises its pressure from 1 bar to 30 bar. Take the density of liquid as 990 kg/m^3. The isentropic specific work done by the pump in kJ/kg is :

(a) 3.93 (b) 1.93

(c) 4.93 (d) 2.93

ISRO Scientist/Engineer (RAC), 10.03.2019

GATE 2011

Ans. (d) : work $= \int v dP$

$= \int \frac{dP}{\rho}$

$= \frac{P_2 - P_1}{\rho} = \frac{(30-1) \times 100}{990} = 2.929\ kJ/kg$

148. A steam turbine receives steam at 15 bar, 350^{o}C [h = 3147.5 kJ/kg, s = 7.100 kJ/kg-K] and exhaust to the condenser at 0.06 bar. [h_f = 151.5 kJ/kg, h_{fg} = 2416.0 kJ/kg, s_f = 0.520 kJ/kg-K, s_{fg} = 7.800 kJ/kg-K] What will be the approximate thermal efficiency of ideal Rankine cycle operating between these two limits? [Neglect the pump work]

(a) 49.79% (b) 45.76%

(c) 22.76% (d) 31.97%

SJVN ET 2019

Ans. (d) : Given,

$h_1 = 3147.5$ kJ/kg, $\quad s = 7.100$ kJ/kg-K

$h_f = 151.5$ kJ/kg, $\quad s_f = 0.520$ kJ/kg-K

$h_{fg} = 2416.0$ kJ/kg, $\quad s_{fg} = 7.800$ kJ/kg-K

$\because$ In turbine, entropy is constant,

So, $s_1 = s_2 = s$

$\because \quad s = s_f + x s_{fg}$

$7.100 = 0.520 + x(7.800)$

$x = 0.8435$

Enthalpy of turbine at the exhaust,

$h_2 = h_f + x h_{fg}$

$= 151.5 + 0.8435\ (2416)$

$h_2 = 2189.396$ kJ/kg

Efficiency, $\eta = \frac{W_T - W_P}{Q_S}$

If pump work is neglected than–

$\eta = \frac{W_T}{Q_S}$ or $\eta = \frac{h_1 - h_2}{h_1}$

$\eta = \frac{3147.5 - 2189.396}{3147.5}$

$\boxed{\eta = 30.45\%}$

Search on Telegram @apna_pdf

149. **Statement I:** Rankine efficiency of a steam power plant increases in winter compared to summer.
Statement II: The increase in Rankine efficiency is due to lower condenser temperature.

ESE 2018

Ans. (a) : In winter condenser temperature decreases as cooling water temperature decreases, hence thermal efficiency increases.

150. **Statement I:** Direct condensers are more efficient than surface condensers.
Statement II: In condenser, the momentum pressure drop opposes the frictional pressure drop.

ESE 2018

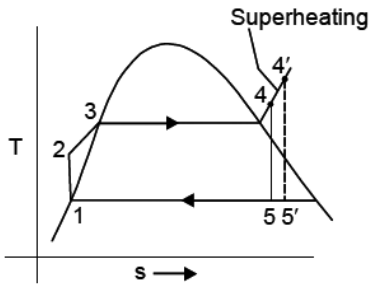
Ans. (b) : Direct condensers are more efficient than contact type condenser as velocity of water plus vapour at inlet is more than velocity of water at exit from condenser.
Hence momentum pressure drop is negative and friction drop is positive.

151. **All power plants use superheated steam due to which of the following advantages?**
1. **Superheating is mostly done from waste heat of boiler without additional cost of fuel.**
2. **The plant efficiency increases due to higher temperature of steam.**
3. **There is less corrosion and erosion of equipment due to absence of moisture in the steam.**

Select the correct answer using the code given below:
(a) 1 and 2 only (b) 2 and 3 only
(c) 1 and 3 only (d) 1, 2 and 3

ESE 18.07.2021

Ans. (d) :



- 1 – 2 – 3 – 4 – 5 is normal Rankine cycle
- 1– 2 – 3 – 4'– 5' is superheated Rankine cycle because of superheating mean temperature (T_m) of heat addition ↑.

As $\eta = f(T_m)$
So, h ↑ for superheated cycle

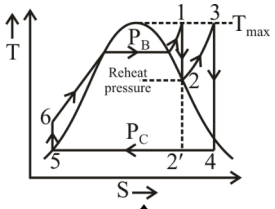
- at point 5', dryness fraction is more than at point 5, so moisture content is less after the turbine exit, so less erosion and corrosion is there in superheated Rankine cycle than Rankine cycle.
- Superheaters (CSH) are placed after the reheater and before the economizer which uses waste heat releasing to the stack.

152. **Consider the following statements regarding Reheat Rankine Steam Cycle:**
1. The main purpose of reheat in Rankine cycle is to increase the efficiency of the cycle
2. In practice, the reheat is generally limited to one point of expansion
3. Due to reheat, the steam rate (specific steam consumption) is reduced.

Which of the above statements are correct?
(a) 1 and 2 only (b) 2 and 3 only
(c) 1 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (b) : The main purpose of reheating is to avoid excess moisture in steam at the end of expansion to protect the turbine. But it need not improve the cycle efficiency.



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net} \uparrow}$
- x-↑, ↓errosion of turbine blade

153. **Statement I:** The condenser in a steam power plant is always filled with a mixture of water, steam and air.
Statement II: Slightly wet steam enters the condenser where in the pressure is below the atmospheric conditions, causing some leakage of air through the glands and also the release of some air dissolved in the boiler feed water.

ESE 2018

Ans. (a) : Steam enters the condenser in wet state, hence we have water, vapour and air.
At lower pressures air leaks through glands and also releases some air dissolved in boiler feed water.
Hence both the statements are correct and II is correct explanation of I.

154. **Which one of the following methods is more effective to improve the efficiency of the Rankine cycle used in thermal power plant?**
(a) Increasing the condenser temperature
(b) Decreasing the condenser temperature
(c) Decreasing the boiler temperature
(d) Increasing the boiler temperature

ESE 2018

Ans. (b) : Method to increase the efficiency of the Rankine cycle
(i) Lowering the condenser pressure
(ii) Superheating the steam to high temperature
(iii) Increasing the Boiler pressure

155. **Statement I:** Reheating between the high-pressure and low-pressure turbines increases the turbine work output.
Statement II: The constant pressure lines on T-s diagram diverge away from the origin.

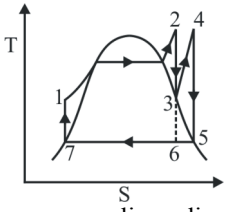
ESE 2018

Search on Telegram @apna_pdf

Ans. (a)

■ Work output of the reheat cycle is increased as

$$(h_3 - h_6) < (h_4 - h_5')$$



■ The constant pressure line diverge on the T-s diagram from the origin.

156. Which of the following process is represented by a horizontal line parallel to the abscissa of a Mollier-diagram?

(a) constant pressure
(b) constant temperature
(c) free expansion on throttling
(d) adiabatic expansion

GPSC Executive Engineer 23.12.2018

Ans. (c) : Free expansion on throttling.

157. The thermal efficiency of a steam plant is defined as ?

(a) The ratio of heat equivalent of electrical output to the heat of combustion of coal
(b) The ratio of heat of combustion of coal to the heat equivalent of electrical output.
(c) The ratio of heat equivalent of mechanical energy transmitted to the turbine shaft to the heat of combustion of coal.
(d) The ratio of heat of combustion of coal to the heat equivalent of mechanical energy transmitted to the turbine shaft.

Vadodara Muncipal Corp. DEE, 2018

Ans. (c) : Thermal efficiency of steam power plant is the ratio of heat equivalent of mechanical energy transmitted to the turbine shaft and heat of the combustion of coal.

158. In Rankine cycle, adiabatic enthalpy drop across the prime mover is 840 kJ/kg. The enthalpy of steam supplied is 2940 kJ/kg. If the back pressure is 0.1 bar, then the specific steam consumption is (assume h_f at 0.1bar = 191.8 kJ/kg):

(a) 2.4 kg/kWh (b) 3.4 kg/kWh
(c) 12.4 kg/kWh (d) 4.2 kg/kWh

AAI Jr. Executive 29.11.2018

Ans. (d) : Adiabatic enthalpy drop = $(h_1 - h_2)$= 840 kJ/kg
Enthalpy steam supplied (h_1) = 2940 kJ/kg
Back pressure P_2 = 0.1 bar
Corresponding 0.1 bar and h_f = 191.8 kJ/kg
Useful work done per kg steam = 840 kJ/kg
∴ Specific steam consumption or steam rate,

$$= \frac{3600}{W_{net}} \text{kg/kW-hr}$$

$$= \frac{3600}{840}$$

$$= 4.285 \text{kg/kWh}$$

159. Which of the following is incorrect for Rankine vapor power cycle?

(a) It has two reversible adiabatic and two reversible isobaric process.
(b) Its efficiency is dependent on mean temperature of addition and temperature of heat rejection.
(c) Constant pressure heat rejection takes place in the turbine.
(d) The efficiency of Rankine cycle can be increased by increasing the degree of superheat at constant pressure.
(e) Heat addition takes place in the boiler at constant pressure.

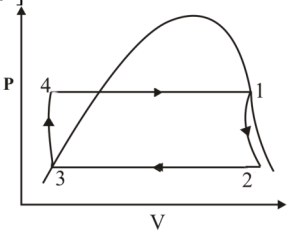
CGPSC AE 25.02.2018

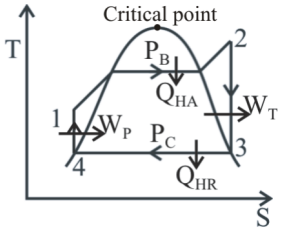
Ans. (c) : Process 1 - 2 – Reversible adiabatic expansion [Turbine work]

Process 2-3– Reversible isobaric heat rejection [isothermal heat rejection]

Process 3-4– Reversible adiabatic compression [Pump work]

Process 4-1– Reversible isobaric heat addition [In Boiler]





160. A curve showing the variation of load on a power station with respect to time is known as-

(a) Load curve (b) Load duration curve
(c) Diversity factor (d) Performance curve

RPSC AE 2018
UPPSC AE 12.04.2016 Paper-II

Ans. (a) : A curve showing the variation of load on a power station with respect to time is known as Load curve.

161. A power generation station is to supply four regions of loads with peak demand of 10 MW, 15 MW, 20 MW and 30 MW. If the diversity factor is 1.5, the maximum demand on the station is-

(a) 70 MW (b) 60 MW
(c) 50 MW (d) 40 MW

RPSC AE 2018

Ans. (c) : Diversity factor—Diversity factor is the ratio of the sum of the individual non-coincident maximum loads of various sub-divisions of the system to the maximum demand of complete system.

Search on Telegram @apna_pdf

The diversity factor is almost always larger than 1, since all components would have to be on simultaneously at full load for it to be one.

Data given:-

Peak demands—10 MW, 15 MW, 20 MW, 30 MW

Diversity factor = 1.5

$$\text{Diversity factor} = \frac{\text{Sum of all peak demands}}{\text{The maximum demand on the station}}$$

The maximum demand on the station

$$= \frac{10+15+20+30}{1.5} = \frac{75}{1.5}$$

$$= 50 \text{ MW}$$

162. In a steam generator, feed water supply rate is 205 kg/h and rate of coal fired is 23 kg/h. The net enthalpy rise of water for conversion to steam is 145 kJ/kg. If the calorific value of coal is 2050 kJ/kg, the steam generator efficiency will approximately be:

(a) 52% (b) 42%

(c) 72% (d) 62%

AAI Jr. Executive 29.11.2018

Ans. (d) : $\text{Efficiency of boiler} = \frac{\text{Enthalpy rise}}{\text{Heat extracted}}$

$$= \frac{205 \times 145}{23 \times 2050}$$

$$= 0.63$$

$$= 63\%$$

163. Which one of the following modifications to a Rankine cycle would upgrade/enhance its efficiency so as to approach that of Carnot cycle?

(a) Incomplete expansion of steam

(b) Reheating of steam

(c) Regenerative feed heating by steam

(d) Partial condensation of steam

HPPSC Asstt. Prof. 18.09.2017

Ans. (c) : Regenerative feed heating by steam.

164. If reheating is done in Rankine cycle, then:

(a) work output decreases

(b) pump work increases

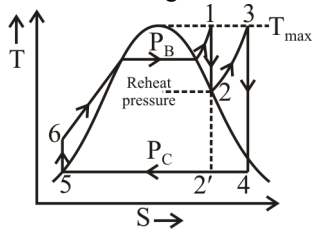
(c) heat rejection remains constant

(d) dryness fraction increases

(e) heat rejection decreases

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : Reheating :- It is process by which we can increase the dryness fraction of steam at the turbine exhaust is known as reheating.



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net} \uparrow}$
- x-↑, ↓errosion of turbine blade

165. If the boiler pressure increases at fixed maximum temperature, what will be the impact on work done for Rankine cycle?

(a) Increases linearly

(b) Decreases linearly

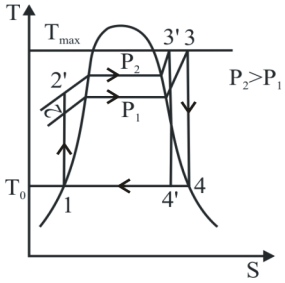
(c) Increases exponentially

(d) Decreases exponentially

(e) Almost remains constant

CGPSC ARTO & TSI 07.01.2017

Ans. (e) :



Here,

$$(W_T)_{P_1} = h_3 - h_4$$

$$(W_T)_{P_2} = h_{3'} - h_4$$

$$\boxed{h = f(T)}$$

(T_{max} - T_o) are same for both

i.e (1, 2, 3, 4) & (1 2' 3' 4')

166. In a steam engine the change in internal energy equal to:

(a) The work done during whole of the Rankine cycle

(b) The work done during adiabatic expansion only

(c) The work done during compression

(d) The change of enthalpy

PTCUL AE 25.06.2017

Ans. (b) :

167. One kilowatt is equal to -

(a) 1 N-m/s (b) 100 N-m

(c) 1000 N-m/s (d) 1×10^6 N-m/s

GMB AAE 25.06.2017

Ans. (c) : 1 kilowatt = 1000 Nm/sec.

One kilowatt is defined as energy consumption of 1000 Jule for 1 second.

1 kW = 1000 J/sec.

1 kW = 1000 W

168. On a Mollier chart the flow through turbine is represented by

(a) horizontal line (b) vertical line

(c) curved line (d) Any one of above

WBPSC AE, 2017

Ans. (b) : On a Mollier chart the flow through turbine is represented by vertical line.

Search on Telegram @apna_pdf

169. Boiler rating is usually defined in terms of :

(a) Maximum temperature of steam in Kelvin
(b) Heat transfer rate in kJ/hr
(c) Heat transfer area in meter^2
(d) Steam output in kg/hr

HPPSC Asstt. Prof. 20.11.2017, GATE 1992

Ans. (d) : Boiler rating is usually defined in terms of steam output in kg/hr.

170. In a steam generation process, in case of a natural draught system, the heat carried away by flue gases is

(a) Less due to lower flue gas temperatures
(b) Less due to higher flue gas temperatures
(c) More due to lower flue gas temperature
(d) More due to higher flue gas temperatures

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (d) : Draught is the pressure difference which cause a flow of air or gases from one point to another point in the boiler system.
Draught is required in a boilers system mainly to remove flue gases from the system after combustion and the heat exchange.

171. Safety valves release excess steam when the pressure of steam inside the boiler exceeds rate pressure and as per boiler regulations every boiler must be fitted with two safety valves. Which of the following is NOT an example of safety valve?

(a) Dead weight
(b) Lever
(c) Low steam and high water
(d) Spring loaded

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (c) : Dead weight, lever, spring loaded is the type of safety valve.

- Low steam and high water is example of water level indicator.

172. Blowing down of boiler water is the process to

(a) Reduce the boiler pressure
(b) Increase the steam temperature
(c) Control the solids concentration in the boiler water
(d) Control the drum level

GPSC Asstt. Director of Transport 05.03.2017

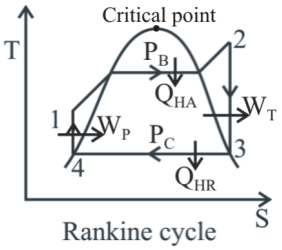
Ans. (c) : Blowing down is a process which involves draining a small amount higher hardness and solids water from the boiler and replacing it with lower hardness and solids makeup water to maintain a predetermined concentration of hardness and solids, so we can say it controls the solids concentration in the boiler water.

173. Rankine cycle efficiency for fixed steam temperature of any value up to critical temperature will be maximum for steam pressure of

(a) 9.8 MPa
(b) 19.61 MPa
(c) Half the critical pressure
(d) Critical pressure

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : Rankine cycle efficiency for fixed steam temperature of any value upto critical temperature will be maximum for steam pressure of critical pressure.



174. Which of the following is most appropriate for vapour power cycles?

(a) In Carnot cycle, expansion of vapour occur without change in entropy
(b) In Rankine cycle, transformation of liquid water in steam generator occurs at constant temperature
(c) In Carnot cycle heating of vapour occurs at constant volume
(d) In Rankine cycle, entropy of vapour increases during its expansion in steam turbine

ISRO Scientist/Engineer 17.12.2017

Ans. (a)

- In Carnot cycle, compression and expansion takes place isentropically while Rankine cycle, transformation of liquid water in steam generator occurs at constant pressure.
- In Carnot cycle heating of vapour occurs at constant temperature while Rankine cycle, entropy of vapour remain constant during its expansion in steam turbine

175. A steam power plant is a classic example of _____.

(a) Heat reservoir (b) Heat pump
(c) Heat engine (d) Refrigerator
(e) Compressor

(CGPSC Polytechnic Lecturer 2017)

Ans. (c) : A steam power plant is a classic example of a heat engine. External fired heat engine are generally steam engines, and they differ from internal combustion engine in that the heat source is separate from the fluid that does work.
For Example–An external combustion engine would use a flame to heat water into steam, then using the steam to run a turbine.

176. The fusible plug of a boiler is an example of

(a) Safe life approach
(b) Fail safe approach
(c) Reliability approach
(d) Maintainability approach

UPSC JWM 2017

Ans. (b) : Fusible plug in boiler is a fitting used in steam boiler to enhance the safety during operation. Fusible plug is installed in small horizontal fire tube boilers between furnance and boiler water drum for protection of boiler while lower water level in drum. Fusible plug is an example of fail safe approach.

177. Consider the following statements:

1. For a given power, a fire tube boiler occupies less space than a water tube boiler,

Search on Telegram @apna_pdf

2. Steam at a high pressure and in large quantities can be produced with a simple vertical boiler
3. A simple vertical boiler has a fire tube

Which of the above statements is/are correct?

(a) 1 only (b) 2 only
(c) 3 only (d) 1, 2 and 3

UPSC JWM 2017

Ans. (c) : For a given power, a fire tube boiler occupies more space than a water tube boiler.
Fire tube boiler- In fire tube boiler, the flue gases flow in the tubes and water flows from the shell. Fire tube boiler is a vertical boiler.
Water tube boiler- in water tube boiler, water flows from the tubes and the flue gases from the shell or passes over the tubes.

178. Consider the following statements with regard to reheat Rankine cycle:

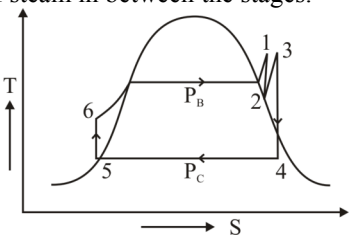
1. All the steam is taken out of the turbine after partial expansion for reheating at constant volume
2. The cycle permits the use of very high pressure without excessive moisture at condenser inlet
3. The efficiency of the reheat cycle may or may not exceed that of a simple cycle operating between the same maximum temperature and pressure
4. If the reheat pressure is more than 80% of the maximum system pressure, the thermal efficiency will be more than that for a simple cycle

Which of the above statements are correct?

(a) 2, 3 and 4 only (b) 1 and 2 only
(c) 1, 3 and 4 only (d) 1, 2, 3 and 4

UPSC JWM 2017

Ans. (a) : Reheat Rankine cycle- In reheat cycle, the total expansion of steam from boiler to condenser pressure take place in more than 1st stage with reheating of steam in between the stages.



As steam quality x is increases, the moisture content at the inlet of condenser decreases.
For the same maximum pressure and temperature limit, the efficiency of Rankine cycle increase or decrease.

- All the steam is taken out of the turbine after partial expansion for reheating at constant pressure.

179. Statement (I): Water entering into a condenser from the cooling tower has much dissolved impurities.
Statement (II): In a closed cooling system, the water is continuously aerated, therefore, there is abundant dissolved oxygen in this water.

ESE 2017

Ans. (c) : A cooling tower is an open cooling system and water can dissolved impurities from air because of direct contact.
A condenser a closed cooling system and there exists a vacuum in the condenser during operation. Hence there exist a possibilities of air leakage which is continuously deaerated.

180. Statement (I): Heat carried away by hot gases in chimney draught is much greater than the work required for lifting the same gases through the height of the chimney. Yet artificial draught is not preferred.
Statement (II): Artificial draught involves large initial cost as well as large maintenance cost.

ESE 2017

Ans. (d)

181. Statement (I): The overall combustion efficiency of a fuel oil based plant is less as compared to that of a coal burning plant.
Statement (II): Fuel oils contain comparatively larger percentage of hydrogen, which produce more moisture per kg of fuel burnt.

ESE 2017

Ans. (d)

182. Statement (I): Providing reheat in a Rankine cycle would increase the efficiency of the cycle.
Statement (II): Reheat in Rankine cycle reduces specific steam consumption.

ESE 2017

Ans. (d) : Advantage of Reheating–
(i) By reheating there is gain of 4 to 7% of thermal efficiency take place as the output of turbine is increased.
(ii) Reheating may also shortout blade erosion and corrosion problem in turbine.

$\because$ Specific steam consumption (S.S.C) $= \frac{3600}{W_{net}}$ kg/kW-hr

Due to reheating W_{net} increases and specific steam consumption decreases.

183. Consider the following statements in respect of regenerative Rankine cycle:

1. Regeneration increases the efficiency of the cycle.
2. The boiler capacity is increased for a given output.
3. The capacity of the condenser is reduced.

Which of the above statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 1 and 3 only (d) 2 and 3 only

ESE 2017

Ans. (a) :

- Regeneration increases the mean temperature of heat addition of cycle, hence the efficiency of cycle increases.
- For same power output steam flow rate requires bigger boiler.
- Because of steam flow rate to condenser decreases so small condenser is required.

Search on Telegram @apna_pdf

184. Consider the following statements:
The presence of air inside condensers
1. remains as a non-condensable gas
2. reduces the condensing coefficient
3. tends to cling to the surface
4. introduces large thermal resistance

Which of the above statements are correct?
(a) 1, 2, 3 and 4 (b) 1, 2 and 3 only
(c) 3 and 4 only (d) 1, 2 and 4 only

ESE 2017

Ans. (a) : Effect of air inside the condenser :
(i) The performance of condenser due to presence of air gets affected badly.
(ii) The heat transfer surfaces such as outside the surface of condenser tubes which reduces the condensing heat transfer co-efficient.
(iii) As air tend to cling the surface which reduces the condensing co-efficient.
(iv) Because of low thermal conductivity of air, air imparts large thermal resistance.

185. The boiler flue gas is source of
(a) HCl (b) NO
(c) HF (d) Volatile organic compounds

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (b) : Nitrogen oxide (NO) compound is the main source of boiler flue gas.

186. The boiler consists of horizontal fire tubes is
(a) Cochran (b) Cornish
(c) Babcock and Wilcox (d) Stirling

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (a) : Cochran boiler is multi-tubular vertical fire tube boiler having a number of horizontal fire tubes.

187. The Grate in the boilers
(a) used as a base on which the burning of the solid fuel takes place
(b) used for superheating the steam
(c) used as a water storing device
(d) used for collecting the mud in present in the water

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : The grate in the boilers used as base on which the burning of the Solid fuel take place.

188. A steam engine is a
(a) External combustion engine
(b) Internal combustion engine
(c) It may be internal or external type
(d) All of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : Steam engine is a heat engine that performs mechanical work using steam as a working fluid.

189. A simple steam power cycle receives 1,00,000 kJ/min as heat transfer from hot combustion gases and rejects 66,000 kJ/min as heat transfer to the environment. If the pump power required is 1400 kJ/min, the thermal efficiency of the cycle and turbine power output is
(a) 51.5% and 590 kW
(b) 34% and 590 kW
(c) 51.5% and 566.6 kW
(d) 34% and 566.6 kW

ISRO Scientist/Engineer 03.07.2016

Ans. (b) : $Q_S = 100{,}000$ kJ/min
Pump work required = 1400 kJ/min
$Q_R = 66000$ kJ/min
$W_{net} = Q_S - Q_R$
$= 34000$ kJ/min
Turbine work = W_{net} + Pump work required
$= 34000 + 1400$
$= 35400$ kJ/min

$$\text{Turbine work} = \frac{35400}{60} = 590 \text{ kW}$$

$$\text{Thermal efficiency} = 1 - \frac{Q_R}{Q_S}$$

$$= 1 - \frac{66000}{100{,}000} = 34\%$$

190. Regarding the energy scenario of India, the power installed capacity as on 31st December 2015 approximately is
(a) 280×10^3 MW (b) 320×10^3 MW
(c) 400×10^3 MW (d) 470×10^3 MW

GPSC ARTO 01.05.2016

Ans. (a) : 280×10^3 MW

191. A boiler in India should confirm to safety regulations of ..... .
(a) DIN (b) BS
(c) ASTM (d) IBR

GWSSB DEE 07.07.2016

Ans. (d) : Indian Boiler Regulation (IBR) Governs design, manufacture, installation and operation of all steam producing vessels.

192. Thermal efficiency of a thermal power plant is of the order of ..... .
(a) 15% (b) 20%
(c) 30% (d) 45%

GWSSB DEE 07.07.2016

Ans. (c) : Thermal efficiency of a thermal power plant is 30%.

193. The height of chimney in a power plant s governed by ..... .
(a) control of pollution
(b) the draught to be created
(c) limitation o construction facilities
(d) quantity of flue gases to be handled

GWSSB DEE 07.07.2016

Ans. (b) : For producing a natural draught, height of chimney should be very high.
$\uparrow \Delta P = (\rho_0 - \rho_1) g H \uparrow$

194. The boiler commonly used in sugar mills is
(a) Cochran (b) Cornish
(c) Lancashire (d) Stirling

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Lancashire, a fire tube boiler is used in sugar mills & industries. It is reliable and simplicity is design easy in operation and less operating and maintenance cost. This Lancashire boiler is used, where a lot steam is required.

Search on Telegram @apna_pdf

195. Efficiency of cycle will increase due to Reheating if

(a) Mean temperature of heat addition in boiler is higher than in reheat process
(b) Mean temperature of heat addition in boiler is lower than in reheat process
(c) it will increase without any conditions
(d) it will not increase

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (a) : Efficiency of cycle will increase due to reheating if temperature of heat addition in boiler is higher than in reheat process

$$\text{Efficiency} = \frac{\text{Work output}}{\text{Heat supplied is less in this condition only}}$$

196. Why don't use more than two reheats?

(a) Not economical
(b) Increased and mechanical stresses
(c) Net efficiency is decreased
(d) All of the mentioned

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : We never use two reheat of same time, because the mechanical stresses increases in much higher proportion than the pressure because of the prevailing high temperature, not economical also, net efficiency is decreased.

197. The cycle efficiency in a single reheat plant is influenced by

(a) Pressure at turbine inlet
(b) Pressure at which steam is reheated
(c) temperature at which steam is reheated
(d) temperature at turbine inlet

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : Reheating below a certain pressure reduces the mean temperature of heat addition below the earlier value causing decrease in efficiency.

198. The optimum reheat pressure for the most of the modern power plants is

(a) 0.1-0.5 (b) 0.2-0.3
(c) 0.2-0.25 (d) 0.25-0.3

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : The optimum reheat pressure for the most of the modern power plants is 0.2 – 0.25 of the initial steam pressure. In this range of reheat pressure efficiency is maximum.

199. What should be the dryness fraction at the time of exhaust?

(a) 0.88 (b) 0.80
(c) 0.90 (d) 0.75

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : For modern turbines, the admissible dryness fraction of exhaust steam (at the turbine exit) should be not less than, $x = 0.86$ to 0.88

200. Reheat is preferred for the plants having efficiency greater than

(a) 150 MW (b) 200 MW
(c) 100 MW (d) 250 MW

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Reheat is preferred for the plants having efficiency greater than 100 MW, for producing power less than this reheat will not be economical.

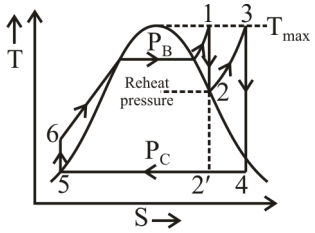
201. Which one of the following is an advantage of reheat cycle

(a) The size of the Low pressure (LP) turbine blades is reduced because specific volume is reduced by 7 to 8%
(b) The reheating reduce 4 to 5% fuel consumption with a corresponding reduction in the fuel handling
(c) Lower steam pressures and temperatures and less costly materials can be used to obtain the required thermal performance
(d) All of the mentioned

Nagaland PSC (CTSE) 2016, Paper-II

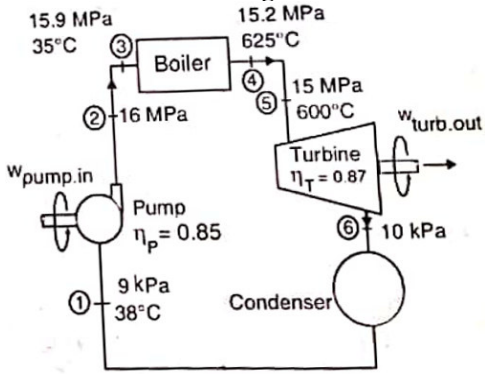
Ans. (d) : Advantage of Reheat Cycle are:-

(i) Size of the Low Pressure (LP) turbine blades is reduced because specific volume is reduced by 7 to 8%.
(ii) The reheating reduce 4 to 5% fuel consumption with a corresponding reduction in the fuel handling.
(iii) Lower steam pressure and temperature and less costly materials can be used to obtain the required thermal performance.



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net}\uparrow}$
- x-↑, ↓errosion of turbine blade

202. A steam power plant operates on the cycle shown in given below. If the isentropic efficiency of the turbine is 87 percent and the isentropic efficiency of the pump is 85 percent, determine the thermal efficiency of the cycle and the net power output of the plant for a mass flow rate of 15 kg/s.



Search on Telegram @apna_pdf

(a) 0.361 and 18.9 MW
(b) 0.301 and 18.9 MW
(c) 0.361 and 16.9 MW
(d) 0.3 and 18.9 MW
(e) None of these

CGPSC AE 16.10.2016

Ans. (a) : $W_{pump\,in} = \frac{W_{s_{pump\,in}}}{\eta_p} = \frac{V_1(P_2 - P_1)}{\eta_p}$

$= \frac{0.001009 \times (16000 - 9)}{0.85} = 19.0\,kJ/kg$

$W_{turb\,out} = \eta_t \; W_{s_{turb\,out}} = \eta_T(h_5 - h_6)$ (from steam table)

$= 0.87(3583.1 - 2115.3)$

$= 1277.0$ kJ/kg

$q_{in} = h_4 - h_3 = (3647.6 - 160.1)$

$= 3487.5$ kJ/kg

$W_{net} = W_{turbine} - W_{pump}$

$= 1277 - 19 = 1258$ kJ/kg

Thermal efficiency,

$\eta_{th} = \frac{W_{net}}{q_{in}} = \frac{1258}{3487.5} = 0.361 = 36.1\%$

$\dot{W}_{net} = \dot{m}(W_{net})$

$= 15 \times 1258.0 = 18.9$ MW

Note-This question has been deleted by CGPSC.

203. What is the efficiency of an ideal regenerative Rankine cycle power plant using saturated steam at 377^0C and pressure 135 bars at the inlet to the turbine and condensing temperature of 25^0C (corresponding saturation pressure of 3.6kPa)?
(a) 92.3% (b) 45.8%
(c) 85.6% (d) 63.8%

UPRVUNL AE 21.08.2016

Ans. : (b) The efficiency of an ideal regenerative Rankine cycle power plant = 45.8%

204. The number of fire tubes in a Cochran boiler are
(a) 75 (b) 115
(c) 165 (d) 225

APPSC AEE Screening Test 2016

Ans. (c) : The number of the fire tubes in a Cochran boiler are 165.

205. Thermal efficiency of Rankine cycle can be enhanced by
(a) Decreasing the average temperature of heat addition
(b) Increasing the superheat of constant pressure
(c) Increasing the average temperature of heat rejection
(d) The efficiency of Rankine cycle does not depend on average temperature of heat addition

RPSC LECTURER 16.01.2016

Ans. (b) : Thermal efficiency of Rankine cycle can be enhanced by—
1. Decrease in condenser pressure
2. Increase the boiler pressure
3. Increasing the superheat at constant pressure

206. The ratio of average load to the maximum load is known as
(a) Utilization factor (b) Diversity factor
(c) Plant capacity factor (d) Load factor

RPSC LECTURER 16.01.2016

Ans. (d) : Load factor— The ratio of average load to the maximum load is known as load factor.
Utilization factor— It is defined as the ratio of the time that a equipment is in use to the total time that it could be in use.
Diversity factor— Diversity factor is defined as the ratio of sum of individual maximum demand to maximum demand on power station.

$$\text{Diversity factor} = \frac{\text{Installed load}}{\text{Running load}}$$

207. Use of modified Rankine cycle causes the
(a) Reduction of the bore of cylinder
(b) Reduction of the stroke of cylinder
(c) Increase the work output of an engine
(d) Increase the efficiency of an engine

RPSC LECTURER 16.01.2016

Ans. (b) : Use of modified Rankine cycle causes the reduction of the stroke of cylinder.

208. Regeneration of simple Rankine cycle leads to
(a) The heating process in the boiler be less irreversible
(b) The heating process in the boiler be more irreversible
(c) The reduction in average temperature of heat addition
(d) The reduction in efficiency of cycle

RPSC LECTURER 16.01.2016

Ans. (a) : Regeneration—It is a process of steam extracting from intermediate of turbine which is used for increase the temperature of feed water. It tends to heating process in the boiler be less irreversible.

209. "Sinking fund method" is used to calculate the
(a) Initial cost of the power plant
(b) Installation cost of the power plant
(c) Depreciation cost of the power plant
(d) Interest on the loan borrowed to install the power plant

RPSC LECTURER 16.01.2016

Ans. (c) : "Sinking fund method" is used to calculate the depreciation cost of the power plant.

210. Fire tube boilers are those in which-
(a) flue gases pass through tubes and water around it
(b) water passes through the tubes and flue gasses around it
(c) forced circulation takes place
(d) tubes are laid vertically

RPSC IOF & Boiler 20.09.2017

Ans. : (a) Fire tube boilers are those in which flue gases pass through tubes and water around it.
Fire tube boilers are-
1. Cornish Boiler
2. Cochran Boiler
3. Locomotive Boiler
4. Lancashire Boiler
5. Scotch marine Boiler

Search on Telegram @apna_pdf

211. When a liquid boils at constant pressure, the following parameter increases

(a) temperature
(b) latent heat of vapourization
(c) kinetic energy
(d) entropy

RPSC IOF & Boiler 20.09.2017

Ans. : (d) In Rankine vapour cycle liquid boils at constant pressure in boiler and entropy increases.

212. Volume of 1 kg of dry steam is known as:

(a) total volume (b) saturated volume
(c) specific volume (d) none of these

(HPPSC LECT. 2016)

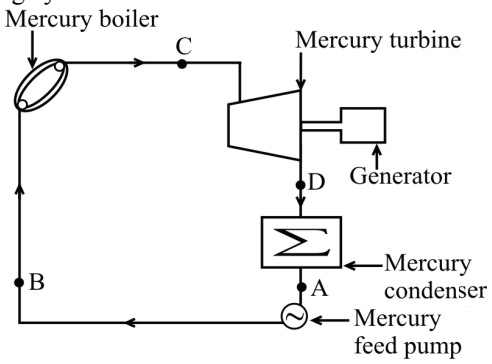
Ans. : (c) Volume of 1 Kg of dry steam is known as specific volume.

213. In binary vapour cycle

(a) Mercury is used in the bottoming cycle
(b) Steam is used in topping cycle
(c) Mercury is used in topping cycle
(d) Either mercury or steam is used in topping cycle

HPPSC W.S. Poly. 2016

Ans. : (c) In binary vapour cycle Mercury is used in topping cycle.



Binary vapour plant
In binary vapour cycle mercury is used in topping cycle.

214. The process of maintaining the speed of a steam turbine constant for various load conditions is known as :

(a) Reheating (b) Bleeding
(c) Governing (d) Cooling

HPPSC W.S. Poly. 2016

Ans. : (c) The process of maintaining the speed of a turbine for various load conditions is known as governing.
The throttle governing of a steam turbine is a method of controlling the turbine output by varying the quantity of steam entering into the turbine. This method is also known as servomotor method.

215. Economizer is used in a steam power plant to heat

(a) air (b) feed water
(c) flue gases (d) steam

RPSC AE 2016

Ans. : (b) Economizer is used in steam power plant to heat feed water.
An economiser is a device used to heat feed water by utilising the heat in the exhaust flue gases before leaving through the chimney. As the name indicates, the economiser improves the economy of the steam boiler.

216. Depreciation charges are high in case of

(a) thermal plant (b) diesel plant
(c) hydroelectric plant (d) gas turbine plant

RPSC AE 2016

Ans. : (a) Depreciation charges are high in case of thermal plant.

217. Which of the following is the commercial unit used to measure electricity consumption?

(a) Kilowatt-hour (b) Kilowatt
(c) Joule per second (d) Mega watts

UJVNL AE 2016

Ans. : (a) Kilowatt- hour is the Commercial unit used to measure electricity consumption.
1 kW.h=1kW.3600s=3600kWs=3600kJ=3.6MJ

218. For a given set of operating pressure limits of a Rankine cycle the highest efficiency occurs

(a) Saturated cycle (b) Superheated cycle
(c) Reheat cycle (d) Regenerative cycle

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
UPPSC AE 12.04.2016 Paper-II

Ans. : (d) Operating pressure limits of a Rankine cycle the highest efficiency occurs in regenerative cycle. In practical regenerative cycle the feed water enters the boiler at high temperature as compared to the corresponding temperature in case of simple Rankine cycle and it is heated by steam extracted or bleed from intermediate stages of the turbine.

219. A pipe carrying steam (h=3000kJ/kg) at flow rate of 1 kg/s and another pipe carrying steam (h=2500kJ/kg) at flow rate of 2 kg/s mixes adiabatically to flow in single pipe. Find the enthalpy of resulting steam:

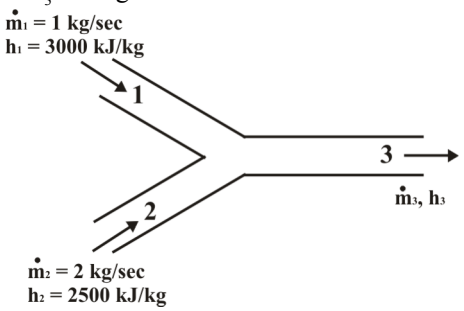
(a) 2767 kJ/kg (b) 2667 kJ/kg
(c) 2867 kJ/kg (d) 8000 kJ/kg

UPRVUNL AE 2016

Ans. (b) : Mass conservation law

$$\dot{m}_1 + \dot{m}_2 = \dot{m}_3 = 1 + 2$$

$$\dot{m}_3 = 3 \text{ kg/sec}$$



Energy conservation law,

$$\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$$

$$1 \times 3000 + 2 \times 2500 = 3 \times h_3$$

$$3 \times h_3 = 8000$$

$$h_3 = 2667 \text{ kJ/kg}$$

Search on Telegram @apna_pdf

220. The behaviour of superheated vapour is similar to that of

(a) perfect gas (b) steam
(c) air (d) ordinary gas

APPSC AEE MAIN 2016 PAPER-III

Ans. (a) : The behaviour of superheated vapour is similar to that of perfect gas (ideal gas).

221. Rankine efficiency of steam power plant

(a) improves in summer as compared to that in winter
(b) improves in winter as compared to that in summer
(c) in unaffected by climatic conditions
(d) none of these

RPSC IOF & Boiler 20.09.2017

Ans. : (b) Improves in winter as compared to that in summer

222. Steam enters adiabatic turbine operating steady state with an enthalpy of 3251.0 kJ/Kg leaves as a saturated mixture of 15 kPa with dryness faction (quality) 0.9. The enthalpy of the saturated liquid and vapour at 15 kPa are h_f = 225.94 kJ/Kg and h_g= 2598.3 kJ/Kg respectively. The mass flow rate of steam is 10 Kg/sec. Kinetic & Potential energy changes are negligible. The power output of Turbine in Mega Watt is–

(a) 6.5 (b) 9.1
(c) 8.9 (d) 27.0

RPSC IOF & Boiler 20.09.2017
GATE 2012

Ans. : (c) Given,

$h_1 = 3251.0$ kJ/kg
$h_f = 225.94$ kJ/kg
$h_g = 2598.3$ kJ/kg
$x = 0.9$
$h_2 = h_f + x\,(h_g - h_f)$
$= 225.94 + 0.9\,(2598.3 - 225.94)$
$= 2361.064$
$h_2 = 2361.064$ kJ/kg
$\therefore$ Power output from turbine,
P = Mass flow rate $\times (h_1 - h_2)$
$= 10 \times (3251 - 2361.064)$
$= 8899.36$ kJ/Sec.
$= 8899.36$ kJ/Sec.

$P \approx 8.9\,MW$

223. A small steam whistle (perfectly insulated) and doing no shaft work causes a drop of 0.8 kJ/kg in the enthalpy of steam from entry to exit. If the kinetic energy of steam at entry is negligible, the velocity of steam at exit is–

(a) 4 m/s (b) 20 m/s
(c) 80 m/s (d) 120 m/s

RPSC IOF & Boiler 20.09.2017

Ans. : (*) Velocity $= 44.72\sqrt{\Delta h}$
$= 44.72\sqrt{0.8}$
$= 39.99\ m/s$
$\approx 40 m/s$

Where, Δh is in kJ/kg and velocity in m/s.

224. Ratio of indicated work to hypothetical Indicated work in a steam engine is the:

(a) Indicated thermal efficiency
(b) Friction factor
(c) Mechanical efficiency
(d) Diagram factor

UJVNL AE 2016
ESE 1996

Ans. : (d) Diagram factor $= \dfrac{\text{Actual indicated work}}{\text{Hypothetical indicated work}}$

225. A solar thermal collector

(a) Collects the solar energy and reflects it back
(b) Absorbs the solar radiation and dissipates it to the ambient
(c) Collects and converts the solar energy into electrical energy
(d) Collects and converts the solar energy into thermal energy and delivers it to the next stage of the system

UPPSC AE 12.04.2016 Paper-II

Ans. : (d) A solar thermal collector collects and converts the solar energy into thermal energy and delivers it to the next stage of the system.

226. A solar cell is basically

(a) A voltage source, controlled by flux of radiation
(b) A current source, controlled by flux of radiation
(c) An uncontrolled current source
(d) An uncontrolled voltage source

UPPSC AE 12.04.2016 Paper-II

Ans. : (b) A solar cell is basically current source, controlled by flux of radiation.

227. The capacity of generators being installed in super thermal power plant is

(a) 100 MW (b) 200 MW
(c) 400 MW (d) 500 MW

UPPSC AE 12.04.2016 Paper-II

Ans : (d) The capacity of generators being installed in super thermal power plant is 500 MW.

228. Rankine cycle uses steam. The "high" temperature and pressure are 500 K and 35 bar; the "low" pressure is 1 bar. The pump work (kJ/kg) for the cycle is (specific volume of water = 1.043×10^{-3} m^2/kg)-

(a) 3.55 (b) 3.4
(c) 3.6 (d) None of these

RPSC ADE 2016

Ans. (a) : Suction side pressure in pump (P_1) = 1 bar
Delivery side pressure in pump (P_2) = 35 bar
Pump work = $-vdp = -1.043 \times 10^{-3} \times (35-1) \times 10^5$
$= -3545.2$ Joule/kg
$= -3.546$ kJ/kg
Note – Negative sign is due to work done on the pump.

229. Consider the following statements: 1. Boiler mountings are mainly protective devices 2. Steam stop Valve is an accessory 3. Feed water pump is an accessory 4. Economiser is a mounting which of these statements are correct?

Search on Telegram @apna_pdf

(a) 1, 2, 3 and 4 (b) 1, 2 and 4
(c) 2 and 3 (d) 3 and 1

RPSC VPITI 14.02.2016

Ans. (d) : Boiler mountings are protective/safety devices whereas accessories increases boiler efficiency.

Boiler Mountings–

Safety valve, water level indicator, pressure gauge, fusible plug, blow off cock, feed check valve, steam stop valve.

Boiler Accessories–

Superheater, economiser, injector, airpreheater, feed pump.

230. Steam lap is

(a) similar to missing quantity
(b) there is nothing like steam lamp
(c) the amount of opening in the steam port when the piston is exactly at the end of the stroke
(d) the distance the valve must move from its mid-position before steam is admitted to the cylinder

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (d) : Steam lap is the distance that valve must move from its mid position before steam is admitted to the cylinder.

231. The size of coal fed in a pulverized coal fired boiler for efficient combustion should be

(a) 75 -85% of coal passing through 100 mesh BIS sieve
(b) 85 - 95% of coal passing through 150 mesh BIS sieve
(c) 70-75% of coal passing through 200 mesh BIS sieve
(d) 70 - 80% coal passing through 50 mesh BIS sieve

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (c) : The size of coal feed in pulverized coal fired boiler for efficient combustion is 70–75 % at coal passing through 200 mesh BIS sieve.

232. A vessel of volume 1.5 m^3 contains a mixture of liquid water and steam in equilibrium at 1 bar given that 80% of the volume is occupied by the steam. Find the dryness fraction of the mixture. Assume at 1 bar; $v_f = 0.002\ m^3/kg$ and $v_g = 2\ m^3/kg$

(a) 0.8 (b) 0.08
(c) 0.04 (d) 0.004
(e) 0.008

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (d) : Given, $v_f = 0.002\ m^3/kg$, $v_g = 2\ m^3/kg$

$V_g = 0.80\ m^3$, $V_f = 0.20\ m^3$

$$\text{So, mass of mixture} = \frac{V_g}{v_g} + \frac{V_f}{v_f}$$

$$= \frac{0.80}{2} + \frac{0.20}{0.002}$$

$$= 0.4 + 100$$

$$= 100.4 \text{ kg}$$

$$\text{Specific volume (v)} = \frac{1}{m} = \frac{1}{100.4}$$

$$= 0.00996\ m^3/kg$$

We know that,

$$v = v_f + x(v_f - v_g)$$

$$0.00996 = 0.002 + x(2 - 0.002)$$

$$0.00996 - 0.002 = x(2 - 0.002)$$

$$x \times 1.998 = 0.00796$$

$$x = \frac{0.00796}{1.998}$$

$$x = 0.00398 \approx 0.004$$

233. A steam power plant has the boiler efficiency of 90%, turbine efficiency of 92%, generator efficiency of 87% and cycle efficiency of 47%. If 8% of the generated power is used to run the auxiliaries, what is the overall plant efficiency?

(a) 31% (b) 35%
(c) 38% (d) 41%
(e) 45%

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (a) : As we know,

$$\eta_{overall} = \eta_{boiler} \times \eta_{turbine} \times \eta_{generator} \times \eta_{aux}$$

$$\eta_{aux} = \frac{\text{Net power transmitted by generator}}{\text{Gross power produced by plant}}$$

$$= 0.92$$

$$\eta_{overall} = 0.90 \times 0.92 \times 0.87 \times 0.47 \times 0.92$$

$$= 31\%$$

234. Natural Circulation through water wall in boiler operating in subcritical regime is caused by

(a) Temperature difference between economizer inlet water and down comer tube water
(b) Density difference between furnace wall water and downcomer tube water
(c) Water and steam flow difference between economiser and final superheater
(d) Pressure difference between boiler drum pressure and superheater inlet steam pressure

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : Natural circulation of water in boiler due to density difference furnace wall water and downcomer tube water.

235. Water circulation in a thermo-syphon cooling system caused by :

(a) Conduction currents
(b) A belt driven water pump
(c) A belt driven impeller
(d) Change in density of water

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) Water circulation in a thermo-syphon cooling system caused by change in density of water.

236. Furnace wall of water tube boilers receives mainly

(a) Sensible heat (b) Radiant heat
(c) Convection heat (d) Conduction heat

Rajasthan Nagar Nigam AE 2016, Shift-I

Search on Telegram @apna_pdf

Ans. (b) : As mentioned earlier, water tube boilers are used for high output.

- These are invariably used in all the power plants.
- These are either forced circulation type or natural circulation type.
- 'Steam drum' is the heart of these boilers and stores wet and dry steam.

237. Steam flow in a steam generator is controlled by using :

(a) Drum level sensor
(b) Feed water flow sensor
(c) Steam flow sensor
(d) All of the above

OPSC AEE 2015 Paper - II

Ans : (c) Steam flow in a steam generator is controlled by using steam flow sensor.

238. In the design of tall chimney for a factory, in addition to strength and rigidity considerations, care should be taken to check its safety against wind, because.

(a) the wind creates a large bending moment on the chimney
(b) the wind can have any direction
(c) additional forces are exerted on the chimney due to mixing of the effluent gases with the surrounding air
(d) of the effect of vortex shedding on the chimney

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : In the design of tall chimney for a factory, in addition to strength and rigidity considerations, care should be taken to check its safety against wind, because of the effect of vortex shedding on the chimney.

239. What are the effects of regenerative feed water heating for the same turbine output?

1. It significantly increases the cycle efficiency and reduces the heat rate.
2. It increases the steam flow rate.
3. It increases the steam flow to the condenser.
4. If there is no change of boiler output, the turbine output drops.

Select the correct answer using the code given below:

(a) 1, 2 and 3 only (b) 1, 2 and 4 only
(c) 1, 3 and 4 only (d) 2, 3 and 4 only

ESE 18.07.2021

Ans. (b) Effect of regeneration:

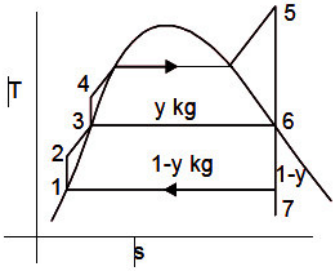
(i) $\eta \uparrow$ & Heat rate $\downarrow$ Due to $\uparrow$ in mean temperature of heat addition.

$$\eta \propto \frac{1}{\text{Heat rate}}$$

(ii) For the same turbine output steam flow $\uparrow$ (bigger boiler is required) due to bleeding of steam to heat the feed water.

(iii) Steam flow rate in Condenser is reduces as each stage of regeneration, steam is bleeding off because of this less amount of steam condense in condenser.

(iv) If boiler size is fixed and same amount of steam is produced then because of bleeding, less amount of steam available at turbine at each stage leads to $\uparrow$ in turbine output.



- Due same boiler output

$$\eta = \frac{W_T \rightarrow \text{reduced}}{Q \rightarrow \text{more reduced}}$$

- Since the amount of heat input in the boiler reduced significantly compared to work lost,

the efficiency$\uparrow$.

240. The diameter of fire tubes in Cochran boiler is of the order of

(a) 2 cm (b) 6 cm
(c) 8 cm (d) 12 cm

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : The diameter of fire tubes in Cochran boiler is of the order of 6 cm.

241. Which is not correct statement about the function of furnace

(a) To provide proper conditions for continuous complete combustion
(b) mix fuel with air and ignite
(c) Separate ash from coal
(d) Maintain heat supply to prepare and ignite the incoming fuel

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : Not correct statement option (c) separate ash from coal.

242. In steam power plant, what is the outcome of regenerative feed heating :

(1) Increase in specific output
(2) Increase in cycle efficiency
(3) Improved quality of exhaust steam
(4) Reduced condenser load

Select the correct answer

(a) (1) and (3) only (b) (2) only
(c) (2) and (3) (d) (1), (2) and (3)

TSPSC Managers, 2015

Ans. (c) : In steam power plant, regenerating feed heating-

- Increase in cycle thermal efficiency $\eta\uparrow$
- Reduced condenser load,
- decreases in specific output.

243. The average load factor of thermal power plants in India is

(a) 100% (b) 80 to 95%
(c) 50 to 60% (d) 35 to 45%

VIZAG STEEL MT 2015

Search on Telegram @apna_pdf

Ans. (c) : The average load factor of thermal power plants in India is 50 to 60%.

244. The basic job of feed water treatment in boilers is to overcome the problem of :

(a) carryover
(b) embrittlement
(c) All of three mentioned here
(d) corrosion

GWSSB AAE, 27.12.2015

Ans. (c) : The basic of feed water treatment in boiler to reduce carryover, embrittlement and corrosion.

245. Fire tube boilers are those in which:

(a) water passes through the tubes and flue gases around it :
(b) forced circulation takes place
(c) None of three mentioned here.
(d) flue gases pass through tubes and water around it.

GWSSB AAE, 27.12.2015

Ans. (d) : Flue gases passes through tubes and water around it.

246. A regenerative steam cycle results in

(a) increased work output per unit mass of steam
(b) decreased work output per unit mass of steam
(c) increased thermal efficiency
(d) decreased work output per unit mass of steam as well as increased thermal efficiency

Nagaland PSC CTSE 2015 Paper-II

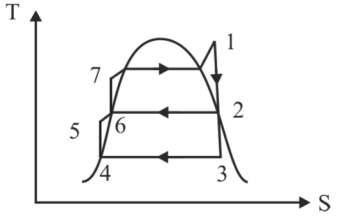
Ans. (d) : Effect of Regeneration–

(1) It increases the cycle efficiency because supplying heat rate decreases.

$$\eta \uparrow = \frac{W_{net}}{Q_s \downarrow}$$

(2) There is no change in boiler output but turbine output decreases.

(3) It decreases the steam flow rate to the condenser, thus requiring smaller condenser.



247. Consider the following statements:

1. In a steam power plant, the volume flow at the low pressure end is considerably reduced by bleeding.
2. Theoretically, the efficiency of a steam power plant increases with the increasing number of feed heaters but the gain is in diminishing return.

Which of the statements given above is/are correct?

(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor 2

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) :

248. A thermal electric power plant produces 1500 MW of power. If the coal releases 900 × 10^7 KJ/h of energy, then what is the rate at which heat is rejected from the power plant?

(a) 500 MW (b) 1000 MW
(c) 1500 MW (d) 2000 MW

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : Energy released by coal = 900 × 10^7 kJ/hr
= 2500 MW

Heat rejected from power plant
2500 – 1500
= 1000 MW

249. Consider the following statements:

Expansion joints in steam pipelines are installed to

1. Allow for future expansion of plant.
2. Take stresses away from flanges and fittings.
3. Permit expansion of pipes due to temperature rise.

Of these statements, which are correct

(a) 1, 2 and 3 (b) 1 and 2
(c) 2 and 3 (d) 1 and 3

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : Expansion joints in steam pipelines are installed to,
1. Allow for future expansion of plant.
2. Take stresses away from flanges and fittings.
3. Permit expansion of pipes due to temperature rise.

250. Compound steam engine is one in which

(a) Steam expands twice
(b) Two engines are combined together
(c) Major parts are repeated twice
(d) Two units are put together

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : Compound steam engine is one in which steam expands twice.

251. What is the efficiency of an ideal regenerative Rankine cycle power plant using saturated steam at 327^0C and pressure 135 bar at the inlet to the turbine and condensing temperature of 27^0C (corresponding saturation pressure of 3.6 kPa) ?

(a) 92% (b) 33%
(c) 50% (d) 42%

TSGENCO AE 14.11.2015

Ans. (c) : Ideal regenerative Rankine cycle efficiency is same as carnot cycle

$$\eta = 1 - \frac{T_2}{T_1}$$

Given, –

T_1 = 327°C = 327 + 273
= 600 K

T_2 = 27^0C = 273 + 27 = 300 K

$$\eta = \left(1 - \frac{300}{600}\right)$$

$\eta = 50\%$

Search on Telegram @apna_pdf

252. Degree of superheating obtained using a liquid-to suction heat exchanger is:

(a) Always greater than the degree of sub cooling
(b) Always less than degree of sub cooling
(c) Always equal to degree of sub cooling
(d) Depends on the effectiveness of heat exchanger
(e) Depends on the type of the refrigerant

CGPSC AE 26.04.2015 Shift-II

Ans. (a) : Degree of Superheating obtained using a liquid-to-suction heat exchanger is always greater than the degree of sub cooling.

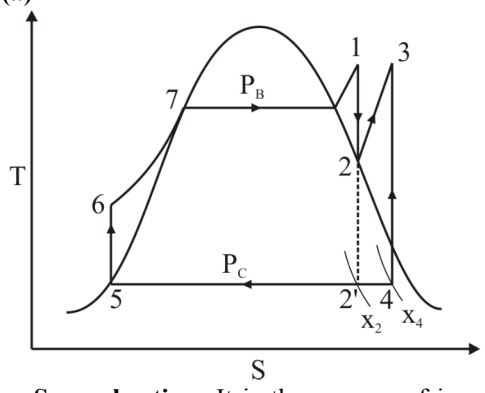
253. Consider the following statement regarding superheating in Rankine cycle

(1) Reduces specific steam consumption
(2) Increase dryness fraction at exhaust for the same condenser pressure
(3) It reduces cycle efficiency, of these statement

(a) 1 and 2 are correct
(b) 2 and 3 are correct
(c) 1 and 3 are correct
(d) 1, 2 and 3 are correct

TSPSC AEE 2015, CSE Pre-1995

Ans. (a)



Super heating- It is the process of increasing the temperature at constant pressure above saturated vapour.

Effect of superheating in Rankine cycle-

$W_T \uparrow$, W_P = constant
$W_{net} \uparrow$, $Q_r \uparrow$, $Q_S \uparrow$, $T_{MA} \uparrow$, $T_{MR} \uparrow$
$x \uparrow \rightarrow$ erosion of blade$\downarrow$

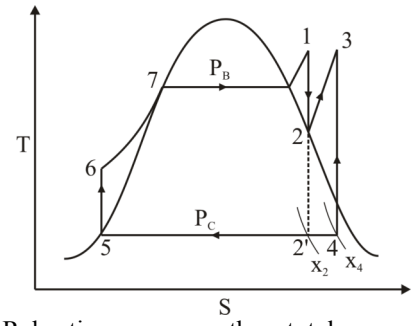
254. Which combination of the following statements are correct. The incorporation of reheater in a steam power plant

P. Always increase thermal efficiency
Q. Always increase dryness fraction at condensed inlet
R. Increase the mean temperature of heat addition
S. Always increases specific work output

(a) P and S (b) Q and S
(c) P only (d) Q only

TSPSC AEE 2015, GATE 2007

Ans. (b) : Reheating- The primary aim of the reheating is to improve the quality (x) of the working fluid [steam] at the exist of turbine. So that less erosion of blade.



Reheating means the total expansion of working fluid takes place in more than one stage there for with the use of reheating the specific steam consumption [S.S.C.] and make the plant compact.

Effect of reheating in Rankine cycle –

$W_T \uparrow$, W_P = constant, $Q_R \uparrow$, $\eta \uparrow\downarrow$, $W_{net} \uparrow$, $T_{MA} \uparrow\downarrow$, $x \uparrow \rightarrow$ vapour $\uparrow \rightarrow$ liquid $\downarrow \rightarrow$ erosion of turbine blade$\downarrow$.

255. Dryness fraction is the ratio of :

(a) mass of dry steam to the mass of water vapour in suspension
(b) mass of water vapour in suspension to the mass of water vapour and mass of dry steam
(c) mass of dry steam to the mass of dry steam and mass of water vapour in suspension
(d) mass of water vapour in suspension to the mass of dry steam

(KPSC AE. 2015)

Ans. : (c) Dryness fraction is the ratio of mass of dry steam to the mass of dry steam and mass of water vapour in suspension.

$$x = \frac{m_g}{m_g + m_f} = \frac{m_g}{m}$$

m_g = Mass of actual dry steam
m_f = Mass of water in suspension
$m = m_g + m_f$

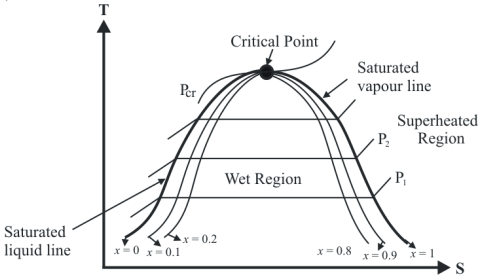
The value of dryness fraction. In case of dry steam is unity. At this stage, the mass of water in suspension (m_f) is zero.

256. If the dryness fraction of steam (x) is less than '1' then the steam is called as

(a) Dry steam (b) super heated steam
(c) Wet steam (d) Both (a) & (b)

TSPSC AEE 2015

Ans. : (c) If the dryness fraction of steam (x) is less then 1, then steam is called as wet steam.



Search on Telegram @apna_pdf

257. A Carnot Cycle is having an efficiency of 0.75. If the temperature of the high temperature reservoir is 727°C, what is the temperature of low temperature reservoir?

(a) 23°C (b) 0°C
(c) –23°C (d) 250°C

GPSC AE 26.07.2015

Ans. (c) : $\eta = 1 - \frac{T_L}{T_H}$

$0.75 = 1 - \frac{T_L}{(727+273)}$

$T_L = 250K = -23^0C$

258. According to IBR the thickness of boiler shell is not to be less than

(a) 5 mm (b) 7 mm
(c) 10 mm (d) 12 mm

GPSC AE 26.07.2015

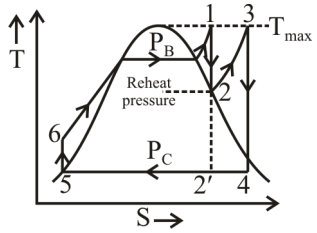
Ans. (b) : According to IBR the thickness of boiler shell is not to be less than 7 mm.

259. In a Rankine cycle, with maximum steam temperature being fixed from metallurgical considerations, as the boiler pressure increases:

(a) the condenser load will increase
(b) the quality of turbine exhaust will decrease
(c) the quality of turbine exhaust will increase
(d) the quality of turbine exhaust will remain unchanged

UPPSC AE 13.12.2020 Paper-II
HPPSC Asstt. Prof. 2014
ESE 1997

Ans. (b)



- Dryness fraction (quality of steam) x↑
- Moisture content ↓

As pressure increases quality of steam at exhaust will decreases to increase quality of steam at outlet of turbine reheat is adopted.

260. Rankine cycle efficiency for a power plant is 29%. The carnot cycle efficiency will be

(a) 15% (b) 25%
(c) 29% (d) None of these

MPPSC State Forest Service Exam, 2014

Ans. (d) : $\eta_{rankine} = \frac{Q_1 - Q_2}{Q} = 1 - \frac{Q_2}{Q_1} = 29\%$

$\eta_{carnot} = 1 - \frac{T_2}{T_1}$

But here we can't find the efficiency because both process have different.

261. An example of forced circulation boiler is

(a) Cochran boiler
(b) Lancashire boiler
(c) Babcock and Wilcox boiler
(d) Lamont boiler

MPPSC State Forest Service Exam, 2014

Ans. (d) : Lamont boiler is a high pressure forced circulation, water tube boiler with internally fired furnace, an external pump is used to circulate the pressurized water.

262. Function of air pump in condenser is to

(a) Remove water
(b) Maintain vacuum
(c) Remove condensate
(d) None of these

MPPSC State Forest Service Exam, 2014

Ans. (b) : The main function which an air pump performs is that it maintains vacuum in the condenser nearly as possible equal to that corresponding to the exhaust steam temperature by removing air from the condenser.

263. For a pure substance, what are the numbers of the thermodynamic degree of freedom for saturated vapour and superheated vapour, respectively?

(a) 1 and 1 (b) 1 and 2
(c) 2 and 1 (d) 2 and 2

HPPSC Asstt. Prof. 2014, ESE 2007

Ans. (b) :

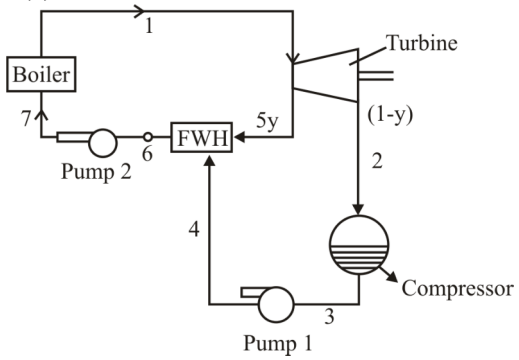
Degree of freedom	
Saturated vapour-	1
Superheated vapour -	2

264. In regenerative Rankine's cycle

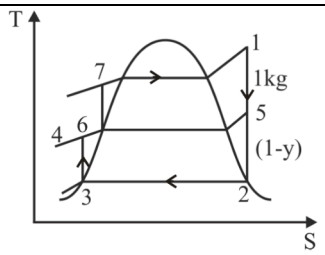
(a) Feed water is heated with the help of steam
(b) The steam is extracted at a suitable point in a turbine and is reheated
(c) The steam is heated after expansion in the turbine
(d) The steam is heated before entering the turbine

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

Ans. (a)



Search on Telegram @apna_pdf



FWH = Feed water Heater

- In feed water heater, water is heated with the help of steam.

265. Demand factor is defined as
(a) Average load/ maximum demand
(b) Maximum demand/ connected load
(c) Connected load/ maximum demand
(d) Maximum demand × connected load

TNPSC AE 2014

Ans. (b) : Demand factory is defined as the ratio of maximum demand to connected load.

266. In the operation of steam engines the vapour cycle adopted is
(a) Carnot cycle
(b) Rankine cycle
(c) Modified Rankine cycle
(d) Regenerative cycle

TNPSC AE 2014

Ans. (c) : In the operation of steam engines the vapour cycle adopted is modified Ranking cycle.

267. Without the use of superheater a boiler produces steam of about
(a) 80% dryness fraction
(b) 90% dryness fraction
(c) 98% dryness fraction
(d) 88% dryness fraction

TNPSC AE 2014

Ans. (c) : Without the use of superheater a boiler produces steam of about 98% dryness fraction.

268. The density of super saturated steam in comparison to ordinary saturated steam at the corresponding pressure is about.
(a) 0.5 times (b) 1.0 time
(c) 8.0 times (d) 4.0 times

GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : The density of super saturated steam in comparison to ordinary steam at the corresponding pressure is about 8 time as sp. volume of supersaturated steam is greater than saturated steam at same pressure.

269. An ideal fluid for vapour turbine cycle should have
(a) High critical temperature with low pressure
(b) High critical temperature with high pressure
(c) Low critical temperature with high pressure
(d) Low critical temperature with low pressure

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) : An ideal fluid for vapour turbine cycle should have – high critical temperature and low pressure as pressure increase its latent heat of evaporation decreases and at critical points it becomes zero.

270. A power plant giving least running cost of production of electric power is
(a) Nuclear power plant
(b) Steam power plant
(c) Hydro electric power plant
(d) Gas turbine power plant

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) : A power plant giving least running cost of production of electric power is nuclear power plant but installation cost is very high

271. The reheat cycle helps to reduce
I. fuel consumption.
II. steam flow.
III. the condenser size.
Of these statements, which is correct?
(a) I and II (b) I and III
(c) II and III (d) I, II and III

APPSC Poly. Lect. 2013, ESE 2000

Ans. (a) : The reheat cycle helps to reduce, fuel consumption and steam flow. In reheat cycle condenser size increases while in regeneration cycle condenser size reduces.

272. Hydro electric power plants classified on the basis of head of operation, are..
(a) ultra low, low, medium and light only
(b) low, medium and light only
(c) ultra low, low and medium only
(d) ultra low and medium

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : Hydro electric power plants are classified on the basis of head of operation, are –
(1) ultra low, (2) low, (3) medium and light.

273. The locomotive boiler has
(a) 137 fire tubes and 44 super-heated tubes
(b) 147 fire tubes and 34 super-heated tubes
(c) 157 fire tubes and 24 super-heated tubes
(d) 167 fire tubes and 14 super-heated tubes

JPSC AE 2013 Paper-V

Ans. (c) : 157 fire tubes and 24 super-heated tubes

274. In a boiler, various heat losses take place. The biggest loss is due to
(a) moisture in fuel (b) dry flue gases
(c) steam formation (d) unburnt carbon

JPSC AE 2013 Paper-V

Ans. (b) : The biggest loss is due to dry flue gases.

275. The maximum percentage gain in regenerative feed heating cycle, the thermal efficiency
(a) increases with number of feed heaters increasing
(b) decreases with number of feed heaters increasing
(c) remains same unaffected by number of feed heaters
(d) None of the above

JPSC AE 2013 Paper-V

Ans. (a) : In regenerative cycles, the increase in efficiency due to regeneration is proportional to increases in temperature of feed water in a feed water heater.

Search on Telegram @apna_pdf

276. The reheat factor depends upon
(a) initial pressure and super-heat
(b) exit pressure
(c) turbine stage efficiency
(d) All of the above

JPSC AE 2013 Paper-V

Ans. (d) : The reheat factor (R.F.)

$$R.F. = \frac{\text{Cumulative heat drop}}{\text{Isentropic heat drop}}$$

It depends on:
(i) Initial pressure and superheat.
(ii) Exit pressure.
(iii) Turbine stage efficiency.
It increase with the increase in number of stages. The value of reheat factor varies from 1.02 to 1.06.

277. Which power plant has maximum life expectancy?
(a) Hydro-Power Plant
(b) Thermal Power Plant
(c) Nuclear Power Plant
(d) Same for all

SJVN ET 2013

Ans. (a) : Hydro-power plant has maximum life expectancy.

278. The degree of collection for a given ash collector in which 75 kg/s of ash is entering and 25 kg/s of ash leaving is
(a) 0.67 (b) 0.75
(c) 0.52 (d) 0.93

TNPSC AE 2013

Ans. (a) : $m_{in} = 75$ kg/s
$m_0 = 25$ kg/s
Collection of ash in given ash collector is given as

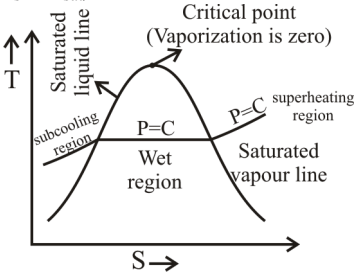
$$\text{Degree of collection (DOC)} = \frac{\dot{m}_{in} - \dot{m}_o}{\dot{m}_{in}}$$

$$= \frac{75 - 25}{75}$$
$$= 0.6667$$

279. The excess temperature ΔT_e
T_s - Surface temperature
T_{sat} - Saturation temperature
T_{sup} - Super heated
(a) T_{sup} (b) $(T_s + T_{sat})$
(c) $(T_{sup} - T_{sat})$ (d) $(T_s - T_{sat})$

TNPSC AE 2013

Ans. (d) : Excess temperature ΔT_e or degree of superheating
$= (T_s - T_{sat})$



280. The heat carried away by coolant is called as
(a) Unaccounted Loss (b) Dead Loss
(c) Minor Loss (d) Major Loss

TNPSC AE 2013

Ans. (b) : The heat carried away by coolant is called as dead loss.

281. The following boiler operates in supercritical range of pressure:-
(a) Benson (b) Babcock and Wilcox
(c) Loeffler (d) Cornish

UKPSC AE-2013, Paper-II

Ans. (a) : Benson boiler operates in supercritical range of pressure.

282. The capacity of boiler is defined as:-
(a) The volume of feed water inside the shell
(b) The volume of the steam space inside the shell
(c) The maximum pressure at which steam can be generated
(d) Amount of water converted into steam from 100°C to 110°C in one hour

UKPSC AE-2013, Paper-II

Ans. (d) : The capacity of boiler is defined as amount of water converted into steam from 100°C to 110°C in one hour.

283. The type of safety valve recommended for high pressure boiler is:-
(a) Dead weight safety valve
(b) Lever safety valve
(c) Spring loaded safety valve
(d) None of the above

UKPSC AE-2013, Paper-II

Ans. (c) :

284. Babcock-Wilcox boiler is
(a) water tube boiler (b) once through boiler
(c) supercritical boiler (d) fire tube boiler

VIZAG STEEL MT 18.08.2013

Ans. (a) : Water tube bailer– It is the type as boiler in which water circulates in tubes heated externally by the fire fuel is burned inside the furnace, creating hot gas which boils water in the steam-generating tubes.

285. Water requires for attemperation is taken from
(a) reheater (b) preheater
(c) condenser (d) economizer

VIZAG STEEL MT 18.08.2013

Ans. (b)
- Boiler feed water is used attemperation and water required for attemperation is taken from preheater.
- A direct contact attemperator injects a stream of high purity water into the superheated steam.
- Attemperation is the primary means for controlling the degree of superheat in a superheated boiler.

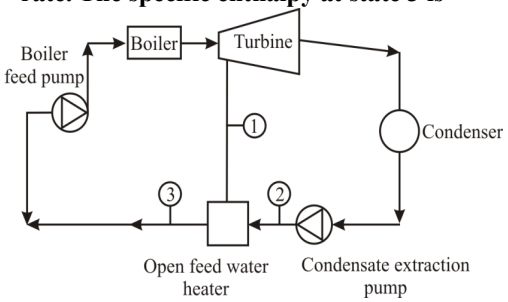
286. Super critical boilers are
(a) fire tube boilers
(b) water tube boilers
(c) a combination of (A) and (B)
(d) once through boilers

VIZAG STEEL MT 18.08.2013

Search on Telegram @apna_pdf

Ans. (d) : Supercritical Boiler– A super critical steam generator is a type of boiler that operates at supercritical pressure, frequently used in the protection of electric power. In contrast to a subcritical boiler in which bubbles can form, a super critical steam generator operator at pressure above the critical pressure 22 MPa.

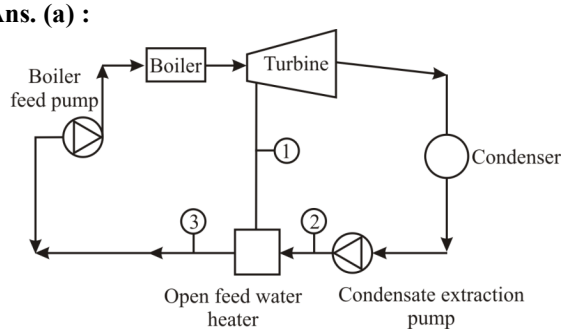
287. A thermal power plant operates on a regenerative cycle with a single open feed water heater as shown in the figure. From the state points shown, the specific enthalpies are: h_1 = 2800 kJ/kg, and h_2 = 200 kJ/kg. The bleed to the feed water s 20% of the boiler steam generation rate. The specific enthalpy at state 3 is



(a) 720 kJ/kg (b) 2280 kJ/kg
(c) 1500 kJ/kg (d) 3000 kJ/kg

VIZAG STEEL MT 18.08.2013
GATE 2008

Ans. (a) :



$h_1 = 2800$ kJ/kg $h_2 = 200$ kJ/kg $h_3 = 0.2h_1 + h_2 \times 0.8$

$= 0.2 \times 2800 + 200 \times 0.8 = 560 + 160$

$\boxed{h_3 = 720 \text{ kJ/kg}}$

288. Within the boiler, the temperature of steam is highest in

(a) water drum (b) water tubes
(c) water walls (d) super heater

VIZAG STEEL MT 18.08.2013

Ans. (d) : Super Heater – Super heater tubes have steam on one side and hot combustion gases on the other. surface temperature are higher than the boiler tubes. The passage of heat from the flue gas through tube wall increases the temperature to about 565°C.

289. Reheat cycle in steam power plant is used to :

(a) prevent excess of 10-12% moisture content in last stages of turbine
(b) utilize heat of the flue gases
(c) increase plant efficiency
(d) improve condenser performance

J&K PSC Civil Services Pre, 2013

Ans. (a) : Reheat cycle in steam power plant is used to prevent excess of 10-12% moisture content in last stages of turbine.

290. The maximum percentage gain in regenerative feed heating cycle thermal efficiency

(a) increases with number of feed heaters increasing
(b) decreases with number of feed heaters increasing
(c) remains same unaffected by feed heaters
(d) none of the above

APPSC Poly. Lect. 2013

Ans. (a) : The maximum percentage gain in regenerative feed heating cycles thermal efficiency increase with number of feed heaters increasing.

291. In steam tables the entropy is shown a zero for

(a) Saturated vapour at atmospheric pressure
(b) Saturated liquid at atmospheric pressure
(c) Saturated vapour at 0°C
(d) Saturated liquid at 0°C

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (d) : In steam tables the entropy is shown a zero for saturated liquid at 0°C.
The unit of specific entropy in the steam tables is kJ/kg-K and the values are given relative to an arbitrary reference state (i.e. triple point).
In the steam tables, the entropy of saturated liquid at 0.01°C ≈ 0°C is given by value of zero.

292. Choose the wrong statement about the regenerative vapour power cycle employing bleed steam for feed water heating:

(a) It increases the thermodynamic efficiency of the cycle.
(b) The thermal stresses in the boiler are reduced
(c) Work done per kg of steam is increased.
(d) It requires boiler of large capacity for same level of power output as compared to a simple Rankine cycle.

RPSC AEN Pre-2013

Ans. (c) : About the regenerating vapour power cycle employing bleed steam for feed water heating.

- The regeneration process in steam power plants is accomplished by extracting (or bleeding) steam from turbine at various stages and feed that steam in heat exchangers where the feed water is heated. These heat exchangers are called regenerator or Feed Water Heater (FWH).
- It increases the thermodynamic efficiency of the cycle.
- The thermal stresses in the boiler are reduced.
- It requires boiler of large capacity for same level of power output as compared to a simple Rankine cycle.

293. In a steam condenser, the partial pressure of steam and air are 0.06 bar and 0.007 bar respectively. The condenser pressure is :

(a) 0.067 bar (b) 0.06 bar
(c) 0.053 bar (d) 0.007 bar

TNPSC AE (Industries) 09.06.2013

Search on Telegram @apna_pdf

Ans. (a) : $P_C = P_a + P_s$
$= 0.06 + 0.007$
$= 0.067$ bar

294. Given below an extract from steam tables.

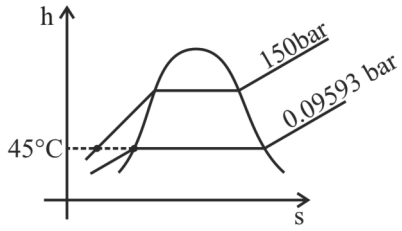
		Specific Volume (m^3/kg)		Enthalpy (KJ/kg)	
Temperature (°C)	P saturated (bar)	Saturated liquid	Saturated vapour	Saturated liquid	Saturated vapour
45	0.09593	0.001010	15.26	188.45	2394.8
342.24	150	0.001658	0.10337	1610.5	2610.5

The specific enthalpy of water in KJ/kg at 150 bar and 45°C will be

(a) 203.60 (b) 200.53
(c) 196.38 (d) 188.45

Vizag Steel MT (Re-Exam) 24.11.2013
GATE 2006

Ans. (a) :



$\Rightarrow (h)_{\text{at 45°C and 150bar}}$
$= (h)_{\text{at 45° and 0.0959bar}} + (v_f)_{\text{at 45°C and 0.0959 bar}} \times (dP)$
$= 188.45 + 0.00101\,(150 \times 100 - 9.59)$
$= 188.45 + 15.14 = 203.59$ kJ/kg $\simeq 203.6$ kJ/kg

295. The diameter of Cornish boiler is of the order of :

(a) 1-2 m (b) 1.5-2.5 m
(c) 2-3 m (d) 2.5-3.5 m

J&K PSC Civil Services Pre, 2013

Ans. (a) : Cornish boiler consist of an iron tube of approximate 1.5 m dia and 8.5 m long.

296. Which of the following is a fire tube type high pressure boiler?

(a) Velox boiler (b) Benson boiler
(c) Loeffler boiler (d) Lancahsire boiler

RPSC AEN Pre-2013

Ans. (a) : Velox Boiler– Velox boiler is a high pressure, forced circulation water tube boiler.
Benson boiler- Its a high pressure water tube boiler with forced circulation.
Lancahsire– Lancashire boiler is a horizontal and stationary type fire tube boiler.
Loeffler boiler- Loeffler is a water tube boiler used for generating steam by the burning of fuel which is coal and further that used for generation of power.

297. The peak loaded on a power plant is 40 MW and a group of four loads having maximum demand of 15 MW, 12 MW, 18 MW and 5 MW respectively are connected to the plant. The capacity of the plant is 60 MW. What is diversity factor of the plant?

(a) 1.5 (b) 1.25
(c) 0.8 (d) 0.75

RPSC AEN Pre-2013

Ans. (b) : Diversity factor, (DF)

$$= \frac{\sum(\text{Individual maximum demands})}{\text{maximum demand of the system}}$$

$$= \frac{12+15+18+5}{40}$$

$$= \frac{50}{40} = 1.25$$

298. The function of a condenser in thermal power plant is

(a) to act as reservoir to receive steam for turbine
(b) to condense steam into condensate to be reused again
(c) to create vacuum
(d) all of the above

BPSC AE 2012 Paper - V

Ans. : (d) : The function of a condenser in thermal power plants is -
■ to act as reservoir to receive steam for turbine.
■ to condense steam into condensate to be reused again.
■ to create vacuum.

299. After turbine trip, the cooling water to condenser

(a) is stopped immediately
(b) is stopped after 15-30 minutes
(c) is never stopped
(d) may be stopped anytime

BPSC AE 2012 Paper - V

Ans. : (b) : After turbine trip, the cooling water to condenser is stopped after 15-30 minutes.

300. Which of the following are the advantages of pulverized coal firing?
1. Higher boiler efficiency.
2. Fast response for no load changes.
3. Ability to use low preheated air reducing internal losses.
4. Ability to release large amounts of heat enabling it to generate about 2000 t/h of steam in one boiler.
Select the correct answer using the code given below:

(a) 1 and 2 only (b) 1 and 3 only
(c) 1 and 4 only (d) 2, 3 and 4 only

ESE 18.07.2021

Ans. (c) : Pulverized coal firing system has following advantages:
- It has better and far response over firing with load variation.
- Ability to use high preheated air reducing exhaust losses.
- Ability to release large amount of heat enabling it to generate about 2000 t/h of steam or more in one boiler.

301. One kg steam sample contains 0.4 kg water vapor. Its dryness fraction is

(a) 0.4 (b) 0.6
(c) $\frac{0.4}{1.4}$ (d) 0.4×0.6

BPSC AE 2012 Paper - V

Search on Telegram @apna_pdf

Ans. : (a)

$$\text{Dryness fraction} = \frac{\text{mass of vapour}}{\text{total mass}}$$

$$= \frac{m_v}{m_v + m_a} = \frac{0.4}{1} = 0.4$$

302. For high boiler efficiency the feed water is heated by

(a) recuperator (b) convective heater
(c) super heater (d) economiser

UKPSC AE 2012 Paper–II

Ans. (d) : economiser

303. Which of the following is not a high pressure boiler ?

(a) Lancashire boiler (b) La-mont boiler
(c) Benson boiler (d) Loeffler boiler

UKPSC AE 2012 Paper–II

Ans. (a) : Lancashire boiler

304. The most practical vapour power cycle is

(a) Carnot (b) Joule
(c) Rankine (d) Binary

UKPSC AE 2012 Paper–II

Ans. (c) : Rankine

305. The shell diameter and length of locomotive boiler are

(a) 1.5 m, 4 m (b) 1.5 m, 6 m
(c) 1 m, 4 m (d) 2 m, 4 m

BPSC AE 2012 Paper - V

Ans. : (a) : Shell diameter of locomotive boiler is 1.5 m and length of locomotive boiler is 4 m.

306. Consider the following statements for cooling towers:

(1) Cooling tower is an artificial device used to cool the hot cooling water coming out of condenser more effectively.
(2) The amount of water usually lost with induced draft cooling tower ranges from 5% to 6% by evaporation.
(3) The amount of water usually lost with induced draft cooling tower ranges from 7% to 8% by drift losses.
(4) The rate of evaporation of water and its cooling effect on the remaining water depends upon the relative humidity of air passing through the tower.

Which of the above statements are correct?

(a) 1 and 4 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2, 3 and 4

ESE 18.07.2021

Ans. (a) : The amount of water usually lost with induced draft cooling towers ranges from 1 to 2% by evaporation and 0.5 to 2% by drift losses.

- Cooling tower is an artificial device used to cool the hot cooling water coming out of condenser more effectively.
- The rate of evaporation of water and its cooling effect on the remaining water depends upon the relative humidity of air passing through the tower.

307. Super heating of steam for steam engine results in

(a) reducing misting quantity
(b) more balanced engine
(c) less work output
(d) increase in efficiency of Rankine cycle

APPSC AEE 2012

Ans. (d) : A common modification to the Rankine cycle is superheating the steam in the boiler increase the efficiency of cycle.

308. Water tube boilers are

(a) internally fired
(b) externally fired
(c) internally as well as externally fired
(d) none of these

TNPSC ACF 2012

Ans. (b) : Water tube boilers are externally fired where as fire tube boilers are internally fired.

309. The draught may be produced by

(a) mechanical fan (b) chimney
(c) a steam jet (d) all of these

TNPSC ACF 2012

Ans. (d) : The draught may be produced by
(1) Mechanical fan (2) Chimney (3) Steam jet

310. Balanced draught system uses

(a) steam jet draught
(b) induced draught
(c) forced draught
(d) both induced and force draught

TRB Poly. Lect., 2012

Ans. (d) : Balanced draught uses both forced & induced draught to overcome the resistance in air pre-heater and grate, while the induced draught fan overcome draught losses through boiler, economiser & connecting flue passage etc.

311. Economizer is generally placed between :

(a) Last superheater / reheater and air preheater
(b) Air preheater and chimney
(c) Electrostatic precipitators
(d) Induced draft fan and forced draft fan

PSPCL AE, 2012

Ans. (a) : Last superheater / Reheater and air preheater
Boiler feed water → Radiant super heater → Reheater Constructive superheater → Economizer → Air preheater → Electrostatic precipitator → Fan → Chimney

312. Steam flow is controlled by using :

(a) Drum level sensor
(b) Feedwater flow sensor
(c) Steam flow sensor
(d) All of these

OPSC Civil Services Pre. 2011

Ans. (d) : steam flow is control by using :
■ Drum level sensor
■ Feedwater flow sensor
■ Steam flow sensor

Search on Telegram @apna_pdf

313. Plants A, B and C require 3 kg/s, 8 kg/s and 28 kg/s of saturated water flow in the downcomer to produce 1 kg/s steam respectively. The most feasible plant will be :

(a) Plant B (b) Plant A
(c) Plant C (d) Plant A and B

OPSC Civil Services Pre. 2011

Ans. (b) : The most feasible plant will be plant A.

314. Load centre in a power station is :

(a) centre of coal fields
(b) centre of maximum load of equipments
(c) centre of gravity of electrical load
(d) centre of power station

RPSC ACF-2011

Ans. (c) : Load centre in a power station is centre of gravity of electrical load.

315. Diversity factor is always :

(a) equal to unity (b) less than unity
(c) more than unity (d) zero

RPSC AE 2016
RPSC ACF-2011

Ans. (c) : Diversity is usually more than one. Diversity factor is the ratio of sum of the individual maximum demands of the various subdivisions of a system (or part of a system) to the maximum demand of the whole system (or part of the system).

316. High load factor indicates that :

(a) cost of generation per unit power is increased
(b) total plant capacity is utilized for most of the time
(c) total plant capacity is not properly utilized for most of the time
(d) load on the plant is high

RPSC ACF-2011

Ans. (b) : High load factor indicates total plant capacity is utilized for most of the time.

317. Which one of the following does not cause thermal pollution?

(a) Nuclear power plant
(b) Hydro power plant
(c) Coal-fired power plant
(d) Solar-thermal power plant

RPSC AE GWD, 2011

Ans. (b) : Hydro power plant does not cause thermal pollution.

318. Centralised collection device for generating power from the Sun is called

(a) Fuel cell (b) Power tower
(c) Solar collector (d) Solar photovoltaic

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : Centralised collection device for generating power from sun is called power tower, it uses a concave mirror or lenses to concentrate a large area of sunlight onto a receiver, which is converted into heat & then into electricity using electric generator.

319. The future growth of large scale hydro power plants in the developed world probably will be limited because

(a) the release of impounded water alters stream flow patterns
(b) most economical sites are already used
(c) reservoirs eventually fill with sediments
(d) all of the above

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (d) : The future growth of large scale hydro power plants is limited due to many reason,

- Release of impounded water alters stream flow patterns.
- Most economical sites are already used.
- Reservoirs eventually fill with sediments and sources are limited etc.

320. Consider the following statements for reheating in steam power plants :

1. Reheating is a must for modern high pressure power plants using pressure above 100 bar.
2. Not more than two reheats are used in a steam power plant.
3. Reheating reduces the steam rate.

Which of these statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (a) : Explanation- Incase of the reheating in steam power plants-

(1) Reheating is a must for modern high pressure power plants using pressure above 100 bar. (also above 250 bar)
(2) Not more than two reheats are used in a steam power plant because its thermal efficiency reduced.
(3) Reheating reduces the steam rate also.

321. Consider the following statements for regeneration in steam power plant cycle :

1. The steam rate increases by regeneration
2. The heat rate decreases by regeneration.
3. The condenser size is reduced due to regeneration.

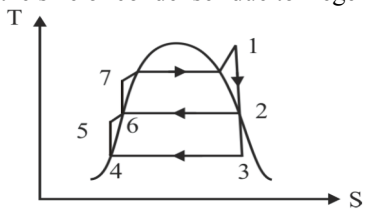
Which of these statements are correct ?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (a) : Explanation- Due to the Regeneration in steam power plant.

- Increase the cycle efficiency due to regeneration.
- Reduces the Heat rate.
- It increase the steam flow rate
- Reduced the size of condenser due to Regeneration.



Search on Telegram @apna_pdf

322. Consider the following statements for Brayton cycle and Rankine cycle :

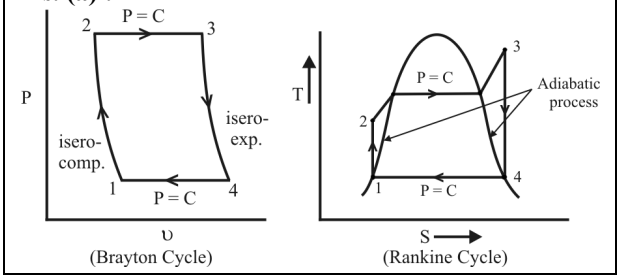
1. Both Rankine cycle and Brayton cycle consist of two reversible isobars and two reversible adiabatic.
2. The work ratio of Rankine cycle is higher than that of Brayton cycle
3. The efficiency of Rankine cycle steam plants using steam turbines is higher than that of Brayton cycle plants using gas turbines.

Which of these statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (a) :

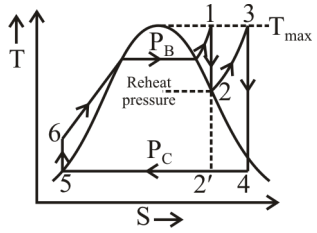


323. How do the pump work change when a simple Rankine cycle is modified with reheating ?

(a) increase (b) decrease
(c) remains same (d) none of these

J&K PSC Civil Services Pre, 2010

Ans. (c) : Pump work remains same when a simple rankine cycle is modified with reheating.



- W_T-↑, W_P-Constant, W_{net}-↑
- Q_s-↑, Q_R-↑, T_{MA}-↓↑, η-↑↓ (Can't say)
- $\downarrow \text{Specific Steam Consumption} = \dfrac{3600}{W_{net}\uparrow}$
- x-↑, ↓errosion of turbine blade

324. For the same power output operating charges are minimum for a :

(a) thermal plant (b) nuclear plant
(c) hydel plant (d) gas turbine plant

APPSC IOF, 2009

Ans. (c) : Hydroelectric power plant has minimum charges for same power output operating charges.

325. The draught produced by chimney of given height at given outside temperature :

(a) decreases if the chimney gas temperature increases
(b) remains same irrespective of chimney gas temperature
(c) increases if the chimney gas temperature increases
(d) may increase or decrease

APPSC IOF, 2009

Ans. (c) : The draught produced by chimney of given height at given outside temperature increases if the chimney gas temperature increases.

326. The power station supplies loads having maximum demands of 45 MW, 30 MW, 25 MW and 10 MW. The annual peak load is 70 MW. The demand factor is :

(a) 1.571 (b) 0.636
(c) 0.786 (d) 1.273

APPSC IOF, 2009

Ans. (a) : $\text{Demand factor} = \dfrac{\text{Actual max. consumption}}{\text{Total connected load}} = \dfrac{45+30+25+10}{70} = 1.571$

327. In a simple Rankine cycle, steam enters the condenser at saturated vapour and leaves as saturated liquid. The condenser and boiler pressure are maintained at p_1 and p_2, respectively. If v_f and v_g are the specific volumes of saturated liquid and saturated vapour at condenser pressure, then pump work can be approximated as :

(a) $v_g(p_2-p_1)$ (b) $v_f(p_2-p_1)$
(c) $p_1(v_g-v_f)$ (d) $p_2(v_g-v_f)$

DRDO Scientists 2009

Ans. (b) : Pump work $W_p = \int v dp$

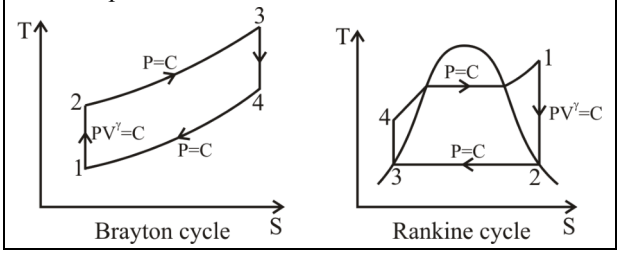
$$\boxed{W_p = V_f(P_2 - P_1)}$$

328. Two reversible isobars and two reversible adiabatics constitute the Brayton cycle. The same processes also make up the:

(a) Stirling cycle (b) Ericssion cycle
(c) Otto cycle (d) Rankine cycle

UPSC JWM Adv. No-16/2009

Ans. (d) : Rankine cycle and Brayton cycle constitute the same processes.



329. The efficiency of reheat cycle is given by

(a) $\dfrac{\text{Work done}}{\text{Heat supplied}}$

(b) $\dfrac{\text{Total useful heat drop}}{\text{Heat supplied}}$

Search on Telegram @apna_pdf

(c) $\frac{\text{Aditabatic heat drop}}{\text{Heat supplied}}$

(d) $\frac{\text{Total useful heat drop}}{\text{Total aditabatic heat drop}}$

TNPSC AE, 2008

Ans. (a) : $\eta_{\text{reheat cycle}} = \frac{\text{Work done}}{\text{Heat supplied}}$

330. The ideal cycle for a steam power plant is the Rankine cycle instead of the Carnot cycle because
(a) the Rankine cycle has higher efficiency
(b) the Rankine cycle efficiency equals the Carnot cycle efficiency
(c) the Rankine cycle has higher work ratio and is easier to implement
(d) the Carnot cycle gives lower turbine work

DRDO Scientists 2008

Ans. (c) : The ideal cycle for a steam power plant is the Rankine cycle instead of the Carnot cycle because the Rankine cycle has higher work ratio and is easier to implement.

331. The modern steam power plant runs on
(a) Carnot cycle
(b) Ericson cycle
(c) Modified Rankine cycle
(d) Otto cycle

WBPSC AE, 2007

Ans. (c) : The modern steam power plant runs on modified Rankine cycle.

332. Corrosion in boilers is minimised by maintaining boiler water as
(a) Acidic (b) Alkaline
(c) At high pressure (d) None of the above

UKPSC AE 2007 Paper -II

Ans. (b) : Alkaline

333. An air preheater
(a) increases evaporative capacity of a boiler
(b) increases the efficiency of boiler
(c) enables low grade fuel to be burnt
(d) all of the above

UKPSC AE 2007 Paper -II

Ans. (d) : An air preheater –
- Increases evaporative capacity of a boiler.
- Increases the efficiency of boiler.
- Enables low grade fuel to be burnt.

334. An economizer in a boiler
(a) increases steam pressure
(b) increase steam flow
(c) decreases fuel consumption
(d) decreases boiler efficiency

J & K PSC Screening, 2006

Ans. (c) : Economiser is a device which utilize heat of exhaust flue gases in order to increase temperature of feed water entering into the boiler so less heat will be required to convert water into steam. So it decreases fuel consumption in boiler.

335. The term heating surface in a boiler means.
(a) area of grate
(b) volume of furnace
(c) outer surface area of boiler shell
(d) surface area which is in contact with flue gases.

J & K PSC Screening, 2006

Ans. (d) : The term heating surface in boiler means surface area which is in contact with flue gases.

336. The efficiency of Rankine cycle
(a) increases with increase in exhaust pressure
(b) increases with decrease temperature of heat rejection
(c) decreases with increase in temperature of heat rejection
(d) is independent of temperature of heat rejection and exhaust pressure

J & K PSC Screening, 2006

Ans. (b & c) : The efficiency of rankine cycle is increased by increasing the mean temperature of heat addition or decreasing the mean temperature of heat rejection.

337. The burner tips in corner fired boiler are tilted to control
(a) steam temperature
(b) steam quantity
(c) air fuel ratio
(d) atmospheric pollution

OPSC Civil Services Pre 2006

Ans. (a) : The burner in the corners are tilted up or down to increase the radiant going to the reheater surface. This also affects the super heat absorption and temperature of super heater.

338. At a pressure of 221.2 bar and temperature of 374.15°C, the change of volume accompanying evaporation of water is
(a) very high (b) very low
(c) negligible (d) zero

OPSC Civil Services Pre 2006

Ans. (d) : At critical point latent heat of vaporisation is zero and at this point density of liquid and vapour is same for water critical point occurs at 374.14°C temperature and 221.2 bar pressure.

339. Hydraulic testing of boilers is done at pressures-
(a) Below and above atmosphere
(b) Slightly above atmospheric pressure
(c) At half the working pressures of boiler
(d) At 1.5 to 2 times the working pressure

ISRO Scientist/Engineer 2006

Ans. (d) : Hydraulic test shall be carried as–
- The test pressure shall be raised gradually.
- It shall not exceed by more than 6% of the required pressure.
- The test pressure shall be maintained for 30 minutes.
- The pressure shall be reduced to maximum allowable working pressure and maintained for close visual inspection of the pressure parts.

Search on Telegram @apna_pdf

■ Hydraulic testing before assembly into the boiler if the completed boiler is tested hydraulically to 1.5 times the maximum permissible working pressure at site.

340. Which one of the following is true in an isentropic process of expansion from state (1) to state (2) ?

(a) $\frac{P_2}{P_1}=\left(\frac{T_1}{T_2}\right)^{\frac{K-1}{K}}$ (b) $\frac{P_2}{P_1}=\left(\frac{T_2}{T_1}\right)^{\frac{K-1}{K}}$

(c) $\frac{P_2}{P_1}=\left(\frac{T_1}{T_2}\right)^{\frac{K}{K-1}}$ (d) $\frac{P_2}{P_1}=\left(\frac{T_2}{T_1}\right)^{\frac{K}{K-1}}$

TNPSC AE, 2008

Ans. (d) $\frac{P_2}{P_1}=\left(\frac{T_2}{T_1}\right)^{\frac{K}{K-1}}$

Where, K = Adiabatic index

2. Fuels and Combustion

341. Coal fired power plant boilers manufactured in India generally use :

(a) Pulverized fuel combustion
(b) Fluidize bed combustion
(c) Circulating fluidized bed combustion
(d) Moving stoker fired system

RPSC IOF & Boiler 20.09.2017
RPSC AE GWD, 2011, ESE 1997

Ans. (a) : Coal fired power plant boilers manufactured in India generally use Pulverized fuel combustion get high burning rate.

342. Which of the following coal has the highest calorific value ?

(a) Anthracite (b) Bituminous
(c) Lignite (d) Peat

HPPSC W.S. Poly. 2016
TNPSC AE (Industries) 09.06.2013

Ans. (a) :

Coal	Calorific Value (kJ/kg)
Peat	23000
Lignite	25000
Bituminous	33500
Anthracite	36000

Anthracite Coal has the highest Calorific Value.

343. The excess air required for combustion of pulverised coal is of the order of

(a) 100 to 150% (b) 30 to 60%
(c) 15 to 40% (d) 5 to 10%

RPSC IOF, 2020, ESE 1996

Ans. (c) : The amount of air more than the theoretical requirement is referred to as excess air. Power plant boilers normally run about 10 to 20 percent excess air. Natural gas-fired boilers may run as low as 5 percent of excess air.

Pulverized coal fired boilers may run with 15 to 40% of excess air.

344. Calorific value of fuel obtained by using Bomb Calorimeter is:

(a) Constant Volume Lower Calorific Value
(b) Constant Volume Higher Calorific Value
(c) Constant Pressure Lower Calorific Value
(d) Constant Pressure Higher Calorific Value

OPSC AEE 2019 PAPER - II
ESE 1992

Ans. : (b) : The calorific value obtained in a bomb calorimeter test represents the gross heat of combustion, per unit mass of fuel sample. This is the heat produced when the sample burns plus the heat given up when the newly formed water vapour condenses and cools to the temperature of bomb.

345. Volumetric analysis of sample of dry products of combustion gave the following results:
CO_2 = 10%, CO = 1%, O_2 = 8%, N_2 = 81%
Their proportion by weight will be

(a) 440 : 28 : 256 : 2268
(b) 22 : 14 : 256 : 1134
(c) 440 : 14 : 28 : 2268
(d) 22 : 28 : 14 : 1134

Nagaland PSC CTSE 2015 Paper-II
ESE 1993

Ans. (a) : Given, Volumetric analysis
CO_2 = 10%, CO = 1%, O_2 = 8%, N_2 = 81%
Proportion ratio of weight
= [12 + 32] × 10 : [12+16] ×1 : [32] × 8 : [28] × 81
= 440 : 28 : 256 : 2268

346. The amount of CO produced by 1 kg of carbon on incomplete combustion is

(a) 3/11kg (b) 3/8 kg
(c) 8/3 kg (d) 7/3 kg
(e) 11/3 kg

CGPSC AE 26.04.2015 Shift-II
ESE 1999

Ans. (d) : The Stoichiometric equation of carbon,

$\underset{12}{C}+\underset{16}{O}\rightarrow\underset{28}{CO}$

CO Produced by one kg Carbon-

$=\frac{28}{12}=\frac{7}{3}$kg CO/kg of Carbon

347. Consider the following statements:
The maximum temperature produced by combustion of a unit mass of fuel depends on
I. LCV
II. ash content
III. mass of air supplied.
IV. pressure in the furnace.
Of these statements

(a) I alone is correct
(b) I and III are correct
(c) II and IV are correct
(d) III and IV are correct

APPSC Poly. Lect. 2013
ESE 1998

Ans. (b) : The maximum temperature produced by the combustion of an unit mass of fuel depend upon lower calorific value (LCV) and mass of air supplied.

Search on Telegram @apna_pdf

348. Lignite, bituminous and anthracites are different type of

(a) nuclear fuels (b) coal
(c) natural gas (d) biogas

Assam PSC AE (IWT) 14.03.2021

Ans. (b) : Lignite, bituminous and anthracites are different types of coal.
The rank of coal (from most to least carbon content) are as follows-anthracite, bituminous coal, sub-bituminous coal and lignite.

349. Depletion of the ozone layer is damaging to human health. Negative effects include

(a) skin cancer (b) osteoporosis
(c) dyspepsia (d) AIDS

Assam PSC AE (IWT) 14.03.2021

Ans. (a) : The ozone layer in the upper atmosphere or stratosphere absorbs harmful ultraviolet rays from the sun and protect us from skin cancer. CFCs are linked to the depletion of this ozone layer.
Depletion of the ozone layer is damaging to human health negative effects include skin cancer.

350. A fuel consists of 92% carbon, 7% hydrogen and remaining residual matter by mass. Working from first principles, the higher calorific value of the fuel is

(a) 40176 kJ/kg (b) 41176 kJ/kg
(c) 40876 kJ/kg (d) 41678 kJ/kg

ESE 18.07.2021

Ans. (a) : 1 mole of carbon = 393.5 kJ/mol
1 mole of hydrogen = 286 kJ/mol

$$\text{Moles of carbon} = \frac{920}{12}$$

$$\text{Moles of } H_2 = \frac{70}{2}$$

$$\text{Energy released} = \frac{920}{12} \times 393.5 + \frac{70}{2} \times 286$$
$$= 40178.33 \text{ kJ/kg.}$$

351. In order to burn a fuel completely, which of the following basic conditions must be fulfilled?

1. **Supply enough air for complete combustion of fuel.**
2. **Secure low turbulence for through mixing of fuel and air.**
3. **Maintain a furnace temperature high enough to ignite the incoming fuel air mixture.**
4. **Provide a furnace volume large enough to allow time for combustion to be completed.**

Select the correct answer using the code given below:

(a) 1, 2 and 3 only (b) 1, 2 and 4 only
(c) 1, 3 and 4 only (d) 2, 3 and 4 only

ESE 18.07.2021

Ans. (c) : Basic conditions must be fulfilled-
(i) Supply enough air for combustions of fuel.
(ii) Maintain a furnace temperature high enough to ignite the incoming fuel air mixture.
(iii) Provide a furnace volume large enough to allow time for combustion to be completed.

352. Consider the following statements for solid fuels:

(1) Peat is the first stage in the formation of coal from wood.
(2) The average calorific value of bituminous coal is 1524 kJ/kg.
(3) Anthracite is very hard coal and has a shining black lustre.
(4) Wood charcoal is obtained by destructive distillation of wood.

Which of the above statements are correct?

(a) 1, 2 and 3 only (b) 1, 3 and 4 only
(c) 2 and 3 only (d) 1, 2 and 4 only

ESE 18.07.2021

Ans. (b) :
- Anthracite is the highest grade of coal, it is a shiny black dense, hard, brittle coal that borders on graphite.
- The calorific value of coals range from 25600 to 32600 kJ/kg.
- Peat is considered as the first geological step in coal's formation.
- Wood charcoal is obtained by destructive distillation of wood.

353. Which of the following are the essential functions of fuel cells?

1. **The charging (or electrolyser) function in which the chemical AB is decomposed to A and B**
2. **The storage function in which A and B are held apart.**
3. **The charge function in which A and B are charged with the simultaneous generation of electricity.**

(a) 1 and 3 only (b) 2 and 3 only
(c) 1 and 2 only (d) 1, 2 and 3

ESE 2020

Ans. (c) : 1 and 2 only
The discharge function in which A and B are charged with the simultaneous generation of electricity.

354. Which of the following are related to the Proton Exchange Membrane Fuel Cell (PEMFC)?

1. Polymer electrolyte
2. Hydrogen fuel and oxygen
3. Pure water and small amount of electricity
4. Nitrogen gas

(a) 1 and 3 only (b) 2 and 4 only
(c) 1 and 2 only (d) 3 and 4 only

ESE 2020

Ans. (c) : 1 and 2 only

355. A fluidized bed combustion system having an output of 35 MW at 80% efficiency when using a coal of heating value 26 MJ/kg with a sulphur content of 3.6% requires a particular limestone to be fed to it at a calcium-sulphur molar ratio of 3.0 so as to limit emissions of SO_2 adequately. The limestone used contains 85% $CaCO_3$. The required flow rate of limestone will be

Search on Telegram @apna_pdf

(a) 2405 kg/h (b) 2805 kg/h
(c) 3205 kg/h (d) 3605 kg/h

ESE 2020

Ans. (a) : Coal burning rate = $\frac{35}{0.80\times 26} = 1.683 \text{ kg/s}$
$= 6057.7 \text{ kg/h}$
$\therefore$ Flow rate of sulphur = $\frac{6057.7\times 0.036}{32}$
$= 6.81 \text{ kmol/h}$
for a Ca:S molar ratio of 3.0, the flow rate of calcium is $6.81\times 3.0=20.44$ kmol/h
$\therefore$ Mass flow rate of $CaCO_3$ required = 20.44×100
= 2044 kg/h (Since molecular weight of $CaCO_3$ is 100)
$\therefore$ Mass flow of limestone = 2044/0.85 = 2404.7 kg/h which is about 40% of the coal burning rate.

356. A thermal power plant generates power of 1000 MW. Coal releases 900 × 10^7 kJ/h of energy. The rate at which heat is rejected from the this power plant will be:
(a) 500 MW (b) 1000 MW
(c) 1500 MW (d) 250 MW

AAI Jr. Executive 29.11.2018
ESE 2009

Ans. (c) :
Energy released by coal $= \frac{900\times 10^7\times 1000}{3600} \text{ J/sec}$
$= 2500 \text{ MW}$
Heat rejected from the power plant = 2500 – 1000
= 1500 MW

357. A base load power station of capacity 35 MW has annual output of 150 ×10^6 kWh. The plant capacity factor of the power plant is
(a) 68% (b) 35%
(c) 49% (d) 25%

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (c) : Capacity Factor—The capacity factor is defined as the ratio of the total actual energy produced or supply over a definite period, to the energy that would have been produced if the plant has operated continuously at the maximum rating. The capacity factor mainly depends on the type of the fuel used in the circuit.
So, actual annual output is given as
$$Q_O = 150\times 10^6\times 3600 kJ$$
Ideal annual output is given as
$$Q_i = 35\times 10^3\times 365\times 24\times 3600 \ kJ$$
So capacity factor
$$CF = \frac{Q_o}{Q_i} = 0.489 \approx 0.49$$

358. Liquefied Petroleum Gas is a mixture of
(a) Propane and butane
(b) Propane and ethane
(c) Methane and isopropane
(d) Butane and ethane

HPPSC AE 2018

Ans. (a) : Liquefied Petroleum gas is a mixture of propane and butane are flammable mixture of hydrocarbon gases used as fuel in heating appliances, cooking equipment and vehicles.

359. The natural solid fuel is
(a) wood (b) coke
(c) anthracite coal (d) pulverized coal

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : Solid fuel refers to various types of solid materials that one used as fuel to produce energy and provide heating. Usually released through combustion solid fuels include wood, charcoal, peat coal, hexamine fuel tablets and pellets made from wood, corn, wheat rye and other grains. So, Natural solid fuel is wood.

360. The fuel mostly used in cement industry and in metallurgical process is
(a) wood charcoal (b) bituminous coke
(c) pulverized coal (d) coke

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The fuel mostly used in cement industry and in metallurgical process is pulverized coal. A pulverized coal fired in the form of powdered coal or coal dust it is fine as face powder in cosmetic makeup. Pulverized coal firing ensures complete combustion of coal, thus ensuring higher efficiency of stream generators. It is predominantly adopted in large coal fired utility boilers. The finer the grinding of coal, the more efficient its combustion.

361. Coke is produced
(a) when coal is first dried and then crushed to a fine powder by pulverising machine
(b) from the finely ground coal by moulding under pressure with or without a binding material
(c) when coal is strongly heated continuously for 42 to 48 hours in the absence of air in a closed vessel
(d) by heating wood with a limited supply of air to a temperature not less than 280ºC.

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Coke is produced by destructive distillation of coal in coke ovens for 42 to 48 hours in the absence of air in a closed vessel until all volatile components in the coal evaporate. The material remaining is called coke.

362. Steam coal is a
(a) pulverized coal
(b) brown coal
(c) coking bituminous coal
(d) non-coking bituminous coal

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Steam coal is a non-coking bituminous coal. Steam coal is a grade of steam to create electricity. Most of the coals used in power plant.

363. Producer gas is obtained by
(a) partial combustion of coal, coke, anthracite coal or charcoal in a mixed air steam blast
(b) carbonization of bituminous coal
(c) passing steam over incandescent coke
(d) passing air and a large amount of steam over waste coal at about 650ºC

Nagaland PSC (CTSE) 2018, Paper-II

Search on Telegram @apna_pdf

Ans. (a) : Producer gas is obtained by partial combustion of coal, coke anthracite coal or charcoal in a mixed air steam blast. Producer gas is a gas mixture containing carbon monoxide, hydrogen, carbon dioxide and nitrogen.

364. In Pulverized fuel burners, the rate of combustion is high in

(a) Long flame burner (b) Cyclone burner
(c) Tangential burner (d) Turbulent burner

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (d) : In pulverized fuel burner, the rate of combustion is high in turbulent burner because the fuel and air mixed in this burner.

365. A diesel power station has fuel consumption of 0.2 kg per kWh. If the calorific value of diesel is 11000 kcal per kg, overall efficiency of power station is

(a) 43.3% (b) 65.5%
(c) 39.2% (d) 25.6%

ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (c) : Power plant output is given as

$$P_o = \frac{1}{0.2}\frac{kWh}{kg}$$

$$= \frac{3600}{0.2}\frac{kJ}{kg}$$

Power plant input is given as

$$P_i = 11000 \times 4.18 \frac{kJ}{kg}$$

1 Cal = 4.18 J

Then efficiency as

$$\eta = \frac{P_o}{P_i} \approx 0.395$$

366. Which fuel cell is suitable for spacecraft applications?

(a) Direct methanol fuel cell
(b) Proton exchange membrane fuel cell
(c) Alkaline fuel cell
(d) Phosphoric acid fuel cell

ESE 2017

Ans. (c) : Fuel Cell– A fuel cell converts hydrogen and oxygen into water, producing electricity and heat in the process.

Alkaline Fuel Cell– Long used by NASA on space missions, alkaline fuel cells can achieve power generating efficiencies of up to 70%. They were used on the Apollo spacecraft to provide both electricity and drinking water.

Proton Exchange Membrane Fuel Cell (PEM)–These fuel cells operate at relatively low temperatures, have high power density, can vary their output quickly to meets shifts in power demand, and are suited for applications, such as automobiles, where quick startup is required.

Direct Methanol Fuel Cell–These cell are similar to the PEM cells in that they both use a polymer membrane as the electrolyte.

Phosphoric Acid Fuel Cell–This type of fuel cell is used in stationary power generators with output in the 100 kW to 400 kW. range to power many commercial premises around the world.

367. Volumetric analysis of a certain flue gas gave CO_2 15%, O_2 5% and rest as N_2. The gas was at a temperature of 200°C and a pressure of 5 bar. The partial pressure of N_2 in the flue gas is

(a) 250 kN/m^2 (b) 300 kN/m^2
(c) 350 kN/m^2 (d) 400 kN/m^2

ESE 2017

Ans. (d) : Given,

$X_{CO_2} = 0.15$

$X_{O_2} = 0.05$

$X_{N_2} = 0.8$

$P_{total} = 5$ bar

Partial pressure of N_2

$$= \frac{\text{No. of moles of } N_2}{\text{Total no. of moles}} \times P_{Total}$$

$$= \frac{0.8}{0.15+0.05+0.8} \times 500 = 400 \text{ kPa}$$

368. Statement (I): Proximate analysis of coal is done to determine its calorific value.

Statement (II): In proximate analysis of coal, the percentages of moisture, volatile matter, fixed carbon and ash are determined.

ESE 2017

Ans. (d) : Proximate analysis is done to examine four factors i.e. Moisture, volatile compound ash content and fixed carbon.
Calorimeters are used for calorific value estimation.
So, statement-I is wrong.

369. Continuous single effect evaporator is to be fed with 5000 Kg/hour of the solution containing 1 wt% solute and is concentrated with 5 wt% solute. The vapour production rate equals to

(a) 4000 kg/hour (b) 2000 kg/hour
(c) 3000 kg/hour (d) 1000 Kg/hour

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (a) : Feed (F) - 5000 kg/hr

x_F = 1 wt % = 0.01 kg solute / kg feed

x_L = 5 wt % = 0.05 kg solute / kg liquid product

Solute balance

$F\,x_F = L\,X_L$ (No solute in the vapour)

$5000 \times 0.01 = L \times 0.05$

L = 1000 kg/ hr

Overall material balance

$F = L + V \Rightarrow 5000 = 1000 + V$

V = 4000 kg/hr

370. According to EPA of USA, the following is not one of the six major pollutants?

(a) Ozone (b) Carbon monoxide
(c) Nitrogen oxides (d) Carbon dioxide

Nagaland PSC (CTSE) 2016, Paper-II

Search on Telegram @apna_pdf

Ans. (d) : According to EPA of USA, the six pollutants majorly
(i) Carbon monoxide
(ii) Nitrogen oxide
(iii) Sulphur dioxide
(iv) Lead
(v) Ground level ozone
(iv) Particulate matter

371. The Pollution Standard Index (PSI) scale has span from
(a) 0-200 (b) 0-300
(c) 0-400 (d) 0-500

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : The Pollution Standard Index (PSI) scale has span from 0 to 500. The index figures enables the public to determine whether the air pollution levels in a particular location are good, unhealthy, hazardous or worse.

372. Which of the following is/are inorganic gases?
(a) Carbon monoxide (b) Hydrogen sulphide
(c) Chlorine (d) All of the above

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : Some of the inorganic gases are:-
(i) Carbon monoxide
(ii) Hydrogen chloride
(iii) Chlorine
(iv) Hydrogen sulphide
(v) Fluorine

373. The major contributor of Carbon monoxide is
(a) Motor vehicle
(b) Industrial processes
(c) Stationary fuel combustion
(d) None of the above

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Carbon monoxide (CO), a colorless, odorless tasteless and toxic air pollutant is produced in the incomplete combustion of carbon containing fuels. The major contributor of carbon monoxides is motor vehicle.

374. Fugitive emissions consist of
(a) Street dust
(b) Dust from construction activities
(c) Dust from farm cultivation
(d) All of the above

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : Fugitive emissions are emissions of gases or vapors from pressurized equipment due to leaks and other unintended or irregular releases of gases, mostly from industrial activities, dust, fine particles.

375. The principal source of volatile organics (Hydrocarbons) is
(a) Transportation
(b) Industrial processes
(c) Stationary fuel combustion
(d) Volcanoes

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : The principal source of volatile organics (hydrocarbons) is crude oil & through industrial process, where there is a large of decomposed organic matters contains hydrogen and carbon in abundance.
When they are made to bond, hydrocarbons are formed others key sources of natural hydrocarbons are coal petroleum and natural gas.

376. The list of industrial sources of air pollution and their emissions are given. Match the following.

A. Ammonia	**1.Carbon monoxide**
B. Plating	**2. Particulates**
C. Fertilizers	**3. Metal fumes**

The correct order is

	A	B	C
(a)	1	2	3
(b)	3	2	1
(c)	1	3	2
(d)	3	1	2

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) :

List of Industrial Sources	Emissions of air pollutions
A. Ammonia	1.Carbon monoxide
B. Plating	2. Metal fumes
C. Fertilizers	3. Particulates

377. The threshold concentration of sulphur dioxide in any industrial activity should not be permitted beyond
(a) 2 ppm (b) 3 ppm
(c) 4 ppm (d) 5 ppm

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : The threshold concentration of sulphur dioxide in any industrial activity should not be permitted beyond the 5 ppm. (range).

378. The following method is used for analysis of combustion products (flue gases)?
(a) Non Dispersive Infra-Red Analyzer
(b) Flame Ionization Detector
(c) Flue Gas Analyzer for Boiler Flue Gases
(d) All of the above

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : Following methods used for analysis of combustion products (flue gases) are: -
(i) Non dispersive infra- red analyzer
(ii) Flame ionization detector
(iii) Flue gas analyzer for boiler flue gases

379. Consider the following statement:
The difference between higher and lower heating values of the fuels is due to _____
1. heat carried by steam from the moisture content of fuel
2. Sensible heat carried away by the flue gases
3. heat carried away by steam from the combustion of hydrogen in the fuel
4. heat lost by radiation
(a) 1, 2, 3 and 4 are correct
(b) 1 and 2 are correct
(c) 3 alone is correct
(d) 2, 3 and 4 are correct

UPRVUNL AE 21.08.2016

Search on Telegram @apna_pdf

Ans. : (c) The difference between higher and lower heating values of the fuels is due to heat carried away by steam from the combustion of hydrogen in the fuel

380. The ratio of "additional input required" to "increase an additional output" in power plant is known as

(a) Heat rate (b) Incremental heat rate
(c) Steam rate (d) Efficiency

RPSC Lecturer 16.01.2016

Ans. (b) : Incremental heat rate—Incremental heat rate is the ratio of the heat input required for a step change in net power output for power plant.
Incremental heat rates are normally given in units of Btu/kWh, or kJ/kWh.

381. Junker's gas calorimeter is used to determine the calorific value of:

(a) gaseous fuels (b) petrol
(c) coke (d) all fuels

(HPPSC LECT. 2016)

Ans. (a) : (i) Junker's gas calorimeter is used to determine the calorific value of gaseous fuels.
(ii) Bomb calorimeter is used for finding the higher calorific value of solid and liquid fuels.
(iii) The modification of Boy's gas calorimeter is known as Junker's colorimeter.

382. Which of the following is considered to be superior quality coal for power plants?

(a) Bituminous coal (b) Peat
(c) Coke (d) Lignite

UPPSC AE 12.04.2016 Paper-II

Ans. : (a) Non- coking bituminous coal is the fuel mostly used in boilers. The colorific value of the common coal varieties are
Peat:- 21000 kJ/kg, Lignite:- 25000 kJ/kg
Bituminous:- 33500 kJ/kg

383. Low grade fuels have

(a) Low moisture content
(b) Low ash content
(c) Low calorific value
(d) High carbon content

UPPSC AE 12.04.2016 Paper-II

Ans. : (c) Low grade fuels have low calorific value.

384. The presence of Carbon monoxide (CO) in the flue gas show inefficient combustion. This is because,

(a) The CO is slow to exchange heat through the heat exchange surfaces than CO_2
(b) The combustion of coal to CO releases less heat as compared to that released during combustion of CO to carbon-dioxide (CO_2)
(c) The combustion of coal to CO releases more heat as compared to that released during combustion of coal to carbon-dioxide (CO_2)
(d) The CO carries away more heat as compared to equal amount of carbon dioxide (CO_2).

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (b) : CO is form of unburnt fuel so combustion is in efficient.
The combustion of coal to CO releases less heat as compared to that released during combustion of CO to CO_2 (carbon dioxide).

385. Orsat gas analyzer determines volumetric composition of the flue gases in respect of

(a) O_2 and N_2
(b) O_2 and CO_2
(c) CO, CO_2 and N_2
(d) N_2, O_2, CO_2 and CO

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : The volumetric composition of flue gases N_2, CO_2, CO and O_2.

386. Solar cells are made of

(a) silica (b) steel
(c) sulphur (d) antimony

VIZAG STEEL MT 2015

Ans. (a) : Solar cells are made of silica.

387. Gasohol is a mixture of:

(a) 90% ethanol+ 10% gasoline
(b) 10% ethanol + 90% gasoline
(c) 40% ethanol + 60% gasoline
(d) 50% ethanol + 50 % gasoline

OPSC AEE 2015 PAPER-II

Ans. (b) : Gasohol is a mixture of 10% ethanol +90% gasoline.

388. Major disadvantage of LPG as a fuel in automobile is:

(a) Reduction in life of the engine
(b) Less power compared to gasoline
(c) Both (A) and (B)
(d) Knocking tendency

OPSC AEE 2015 PAPER - II

Ans. (c) : Major disadvantage of LPG as a fuel in automobile is less power compared to gasoline.

389. Dry flue gases with a composition of CO_2 = 10.4%, O_2 = 9.6% and N_2 = 80%, indicate that

(a) excess air is used
(b) air is insufficient
(c) hydrogen is not present in the coal
(d) air is just sufficient

Nagaland PSC CTSE 2015 Paper-II, ESE 1995

Ans. (a) : Presence of O_2 in dry flue gases shows that the excess air is used.

390. Which of the following gases has the highest calorific value ?

(a) producer gas (b) coal gas
(c) coke oven gas (d) blast furnace gas

J&K PSC Civil Services Pre, 2013

Ans. (b) : Gas/fuel	Calorific value
Producer gas	5800 kJ/m^3
Coal gas (N_2 + CH_4 +CO)	10 to 20 MJ / m^3
Blast furnace gas	3900 KJ/m^3

391. For each mole of oxygen, number of moles of nitrogen required for complete combustion of carbon are

(a) 20/21 (b) 2/21
(c) 77/21 (d) 79/21

APPSC Poly. Lect. 2013

Ans. (d) : For each mole of Oxygen number of moles of nitrogen required for combustion of Carbon are 79/21 = 3.76 moles of nitrogen.

Search on Telegram @apna_pdf

392. Anthracite coal is:
(a) Clean, dense and hard
(b) Non-caking and hard to ignite
(c) Burns smokelessly
(d) All of these

SJVN ET 2013

Ans. (d) : Anthracite, often referred to as hard coal, compact variety of coal that has a submetallic luster, the fewest impurities and the highest energy density of all types of coal and is the highest ranking of coals.

393. Examples of slurry type fuels for thermal plants are:
(a) Coal and oil (b) Coal and water
(c) Coal and methanol (d) All of these

SJVN ET 2013

Ans. (d) : Examples of slurry type fuels for thermal plants are-
(i) coal and oil
(ii) coal and water
(iii) coal and methanol

394. The permissible maximum concentration of SO_2 at ground level are
(a) 0.05 to 0.08 ppm for 24 Hrs
(b) 0.07 to 0.09 ppm for 1 Hr
(c) 0.15 to 0.2 ppm for 24 Hrs
(d) 0.08 to 1.15 ppm for 1 Hr

TNPSC AE 2013

Ans. (a) : The permissible maximum concentration of SO_2 at ground level are 0.05 to 0.08 ppm for 24 Hrs.

395. Chloro-fluorocarbons are banned due to
(a) High cost
(b) Toxicity
(c) High Boiling Point
(d) Preventing Infrared rays to escape and allowing UV rays to Earth

TNPSC AE 2013

Ans. (d) : Chloro-fluorocarbons are banned due to preventing Infrared rays to escape and allowing UV rays to Earth.

396. The specific heat of the products of combustion increases with increase in
(a) pressure (b) temperature
(c) fuel-air ratio (d) both (b) and (c)

BPSC AE 2012 Paper - V

Ans. : (d) : The specific heat of the products of combustion increases with increase in temperature and fuel-air ratio.

397. What two gases are typically combined in a fuel cell?
(a) Hydrogen and nitrogen
(b) Hydrogen and oxygen
(c) Oxygen and nitrogen
(d) Helium and nitrogen

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : Fuel cell is an electrochemical cell that converts the chemical energy of fuel into electrical energy. Here fuel is hydrogen & the oxidising agent is oxygen.

398. Correct statement is :
(a) MOX is multi - oxide fuel
(b) MOX is molten oxide fuel
(c) MOX can utilize surplus weapon grade plutonium
(d) MOX is not commercially prepared till to date

OPSC Civil Services Pre. 2011

Ans. (c) : Mixed oxide fuel (MOX), common referred to as mox fuel, is nuclear fuel that contains more than one oxide of fissile material, usually consisting of plutonium blended with natural uranium, reprocessed uranium or depleted uranium.

399. Which is not a minor actinide ?
(a) Uranium (b) Americium
(c) Curium (d) Neptunium

OPSC Civil Services Pre. 2011

Ans. (a) : The minor actinides are the actinide elements in used nuclear fuel other than uranium and plutonium, which are termed the major actinides. The most important isotope in spent nuclear fuel are neptunium, americium, curium, Through– 248, Through –252, Californium.

400. Sulphur in coal results in
(a) causing clinkering and slagging
(b) corroding air heaters
(c) spontaneous combustion during coal storage
(d) all of the above

TNPSC AE, 2008

Ans. (d) : Sulphur in coal results in –
- Causing clinkering and slagging
- Corroding air heaters
- Spontaneous combustion during coal storage

3. Steam Turbine

401. Bleeding in turbine means
(a) leakage of steam
(b) steam doing no useful work
(c) extracted steam for pre-heating feed water
(d) removal of condensed steam

CGPSC AE 15.01.2021, HPPSC ADF 05.03.2019
RPSC IOF & Boiler 20.09.2017
Kerala PSC Asstt. Prof. 27.09.2016
UKPSC AE 2012 Paper–II
UKPSC AE 2007 Paper -II

Ans. : (c) Bleeding in turbine means extracted steam for pre-heating feed water.
The effects of Bleeding are –
(i) It increases thermodynamic efficiency of the turbine.
(ii) The boiler is supplied with hot water.
(iii) A small amount of work is lost by the turbine, which decreases the power developed.

402. The compounding of steam turbine is usually done for:
(a) Reduction of steam consumption
(b) Reduction in turbine size
(c) Reduction of motor speed
(d) Efficiency improvement

OPSC AEE 2019 PAPER - II

Search on Telegram @apna_pdf

HPPSC Asstt. Prof. 20.11.2017
RPSC AE 2016, PSPCL AE 2012
RPSC ACF 2011
UKPSC AE 2007 Paper-II, ESE 1999

Ans. : (c) : Since the speed of single stage impulse turbine is very high. To bring this speed in practical application range, compounding (Pressure and velocity) is done. Here either the pressure of steam is reduced in steps (Pressure compounding) or high velocity is used in steps (Velocity compounding). Gear box is out of option because for such high reduction it is not an economical idea.

403. Which of the following is correct about Rateau turbine?

(a) Rateau turbine is a simple turbine.
(b) Rateau turbine is velocity compounded.
(c) Rateau turbine is pressure compounded.
(d) Rateau turbine is both, pressure and velocity compounded.
(e) Rateau turbine is 50% reaction turbine.

GPSC ARTO Pre-30.12.2018
CGPSC ARTO & TSI 07.01.2017
Nagaland PSC CTSE 2015 Paper-II
CGPSC AE 2014 Paper-II
VIZAG Steel MT Re-Exam 24.11.2013
RPSC IOF 2010, GATE 2000

Ans. (c) :
- Simple Impulse Turbine - De- laval turbine
- Velocity compounded impulse turbine -Curtis
- Pressure compounding impulse turbine- Rateau Turbine
- 50% Reaction Turbine- Parson's Turbine
- 100% Reaction turbine - Hero's Turbine

404. De Laval turbine is

(a) simple single wheel impulse turbine
(b) simple single wheel reaction turbine
(c) velocity compounded impulse turbine
(d) pressure compounded impulse turbine

JPSC AE, 10.04.2021, Paper-I
GPSC Lect. 23.10.2016
TSPSC AEE 2015, (KPSC AE 2015)
UKPSC AE 2012 Paper–II

Ans. (a) : De-Laval turbine is simple single wheel impulse turbine. Expansion of steam takes place in one set of nozzle and moving blades. At nozzle exit steam pressure drop to condenser pressure & velocity is very high.

405. The maximum efficiency for Person's reaction turbine is given by

(a) $\eta_{max} = \frac{\cos\alpha}{1+\cos\alpha}$ (b) $\eta_{max} = \frac{2\cos\alpha}{1+\cos\alpha}$

(c) $\eta_{max} = \frac{2\cos^2\alpha}{1+\cos^2\alpha}$ (d) $\eta_{max} = \frac{1+\cos^2\alpha}{2\cos^2\alpha}$

BPSC Poly. Lect. 2016
CGPSC AE 26.04.2015 Shift-II
TNPSC AE 2014, JPSC AE 2013 Paper-V
ESE 2006, 2004, 1999, CSE Pre-2001, 1996

Ans. (c) : The maximum efficiency for Person's reaction turbine is given by $\eta_{max} = \frac{2\cos^2\alpha}{1+\cos^2\alpha}$

406. The condition for maximum blade efficiency for a single-stage impulse turbine is that the speed ratio should be equal to :

(a) $\cos 2\alpha$ (b) $\frac{\cos\alpha}{2}$

(c) $\frac{1}{2}\cos 2\alpha$ (d) $2\cos\alpha$

where α = angle made by absolute velocity at inlet

CGPSC AE 15.01.2021
NLC GET 17.11.2020, Shift-II
APPSC AEE Screening Test 2016

Ans. (b) : The condition for maximum blade efficiency for a single stage turbine is that the speed ratio should be equal to :

$$\rho_{optimum} = \frac{U}{V_1} = \frac{\cos\alpha}{2}$$

407. The net result of pressure-velocity compounding of steam turbine is

(a) less number of stages
(b) large turbine for a given pressure drop
(c) shorter turbine for a given pressure drop
(d) lower friction loss

RPSC IOF, 2020
J&K PSC Civil Services Pre, 2010
ESE 1997

Ans. (b) : Principle of compounding is decreasing rotor speed by increasing number of stages of expansion hence larger turbines.

408. Curtis turbine is

(a) reaction steam turbine
(b) pressure velocity compounded steam turbine
(c) pressure compounded impulse steam turbine
(d) velocity compounded impulse steam turbine

Haryana PSC AE (PHED) 04.09.2020, Paper-I
OPSC AEE 2015 Paper-II
APPSC Poly. Lect. 2013

Ans. (d) : De-laval - simple impulse turbine
Curtis- Velocity compounded impulse turbine
Rateau- Pressure compounded impulse trubine

409. In case of reaction steam turbine

(a) There is enthalpy drop in fixed and moving blades
(b) There is enthalpy drop only in fixed blades
(c) There is enthalpy drop only in moving blades
(d) There is no enthalpy drop

GPSC ARTO Pre-30.12.2018
HPPSC Asstt. Prof. 18.09.2017
RPSC AE 2016, RPSC ACF-2011
MPPSC State Forest Service Exam, 2014

Ans. (a) : For a reaction steam turbine, there is enthalpy drop in fixed & moving blades.

Search on Telegram @apna_pdf

410. Parson's turbine is a :

(a) impulse turbine of 50 percent degree of impulse
(b) reaction turbine of varying degree of reaction.
(c) reaction turbine of 50 percent degree of reaction
(d) impulse turbine of 50 percent degree of reaction.

NLC GET 17.11.2020, Shift-II
MPPSC State Forest Service Exam, 2014
JPSC AE 2013 Paper-V

Ans. (c) : Parson's turbine is a reaction turbine of 50 percent degree of reaction thus a blade with 50% degree of reaction or a 50% reaction stage is one in which half the enthalpy drop of the stage occurs in the fixed blade and half in the moving blades. A very widely used design has half degree of reaction or 50% reaction and this is known as parson's turbine.

411. In a single-stage impulse turbine, which of the following is correct? [where η_s = Stage efficiency, η_b = Blade efficiency, η_N = Nozzle efficiency]

(a) $\eta_s = \eta_b \times \eta_N$ (b) $\eta_s = \eta_b/\eta_N$
(c) $\eta_s = \eta_N/\eta_b$ (d) $\eta_s = \eta_N = \eta_b$

SJVN ET 2019, ESE 2008
UKPSC AE 2007 Paper-II

Ans. (a) : Stage consists is combination of blade and nozzle and both arranged in series.
So stage efficiency = blade efficiency × nozzle efficiency.

412. The diagram efficiency is highest for simple impulse turbine stage having smooth and symmetrical blade when blade steam speed ratio can be given as

(a) $\cos\alpha_1$ (b) $\frac{\cos\alpha_1}{4}$
(c) $\frac{\cos\alpha_1}{2}$ (d) None of these

Where α_1 is the angle of absolute velocity at inlet.

UPPSC AE 12.04.2016 Paper-II
OPSC AEE 2015 PAPER - II
ESE 2001

Ans. : (c) The diagram efficiency is highest for simple impulse turbine stage having smooth and symmetrical blade when blade steam speed ratio can be given as

$$\frac{\cos\alpha_1}{2}$$

Impulse Turbine:-

* Blade velocity $(V_b) = \frac{\pi DN}{60}$

* The area of flow $(A_b) = \frac{\pi}{4}(D_2^2 - D_1^2)$

* Optimum velocity ratio $(\rho_{opt}) = \frac{\cos\alpha_1}{2}$

* Maximum efficiency $(\eta_{max}) = \frac{1+k_b}{2}.\cos^2\alpha$

413. In case of impulse steam turbine there is :

(a) enthalpy drop in fixed and moving blades
(b) enthalpy drop only in moving blades
(c) enthalpy drop in nozzles
(d) no enthalpy drop

RPSC AE 2016, RPSC ACF-2011, ESE 2012

Ans. (c) : In case of impulse steam turbine enthalpy drop in nozzles. In a impulse turbine there is no change in the pressure of the steam as it passes through the moving blades. There is change only in the velocity.

414. Degree of reaction is defined as the ratio of :

(a) Enthalpy drop in moving blades to enthalpy drop in fixed blades
(b) Enthalpy drop in fixed blades to total enthalpy drop in moving and fixed blades
(c) Enthalpy drop in fixed blades to enthalpy drop in moving blades
(d) Enthalpy drop in moving blades to total enthalpy drop in fixed and moving blades

GPSC ARTO Pre 30.12.2018
RPSC LECTURER 16.01.2016
CSE Pre-1996, 1994

Ans. (d) :

$$\text{Degree of Reaction} = \frac{\Delta h_{\text{moving blades}}}{\Delta h_{\text{moving blades}} + \Delta h_{\text{fixed blades}}}$$

415. De laval turbine is used for applications requiring

(a) Low power, low speed
(b) Low power, high speed
(c) High power, high speed
(d) High power, low speed

APPSC AEE Screening Test 2016
JPSC AE 2013 Paper-I, ESE 2018

Ans. (b) : De Laval turbine is an impulse turbine in which steam impinges upon revolving blades from a flared nozzle. Causes expansion of the steam, and hence changes its pressure energy into kinetic energy.
De laval turbine is used for low power and high speed.

416. Degree of reaction of the turbine if the isentropic enthalpy drop in fixed blade is 1.5 times of the isentropic enthalpy drop in the moving blade.

(a) 0.6 (b) 0.5
(c) 0.4 (d) 0.66

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II, ESE 1993

Ans. (c) : Degree of reaction (R)

$$= \frac{(\Delta h)_{\text{isen MB}}}{(\Delta h_{\text{isen}})_{MB} + (\Delta h_{\text{isen}})_{FB}}$$

$$= \frac{(\Delta h)_{MB}}{(\Delta h)_{MB} + 1.5(\Delta h)_{MB}}$$

$$= \frac{1}{1+1.5}$$

$$\boxed{R = 0.4}$$

Search on Telegram @apna_pdf

417. If the enthalpy drop in the moving blades and fixed blades of a steam turbine is 20 kJ/kg and 30 kJ/kg respectively then what is the degree of reaction?

(a) 33% (b) 40%
(c) 60% (d) 67%
(e) 77%

CGPSC AE 26.04.2015 Shift-II
TNPSC AE (Industries) 09.06.2013

Ans. (b) : We know that

$$\text{DOR} = \frac{\text{Heat drop in moving blades}}{\text{Head drop in a stage}}$$

$$\text{DOR} = \frac{20}{(20+30)} = 0.40$$

$$\boxed{\text{DOR} = 40\%}$$

418. In steam turbines the reheat factor:

(a) Increases with the increase in number of stages
(b) Decreases with the increase in number of stages
(c) Remains same irrespective of number of stages
(d) None of the above

OPSC AEE 2015 PAPER - II
UKPSC AE 2007 Paper-II

Ans. : (a) In steam turbine the reheat factor increase with the increase in number of stages.
Reheat factor:- It is an important term used for the multi-stage turbines, which may be broadly defined as the ratio of cumulative heat drop to the isentropic heat drop.

419. The isentropic heat drop in the nozzle of an impulse steam turbine with a nozzle efficiency 0.9, blade velocity ratio = 0.5, the mean blade velocity 150 m/s in kJ/kg is

(a) 50 (b) 60
(c) 40 (d) 75

ISRO Scientist/Engineer (RAC) 12.01.2020
GPSC ARTO 01.05.2016

Ans. (a) : Blade velocity ratio $= \frac{U}{V_1} = 0.5$

Where, U = mean blade velocity and

V_1 = Absolute velocity of steam at inlet $= \frac{150}{0.5} = 300$ m/sec.

By SFEE actual heat drop –

$$\frac{V_1^2}{2} = \frac{(300)^2}{2} \text{ J}$$

Nozzle efficiency, $= \frac{\text{Actual heat drop}}{\text{Isentropic heat drop}}$

$\therefore$ Isentropic heat drop in nozzle $= \frac{(300)^2}{2\times 0.9} = \frac{90000}{2\times 0.9}$

$$\boxed{\text{Isentropic heat drop} = 50 \text{ kJ/kg}}$$

420. Blade erosion in steam turbines occurs due to:

(a) high temperature steam
(b) droplets in steam
(c) high flow rate
(d) high rotational speed
(e) high kinetic energy

JPSC AE 10.04.2021 Paper-I
CGPSC ARTO & TSI 07.01.2017, ESE 2007

Ans. (b) : Steam turbine blade erosion is of two types. Erosion by particulates is due to oxides scales and is found at the front end of turbines. Erosion by water droplets is essentially a back-end problem.
Stream turbine blades are highly subjected to Water Droplet Erosion (WDE) caused by high energy impingement of liquid water droplets.

421. Pressure on two sides of impulse wheel of a steam turbine

(a) is same
(b) is different
(c) increase from one side to the other side
(d) decrease from one side on the other side

RPSC AE 2016, RPSC ACF-2011

Ans. (a) : Pressure on two side of impulse wheel of a steam turbine is same.

422. Commonly used method of governing in steam turbines is by :

(a) throttle governing
(b) nozzle control governing
(c) bypass governing
(d) hydraulic governing

Kerala PSC Poly. Lect. (Auto) 05.05.2016
J&K PSC Civil Services Pre, 2013

Ans. (a) : Throttle governing is commonly used method of governing in steam turbines.

423. Reheat factor in steam turbine depends upon :

(a) exit pressure only
(b) stage efficiency only
(c) initial temperature and pressure only
(d) all of the above

JPSC AE, 10.04.2021, Paper-I
J&K PSC Civil Services Pre, 2010

Ans. (d) $\text{Reheat factor} = \frac{\text{Commulative enthalpy drop}}{\text{isentropic enthalpy drop}}$

Reheat factor depends upon-
(i) Stage efficiency
(ii) Initial pressure and condition of steam
(iii) final pressure
It increases with increase in number of stages, the value of reheat factor varies from 1.02 to 1.06.

424. If the pressure of steam at the exhaust from the turbine is saturated corresponding to the temperature of process heat requirement, then this turbine is known as:

(a) Reaction turbine
(b) Impulse turbine
(c) Pass out turbine
(d) Back pressure turbine

ESE 2020, UPRVUNL AE 2016

Search on Telegram @apna_pdf

Ans. (d) : If the pressure of steam at the exhaust from the turbine is saturated corresponding to the temperature of process heat requirement, then this turbine is known as back pressure turbine.

425. When two rotors of the outward radial flow turbine is rotating in opposite direction then it is known as:

(a) Pass out turbine
(b) Ljungstrom turbine
(c) 50% reaction turbine
(d) Condensing turbine

OPSC AEE 2019 PAPER - II, ESE 1994

Ans. : (b) : When two rotors of the outward radial flow turbine is rotating in opposite direction then it is known as Ljungstrom turbine.

426. Consider the following statements : In an impulse turbine :

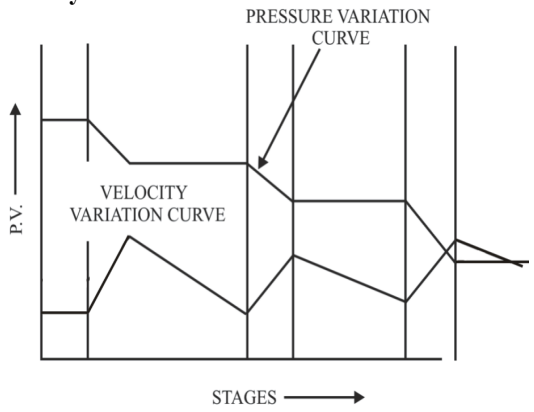
1. The relative velocity of steam at inlet and outlet of moving blades are equal
2. The moving blades are symmetrical
3. The outlet area of the moving blades is smaller than the inlet area.

(a) 1, 2 and 3 are correct
(b) 2 and 3 are correct
(c) 1 and 2 are correct
(d) 1 and 3 are correct

GPSC ARTO Pre 30.12.2018, CSE Pre-1997

Ans. (c) : In Impulse turbine,
(i) The relative velocity at inlet and outlet of moving blades are equal.
(ii) The moving blades are symmetrical.
(iii) The outlet area of moving blades is equal to the inlet area.

427. The given figure represents pressure and velocity variation for a :



(a) Reaction type turbine
(b) Velocity compounded impulse turbine
(c) Pressure-velocity compounded impulse turbine
(d) Pressure compounded impulse turbine

GPSC ARTO Pre 30.12.2018, CSE Pre-1995

Ans. (d) : Pressure Compounding Impulse Turbine.
Rateau Impulse Turbine (Pressure Compounding)– In pressure compounded turbine, moving blades and fixed blades are shown in fig. (given in question)

The steam of boiler pressure enters the first set of nozzle but does not drop the total pressure in one set of nozzles. The total steam pressure is dropped by number of stages and each stage consists of a set of nozzles and a ring of moving blades.

428. What is the cause of reheat factor in a steam turbine?

(a) Supersaturation (b) Reheating
(c) Superheating (d) Blade friction

UPRVUNL AE 21.08.2016
CSE Pre-2005

Ans. : (d) Reheat factor – It is an important term used for the multi stage turbine, which may be broadly defined as the ratio of cumulative heat drop to the isentropic heat drop.

429. In a Parson's turbine stage, the blade velocity is 320 m/s at the mean radius and the rotor blade exit angle is 30°. For minimum kinetic energy of the steam leaving the stage, the steam velocity at the exit of the rotor will be

(a) $160/\sqrt{3}$ m/s (b) $320/\sqrt{3}$ m/s
(c) $640/\sqrt{3}$ m/s (d) $640/\sqrt{3}$ m/s

APPSC AEE MAIN 2016 PAPER-III
ESE 1994

Ans. (c) : Data given
u = 320 m/s
$\alpha = 30°$
then steam velocity at the exit of the ratio will be V then
V cos 30° = u = 320

$$V = \frac{320}{\cos 30°} = \frac{320 \times 2}{\sqrt{3}}$$

$$V = \frac{640}{\sqrt{3}} \text{ m/s}$$

430. The following data refer to an axial flow turbine stage:
Relative velocity of steam at inlet to the rotor = 79.0 m/s., Relative velocity at the rotor exit = 152 m/s rotor mean peripheral velocity = 68.4 m/s, work output per kg of steam = 14100 J. What is the approximate degree of reaction?

(a) 0.9 (b) 0.8
(c) 0.7 (d) 0.6

Nagaland PSC CTSE 2015 Paper-II
ESE 1995

Ans. (d) : Enthalpy drop in moving blades

$$= \frac{V_{r_2}^2 - V_{r_1}^2}{2 \times 1000} = \frac{(152)^2 - (79)^2}{2000} = 8.43 \text{kJ/kg}$$

$$\text{Degree of reaction} = \frac{8.43}{14.1} = 0.597 \cong 0.6$$

431. Which one of the following sketches represents an impulse blade?

(a) (b)
(c) (d)

Nagaland PSC CTSE 2015 Paper-II
ESE 1995

Search on Telegram @apna_pdf

Ans. (a) : Figure (a) impulse turbine blade.
As no pressure change from inlet to outlet no area change is allowed.

432. Governing of steam turbines can be done by the following :

1. Nozzle control
2. Throttle control
3. Providing additional valve of passage

The correct answer will be –

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

PSPCL AE, 2012, ESE 1992

Ans. (a) : Nozzle control : In nozzle governing the flow rate of stream is regulated by opening shutting of sets of nozzles rather than regulating its pressure. In this method groups of two, three or more nozzles form a set and each set is controlled by a separate value.
Throttle control : In throttle governing the pressure of steam is reduced at the turbine entry thereby decreasing the availability of energy the flow rate is controlled using a partially opened steam control value.

433. Given that
α_1 = nozzle angle
n = number of rows of moving blades, in a velocity compounded impulse turbine, the optimum blade speed ratio is

(a) $2\cos\alpha_1.n$ (b) $\frac{n\cos\alpha_1}{2}$
(c) $\frac{\cos\alpha_1}{2(n+1)}$ (d) $\frac{\cos\alpha_1}{2}$

ISRO Scientist/Engineer 2007
ESE 1994

Ans. (d) : α_1 = Nozzle Angle
n = No. of moving blades
In velocity of compound impulse turbine—
So, optimum blade speed ratio $= \frac{\cos\alpha_1}{2}$

434. If the enthalpy drop across the fixed blades in a turbine is zero, the degree of reaction is :

(a) zero (b) 0.5
(c) Unity (d) Infinity

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
RPSC IOF, 2020

Ans. (c) : Degree of reaction $(R) = \frac{(\Delta h)_{MB}}{(\Delta h)_{MB} + (\Delta h)_{FB}}$

$(\Delta h)_{FB} = 0$
MB = Moving blade
FB = Fixed blade

Degree of reaction $(R) = \frac{(\Delta h)_{MB}}{(\Delta h)_{MB} + 0}$

$\boxed{R = 1}$

435. Consider the following statements for steam turbines:

(1) The ratio of actual enthalpy drop to isentropic enthalpy drop is known as mechanical efficiency.
(2) The ratio of enthalpy drop in moving blades to enthalpy drop in the stage is known a degree of reaction.
(3) Rateau turbine is the example of reaction turbine.
(4) Curtis turbine is the example of impulse turbine.

Which of the above statements are correct?

(a) 2 and 4 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2, 3 and 4

ESE 18.07.2021

Ans. (a) :
- Rateau turbine is a pressure compounding multistage impulse turbine.
- Curtis turbine is velocity compounding multistage impulse turbine.

Degree of reaction-

$$R = \frac{(\Delta h)_{\text{moving blade}}}{(\Delta h)_{\text{stage}}}$$

$$R = \frac{(\Delta h)_{\text{moving blade}}}{(\Delta h)_{\text{moving blade}} + (\Delta h)_{\text{fixed blade}}}$$

436. The pressure on the two sides of the moving blades of a reaction steam turbine is

(a) same
(b) higher at inlet
(c) lower at inlet
(d) may be higher or lower depending on quality of entry steam

JPSC AE, 10.04.2021, Paper-I

Ans. (b) : The pressure on the two sides of the moving blades of a reaction steam turbine is higher at inlet.

437. For Parson's reaction steam turbine, degree of reaction is

(a) 60% (b) 50%
(c) 100% (d) 75%

JPSC AE, 10.04.2021, Paper-I

Ans. (b) : Degree of reaction
$= \frac{\text{Isentropic heat drop in moving blade}}{\text{Sum of drop in fixed and moving blade}}$
For Parson's turbine degree of reaction is 50%.
For Hero's reaction turbine, degree of reaction is 100%.

438. 'Bleeding' or 'Extracting' steam from the turbine at various points is done for the purpose of :

(a) Reheating (b) Regeneration
(c) Moisture removal (d) Pressure reduction

RPSC ACF & FRO, 26.02.2021

Ans. (b) : Bleeding or extracting steam from turbine at various points is done for the purpose of Regeneration. In this heat of extracting steam is utilized in feed water heating.

Search on Telegram @apna_pdf

439. The velocity triangles at the inlet and exit of the rotor of a turbo machine are shown. V denotes the absolute velocity of the fluid, W denotes the relative velocity of the fluid, and U denotes the blade velocity. Subscripts 1 and 2 refer to inlet and outlet respectively. If $V_2 = W_1$ and $V_1 = W_2$, then the degree of reaction is _____.

(a) 0 (b) 1
(c) 0.5 (d) 0.25

Assam Engg. College AP/Lect. 18.01.2021

Ans. (c) : If $V_2 = W_1$ and $V_1 = W_2$
Also $\alpha_1 = \beta_2$ and $\beta_1 = \alpha_2$
Then, it represents parson's reaction turbine which has degree of reaction as 0.5.

440. Which of the following are applied (used) ways of compounding steam turbines?
1. Pressure compounding
2. Temperature compounding
3. Velocity compounding

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

ESE 2020

Ans. (d) : There are three types of compounding used in steam turbines which are :
- Pressure compounding
- Velocity compounding
- Pressure-Velocity compounding

441. Whirl velocity in a steam turbine refers to :

(a) the component of the velocity of steam in the direction of blade velocity
(b) the velocity of whirling turbine wheel.
(c) the component of the velocity of turbine wheel in the direction of blade velocity.
(d) the component of the velocity of steam in the direction normal to the blade velocity.

NLC GET 17.11.2020, Shift-II

Ans. (a) : Whirl velocity in a steam turbine refers to the component of the velocity of steam in the direction of blade velocity. The whirl velocity is the tangential component of absolute velocity at the blade inlet and outlet. This component of velocity is responsible for the whirling or rotating of the turbine rotor.

442. Symmetric velocity diagram in a frictionless reaction turbine implies that

(a) the blade angles at inlet and outlet are equal
(b) the flow angles at inlet and outlet are equal
(c) blade angle at inlet is equal to flow angle at outlet
(d) the flow does not accelerate through the rotor vanes

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : This can achieve in inflow impulse turbine absolute inlet velocity = outlet relative velocity inlet relative velocity = outlet absolute velocity blade angle at inlet is equal to flow angle of outlet. It has 50% degree of reaction.

$\alpha_1 = \beta_2$ and $\beta_1 = \alpha_2$

443. Blade speed ratio is the ratio of

(a) blade velocity to whirl component of inflow velocity
(b) whirl component of inflow velocity to blade velocity
(c) inflow absolute velocity to blade velocity
(d) blade velocity to in flow absolute velocity

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Blade ratio is the ratio of blade velocity to inflow absolute velocity $\left(\frac{u_1}{v_1}\right)$.

444. Diagram efficiency of a steam turbine stage is defined as the ratio of

(a) Diagram power to inflow rate of kinetic energy
(b) Diagram power to inflow steams enthalpy
(c) Diagram power to inflow steam stagnation enthalpy
(d) Diagram power to total power input from inflow steam

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Diagram efficiency is also known as blade efficiency or rotor efficiency. It is defined as the ratio of work done per kg of steam by the rotor to the energy available at the inlet, per kg of steam.

445. If blade velocity coefficient of a blade is less than 1, it means that

(a) the blade is smooth and frictionless
(b) the blade is symmetric
(c) the blade is asymmetric
(d) the blade is not smooth

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Blade velocity co-efficient is the ratio of relative velocity of steam at outlet tip of the blade to the relative velocity of steam at inlet tip of the blade if blades velocity co-efficient is less than one it means blade is not smooth.

446. Degree of reaction of smooth, symmetric reaction turbine is

(a) infinite (b) 0.5
(c) zero (d) 0.25

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : For smooth, symmetric reaction turbine
$\alpha = \theta$, $v_1 = v_{r2}$, $u_1 = u_2$
$\beta = \phi$, $v_2 = v_{r1}$
Degree of reaction = 50%

447. Leakage losses are a matter of concern in

(a) velocity compound impulse turbines
(b) simple impulse turbine
(c) reaction turbines
(d) pressure - compound impulse turbines

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : Leakage losses are a matter of concern in impulse turbine.
Note – minor leakage losses also occur in reaction turbine.

Search on Telegram @apna_pdf

448. Which of the following is not achieved through velocity compounding of impulse steam turbine.

(a) Reducing the rotor speed
(b) Reducing blade losses
(c) Reducing the back pressure
(d) Reducing the blade size

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : In impulse turbine, pressure remain same at all place equal to atmospheric pressure so type of compounding in impulse turbine does not reduce the back pressure.

449. In an axial flow impulse turbine stage, if ΔC_w is the change in whirl or circumferential velocity from inlet to outlet and C_b is the blade velocity, the power produced with mass flow rate ($\dot{m}$) of working fluid is

(a) $\dot{m}\Delta C_w \times \Delta C_w$ (b) $\dot{m}\Delta C_w$
(c) $\dot{m}\Delta C_w \times C_b$ (d) $\dot{m}C_b \times C_b$

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : For axial flow circumferential velocity at inlet and outlet is remain same and constant.

$$\text{work} = \dot{m}\left(V_{w_2}u_2 - V_{w_1}u_1\right)$$

$$\dot{m}u\left(V_{w_2} - V_{w_1}\right) \qquad [\because u_1 = u_2]$$

$$= \dot{m} \times \Delta C_w \times C_b$$

450. For a single stage of axial flow impulse turbine with symmetrical blade profile, having angle of attack α and axial flow velocity C_a, the blade velocity C_b should be _____ for maximum power.

(a) $C_a \cos\alpha$ (b) $\frac{C_a \cos\alpha}{2}$
(c) $C_a \cos(\alpha/2)$ (d) $(C_a/\cos\alpha)$

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) :

451. In an isentropic flow of ideal gas though turbine blade without any heat addition and work, if the temperature is constant

(a) internal energy can change
(b) Pressure cannot change
(c) Enthalpy cannot change
(d) Pressure and velocity can change

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : This is similar to nozzle when no heat added / rejected and no work is done. But across section changes pressure and velocity changes.

452. In an impulse reaction turbine stage, the heat drop in fixed and moving blades are 20 kJ/kg and 30 kJ/kg respectively. The degree of reaction for this stage will be :

(a) 3/5 (b) 5/3
(c) 2/5 (d) 5/2

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) :

$$\text{Degree of reaction} = \frac{(\Delta h)_{\text{moving blade}}}{(\Delta h)_{\text{moving blade}} + (\Delta h)_{\text{fixed blade}}}$$

$$= \frac{30}{20+30} = \frac{30}{50} = \frac{3}{5}$$

453. Critical speed of a turbine is

(a) same as run away speed
(b) speed that will cause mechanical failure of the shaft
(c) speed at which natural frequency of vibrations equals the number of revolutions at the same time
(d) speed equal to synchronous speed of the generator

Gujarat PSC AE 2019

Ans. : (c) : Critical speed of a turbine is speed at which natural frequency of vibrations equals the number of revolutions at the same time.

454. Which one of the following statements is correct with respect to axial flow 50% reaction turbine?

(a) The combined velocity diagram is symmetrical.
(b) The outlet absolute velocity should not be axial for maximum utilization
(c) Angles of both stator and rotor are not identical.
(d) For maximum utilization, the speed ratio $\frac{U}{v_1} = \sin^2\alpha$

ESE 2019

Ans. (a) : Efficiency of 50% reaction turbine is –

$$\eta = \frac{2\left(\frac{2V_1}{U}\sin\alpha_1 - 1\right)}{\sigma^2}$$

For maximum efficiency –

$$\Rightarrow \quad \frac{V_1}{U} = \frac{1}{\sin\alpha_1}$$

α_1 is large and efficiency is maximum when –

$$\frac{V_1}{U} \approx 1$$

So maximum efficiency –

$$\alpha_1 = 90°$$

Hence, combined velocity diagram is symmetrical.

455. The degree of reaction is given by:

(a) $\frac{\text{Actual enthalpy change in rotor}}{\text{Actual enthalpy change in stator}}$
(b) $\frac{\text{Actual enthalpy change in rotor}}{\text{Actual enthalpy change in state}}$
(c) $\frac{\text{Actual enthalpy change in state}}{\text{Actual enthalpy change in rotor}}$
(d) $\frac{\text{Actual enthalpy change in stator}}{\text{Actual enthalpy change in rotor}}$

SJVN ET 2019

Search on Telegram @apna_pdf

Ans. (b)
The degree of reaction is given by
$$= \frac{\text{Actual enthalpy change in rotor}}{\text{Actual enthalpy change in state}}$$

456. An impulse turbine of single stage having 1.2 m diameter runs at 1000 rpm. What will be the inlet steam velocity if the blade speed ratio is 0.314?
(a) 200 m/s (b) 100 m/s
(c) 150 m/s (d) 250 m/s

OPSC AEE 2019 PAPER - II

Ans. : (a) : Given,
D = 1.2 m
N = 1000 rpm
$$\frac{u}{v_1} = \text{Speed ratio} = 0.314$$
$$u = \frac{\pi DN}{60}$$
$$= \frac{\pi \times 1.2 \times 1000}{60} = 62.83 \text{ m/s}$$
$$\frac{u}{v_1} = 0.314$$
$$\frac{62.83}{v_1} = 0.314$$
$$v_1 = 200 \text{ m/s}$$

457. A throttle governed steam turbine develops 30 IHP by consuming 300 kg/hr. steam and 60 IHP with 570 kg/hr. How much steam is required to develop 20 IHP?
(a) 210 kg/hr (b) 230 kg/hr
(c) 300 kg/hr (d) 270 kg/hr

OPSC AEE 2019 PAPER - II

Ans. : (a) : Relation between the steam consumption per hour (m) and the Indicated Power (I.P.) is (Willian's law) –
$m = a + b \times I.P.$ Where a and b are constant
Find the value a and b –
$570 = 60 \times b + a$ .....(i)
$300 = 30 \times b + a$ .....(ii)
From equation (i) and (ii) –
$a = 30, b = 9$
$\because$ Steam consumption when developing 20 IHP
$m = 30 + 20 \times 9$
$\boxed{m = 210 \text{ kg/hr}}$

458. The coefficient of velocity for steam turbine is the ratio of:
(a) Relative velocity leaving the blade to the velocity of whirl at inlet of moving blade
(b) Velocity of whirl at inlet of moving blade to the relative velocity leaving the blade
(c) Relative velocity at inlet of moving blade to the relative velocity leaving the blade
(d) Relative velocity leaving the blade to the relative velocity at inlet of moving blade

OPSC AEE 2019 PAPER - II

Ans. : (d) : The coefficient of velocity for steam turbine is the ratio of relative velocity leaving the blade to the relative velocity at inlet of moving blade.

459. In a steam turbine, the nozzle angle at the inlet is 18°. The relative velocity is reduced to the extent of 6% when steam flows over the moving blades. The output of the turbine is 120 kJ/kg flow of steam. If the blades are equiangular, the speed ratio and the absolute velocity of steam ratio and the absolute velocity of steam at inlet for maximum utilization are nearly
(a) 0.42 and 230.2 m/s (b) 0.48 and 230.2 m/s
(c) 0.42 and 515.1 m/s (d) 0.48 and 515.1 m/s

ESE 2019

Ans. (d) : Given,
Nozzle angle at inlet (α) = 18°
Loss of relative velocity = 6%
Output power = 120 kJ/kg
Optimum blade speed, $\left(\frac{V_b}{V_1}\right) = \frac{\cos\alpha}{2}$
$$\left(\frac{V_b}{V_1}\right) = \frac{\cos 18°}{2} = 0.475$$
$$\frac{V_b}{V_1} = 0.48$$
Power developed –
$$\left(V_1 \cos\alpha - V_b\right)\left(2 - \frac{\text{Loss}}{100}\right) \times V_b = 120 \times 10^3$$
Putting, $V_b = 0.48\ V_1$
$\boxed{V_1 = 515.1 \text{ m/s}}$

460. A turbine in which steam expands both in nozzle as well as in blades is called as
(a) impulse reaction turbine
(b) reciprocating steam turbine
(c) gas turbine
(d) Curtis turbine

ESE 2019

Ans. (a) : Impulse reaction turbine
- In impulse turbine steam expands in nozzles only.
- In impulse reaction turbine steam expands in nozzles as well as it passes through blades.

461. A steam turbine is supplied with steam at a pressure of 20 bar gauge. After expansion in the steam turbine, the steam passes to condenser which is maintained at a vacuum of 250 mm of mercury by means of pumps. The inlet and exhaust steam pressures will be nearly
(a) 2101 kPa and 68 kPa
(b) 2430 kPa and 78 kPa
(c) 2101 kPa and 78 kPa
(d) 2430 kPa and 68 kPa

ESE 2019

Ans. (a) : Inlet pressure (P_1) = 20 bar gauge
Absolute inlet pressure
$(P_1)_{abs} = P_1 + P_{atm}$
= 20 + 1.01325
= 21.01325 bar
= 2101 kPa

Search on Telegram @apna_pdf

Exit pressure (P_2) = 250 mm of Hg (vacuum)
Absolute exit pressure $(P_2)_{abs} = P_{atm} - P_{vac}$
$= (101.325 - 13.6 \times 9.81 \times 0.25)$ kPa
$= 67.996$
$= 68$ kPa

462. Consider the following statements regarding compounding in steam turbines:
1. In impulse turbine, steam pressure remains constant between ends of the moving blades.
2. In reaction turbine, steam pressure drops from inlet to outlet of the blade.
3. In velocity compounding, partial expansion of steam takes place in the nozzle and further expansion takes place in the rotor blades.

Which of the above statements are correct?
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2019

Ans. (a) : (i) As the steam flows over the moving blades nearly all its velocity is absorbed. However, the pressure remains constant during the process. It is three stage pressure compounded impulse turbine.
(ii) In reaction turbine steam pressure drops from inlet to outlet of the blade.
(iii) In velocity compounding whole expansion takes place in nozzle and velocity is reduced subsequent stages.

463. The maximum blade efficiency of single stage impulse turbine in terms of nozzle angle α under ideal conditions is proportional to :
(a) $\cos\alpha$ (b) $\sin\alpha$
(c) $\sin^2\alpha$ (d) $\cos^2\alpha$

GPSC ARTO Pre 30.12.2018

Ans. (d) : Max. blade efficiency of single stage impulse turbine.

$$\eta_{max} = \cos^2\alpha$$

For Parson's turbine $\eta_{max} = \dfrac{2\cos^2\alpha}{1+\cos^2\alpha}$

464. In an ideal impulse turbine, the
(a) Absolute velocity at the inlet of moving blade is equal to that at the outlet
(b) Relative velocity at the inlet of the moving blade is equal to that at the outlet
(c) Axial velocity at the inlet is equal to that at the outlet
(d) Whirl velocity at the inlet is equal to that at the outlet

GPSC ARTO Pre 30.12.2018

Ans. (b) : In an ideal impulse turbine, the relative velocity at the inlet of moving blade is equal to that at the outlet.

$$v_{r_1} = v_{r_2}$$

465. In an axial flow impulse turbine, energy transfer takes place due to
(a) Change in relative kinetic energy
(b) Change in absolute kinetic energy
(c) Change in pressure energy
(d) Change in energy because of centrifugal force

GPSC ARTO Pre 30.12.2018

Ans. (a) :

466. A steam turbine rotor of mass 6000 kg is running at 8000 RPM out to the extent of 20 m. The centrifugal force tending to lift the turbine from its foundation will be approximately;
(a) 4.4 MN (b) 8.4 MN
(c) 6.4 MN (d) 10.4 MN

AAI Jr. Executive 29.11.2018

Ans. (b) : $F = mr\omega^2$

$$\omega = \frac{2\pi N}{60} = \frac{2\pi \times 8000}{60}$$
$$= 837.33$$
$$= 6000 \times 20 \times (837.33)^2$$
$$= 8.4 \text{ MN}$$

467. To maximize the efficiency, the speed ratio in Parson's reaction turbine is
(a) $\dfrac{\cos\alpha}{2}$ (b) $\dfrac{\cos^2\alpha}{2}$
(c) $\cos\alpha$ (d) $\cos^2\alpha$

HPPSC AE 2018

Ans. (c) : To maximize the efficiency, the speed ratio in Parson's reaction turbine is cos α.

468. A steam turbine, in which a part of the steam after partial expansion, is used for process heating and the remaining steam is further expanded for power generation, is known as .....
(a) Back pressure turbine
(b) Impulse turbine
(c) Low pressure turbine
(d) Pass out turbine

RPSC AE 2018

Ans. (d) : A steam turbine, in which a part of the steam after partial expansion, is used for process heating and the remaining steam is further expanded for power generation, is known as pass out turbine.

469. Which of the following is true for steam turbines?
(a) In reaction turbine, gradual pressure drop takes place over fixed blades only
(b) In reaction turbine, gradual pressure drop takes place over moving blades only
(c) In impulse turbine, pressure drop takes place in nozzle as well as in the blades
(d) In impulse turbine, pressure drop takes place in nozzle, and increases in the blades
(e) In reaction turbine, gradual pressure drop takes place in moving as well as in fixed blades

CGPSC AE 25.02.2018

Ans. (e) : In reaction turbine, gradual pressure drop takes place in moving as well as in fixed blade whereas in impulse turbine pressure drop takes place in nozzle only.

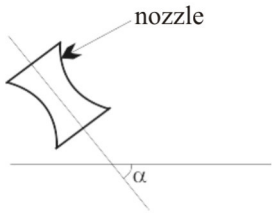
Search on Telegram @apna_pdf

470. Angle made by the absolute velocity of steam to the horizontal is called as

(a) blade entrance angle
(b) nozzle angle
(c) outlet angle
(d) none of the mentioned

RPSC Vice Principal ITI 2018

Ans. (b) :



Angle made by the absolute velocity of steam to the horizontal is called as nozzle angle.

471. In a simple impulse turbine, the nozzle angle at the entrance is 30°. For the maximum diagram efficiency, what is the blade speed ratio?

(a) 0.259 (b) 0.75
(c) 0.3 (d) 0.433

BPSC AE Mains 2017 Paper - V

Ans. : (d) : Given,
Nozzle angle $\alpha = 30°$
for maximum efficiency

Blade speed ratio $= \frac{u}{v} = \frac{\cos\alpha}{2}$

So, $\frac{u}{v} = \frac{\cos 30°}{2}$

$= 0.433$

472. In a steam turbine when steam expand, the entropy

(a) increases linearly
(b) decreases linearly
(c) increases exponentially
(d) does not change

WBPSC AE, 2017

Ans. (d) : In a steam turbine when steam expand, the entropy does not change.

473. The impulse turbine blade efficiency is $\cos^2\alpha$, where α is the nozzle exit angle, if

(a) blade solidity is 0.65
(b) blades are equiangular
(c) blades are equiangular and frictionless
(d) blade velocity coefficient is unity

APGENCO AE, 2017

Ans. (c) : Blades are equiangular and frictionless

Impulse turbine blade efficiency $\boxed{\eta = \cos^2\alpha}$

Where, α = Nozzle angle

474. The isentropic enthalpy drop in fixed blades is one fourth of the isentropic enthalpy drop in moving blades of a turbine. The degree of reaction is

(a) 0.25 (b) 0.50
(c) 0.75 (d) 0.85

APGENCO AE, 2017

Ans. (*)

Degree of reaction $= \frac{\Delta h_{mb}}{\Delta h_{mb} + \Delta h_{fb}}$

Given that, $\Delta h_{fb} = \frac{1}{4}\Delta h_{mb}$

$= \frac{4\Delta h_{mb}}{4\Delta h_{mb} + 1\Delta h_{mb}}$

$= \frac{4\Delta h_{mb}}{5\Delta h_{mb}} = \frac{4}{5} = 0.8$

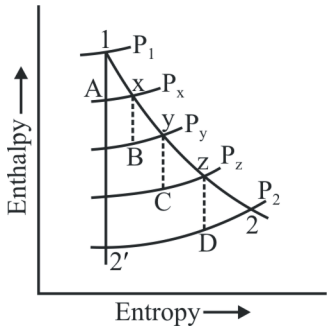
Note-This questions has been excluded for evaluation.

475. The reheat factor R_f for a steam turbine is usually in the range of

(a) 0 to 1 (b) 1 to 1.065
(c) 2 to 2.065 (d) 5 to 10

ISRO Scientist/Engineer 17.12.2017

Ans. (b) :



Reheat factor (RF)

$= \frac{\text{Cumulative enthalpy drop (Isentropic)}}{\text{Isentropic enthalpy drop (overall)}}$

$RF = \frac{\Delta h_{1A} + \Delta h_{xB} + \Delta h_{yC} + \Delta h_{zD}}{\Delta h_{12}}$

It lies between 1 to 1.04

476. Statement (I) : The efficiency of steam turbine considerably reduces if throttle governing is carried out at lower loads.

Statement (II) : Nozzle control can only be applied to the first stage of turbine.

(a) Both Statement (I) and Statement (II) are individually true and Statement (II) is the correct explanation of Statement (I).
(b) Both Statement (I) and Statement (II) are individually true but Statement (II) is NOT the correct explanation of Statement (I).
(c) Statement (I) is true but Statement (II) is false.
(d) Statement (I) is false but Statement (II) is true.

UPSC JWM 2017

Ans. (b) : In throttle governing, the flow rate of steam is controlled using a partially opened steam control valve. If throttle governing carried out at lower load, the efficiency of steam turbine reduced.
Nozzle governing is applied only to the first stage whereas the subsequent stages remain unaffected.

Search on Telegram @apna_pdf

477. From the consideration of the erosion of blades in the later stages of a steam turbine, the maximum moisture content at the turbine exhaust is limited to:

(a) 20% (b) 12%
(c) 88% (d) 5%

TRB Polytechnic Lecturer 2017

Ans. (b) : From the consideration of the erosion of blades in the later stages of a steam turbine, the maximum moisture content at the turbine exhaust is limited to 12%.

478. The turbine having identical fixed and moving blade is

(a) De-laval turbine
(b) Parson's reaction turbine
(c) Rateau's turbine
(d) Zoelly turbine

GPSC ARTO 01.05.2016

Ans. (b) : Turbine having identical fixed and moving blade is parson's reaction turbine.

479. The shaft of a steam turbine is usually rotated at

(a) Natural frequency of vibration
(b) Much below the natural frequency of vibration
(c) Much above the natural frequency of vibration
(d) There is no such eriterion
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (c) : In a shaft of turbine, the critical speed of vibration is higher. So it is operated at much higher frequency.

480. In reaction turbine, a stage is represented by

(a) each row of blades
(b) number of entries of steam
(c) number of easings
(d) number of exits of steam

GPSC Lect. 23.10.2016

Ans. (a) : In reaction turbine, whenever fluid passes through a row of blades, it represents a stage.

481. In reaction turbines-

(a) the steam is expanded in nozzles and there is no fall pressure as the steam passes over the rotor blades
(b) steam is directed over bucket-like-blades which propels the rotor
(c) expansion of steam takes place as it passes through the moving blades on the rotor as well as through the guide blades fixed to the casing
(d) steam pressure remains constant

RPSC 2016

Ans. : (c) Expansion of steam takes place it passes through the moving blades on the rotor as well as through the guide blades fixed to the casing.

- In a reaction turbine there is enthalpy drop both in fixed and moving blades.
- In a reaction turbine the expansion of steam takes place partly in the fixed blades and Partly in the moving blades.
- In case of impulse steam turbine there is enthalpy drop in nozzle.

482. In Rankine cycle, the work output from the turbine is given by

(a) Change in internal energy between inlet and outlet
(b) Change in enthalpy between inlet and outlet
(c) Change in entropy between inlet and outlet
(d) Change of temperature between inlet and outlet

UPPSC AE 12.04.2016 Paper-II
TSGENCO AE 14.11.2015

Ans. : (b) In Rankine cycle, the work output from the turbine is given by change in enthalpy between inlet and outlet

Turbine work $(W_T) = (h_1 - h_2)\,kJ/kg.$

483. The function of fixed blades on reaction turbine is to:

(a) Alter the direction of steam and decrease its velocity
(b) Alter the direction of steam and increase its pressure
(c) Alter the direction of steam and expand it to higher velocity
(d) Only to alter the direction of steam

UPRVUNL AE 2016

Ans. (c) : The function of fixed blades on reaction turbine is to alter the direction of steam and expand it to higher velocity.

484. In Curtis turbines

(a) The velocity of steam drops gradually after passing over the rows of moving blades
(b) The pressure of steam drops gradually after passing over the rows of moving blades
(c) The mass of steam drops gradually after passing over the rows of moving blades
(d) Both pressure and velocity of steam drops gradually after passing over the rows of moving blades

RPSC LECTURER 16.01.2016

Ans. (a) : In Curtis turbines the velocity of steam drops gradually after passing over the rows of moving blades.

- Compounding is done to reduce the rotational speed of the impulse turbine to practical limits.
- Three main types of compounded impulse turbine are:

(a) Pressure compounded steam turbine : The Rateau turbine
(b) Velocity compounded steam turbine: The Curtis turbine
(c) Pressure velocity compounded impulse turbine: The Rateau Curtis turbine.

485. Power developed per unit mass flow rate of steam by an stage of impulse turbine is 60 kW. The velocity of steam from nozzle is 400 m/s. Diagram efficiency will be:

(a) 75% (b) 95%
(c) 65% (d) 85%

UPRVUNL AE 2016

Search on Telegram @apna_pdf

Ans. (a) : Diagram efficiency—It is also known as blade efficiency or rotor efficiency. It is defined as the ratio of work done per kg of steam by the rotor to the energy available at the inlet per kg of steam

$$\eta_D = \frac{\text{Work done/kg of steam}}{\text{Energy available at the inlet per kg of steam (V^2/2)}}$$

$$\eta_D = \frac{2\times 60\times 10^3}{(400)^2}$$

$$\eta_D = \frac{120\times 10^3}{160000} = \frac{3}{4}$$

$$\eta_D = 0.75$$

$$\boxed{\eta_D = 75\%}$$

486. The component of velocity which is responsible for producing the work in steam turbine is called

(a) Axial velocity (b) Whirl velocity
(c) Relative velocity (d) Absolute velocity

RPSC LECTURER 16.01.2016

Ans. (b) : Whirl velocity component which is responsible for producing the work is steam turbine. Whirl velocity is also known as tangential velocity.

487. In a reaction stage turbine, the velocity

(a) increases in stator and remains constant in rotor
(b) increases in stator and decreases in rotor
(c) decreases in stator and remains constant in rotor
(d) remains constant throughout

RPSC IOF & Boiler 20.09.2017

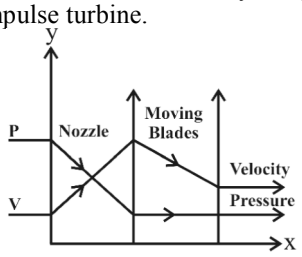
Ans. : (b) Increases in stator and decreases in rotor.

488. In an impulse turbine stage, pressure-

(a) increases in stator and decreases in rotor
(b) decreases in stator and increases in rotor
(c) decreases in stator and remains constant in rotor
(d) remains constant in both stator and rotor

RPSC IOF & Boiler 20.09.2017

Ans. : (c) Pressure and velocity diagram along the length of impulse turbine.



The figure clearly indicates that pressure are constant and velocity reduces in moving blades of impulse turbine.

489. The effect of blade friction in a steam turbine is to

(a) reheat the gas
(b) increase the specific output
(c) reduce the exhaust pressure
(d) reduce work done

BPSC Poly. Lect. 2016

Ans. (d) :

i) Some resistance is always offered by the blade surface to the idling steam jet, whose effect is to reduce the velocity of the Jet.
ii) The effect of blade friction in a steam turbine is to reduce work done.
iii) The blade friction in the impulse turbine reduces the velocity of steam by 10 to 15% passes over the blade.

490. High load factor indicates that

(a) cost of generation per unit power is increased
(b) total plant capacity is utilized for most of the time
(c) total plant capacity is not properly utilized for most of the time
(d) load on the plant is high

RPSC AE 2016

Ans. : (b) High load factor indicates that total plant capacity is utilized for most of the time.

491. The ratio of work done to the energy supplied to rotor in a turbine stage is called

(a) Blade efficiency (b) Stage efficiency
(c) Nozzle efficiency (d) None of these

UPPSC AE 12.04.2016 Paper-II

Ans. : (a)

- The ratio of work done to the energy supplied to rotor in a turbine stage is called blade efficiency.
- The ratio of rate of work done and energy supplied to the stage in a turbine is called stage efficiency.

492. Surging is the phenomenon of ..... .

(a) air stream blocking the passage
(b) motion of air at sonic velocity
(c) unsteady, periodic and reversed flow
(d) production of no air pressure

GWSSB DEE 07.07.2016

Ans. (c) : Surging is the phenomenon of unsteady, Periodic & Reversed flow. It is a momentary back flow through compressor from the discharge to the suction, forward discharge gas will flow backwards through the compressor towards the suction side.

493. Thermodynamic efficiency of a steam turbine as compared to steam engine is :

(a) equal
(b) less
(c) None of three mentioned here.
(d) more.

GWSSB AAE, 27.12.2015

Ans. (d) : Thermodynamic efficiency of a steam turbine as compared to steam engine is more.

494. The value of reheat factor in steam turbines normally varies from

(a) 0.42 to 6.4 (b) 0.61 to 0.82
(c) 1.02 to 1.06 (d) 1.2 to 1.6

TSGENCO AE 14.11.2015

Ans. (c) : Reheat factor > 1
R.F. = 1.04 to 1.08

Search on Telegram @apna_pdf

495. Which one of the following is the correct statement?
The degree of reaction of an impulse turbine.
(a) is less than zero
(b) is greater than zero
(c) is equal to zero
(d) increases with steam velocity at the inlet

TSGENCO AE 14.11.2015

Ans. (c) : The degree of reaction of an impulse turbine is equal to zero.

496. In a two-row Curtis stage with symmetrical blading
(a) Work done by both rows of moving blades are equal
(b) Work done by the fist row of moving blades is double of the work done by second row of moving blades
(c) Work done by the first row of moving blades is three times the work done by second row of moving blades
(d) Work done by the first row of moving blades is four times the work done by the second row of moving blades

TSGENCO AE 14.11.2015

Ans. (c) : Curtis turbine is a velocity compounding turbine. In a Curtis turbine, the work produced in each stage is not the same. The ratio of work produce in a 2 stage curtis turbine with symmetrical blading, the work done by the first row of moving blades is three time as work done by second row of moving blades. So, the work ratio of 2-stage turbine is 3 : 1. The ratio is 5 : 3 : 1 in three-stage turbine and the ratio is 7 : 5 : 3 : 1 in a four stage turbine.

497. Steam turbines are classified according to
(a) direction of flow
(b) principle of action
(c) number of cylinder
(d) arrangement of pressure drop

MPPSC AE 08.11.2015

Ans. (d) : Steam turbines are classified according to arrangement of pressure drop like HP, IP and LP turbine.

498. Steam enter a single stage impulse steam turbine with an inlet velocity of 50 m/s and leaves with and outlet velocity of 20 m/s. The work done by 100kg of steam is
(a) 85kJ (b) 95kJ
(c) 105kJ (d) 115kJ
(e) 125kJ

CGPSC AE 26.04.2015 Shift-II

Ans. (c) :

$$W = m\frac{\left[v_2^2 - v_1^2\right]}{2}$$

$$W = 100\frac{\left[50^2 - 20^2\right]}{2}$$

$$\boxed{W = 105 \text{ kJ}}$$

499. The process of maintaining the speed of the turbine constant for various load conditions is
(a) bleeding (b) reheating
(c) governing (d) compounding

TSPSC AEE 2015

Ans. : (c) The process of maintaining the speed of the turbine constant for various load conditions is governing.
Throttle Governing of steam turbine:- The throttle governing of a steam turbine is a method of controlling the turbine output by varying the quantity of steam entering into the turbine. This method is also know as servo motor method.

500. Due to the presence of friction over the blade of steam turbine, blade velocity coefficient exists and is defined as :
(a) $\frac{\text{Relative velocity of the steam at the exit of blade}}{\text{Relative velocity of the steam at the inlet of blade}}$
(b) $\frac{\text{Absolute velocity of the steam at the exit of blade}}{\text{Absolute velocity of the steam at the inlet of blade}}$
(c) $\frac{\text{Relative velocity of the steam at the inlet of blade}}{\text{Relative velocity of the steam at the exit of blade}}$
(d) $\frac{\text{Absolute velocity of the steam at the inlet of blade}}{\text{Absolute velocity of the steam at the exit of blade}}$
(e) $\frac{\text{Relative velocity of the steam at the exit of blade}}{\text{Absolute velocity of the steam at the inlet of blade}}$

CGPSC AE 26.04.2015 Shift-II

Ans. (a) : Due to presence of friction over the blade of steam turbine blade velocity coefficient exists and is defined as the ratio of relative velocity of the steam at the exit of blade (V_{re}) to relative velocity of the steam at the inlet of blades (V_{ri}).

$$\text{Blade velocity coefficient} = \frac{V_{re}}{V_{ri}}$$

501. If V_N and α are the nozzle exit velocity and nozzle angle in an impulse turbine, the optimum blade velocity is given by
(a) $V_N \cos 2\alpha$ (b) $V_N \sin 2\alpha$
(c) $\frac{V_N \cos\alpha}{2}$ (d) $\frac{V_N^2}{2}$

MPPSC AE 08.11.2015

Ans. (c) : Given, V_N = Nozzle exit velocity
α = Nozzle angle
$\therefore$ In case of Impulse turbine-

$$\rho = \frac{u}{V_N} = \frac{\cos\alpha}{2}$$

$$u = \frac{V_N \cos\alpha}{2}$$

Note- Option (d) is given by the commission.

502. The expansion of steam, as it flows over the blades in reaction turbine, represents
(a) isothermal process
(b) isentropic process
(c) throttling process
(d) free-expansion process

Assam PSC CCE Pre 2015

Search on Telegram @apna_pdf

Ans. (b) : The expansion of steam as it flows over the blades in reaction turbine represents isentropic process.

503. The thermal property that remains same on the two sides of the impulse wheel of a steam turbine is

(a) heat (b) temperature
(c) velocity (d) pressure

Mizoram PSC AE/SDO 2014, Paper-I

Ans. (d) : When the steam passes through the moving blades the velocity drops but the pressure remains same. The fact that the pressure does not drop across the moving blades is the distinguishing feature of the impulse turbine. The pressure at the inlet of the moving blades is the same as the pressure at the outlet of moving blades.

504. For a given pressure and temperature of steam, the thermal efficiency of the steam engine with condenser compared to a steam engine without condenser is always

(a) lower (b) higher
(c) same (d) none of these

Mizoram PSC AE/SDO 2014, Paper-I

Ans. (b : The thermal efficiency of the steam engine with condenser compared to a steam engine without condenser is always higher.

505. As a result of blade friction the relative velocity at outlet of impulse turbine compared to inlet relative velocity is :

(a) nearly same (b) 2% less
(c) 10-15% less (d) 30% less

J&K PSC Civil Services Pre, 2013

Ans. (c) :

506. The super saturation of steam results in slight :

(a) increase in entropy
(b) increase of final dryness fraction
(c) increase of discharge
(d) all of the above

J&K PSC Civil Services Pre, 2013

Ans. (d) : Supersaturated or metastable flow has following effects –

(i) density increases hence increase in mass of steam discharged.
(ii) Increase entropy and specific volume of steam.
(iii) Reduce heat drop tends exit velocity of steam reduced.
(iv) Increase dryness fraction.

507. Absolute velocity Vector =

(a) Peripheral Velocity Vector + Relative Velocity Vector
(b) Relative Velocity Vector
(c) Axial Velocity Vector
(d) Peripheral Velocity Vector

TNPSC AE 2013

Ans. (a) : Absolute velocity Vector = Peripheral Velocity Vector + Relative Velocity Vector.

508. Multi-stage reaction turbines employ

(a) with large pressure drop
(b) with lower pressure drop
(c) constant pressure drop
(d) with high rotational speed

TNPSC AE 2013

Ans. (a) : Multi-stage reaction turbines employ with large pressure drop.

509. The entire change in the static properties occur in the rotor implies

(a) zero degree reaction
(b) hundred percent degree of reaction
(c) degree of reaction
(d) negative degree of reaction

TNPSC AE 2013

Ans. (b) : The entire change in the static properties occur in the rotor implies hundred percent degree of reaction.
This type turbine which have 100% DOR also known as Hero's Turbine.

510. In a reaction turbine, when the degree of reaction is zero, then there is

(a) no heat drop in the moving blades
(b) no heat drop in the fixed blades
(c) maximum heat drop in the moving blades
(d) maximum heat drop in the fixed blades

JPSC AE 2013 Paper-V

Ans. (a) : No heat drop in the moving blades

$$\text{Degree of Reaction} = \frac{\Delta h_{mb}}{\Delta h_{fb} + \Delta h_{mb}}$$

$$\Delta h_{mb} = 0,$$

$$\boxed{DOR = 0}$$

511. The purpose of governing in steam turbine is to

(a) reduce the effective heat drop
(b) reheat the steam and improve its quality
(c) completely balance against end thrust
(d) maintain the speed of the turbine

JPSC AE 2013 Paper-V

Ans. (d) : The purpose of governing in steam turbine is to maintain the speed of the turbine.

512. Pressure compounding can be done in the following type of turbines:-

(a) Impulse turbines
(b) Reaction turbines
(c) Both impulse and reaction turbines
(d) None of the above

UKPSC AE-2013, Paper-II

Ans. (c) : Pressure compounding can be done in impulse as well as the reaction turbine.

513. Blade efficiency of steam turbine is equal to:-

(a) $\frac{V(V_{w1} - V_{w2})}{2g}$ (b) $\frac{2V(V_{w1} + V_{w2})}{V_1^2}$

(c) $\frac{V(V_{w1} - V_{w2})}{V_1^2}$ (d) $\frac{V^2(V_{w1} - V_{w2})}{2V_1}$

UKPSC AE-2013, Paper-II

Ans. (b) : Blade or diagram efficiency,

$$(\eta_b) = \frac{\text{Power developed by runner}}{\text{Kinetics energy}}$$

$$= \frac{2(V_{w_1} + V_{w_2})V}{V_1^2}$$

Search on Telegram @apna_pdf

514. The ratio of static or pressure head change occuring in the rotor to the total change across the stage :

(a) Pressure Ratio (b) Degree of reaction
(c) Reheat factor (d) Aspect ratio

TNPSC AE (Industries) 09.06.2013

Ans. (b) :

$$\text{Degree of reaction} = \frac{\text{Static pressure drop in the rotor}}{\text{Static pressure drop in the stage}}$$

515. In an impulse steam turbine, the steam expands in:

(a) Nozzles
(b) Moving blades
(c) Nozzle and moving blades
(d) Moving and fixed blades

APGENCO AE 2012

Ans. (a) : In an impulse steam turbine the steam expands wholly in nozzle and there is a pressure drop and heat drop.

516. Steam turbines are used for

(a) Electric power generation
(b) Direct drive for fans, compressors
(c) Marine propulsion
(d) All of the above

APGENCO AE 2012

Ans. (d) : Steam turbine (Rankine cycle) are used for electric power generation, Direct drive for fans, compressors and marine propulsion.

517. Steam expands in a turbine from 40 bar, 500°C to 0.10 bar isentropically. Assuming ideal conditions, given enthalpy drop 1198.8 kJ/kg, nozzle angle 16° and N as 3000 rpm. Mean diameter of the wheel, if the turbine were of simple impulse stage, will be

(a) 3.73 m (b) 4.73 m
(c) 5.63 m (d) 4.96 m

ISRO Scientist/Engineer 2012

Ans. (b) : V_1 = rotor velocity
V_b = blade velocity
α = nozzle angle

$$V_1 = 44.72(\Delta h)^{1/2} = 44.72(1198.8)^{1/2} = 1548.37 \text{m/s}$$

$$V_b = \frac{V_1 \cdot \cos\alpha}{2} = \frac{1548.37 \times \cos 16^\circ}{2} = 744.2 \text{ m/s}$$

$$V_b = \frac{\pi DN}{60} = \frac{\pi D \times 3000}{60} = 744.2$$

$$\Rightarrow \quad D = 4.73 \text{ m}$$

518. The ratio of the increase in pressure in rotor blades to total increase in pressure in the stage is called

(a) Pressure ratio
(b) pressure coefficient
(c) degree of reaction
(d) slip factor

BPSC AE 2012 Paper - V

Ans. : (c) : The ratio of the increase in pressure in rotor blades to total increase pressure in the stage is called degree of reaction.

519. In pressure-compounded turbine

(a) pressure drop in each stage is equal
(b) pressure increases as steam flows over blades
(c) most of the kinetic energy of steam is absorbed as it passes over moving blades
(d) None of these

BPSC AE 2012 Paper - V

Ans. : (c) : Pressure compounded turbine- In this type of turbine, the compounding is done for pressure of steam only i.e., to reduce the high rotational speed of turbine the whole expansion of steam is arranged in a number of steps by employing a number of simple turbine in a series keyed on the same shaft. Each of these simple impulse turbine consisting of one set of nozzle and one row of moving blades is known as a stage of the turbine and thus this turbine consists of several stages.

520. The degree of reaction for a turbomachinary in which heat drop in moving blades is 8 kJ/kg and in fixed blades 12 kJ/kg, would be

(a) 66.6% (b) 150%
(c) 40% (d) 166.6%

UKPSC AE 2012 Paper–II

Ans. (c) : Degree of reaction

$$= \frac{\text{Heat drop in moving blade}}{\text{Heat drop in moving blade} + \text{Heat drop in fixed blade}}$$

$$= \frac{8}{12+8} = \frac{8}{20} = \frac{2}{5} = 0.4 = 40\%$$

521. Parson's reaction turbine has

(a) fixed blades only
(b) moving blades only
(c) identical fixed and moving blades
(d) fixed and moving blades of different shapes.

UKPSC AE 2012 Paper–II

Ans. (c) : identical fixed and moving blades

522. Both pressure and velocity of steam drops in the moving blades of

(a) Impulse turbine
(b) Velocity compounded impulse turbine
(c) Reaction turbine
(d) Pressure compounded impulse turbine

ISRO Scientist/Engineer 2012

Ans. (c) : Both pressure and velocity of steam drops in the moving blades of reaction turbine.

523. In parson's steam turbine, steam expands in

(a) nozzles only
(b) blades only
(c) partly in nozzles and partly in blades
(d) none of the above

UKPSC AE 2012 Paper–II

Ans. (c) : In parson's steam turbine, steam expands in partly in nozzles and partly in blades.

524. Wrong statement for the Curtis turbine is :

(a) Curtis turbine consists of a set of nozzles followed by a set of moving blades
(b) In conventional design only two rows of moving blades are used
(c) There is no restriction on the number of rows of moving blades
(d) Curtis stage is also known as velocity compounding

OPSC Civil Services Pre. 2011

Search on Telegram @apna_pdf

Ans. (c) : Curtis turbine –
- Curtis turbine consists of a set of nozzle followed by a set of moving blades.
- In conventional design only two rows of moving blades.
- Curtis stages is also known as velocity compounding.

525. What is the action of steam in a steam turbine?
(a) Static
(b) Dynamic
(c) Static and dynamic
(d) Neither static nor dynamic

VIZAG STEEL MT 2011

Ans. (b) : A steam turbine works on the dynamic action of steam. Steam is caused to fall in pressure in a passage or nozzle. Due to this fall in pressure, certain amount of heat energy is converted into kinetic energy to give it high velocity.

526. For a given power an impulse turbine as compared to a reaction turbine has ___ row of blades :
(a) less (b) more
(c) equal (d) none of above

J&K PSC Civil Services Pre, 2010

Ans. (b) : An impulse turbine as compared to a reaction turbine, for a given power has more row of blades.

527. For reaction turbines which of the following governing methods is not used ?
(a) Throttle governing
(b) By-pass governing
(c) Nozzle control governing
(d) Throttle and by pass governing

J&K PSC Civil Services Pre, 2010

Ans. (c) : Governing method for reaction turbine –
(i) Throttle governing
(ii) By-pass governing
(iii) Throttle and by pass governing
Note - A nozzle used only impulse turbine, and not in reaction turbine.

528. Pressure drop in nozzle occurs in
(a) reaction turbine (b) impulse turbine
(c) steam turbine (d) all of those

TNPSC AE, 2008

Ans. (b) : Pressure losses occurs when fluid flows from convergent to divergent.

529. In a 50% reaction stage of a gas turbine
(a) the static enthalpy drop in the stator is greater than that in the rotor
(b) the static enthalpy rise in the stator is greater than that in the rotor
(c) the static enthalpy rise in the stator is greater than that in the rotor
(d) the stage static enthalpy drop is equally shared by the rotor and stator

DRDO Scientists 2008

Ans. (d) : Degree of reaction

$$R = \frac{\text{Static enthalpy change in rotor}}{\text{Static enthalpy change in stage}}$$

$$= \frac{\Delta h_R}{\Delta h_R + \Delta h_S}$$

$$0.5 = \frac{\Delta h_R}{\Delta h_R + \Delta h_S}, \quad \Delta h_R = 0.5\,\Delta h_R + 0.5\,\Delta h_S$$

$$\Delta h_R = \Delta h_S$$

530. What is the effect of bleeding?
(a) It decreases the power developed by the turbine
(b) The boiler is supplied with hot water
(c) It increases thermodynamic efficiency of turbine
(d) All of above

UKPSC AE 2007 Paper -II

Ans. (d) : All of above

531. Steam turbines are governed by which of following methods?
(a) Throttle governing
(b) Nozzle control governing
(c) Bypass governing
(d) All of above

UKPSC AE 2007 Paper -II

Ans. (d) : All of above

532. For a single stage impulse turbine, having nozzle angle a, maximum blade efficiency under ideal conditions is given by
(a) $\frac{\cos\alpha}{2}$ (b) $\frac{\cos^2\alpha}{2}$
(c) $\frac{\cos 2\alpha}{2}$ (d) $\cos^2\alpha$

UKPSC AE 2012, 2007 Paper -II

Ans. (d) : $\cos^2\alpha$

533. In the impulse turbine the steam expands in
(a) blade
(b) nozzle
(c) partly in nozzle and partly in blade
(d) none of the above

UKPSC AE 2007 Paper -II

Ans. (b)
- In impulse turbine the steam expands in nozzle only.
- In reaction turbine the steam expands in fixed as well as moving blade.

534. Compared to reciprocating steam engines, steam turbines
(a) have higher efficiency
(b) have low steam consumption
(c) have less frictional losses due to sliding parts
(d) all of above

UKPSC AE 2007 Paper -II

Ans. (d) : All of above

535. The condition for maximum efficiency of reaction turbine is given by
(a) $V_b = V_1 \cos\alpha$ (b) $V_b = V_1^2 \cos\alpha$
(c) $V_b = (V_1 \cos\alpha)/2$ (d) $V_b = \frac{V_1^2 \cos 2\alpha}{2}$
[V_1 being the absolute speed of the steam entering the blades and α being nozzle angle]

UKPSC AE 2007 Paper -II

Ans. (a) : $V_b = V_1 \cos\alpha$

Search on Telegram @apna_pdf

536. In steam turbines the ratio of blade length divided by the steam passage width is

(a) aspect ratio (b) diagram factor
(c) unity (d) none of these

OPSC Civil Services Pre 2006

Ans. (a) : Ratio of blade length to the steam passage width is known as aspect ratio.

537. Reheating of steam is used

(a) to increase efficiency
(b) to increase work output
(c) to increase turbine inlet temperature
(d) to reduce amount of fuel used

Nagaland PSC (CTSE) 2017, 2016, Paper-II

Ans. (b) : With reheating of steam turbine is used to increase the work output.
Work output
= Work done by turbine – Work done by compressor

538. Reheat of steam under ideal conditions takes place at constant

(a) Temperature (b) Enthalpy
(c) Pressure (d) Entropy

Nagaland PSC CTSE 2017 Paper-2

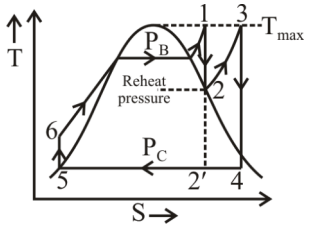
Ans. (c) : Reheating of steam under ideal conditions take place at constant pressure.

539. Reheating of steam

(a) Decreases steam rate
(b) Increases steam rate
(c) No effect on steam rate
(d) None of the mentioned

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Main purpose of reheating is to avoid excess moisture in steam at the end of expansion to protect the turbine. Since, by reheating the work output increase the steam rate decreases.



- W_T-↑, W_P-Constant, W_{net}-↑
- $\downarrow \text{Specific Steam Consumption} = \frac{3600}{W_{net}\uparrow}$
- η-↑↓ (Can't say)

4. Steam Nozzle

540. The critical pressure ratio for maximum discharge in steam nozzle is

(a) $\frac{2}{\gamma+1}$ (b) $\left(\frac{2}{\gamma+1}\right)^{\gamma}$

(c) $\left(\frac{2}{\gamma+1}\right)^{\gamma-1}$ (d) $\left(\frac{2}{\gamma+1}\right)^{\frac{\gamma}{\gamma-1}}$

where 'γ' is the isentropic index

ISRO Scientist/Engineer 17.12.2017
ISRO Scientist/Engineer 03.07.2016
RPSC LECTURER 16.01.2016
BPSC Poly. Lect. 2016, ESE 2002, 2000

Ans. (d) : Critical pressure ratio for maximum discharge

$$\frac{P_2}{P_1} = \left(\frac{2}{\gamma+1}\right)^{\frac{\gamma}{\gamma-1}}$$

541. Shock effect in a nozzle is felt in

(a) divergent portion (b) straight portion
(c) convergent portion (d) throat

BPSC AE Mains 2017 Paper - V
TANGEDCO AE 2015, TNPSC AE 2014
BPSC AE 2012 Paper - V

Ans. : (a) : Shock effect in a nozzle is felt in divergent portion.
For a nozzle to have a supersonic outlet, the speed at the throat should be definitely sonic and the nozzle should be divergent from the throat section.

542. The maximum velocity attainable at the throat of a steam nozzle is

(a) Much less than sonic velocity
(b) Slightly less than sonic velocity
(c) Supersonic velocity
(d) Sonic velocity
(e) None of the above

UPSC JWM 2017
CGPSC Poly. Lect. 22.05.2016
J&K PSC Civil Services Pre, 2013
BPSC AE 2012 Paper-V

Ans. (d) : The maximum velocity attainable at the throat of a steam nozzle is sonic velocity. Sonic is stated that sonic velocity of sound in that fluid (a gas/vapour). Its a maximum that can be achieved by the fluid.

543. The function of steam nozzle is to convert :

(a) heat energy steam into kinetic energy
(b) heat energy steam into rotational energy
(c) kinetic energy into heat energy of steam
(d) heat energy steam into pressure energy

APPSC-AE-2019, Kerala PSC AE 06.08.2015
KPSC AE. 2015, TSPSC AEE 2015

Ans. (a) : Steam nozzle- Steam nozzle is a passage of varying cross-section by means of which heat energy of steam is converted into kinetic energy as the steam expands from higher pressure to a lower pressure.

Therefore nozzle is designed to increase the velocity of steam.

544. Convergent-divergent nozzle is said to be choked when .....

(a) critical pressure is attained at the exit and Mach number at this section is sonic
(b) velocity at the throat becomes supersonic
(c) exit velocity becomes supersonic
(d) mass flow rate through the nozzle reaches a maximum value

RPSC AE 2018
Punjab PSC (Lect.) 06.08.2017, ESE 2016

Search on Telegram @apna_pdf

Ans. (d) : In the choked condition, a constant and maximum mass flow rate of air passes through nozzle. In this condition,

- critical pressure at throat and after that pressure reduces.
- mach number at throat is one i.e. velocity of flow is sonic.
- After the throat, the flow velocity may be subsonic or supersonic depending upon exit pressure of nozzle.

545. Pressure loss occurs in nozzle due to .....

(a) Due to viscous force
(b) When fluid flows from convergent to divergent
(c) Frictional forces
(d) None of the mentioned

Nagaland PSC (CTSE) 2017, 2016, Paper-II

Ans. (b) : Pressure loss generally occurs when fluid flow from convergent section to divergent section in nozzle.

546. The effect of friction in nozzle is to :

(a) keep dryness fraction constant
(b) increase dryness fraction
(c) decrease dryness fraction
(d) first increase dryness fraction up to a certain limit and then decrease

J&K PSC Civil Services Pre, 2013
ESE 1995

Ans. (b) : Effect of friction on nozzles–

- Entropy is increased
- The energy available decreases
- Reduction in enthalpy
- Steam is reheated i.e. quality of vapour at the exit is improved means dryness fraction increases.
- Decreases in mass flow rate.

547. In a nozzle super heated steam expanding from 10 bar to 2 bar, the pressure at the throat will be

(a) 1.66 bar (b) 3.26 bar
(c) 5.46 bar (d) 8.26 bar

RPSC IOF, 2020, APGENCO AE, 2017

Ans. (c) Saturated value n = 1.135
Super heated value n = 1.3

$$\text{Critical pressure} = \frac{P_2}{P_1} = \left(\frac{2}{n+1}\right)^{\frac{n}{n-1}}$$

$$\frac{P_2}{P_1} = (0.869)^{4.33}$$

$$\frac{P_2}{10} = 0.544$$

$P_2 = 5.44$ bar ≈ 5.46 bar

548. In a steam nozzle, inlet pressure of superheated steam is 10 bar. The exit pressure is decreased from 3 bar to 1 bar. The discharge rate will :

(a) remain constant
(b) decrease
(c) increase slightly
(d) increase or decrease depending on whether the nozzle is convergent or convergent-divergent

GPSC ARTO Pre 30.12.2018, ESE 1999

Ans. (a) : In steam nozzle, as the steam pressure is decreased at the exit but according to conservation of mass discharge rate will remain constant.

549. In a steam nozzle, to increase the velocity of steam above sonic velocity by expanding steam below critical pressure.

(a) a vacuum pump is added
(b) ring diffusers are used
(c) divergent portion of the nozzle is necessary
(d) abrupt change in cross-section is needed

GPSC ARTO Pre 30.12.2018, ESE 2006

Ans. (c) : In a steam nozzle, to increase the velocity of steam above sonic velocity by expanding steam below critical pressure, divergent portion of the nozzle is necessary.

550. The critical pressure ratio for initially dry saturated steam is

(a) 0.528 (b) 0.546
(c) 0.577 (d) 0.582

JPSC AE 2013 Paper-V, ESE 1994

Ans. (c) : For dry saturated steam
n = 1.135

$$\frac{P_2}{P_1} = \left(\frac{2}{n+1}\right)^{\frac{n}{n-1}}$$

$$\frac{P_2}{P_1} = \left(\frac{2}{2.135}\right)^{\frac{1.135}{0.135}}$$

$$\frac{P_2}{P_1} = (0.9367)^{8.407}$$

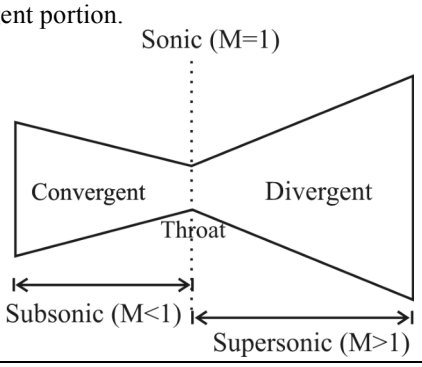
$= 0.577$

551. Mach number is more than unity in which of the following portions of a convergent-divergent nozzle?

(a) Convergent portion (b) Straight portion
(c) Throat (d) Divergent portion

TNPSC AE (Industries) 09.06.2013
BPSC AE 2012 Paper - V

Ans. : (d) : Mach number is more than unity, the nozzle is divergent portion.



Search on Telegram @apna_pdf

552. In a nozzle designed for the maximum discharge conditions, the flow velocity in the convergent section of the nozzle

(a) is sonic
(b) is subsonic
(c) is supersonic
(d) depends upon the initial pressure and condition of steam

BPSC AE Mains 2017 Paper - V
ESE 2013

Ans. : (b) : In a nozzle designed for the maximum discharge conditions, the flow velocity in the convergent section of the nozzle is subsonic.

553. A correctly designed convergent-divergent nozzle working at a designed load is

(a) always isentropic (b) always chocked
(c) never chocked (d) never isentropic

VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012

Ans. (b) : Always chocked– Divergent portion will be act as nozzle only if flow is supersonic for that must be chocked.

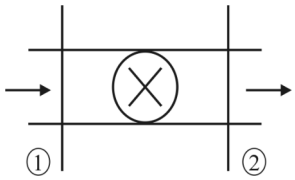
554. If steam is throttled, its.

(a) Pressure and enthalpy remain unchanged.
(b) Temperature and entropy remain unchanged
(c) Enthalpy remains unchanged but other property changes.
(d) Enthalpy remains unchanged but pressure may or may not change.

RPSC ACF & FRO, 26.02.2021

Ans. (c) : If steam is throttled its enthalpy remains unchanged but other property changes.

Throttling Process-



$P_2 < P_1$ (Pressure drop)
$V_2 < V_1$ (Expansion process)
$S_2 > S_1$ (Irreversible process)
$h_1 = h_2$ (Isenthalpic process)

555. If the turbine nozzle operates at a higher pressure ratio than the design value, then it is called _____.

(a) sub critical condition
(b) critical condition
(c) super critical condition
(d) abnormal condition

VIZAG STEEL MT 24.01.2021, Shift-II, Shift-I

Ans. (c) : If the turbine operates at a higher pressure ratio than the design value, then its called super critical condition

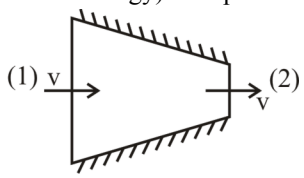
$$\frac{P_c}{P_1} = \left(\frac{2}{n+1}\right)^{\frac{\gamma}{\gamma-1}}$$

556. Which condition is not satisfied for the nozzle?

(a) Velocity decreases
(b) Velocity increases
(c) Heat transfer is zero
(d) Work transfer is zero

VIZAG STEEL MT 24.01.2021, Shift-II

Ans. (a) : Nozzle is a device which increases velocity (i.e. increases kinetic energy) in expanse of pressure.



= Heat transfer zero
= Work transfer zero

557. Air flows isentropically through a duct. At a section, the area is 0.05 m^2, velocity v = 180 m/s and temperature T = 470 K. Compute the stagnation temperature T_0

(a) 486 K (b) 286 K
(c) 556 K (d) 508 K

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : $V_1 = 180$ m/sec, $C_p = 1.005$ kJ/kgK
$T_1 = 470$ K

Stagnation enthalpy $h_0 = h_1 + \frac{V_1^2}{2000}$

$$C_pT_0 = C_pT_1 + \frac{V_1^2}{2000}$$

Stagnation temperature, $T_0 = T_1 + \frac{V_1^2}{2000C_p}$

$$T_0 = 470 + \frac{180^2}{2000 \times 1.005}$$

$$T_0 = 486.119 \text{ K}$$

558. The quality of vapour at the exit of nozzle ------ due to nozzle friction.

(a) Increases (b) Decreases
(c) Does not change (d) Unpredictable

UPPSC AE 13.12.2020, Paper-2

Ans. (a) : The quality of vapour at the exit of nozzle increases due to nozzle friction.
Due to friction, reheating of steam takes place leads to effect of super saturation in nozzle.

559. Which of the following are effects of nozzle friction?

1. Enthalpy drop decreases
2. Exit velocity reduces
3. Decrease in specific volume
4. Decrease in mass flow rate

Select correct code

(a) 1, 2 and 3 (b) 2, 3 and 4
(c) 1, 3 and 4 (d) 1, 2 and 4

UPPSC AE 13.12.2020, Paper-2

Search on Telegram @apna_pdf

Ans. (d) : Effect of Nozzle Friction–
(1) Actual enthalpy drop decreases.
(2) Reduction in the exit velocity of fluid.
(3) Increase in specific volume (density decrease).
(4) Decrease in mass flow rate.
(5) Increase in dryness fraction.
(6) Increase in entropy.

560. When a steam nozzle is supersaturated, the mass flow rate through it, when compared to equilibrium conditions
(a) Does not change
(b) is lower
(c) is higher
(d) may be higher or lower depending on inlet temperature

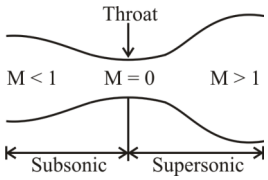
Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : During super saturation or condition of metastable the density is increased (about eight times), which gives the increase in mass of steam discharged.

561. To achieves highest exit flow velocity in application using liquids, the nozzles shape requires is _____
(a) A convergent - divergent passage
(b) A divergent - convergent passage
(c) A divergent passage only
(d) A convergent passage only

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a)



To achieve highest velocity the nozzle should be convergent divergent type. In which velocity in convergent portion subsonic at throat sonic and in divergent portion supersonic.

562. Critical pressure ratio in a nozzle is ratio of pressure at _____ to the inlet pressure
(a) Exit of the nozzle
(b) Minimum area
(c) Location of sonic velocity
(d) Atmospheric

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Critical pressure ratio in a nozzle is ratio of pressure at location of sonic velocity (throat) to the inlet pressure.

563. An aircraft is in its take off roll at sea level with ambient temperature of 18°C. What is the approximate speed of the aircraft if the temperature measured by a probe at the exit of the engine diffuser is 36°C? (Assuming air stagnation at diffuser outlet and C_P of air as 1.0 kJ/kg.K)
(a) 12 m/s (b) 3 m/s
(c) 6 m/s (d) 18 m/s

ISRO Scientist/Engineer 12.01.2020

Ans. (*) : $T_1 = 18°C = 291K$ $C_P = 1.0$ kJ/kgK
Temperature measured by a probe at the exit of the engine diffuser = stagnation temperature = 36°C = 309K

$$T_0 = T_1 + \frac{v^2}{2C_P}$$

$$36 = 18 + \frac{v^2}{2\times1\times10^3}$$

$$v = \sqrt{2\times10^3\times18} = 60\sqrt{10} \text{ m/sec.}$$

v = 189.7 m/sec

Note-This question is deleted by ISRO.

564. If m_f is the mass of fuel supplied per kg of air in one second, then the mass of gases leaving the nozzle of turbojet will be
(a) $(1-m_f)$kg/s (b) $\frac{1}{(1+m_f)}$kg/s
(c) $(1+m_f)$kg/s (d) $\frac{1}{(1-m_f)}$kg/s

ESE 2020

Ans. (c) : $(1+m_f)$kg/s

565. The diameter of a nozzle d for maximum transmission of power through it, is
(a) $\left[\frac{D^5}{8fL}\right]^{\frac{1}{4}}$ (b) $\left[\frac{D^5}{8fL}\right]^{\frac{1}{2}}$
(c) $\left[\frac{D^5}{fL}\right]^{\frac{1}{4}}$ (d) $\left[\frac{8D^5}{fL}\right]^{\frac{1}{2}}$

where :
D = Diameter of pipe
f = Coefficient of friction
L = Length of pipe

ESE 2020

Ans. (a) : $\left[\frac{D^5}{8fL}\right]^{\frac{1}{4}}$

566. A 120 mm diameter jet of water is discharging from a nozzle into the air at a velocity of 40 m/s. The power in the jet with respect to a datum at the jet will be
(a) 380 kW (b) 360 kW
(c) 340 kW (d) 320 kW

ESE 2020

Ans. (b) : Given:
d = 120 mm = 0.12 m
V = 40 m/s

$$P = \frac{1}{2}\dot{m}V^2 \qquad \because \dot{m} = \rho aV$$

$$= \frac{1}{2}(\rho aV)V^2$$

$$= \frac{1}{2}\rho aV^3$$

$$= \frac{1}{2}\times\frac{(1000)}{1000}\times\frac{\pi(0.12)^2}{4}\times(40)^3$$

$$P = 361.91 \text{ kW}$$

$$\approx 360 \text{ kW}$$

Search on Telegram @apna_pdf

567. Subsonic and supersonic diffusers have the following geometry

(a) Divergent and convergent respectively
(b) Both divergent
(c) Both convergent
(d) Convergent and divergent respectively

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a)

- For subsonic compressible flow, converging passage act as nozzle and diverging passage as a diffuser.
- For supersonic compressible flow, converging passage act as diffuser and diverging passage act as nozzle.

568. For a super sonic flow if the area of flow increases then.

(a) Velocity remains constant
(b) Velocity increases
(c) Velocity decreases
(d) Velocity initially increases and after attaining peak decreases.

OPSC AEE 2019 PAPER - II

Ans. : (b) : For a supersonic flow if the area of flow increases pressure decreases and velocity increases.

569. The region inside the Mach cone is called:

(a) Zone of action (b) Zone of silence
(c) Control volume (d) None of these

OPSC AEE 2019 PAPER - II

Ans. : (a) : The region inside the mach cone is called zone of action.

570. At critical pressure ratio, the velocity at the throat of a nozzle is:

(a) Equal to the sonic speed
(b) Less than the sonic speed
(c) More than the sonic speed
(d) None of these

OPSC AEE 2019 PAPER - II

Ans. : (a) : Mach number at throat is one i.e. velocity of flow is sonic.

571. In a supersonic flow, a diffuser is a conduit having:

(a) Constant area throughout its length
(b) Converging-diverging passage
(c) Gradually decreasing area
(d) Diverging-converging passage

OPSC AEE 2019 PAPER - II

Ans. : (c) : In a supersonic flow, a diffuser is a conduit having gradually decreasing area.

572. The sonic velocity in a fluid medium is directly proportional to:

(a) Mach number
(b) Pressure
(c) Temperature
(d) Square root of temperature

OPSC AEE 2019 PAPER - II

Ans. : (d) : $\text{Sonic Velocity} = \sqrt{\gamma RT}$

573. Speed of sound is maximum in

(a) Liquid (b) Gas
(c) Solid (d) Semisolid

Gujarat PSC AE 2019

Ans. (c) : Speed of the sound depends on the density of medium through which it is travelling more the density more is the speed. As density of solid is more than liquid and gases, sound travels with more speed in solids.

574. For nozzle governed turbine the efficiency is mainly affected due to the losses during:

(a) Throttling
(b) Inter stage pressure drop
(c) Stage condensation
(d) Partial admission

OPSC AEE 2019 PAPER - II

Ans. : (d) : For nozzle governed turbine the efficiency is mainly affected due to losses during partial admission.

575. The nozzle efficiency of a turbine is:

(a) Ratio of work done on moving blades to actual enthalpy drop
(b) Ratio of work delivered by blades to Isentropic enthalpy drop
(c) Ratio of actual to Isentropic enthalpy drop
(d) None of these

OPSC AEE 2019 PAPER - II

Ans. : (c) :

$$\text{Nozzle efficiency} = \frac{\text{Useful heat drop}}{\text{Isentropic heat drop}}$$

576. What will be the approximate velocity (in m/s) of bullet fired in standard air (Temperature of air = 300 K) if the mach angle is 30° [R = 0.28 kJ/kg-K, γ = 1.4]

(a) $560\sqrt{6}$ (b) $140\sqrt{6}$
(c) $70\sqrt{6}$ (d) $280\sqrt{6}$

SJVN ET 2019

Ans. (d) : Given, T = 300 K
Mach angle (θ) = 30°
R = 0.28 kJ/kgK = 280 J/kgK
γ = 1.4

$$\sin\theta = \frac{1}{M}$$

$$\sin 30^\circ = \frac{1}{M}$$

$$\frac{1}{2} = \frac{1}{M}$$

$$M = 2$$

$$C = \sqrt{\gamma RT}$$

$$= \sqrt{1.4 \times 280 \times 300}$$

$$= 14 \times 10\sqrt{6}$$

$$= 140\sqrt{6}$$

$$V = MC$$

$$= 2 \times 140\sqrt{6}$$

$$= 280\sqrt{6}$$

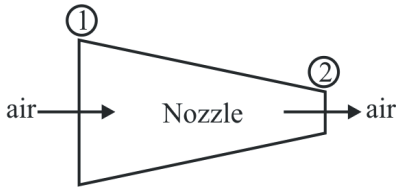
577. In an isentropic flow through a nozzle, air flows at the rate of 600 kg/hr. At inlet to nozzle, the pressure is 2 MPa and the temperature is 127°C. The exit pressure is of 0.5 MPa. If the initial velocity of air is 300 m/s, the exit velocity will be

Search on Telegram @apna_pdf

(a) 867 m/s (b) 776 m/s
(c) 685 m/s (d) 594 m/s

ESE 2019

Ans. (d) :



Given,

$\dot{m} = 600$ kg/hr
$= 0.167$ kg/s
$p_1 = 2$ MPa
$p_2 = 0.5$ MPa
$T_1 = 127 + 273 = 400$ k
$C_1 = 300$ m/s

We know that

$$\frac{T_2}{T_1} = \left(\frac{p_2}{p_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_2}{400} = \left(\frac{0.5}{2}\right)^{\frac{1.4-1}{1.4}}$$

$T_2 = 269.18$ K

From steady flow energy equation

$$\dot{m}\left[h_1 + \frac{C_1^2}{2000}\right] = \dot{m}\left[h_2 + \frac{C_2^2}{2000}\right]$$

$$h_1 + \frac{C_1^2}{2000} = h_2 + \frac{C_2^2}{2000}$$

$$C_p T_1 + \frac{(300)^2}{2000} = C_p T_2 + \frac{C_2^2}{2000}$$

$$(1.005 \times 400) + 45 = 1.005 \times 269.19 + \frac{C_2^2}{2000}$$

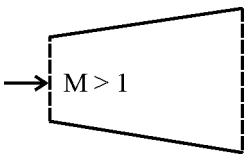
$C_2 = 594.09$ m/s

578. In flow through a nozzle, the Mach number is more than unity

(a) in the converging section
(b) in the diverging section
(c) at the throat
(d) can be in any section of the nozzle depending upon the nozzle profile and geometry

GPSC Executive Engineer 23.12.2018

Ans. (b) :



When mach number (M) > 1

Pressure	Decreases
Velocity	Increases
Mach No.	Increases
Temperature	Decreases
Density	Decreases

579. The velocity of sound in a gaseous medium at a temperature of 400K in 400ms^{-1}. If the temperature of the medium is increased to 600 K, the velocity of sound will be nearly

(a) 400 ms^{-1} (b) 490 ms^{-1}
(c) 600 ms^{-1} (d) None of there

ISRO Scientist/Engineer 22.04.2018

Ans. (b) : We know that velocity of sound in a gaseous medium.

$$C = \sqrt{\gamma RT}$$

$$C \propto \sqrt{T} \qquad \therefore \ \gamma R = Constant$$

$$\frac{C_2}{C_1} = \sqrt{\frac{T_2}{T_1}}$$

$$C_2 = 400 \times \sqrt{\frac{600}{400}}$$

$$C_2 = 400 \times 1.2247$$

$$C_2 = 489.89 \approx 490 \ m/s$$

580. For air (k = 1.4) the critical pressure ratio P_1/P_0 for isentropic flow is

(a) 0.833 (b) 0.728
(c) 0.628 (d) 0.528

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : Critical pressure in nozzle flow

$$\frac{P_1}{P_o} = \left(\frac{2}{k+1}\right)^{k/k-1}$$

Given,

$k = 1.4$

$$\frac{P_1}{P_o} = \left(\frac{2}{1.4+1}\right)^{\frac{1.4}{1.4-1}} = 0.528$$

581. The expansion of steam in a Nozzle follows-

(a) Carnot cycle (b) Joule cycle
(c) Rankine cycle (d) Stirling cycle

GMB AAE 25.06.2017

Ans. (c) : The expansion of steam in a nozzle follows Rankine cycle. The friction in the nozzle increases the dryness fraction of steam. The pressure of steam at throat is called critical pressure.

582. A converging diverging nozzle of a supersonic solid propellant rocket is designed for an exit pressure of 35 KPa. The rocket flying at an altitude having an ambient pressure of 28 KPa would cause

(a) A normal shock in the diverging portion of the nozzle
(b) A normal shock at the exit of the nozzle
(c) A normal shock at the throat of the nozzle
(d) No Shock

GPSC Asstt. Director of Transport 05.03.2017

Ans. (d) : Shock wave will be produced, when the designed pressure is lower than the ambient pressure.

So, $P_{designed} > P_{ambient}$

Here, No, shock will produce.

Search on Telegram @apna_pdf

583. The expansion in a nozzle is a:

(a) isentropic process (b) adiabatic process
(c) isochoric process (d) isobaric process

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (a) :

584. In an atmosphere the speed of sound is 300 m/s. If a plane travels at 1620 km/h in this atmosphere, the Mach angle is

(a) 30.5º (b) 56.3º
(c) 10.7º (d) 41.8º

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) :

$$\sin\alpha = \frac{1}{m} = \frac{1}{\frac{v}{c}} = \frac{c}{v}$$

$$\alpha = \sin^{-1}\left(\frac{c}{v}\right)$$

$$= \sin^{-1}\left(\frac{300}{1620\times\frac{5}{18}}\right) = \sin^{-1}\left(\frac{300}{450}\right)$$

$$= \sin^{-1}(0.667) = 41.8^0$$

585. In a standard atmosphere the temperature is 15 ºC at sea level and –56ºC at an altitude of 20 km. A supersonic plane has the same speed at the sea level as well as at an altitude of 20 km. If its Mach number is 1.5 at sea level, its Mach number at an altitude of 20 km in standard atmosphere is

(a) 2.80 (b) 1.30
(c) 1.99 (d) 1.73

TSPSC AEE 28.08.2017 (Civil/Mechanical)

Ans. (d) : $T_1 = 15°C = 15 + 273 = 288k$

$T_2 = -56°C = -56 + 273 = 217k$

$M_1 = 1.5$

$M_2 = ?$

$$M_1 = \frac{V}{C_1} = \frac{V}{\sqrt{\gamma RT_1}}$$

$$M_2 = \frac{V}{C_2} = \frac{V}{\sqrt{\gamma RT_2}}$$

$$\frac{M_2}{M_1} = \sqrt{\frac{T_1}{T_2}}$$

$$M_2 = 1.5\sqrt{\frac{288}{217}} = 1.73$$

586. The difference of level of tip of main nozzle and fuel level in float chamber of a simple carburetor is called :

(a) Nozzle lip (b) Throttle lip
(c) Throttle dip (d) Nozzle dip

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) The difference of level of tip of main nozzle and fuel level in float chamber of a simple carburetor is called Nozzle lip.

587. Fire hose nozzle is generally made of ..... .

(a) divergent shape
(b) convergent shape
(c) convergent-divergent shape
(d) cylindrical shape

GWSSB DEE 07.07.2016

Ans. (b) : Fire hose nozzle is generally made of convergent shape.

588. Supersonic diffusers have ….. geometry.

(a) Only convergent
(b) Only divergent
(c) Divergent and convergent respectively
(d) Uniform

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) :

589. Head loss in nozzles occurs due to .....

(a) Pipes head loss
(b) Pressure loss
(c) Friction loss
(d) None of the mentioned

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Head loss in nozzles occurs due to pipelines.

590. The purpose of 'diffuser' is opposite to that of:

(a) Compressor (b) Nozzle
(c) Valve (d) Condenser

HPPSC AE (PWD) 10.09.2016

Ans. (b) : Nozzle- A steam nozzle converts heat energy of steam into kinetic energy. Where as diffuser convert kinetic energy into heat energy. A nozzle increase the velocity and decrease the pressure of a fluid while a diffuser decreases the velocity and increase the pressure of a fluid.

591. Air is accelerated isentropically from 100 m/s to 300 m/s in a nozzle. If the temperature at the inlet is 127°C, the inlet Mach number is (take R = 287 J/(kg K) and specific heat ratio = 1.4)

(a) 0.249 (b) 0.442
(c) 0.747 (d) 0.333

ISRO Scientist/Engineer 03.07.2016

Ans. (a) : Actual velocity $V_1 = 100$ m/s

Final velocity $V_2 = 300$ m/s

For an ideal gas, in an isentropic process–

$C = \sqrt{\gamma RT}$

R = 287 J/kg-K, T = 127°C = 127 + 273 = 400 K

$\gamma = 1.4$

$C = \sqrt{1.4\times 287\times 400}$

C = 400.898

Mach number $(M) = \left(\frac{V}{C}\right)$

V = Actual velocity

$M = \frac{100}{400.898}$

M = 0.249

Search on Telegram @apna_pdf

592. Gaseous Nitrogen at 30°C is expanded through a converging nozzle from a total pressure of 0.5 MPa to a back pressure chamber. If the back pressure is increased from 0.1 MPa to 0.4 MPa in steps of 0.02 MPa, the trend in mass flow rate through the nozzle

(a) will gradually decrease
(b) will gradually increase
(c) will remain constant till a point and then gradually decrease
(d) will remain constant till a point and then gradually increase

ISRO Scientist/Engineer 03.07.2016

Ans. (c) : Back pressure chamber

$P_b = 0.5$, $\gamma = 1.4$ "for air"

$$\frac{P_c}{P_b} = \left(\frac{2}{\gamma+1}\right)^{\frac{\gamma}{\gamma-1}}$$

$$P_c = P_b\left(\frac{2}{2.4}\right)^{\frac{1.4}{0.4}}$$

$$P_c = 0.5\left(\frac{2}{2.4}\right)^{\frac{1.4}{0.4}}$$

Critical pressure

$P_c = 0.2641$ MPa

When we start increasing pressure from 0.1 MPa to 0.2641 MPa i.e. upto critical pressure mass flow rate is constant, beyond 0.2641 MPa to 0.4 MPa mass flow rate decreases.

593. The value of index n for isentropic expansion of superheated steam through the nozzle is

(a) 1.4 (b) 1.3
(c) 1.135 (d) 1.113
(e) 1.125

CGPSC AE 26.04.2015 Shift-II

Ans. (b) : The value of index n for isentropic expansion of superheated steam and saturated steam through the nozzle are 1.3 and 1.135 respectively.

594. Semi-cone angle of the divergent part of the convergent divergent steam nozzle is of the order of

(a) 3 to 10 (b) 13 to 20
(c) 23 to 30 (d) 33 to 40
(e) 43 to 50

CGPSC AE 26.04.2015 Shift-II

Ans. (a) : Semi-Cone angle of the divergent part of the convergent divergent steam nozzle is of the order of 3 to 10.

595. Nozzle is designed for

(a) maximum pressure at outlet
(b) maximum discharge
(c) minimum discharge
(d) none of the above

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : A nozzle is a duct of smoothly varying cross sectional area, in which a steadily flowing fluid can be accelerated to a high velocity by a drop in pressure of the fluid along the duct.

Nozzles are used in steam and gas turbines, jet engines, rockets, in flow measurement, in injectors for pumping water, in ejectors for removing air from condensers etc.

Types of Nozzles–

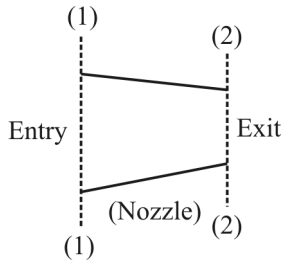
1. Convergent nozzle
2. Convergent-divergent nozzle
3. Divergent nozzle

596. A perfect gas flows through a nozzle where it expands in reversible adiabatic manner. The inlet conditions are 22 bar, 500°C, 38 m/s. At exit the pressure is 2 bar. Given R = 190J/kg K and γ = 1.35. The exit velocity will be

(a) 700 m/s (b) 726 m/s
(c) 801 m/s (d) 701 m/s

MPPSC AE 08.11.2015

Ans. (b) :



$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_2}{(500+273)} = \left(\frac{2}{22}\right)^{\frac{1.35-1}{1.35}}$$

$T_2 = 415.134$ K

$$\gamma = \frac{C_p}{C_v} = 1.35$$

$C_p - C_v = R = 0.190$ kJ/kg-K

$$C_p - \frac{C_p}{1.35} = 0.19$$

$C_P = 0.733$

$$C_p(T_2 - T_1) + \frac{1}{2000}(38)^2 = \frac{C^2}{2000}$$

$$0.733(773 - 415.134) + \frac{1}{2000}(38)^2 = \frac{1}{2000}C^2$$

$$262.32 + \frac{1}{2000}(38)^2 = \frac{1}{2000}C^2$$

$C = 725.31$ m/s.

597. At normal atmospheric conditions, the ratio of the speed of sound in water to that in air is about

(a) 1.5 (b) 2.0
(c) 4.0 (d) 7.0

TNPSC AE 2014

Ans. (c) : At normal atmospheric conditions, the ratio of the speed of sound in water to that in air is about 4.0.

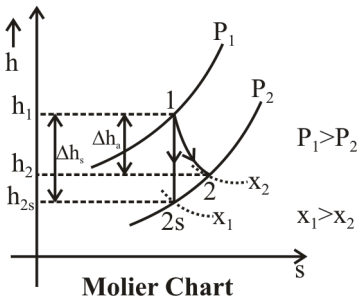
Search on Telegram @apna_pdf

598. In steam nozzle for the same pressure ratio the dryness fraction of exit steam increases due to considering the effect of

(a) friction loss (b) contraction loss
(c) velocity loss (d) pressure loss

Mizoram PSC AE/SDO 2014, Paper-I

Ans. (a) :



Molier Chart

Nozzle Efficiency–In actual working there is always friction while flow takes places through nozzle. Friction is mainly due to surface of nozzle and fluid and also due to internal fluid friction. Nozzle efficiency is defined as a ratio of actual enthalpy drop to the isentropic enthalpy drop possible in a nozzle.

$$\eta_N = \frac{\text{Actual enthalpy drop}}{\text{Isentropic enthalpy drop}}$$

$$\eta_N = \frac{\Delta h_a}{\Delta h_s} = \frac{h_1 - h_2}{h_1 - h_{2s}}$$

The effect of considering friction in steam nozzles for the same pressure ratio leads to increase in dryness fraction of exit steam.

599. The ratio of exit pressure to inlet pressure for maximum mass flow rate per unit area of steam through a nozzle when steam is initially dry saturated is

(a) 0.6 (b) 0.578
(c) 0.555 (d) 0.5457

MPPSC State Forest Service Exam, 2014

Ans. (b) : As we know,
The mass flow rate is maximum where,

$$\frac{d}{dy}\left[y^{2/n} - y^{\frac{n+1}{n}}\right] = 0, \qquad y = \frac{p_2}{p_1}$$

$$y = \left[\frac{2}{n+1}\right]^{\frac{n}{n-1}}$$

For maximum,

$$\frac{p_{cr}}{p_1} = \left[\frac{2}{n+1}\right]^{\frac{n}{n-1}} \Rightarrow n = 1.135$$

$$p_{cr} = 0.578\, p_1$$

600. The isentropic expansion of steam through nozzle for the steam initially dry saturated at inlet is approximated by equation

(a) $pv = C$ (b) $pv^{1.4} = C$
(c) $pv^{1.3} = C$ (d) $pv^{1.135} = C$

MPPSC State Forest Service Exam, 2014

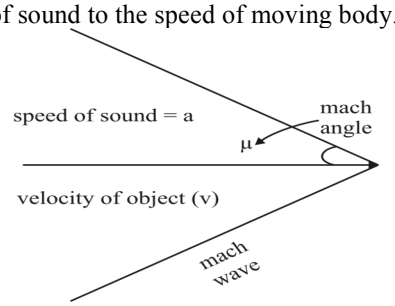
Ans. (d) : $\boxed{PV^n = C}$
$n = 1.3 \rightarrow$ Superheated steam
$n = 1.135 \rightarrow$ Dry saturated steam
$n = 1.035 + 0.1x \rightarrow$ Wet steam

601. Mach angle (α) is defined as the

(a) Quarter angle of the mach cone
(b) Zero angle of the mach cone
(c) Half of the angle of the mach cone
(d) Full angle of the mach cone

TNPSC AE 2014

Ans. (c) : Definition of mach angle– Half of the vertex angle of a mach cone whose sine is the ratio of the speed of sound to the speed of moving body.



$$\sin\mu = \frac{a}{v}$$

$$\sin\mu = \frac{1}{M}$$

602. Steam flow through a nozzle is considered as :

(a) constant volume flow
(b) constant pressure flow
(c) adiabatic flow
(d) isothermal flow

J&K PSC Civil Services Pre, 2013

Ans. (c) : Adiabatic flow is considered for flow through nozzle where heat transfer is taken negligible.

603. The ratio of exit pressure to inlet pressure for maximum mass flow rate per unit area of steam through nozzle when steam is initially superheated is

(a) 0.555 (b) 0.578
(c) 0.5457 (d) 0.6

APPSC Poly. Lect. 2013

Ans. (c) : The critical pressure ratio is defined as the ratio of pressure at the throat to inlet pressure for choked flow (max. mass flow condition) i.e.

$$\text{critical pressure ratio } (P_{cr}) = \left(\frac{2}{n+1}\right)^{\frac{n}{n-1}}$$

for superheated steam, n=1.3$\Rightarrow$ (P_{cr}) = 0.545
for wet steam, n= 1.127$\Rightarrow$ (P_{cr}) = 0.58
for dry saturated steam, n=1.135$\Rightarrow$ (P_{cr}) = 0.577

604. The factors on which nozzle efficiency depends are

I. Reynolds number of flow.
II. Nature of fluid flow and its state.
III. Turbulence in fluid and its state.
IV. Workmanship of the manufacturing of nozzle.

Search on Telegram @apna_pdf

Of these statements, which are correct?

(a) I, II, III and IV (b) I, II and III
(c) II, III and IV (d) none of the above

APPSC Poly. Lect. 2013

Ans. (a) : The nozzle efficiency depends upon the following factors-

i) Material of the nozzle
ii) Size & Shape of the nozzle
iii) Finish of the nozzle
iv) Angle of divergence
v) Nature of the fluid and its state
vi) Friction
vii) Fluid velocity
viii) Turbulence in the flow passages
ix) Reynold number of the flow

605. At some section of convergent-divergent nozzle, the temperature is 200ºC. Then sonic velocity is

(a) 871.8 m/s (b) 435.9 m/s
(c) 217.95 m/s (d) 1600 m/s

APPSC Poly. Lect. 2013

Ans. (b) : Given, $R = 0.287 \times 10^3$ J/kg-K

$T = 200°C$

$= 200 + 273 = 473$

$C = \sqrt{\gamma RT} = \sqrt{1.4 \times 0.287 \times 10^3 \times 473} = 435.9\,m/s$

606. The device which converts kinetic energy of the fluid into pressure energy is :

(a) Nozzle (b) Diffuser
(c) Compressor (d) Turbine

TNPSC AE (Industries) 09.06.2013

Ans. (b) : The device which converts kinetic energy of the fluid into pressure energy is Diffuser.

607. The region outside the Mach cone is called.

(a) zone of action (b) zone of silence
(c) control volume (d) None of the above

JPSC AE 2013 Paper-V

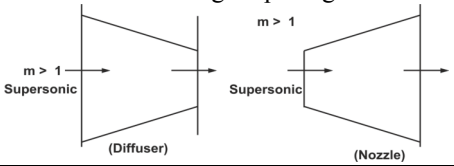
Ans. (b) : The region outside the Mach cone is called zone of silence.

608. When a supersonic flow is admitted into a convergent, the flow will

(a) Accelerate (b) Decelerate
(c) No change (d) None of the above

ISRO Scientist/Engineer 2012

Ans. (b) : For supersonic flow the convergent passage acts as diffuser. And a divergent passage as a nozzle.



609. The sound of explosion on a ship located 10km away from the beach was heard 28.6 seconds after the explosion was seen. Estimate the temperature of air at that time.

(a) 31ºC (b) 31K
(c) 26.2 ºC (d) 288.5K

ISRO Scientist/Engineer 2012

Ans. (a) : Speed of sound at the location

$C = \sqrt{\gamma RT}$

$\gamma = 1.4$ (air)

$R = 287$ J/kgK

$T = ?$

located on ship i.e. Distance

$d = 10$ km

$d = 10 \times 10^3$m

time $t = 28.6$ sec.

So, velocity i.e. $C = \frac{10 \times 10^3}{28.6} = \frac{Distance}{time}$

$C = \frac{10^4}{28.6}$

$\therefore \quad C = \sqrt{\gamma RT}$

$\therefore \quad \sqrt{1.4 \times 287 \times T} = \frac{10^4}{28.6}$

$\therefore \quad T = 304.27k$

$T = 31.1ºC$

610. The flow of steam in nozzle is subsonic at

(a) throat
(b) entrance
(c) convergent portion
(d) divergent portion

BPSC AE 2012 Paper - V

Ans. : (c) : The flow of steam in a nozzle is subsonic at convergent portion.
The flow of steam in a nozzle is supersonic at divergent portion.

611. For a convergent - divergent nozzle, critical pressure ratio occurs when

(a) velocity at exit becomes sonic
(b) shock at exit becomes
(c) nozzle efficiency is maximum
(d) increase in exit and inlet pressure ratio does not increases steam flow rate

BPSC AE 2012 Paper - V

Ans. : (d) : For a convergent divergent nozzle, critical pressure ratio occurs when increase in exit and inlet pressure ratio does not increase steam flow rate.

612. Ideal isentropic velocity of air jet from a nozzle for a drop in enthalpy of 400 kJ/kg in meter per second is

(a) 894.4 (b) 632.5
(c) 2801.7 (d) 400.8

TNPSC ACF 2012

Ans. (a) : $h_1 - h_2 = 400$ kj/kg

$\frac{v^2}{2} = h_1 - h_2$

$v = \sqrt{2(h_1 - h_2)}$

$v = \sqrt{2(400) \times 10^3}$

$v = 894.4$ m/s

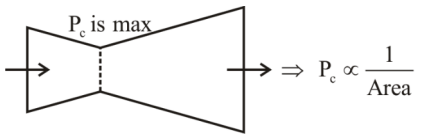
Search on Telegram @apna_pdf

613. In the frictionless flow of the steam, the critical pressure ratio will occur

(a) At exit of the nozzle
(b) Where area is minimum
(c) Where discharge is minimum
(d) Where condition of steam is dry saturated

UPSC JWM Advt. No.-50/2010

Ans. (b) : In the frictionless flow of the steam, the critical pressure ratio will occur where area is minimum in a nozzle.



614. Assertion (A) : While steam flows through a nozzle, its velocity increases and specific volume decreases.

Reason (R) : In a nozzle when steam expands, there is drop in its pressure and enthalpy.

Codes :

(a) Both A and R are individually true and R is the correct explanation of A
(b) Both A and R are individually true and R is not the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (d) : As we know, while streams flow through a nozzle its velocity increases and due to change in mass flow rate its specific volume increases. A nozzle is an element whose primary function is to convert enthalpy into KE. When steam flows through the nozzle from high pressure to

$$h_1 = h_2 + \frac{v_2^2}{2g}$$

For nozzle one at low pressure, its velocity specific volume both increases.

615. In a nozzle, if back pressure is equal to inlet pressure.

(a) no flow occurs
(b) maximum flow occurs
(c) flow is subsonic in diverging section
(d) flow is supersonic in converging as well as diverging sections

TNPSC AE, 2008

Ans. (a) : In a nozzle if back pressure is equal to inlet pressure ($P_b = P_1$). There will be no flow and pressure distribution will be uniform along with the nozzle.

5. Gas Turbine

616. In a two stage gas turbine plant with inter-cooling and reheating

(a) both work ratio and thermal efficiency improve
(b) work ratio improves but thermal efficiency decreases
(c) thermal efficiency improves but work ratio decreases
(d) both work ratio and thermal efficiency decrease

TNPSC AE 2019, GPSC ARTO 30.12.2018
GPSC Executive Engineer 23.12.2018
RPSC AE 2016, TSGENCO AE 14.11.2015
ESE 2014, JPSC AE 2013 Paper-V
RPSC ACF-2011, RPSC AE GWD 2011
CSE Pre-2006

Ans. (b) : In a two stage gas turbine plant with intercooling and reheating, work ratio improves but thermal efficiency decreases.

• Effect of intercooling –
$W_C\downarrow$, W_T-same, $W_{net}\uparrow$, $Q_S\uparrow$, $Q_R\uparrow$, $\eta\downarrow$
• Effect of reheating –
W_C-same, $W_T\uparrow$, $W_{net}\uparrow$, $Q_S\uparrow$, $Q_R\uparrow$, $\eta\downarrow$

$\because$ $\text{Work ratio } (r_w) = \dfrac{\text{Net work}}{\text{Positive work(Turbine)}} = \dfrac{W_{net}}{W_T}$

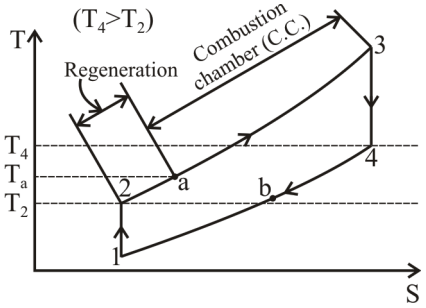
$\eta\downarrow$

617. In a gas turbine plant, a regenerator increases

(a) work output (b) pressure ratio
(c) thermal efficiency (d) all of the above

CGPSC AE 15.01.2021, APGENCO AE, 2017
CGPSC ARTO & TSI 07.01.2017
CGPSC AE 16.10.2016, RPSC AE 2016
TSPSC Managers, 2015, KPSC ADF 2015
TNPSC AE (Industries) 09.06.2013
RPSC ACF-2011, ESE 2008

Ans. (c) :



In a gas turbine power plant, a regenerator increases ($\uparrow$)
W_c = constant
W_T = constant, $W_{net} = W_T - W_C$ = constant
$Q_S\downarrow$ $\eta\uparrow$

618. Reheating in gas turbine results in

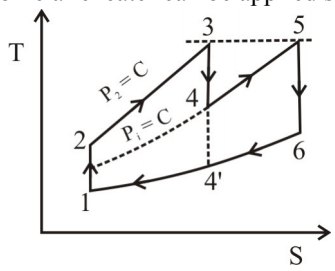
(a) Increase in work ratio but decrease in thermal efficiency
(b) Increase of thermal efficiency
(c) Decrees of work
(d) Decrease of thermal efficiency

Nagaland PSC CTSE 2017 Paper-2
Rajasthan Nagar Nigam AE 2016, Shift-I
APPSC AEE 2016
OPSC AEE 2015 PAPER - II
JPSC AE 2013 Paper-V, SJVN ET 2013
BPSC AE 2012 Paper - V

Search on Telegram @apna_pdf

Ans. (a) : Effect of Reheating in a gas turbine– By staging the heat supply process with a combustion and a reheater, the cycle efficiency decreases, but it permits more heat recovery from the turbine exhaust gases.

Reheating is applied in a gas turbine in such a way that it increases the turbine work without increasing the compressor work or melting the turbine material. When a gas turbine plant has a high pressure and low pressure turbine a reheater can be applied successfully.



Effect of Reheating-

W_c - same	Q_s - ↑	T_{mR} - ↑↑
W_T - ↑	Q_R - ↑	P_{mean} - ↓
W_{net} - ↑	T_{mA} - ↑	η- ↓s

619. Thermal efficiency of a gas turbine plant as compared to diesel engine plant is :

(a) higher (b) lower

(c) same (d) un-predictable

GPSC DEE, Class-2 (GWSSB) 04.07.2021
RPSC AE 2016
APPSC Poly Lect. 2013
RPSC ACF-2011, WBPSC AE 2008
UKPSC AE 2007 Paper-II

Ans. (b) : • The thermal efficiency at 20%, 26% is however, generally lower than comparable steam turbine plant and much lower than equivalent diesel plant.

• Gas turbine plant is significantly lower in capital cost than similarly rated steam turbine and above 5MW has considerable cost advantages over diesel engine.

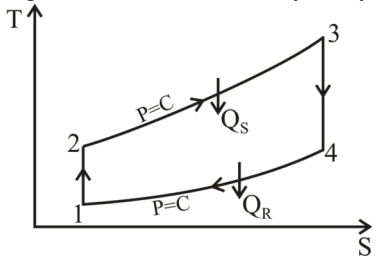
620. A gas turbine works on which one of the following cycles :

(a) Brayton (b) Rankine

(c) Stirling (d) Otto

JPSC AE, 10.04.2021, Paper-I
VIZAG STEEL MT 24.01.2021, Shift-II
Haryana PSC AE (PHED) 04.09.2020, Paper-I
Rajasthan Nagar Nigam AE 2016 Shift II
UJVNL AE 2016
ESE 18.07.2021, 2020, 1998

Ans. (a) : A gas turbine works on Brayton cycle.



1-2 → Isentropic compression
2-3 → Constant pressure heat addition
3-4 → Isentropic expansion
4-1 → Constant pressure heat rejection

621. Intercooling in gas turbine system:

(a) decreases net output but increases thermal efficiency

(b) increases net output but decreases thermal efficiency

(c) decreases net output and thermal efficiency both

(d) increases net output and thermal efficiency both

OPSC AEE 2019 PAPER - II
Punjab PSC SDE 12.02.2017
Kerala PSC AE (Irrigation) 05.04.2017
BPSC AE 2012 Paper - V, ESE 1993

Ans. (b) : Effects of intercooling in Gas Turbine-

- The compressor work (W_C) decreases.
- The Turbine work (W_T) remains same.
- Heat supplied and heat rejected both increases.
- The temperature of heat addition and heat rejection both decreases.
- The scope of regeneration increases as the outlet temperature of compressor decreases from 2 to 4°C.

622. Efficiency of Brayton cycle is given by [where 'T' is the pressure ratio, γ = specific heat ratio]

(a) $\eta = 1 - \frac{1}{r^{\gamma-1}}$ (b) $\eta = 1 - \frac{1}{r}$

(c) $\eta = 1 - \frac{1}{r^{\gamma}}$ (d) $\eta = 1 - \frac{1}{r^{(\gamma-1)/\gamma}}$

CGPSC AE 15.01.2021
ISRO Scientist/Engineer (RAC) 22.04.2018
RPSC LECTURER 16.01.2016
UKPSC AE 2007 Paper -II, GATE 2004

Ans. (d) :

$$\eta_{Brayton} = \frac{q_{in} - q_{out}}{q_{in}}$$

$$= 1 - \frac{q_{out}}{q_{in}}$$

$$= 1 - \frac{C_p(T_3 - T_4)}{C_p(T_2 - T_1)}$$

$$= 1 - \frac{T_3 - T_4}{T_2 - T_1}$$

For Otto and Brayton cycle

$$T_1 \times T_3 = T_2 \times T_4$$

$$= 1 - \frac{T_4\left(\frac{T_3}{T_4} - 1\right)}{T_1\left(\frac{T_2}{T_1} - 1\right)}$$

$$\frac{T_3}{T_4} = \frac{T_2}{T_1}$$

Search on Telegram @apna_pdf

then

$$\eta_{Brayton} = 1 - \frac{1}{\left(\frac{T_1}{T_4}\right)}$$

We know that

$$\left(\frac{T_1}{T_4}\right) = \left(\frac{P_1}{P_4}\right)^{\left(\frac{\gamma-1}{\gamma}\right)}$$

$$\eta_{Brayton} = 1 - \frac{1}{r^{(\gamma-1)/\gamma}}$$

623. In a gas turbine power plant, reheating of gases between high pressure and low pressure turbine stages will

(a) Improve turbine output
(b) Decrease turbine output
(c) Increase compressor work
(d) Decrease compressor work

JPSC AE, 10.04.2021, Paper-I
Haryana PSC AE (PHED) 04.09.2020, Paper-I
ISRO Scientist/Engineer 07.05.2017
TSPSC AEE 2015

Ans. (a) : For gas Turbine–

	Work output	ηth
Regeneration	No effect	↑
Intercooling	↑	↓
Reheating	↑	↓

Following are the effect of reheating in a gas turbine power plant.

- No change in compressor work
- Turbine work output increases
- Network output increases
- Both mean temperature of heat addition and heat rejection increases
- Both heat supplied and heat rejected increases
- Efficiency decreases
- Scope of regeneration increases

624. In a two stage gas turbine plant, reheating after first stage

(a) decrease thermal efficiency
(b) increases thermal efficiency
(c) does not affect thermal efficiency
(d) none of the above

RPSC AE 2016, BPSC Poly. Lect. 2016
TNPSC ACF 2012, RPSC ACF-2011

Ans. (a) : In a two stage gas turbine plant, reheating after first stage decrease thermal efficiency.

• Effect of reheating –

W_C-same, $W_T\uparrow$, $W_{net}\uparrow$, $Q_S\uparrow$, $Q_R\uparrow$, $\eta\downarrow$

625. A gas turbine working on Brayton cycle produces 4000 kW of net power. If its work ratio is 40%, what is the power consumed by the compressor?

(a) 2000 kW (b) 4000 kW
(c) 6000 kW (d) 8000 kW

RPSC Vice Principal ITI 2018
GPSC Executive Engineer 23.12.2018
HPPSC Asstt. Prof. 18.09.2017
TSPSC Managers, 2015

Ans. (c) : Given, Net Power (W_{net}) = 4000 kW

$$r_w = 40\% = \frac{40}{100} = 0.4$$

$$\text{Work ratio } (r_w) = \frac{W_{net}}{W_T}$$

$$\frac{4000}{W_T} = 0.4$$

$$W_T = \frac{4000}{0.4} = 10000\text{kW}$$

We know that, $W_{net} = W_T - W_C$

$$W_C = W_T - W_{net}$$

$$= 10000 - 4000$$

$$W_C = 6000\text{kW}$$

626. In a gas turbine cycle, the turbine output is 600 kJ/kg, the compressor work is 400 kJ/kg and the heat supplied is 1000 kJ/kg. The thermal efficiency of the cycle is :

(a) 80% (b) 60%
(c) 40% (d) 20%

BPSC Mains 2017 Paper-V
KPSC AE 2015
J&K PSC Civil Services Pre, 2010
ESE 2016, 1997

Ans. (d) : Given,

Turbine work (W_T) = 600 kJ/kg

Compressor work (W_C) = 400 kJ/kg

Heat supplied (Q_S) = 1000 kJ/kg

$$\text{Thermal efficiency } (\eta_{thermal}) = \frac{W_{net}}{\text{Heat supplied}\,(Q_s)}$$

$$= \frac{W_T - W_C}{Q_S}$$

$$= \frac{600 - 400}{1000} = \frac{200}{1000}$$

$$= \frac{2}{10} \times 100$$

$$\boxed{\eta_{thermal} = 20\%}$$

627. A gas turbine cycle with infinitely large number of stage during compression and expansion leads to :

(a) Stirling cycle (b) Atkinson cycle
(c) Ericsson cycle (d) Brayton cycle

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
CSE Pre-2008, 2003, GATE 1994

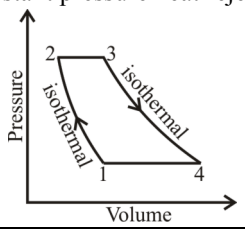
Ans. (c) : Ericsson Cycle– The Ericsson cycle consists of two isothermal and two constant pressure processes. The processes are:

Process 1-2: Reversible isothermal compression.

Process 2-3: Constant pressure heat addition.

Search on Telegram @apna_pdf

Process 3-4: Reversible isothermal expansion.
Process 4-1: Constant pressure heat rejection.



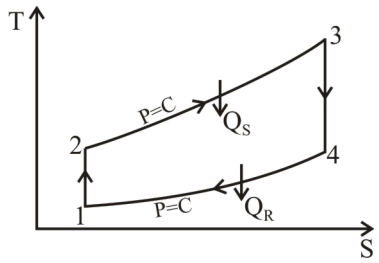
628. The work ratio in a gas turbine plant is equal to
where
r_p = pressure ratio
T_1 = Compressor inlet temperature
T_3 = Turbine inlet temperature

(a) $1-r_p^{\frac{\gamma-1}{\gamma}}$ (b) $1-\frac{T_1}{T_3}r_p^{\frac{\gamma-1}{\gamma}}$

(c) $1+\frac{T_1}{T_2}r_p^{\frac{\gamma-1}{\gamma}}$ (d) $1+r_p^{\frac{\gamma-1}{\gamma}}$

UPPSC AE 13.12.2020, Paper-2
BPSC AE Mains 2017 Paper-V
ESE 2009

Ans. (b)



For gas turbine,

$$\text{Work Ratio } (r_w) = \frac{\text{Net work}}{\text{Turbine work}} = \frac{W_{net}}{W_T}$$

$$r_w = \frac{W_T - W_C}{W_T} = 1 - \frac{W_C}{W_T}$$

$$r_w = 1 - \frac{mC_p(T_2 - T_1)}{mC_p(T_3 - T_4)}$$

$$r_w \Rightarrow 1 - \frac{(T_2 - T_1)}{(T_3 - T_4)} = 1 - \frac{T_1}{T_4}\left(\frac{\frac{T_2}{T_1} - 1}{\frac{T_3}{T_4} - 1}\right)$$

As, $\frac{T_2}{T_1} = \frac{T_3}{T_4}$

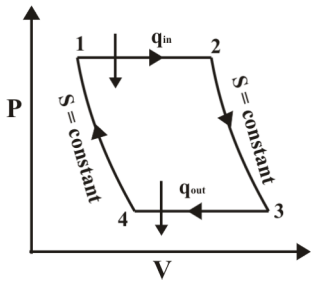
$$r_w \Rightarrow 1 - \frac{T_1}{T_4} = 1 - \frac{T_1}{T_3}\left(r_p\right)^{\frac{\gamma-1}{\gamma}}$$

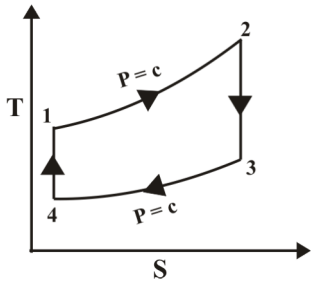
Work ratio, $\boxed{r_w = 1 - \frac{T_1}{T_3}\left(r_p\right)^{\frac{\gamma-1}{\gamma}}}$

629. Brayton cycle consists of
(a) Two reversible isobars and two reversible adiabatic process
(b) Two reversible isotherm and two reversible adiabatic process
(c) Two reversible isotherm and two reversible isobars process
(d) Two reversible adiabatics and one reversible isotherm, one reversible isobaric process

Oil India Senior Officer 23.12.2020
RPSC Lecturer 16.01.2016
TRB Asstt. Prof., 2012

Ans. (a) : Brayton Cycle–Brayton cycle consists of two reversible isobars and two reversible adiabatic process.





630. For air standard Brayton cycle, increase in the maximum temperature of the cycle, while keeping the pressure ratio the same would result in
(a) Increase in air standard efficiency
(b) Decrease in air standard efficiency
(c) No change in air standard efficiency
(d) Increase in the efficiency but reduction in net work
(e) Increase in the net work but reduction in efficiency

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 18.09.2017
CGPSC AE 26.04.2015 Shift-II
CSE Pre-1998

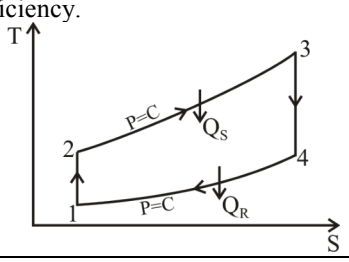
Ans. (c) : Efficiency of Brayton cycle,

$$\eta_{Brayton} = 1 - \frac{1}{\left(r_p\right)^{\frac{\gamma-1}{\gamma}}}$$

For air standard Brayton cycle, air standard efficiency is the function of pressure ratio.

Search on Telegram @apna_pdf

So increase in the maximum temperature of the cycle, while keeping the same pressure ratio no change in air standard efficiency.

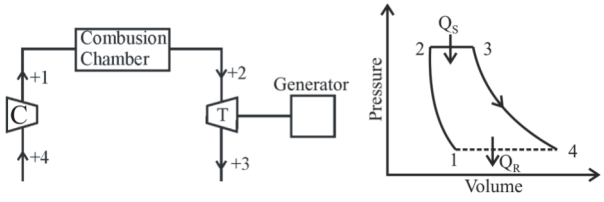


631. An open cycle gas turbine works on

(a) Carnot cycle (b) Otto cycle
(c) Joule's cycle (d) Stirling cycle

COPSC AEE 2019 Paper-II
Nagaland PSC (CTSE) 2018, Paper-II
VIZAG Steel (MT) 2017

Ans. (c) : Open cycle gas turbine works on joule's or Brayton cycle.



Joule cycle has two isentropic and two isobaric process.

632. Open cycle Gas turbine works on :

(a) Carnot cycle (b) Rankine cycle
(c) Stirling cycle (d) Brayton cycle

CGPSC AE 15.01.2021
Kerala PSC AE (Irrigation) 05.04.2017
GWSSB AAE, 27.12.2015

Ans. (d) : Open cycle Gas turbine works on brayton cycle.

633. High air-fuel ratio in gas turbine is used to :

(a) Reduce exhaust temperature after combustion
(b) Improve thermal efficiency
(c) Reduce power input of compressor
(d) Improve net power output of the cycle.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II
Nagaland PSC (CTSE) 2018, 2016, Paper-II

Ans. (a) : High air –fuel ratio in gas turbine reduces exhaust temperature after combustion.

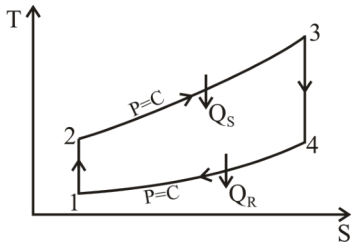
634. The work ratio of closed cycle gas turbine plant depends upon

(a) pressure ratio of the cycle and specific heat ratio
(b) temperature ratio of the cycle and specific heat ratio
(c) pressure ratio temperature ratio and specific heat ratio
(d) only on pressure ratio

TSPSC Manager (Engg.) HMWSSB 12.11.2020
RRB SSE 03.09.2015 Shift-II
TANGEDCO AE 2015

Ans. (c) : 'Work ratio' defined as the ratio of net work to the total turbine work.

- Higher the value of work ratio lesser the effect on the variation of compressor, efficiency and the performance.



Work ratio $(r_w) = 1 - \frac{W_C}{W_T}$

$$r_w = 1 - \frac{T_2 - T_1}{T_3 - T_4}$$

$$r_w = 1 - \frac{T_1}{T_4}\left(\frac{\frac{T_2}{T_1} - 1}{\frac{T_3}{T_4} - 1}\right)$$

$$\frac{T_2}{T_1} = \frac{T_3}{T_4} = (r_p)^{\frac{\gamma-1}{\gamma}}$$

Work ratio $(r_w) = 1 - \frac{T_1}{T_4}$

$$\boxed{r_w = 1 - \frac{T_1}{T_3}(r_p)^{\frac{\gamma-1}{\gamma}}}$$

The work ratio of closed cycle gas turbine plant depends upon pressure ratio, temperature ratio and specific heat ratio.

635. The overall pressure ratio through a three-stage gas turbine is 10 and the efficiency is 0.86. The inlet temperature is 1400 K. Assuming the temperature rise in each stage to be the same, the pressure ratio and the stage efficiency at first stage will be respectively.

(a) 2.487 and 0.8341 (b) 1.895 and 0.8285
(c) 1.895 and 0.8341 (d) 2.12 and 0.8308

CGPSC AE 15.01.2021, CGPSC AE 16.10.2016

Ans. (b) : Given, $\eta = 0.86$, $T_1 = 1400$ K

$$\frac{T_{4'}}{T_1} = \left(\frac{P_{4'}}{P_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_{4'}}{T_1} = \left(\frac{1}{10}\right)^{0.286} \Rightarrow T_{4'} = 724.64\,\text{K}$$

$$\eta_T = \frac{T_1 - T_4}{T_1 - T_{4'}} \Rightarrow 0.86 = \frac{1400 - T_4}{1400 - 724.64}$$

$T_4 = 819.19$ K

As temperature rise same in each stage,

$3(T_1 - T_2) = 1400 - 819.19$

$(T_1 - T_2) = 193.60$ K

$T_2 = 1206.39$ K

Search on Telegram @apna_pdf

Pressure ratio $\boxed{\frac{P_1}{P_2}=\left(\frac{1400}{1206.39}\right)=1.896}$

Stage efficiency for each stage,

$$\eta_{poly}=\frac{\gamma}{\gamma-1}\times\frac{\ln\left(\frac{1400}{819.19}\right)}{\ln 10}$$

$$\eta_{poly}=0.813$$

$$\frac{P_1}{P_2}=\left(\frac{T_1}{T_2}\right)^{\frac{1}{0.286\times0.813}}$$

Stage efficiency,

$$\eta_s=\frac{1-\left(\frac{P_2}{P_1}\right)^{\frac{0.4\times0.813}{1.4}}}{1-\left(\frac{P_2}{P_1}\right)^{\frac{0.4}{1.4}}}=\frac{1-\left(\frac{1}{1.896}\right)^{\frac{0.4\times0.813}{1.4}}}{1-\left(\frac{1}{1.896}\right)^{\frac{0.4}{1.4}}}$$

$$\boxed{\eta_s=0.828}$$

636. An ideal closed cycle gas turbine plant working between temperatures 927^0C and 27^0C using air as working fluid. The pressure ratio for maximum work output is

(a) 11.3 (b) 13.3
(c) 15.3 (d) 17.3

UPPSC AE 13.12.2020, Paper-2
ESE 2018

Ans. (a) : Given,

$T_{max} = 927^0C = 1200$ K

$T_{min} = 27^0C = 300$ K

Optimum pressure ratio, for maximum work output is

$$(r_p)_{opt}=\left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{2(\gamma-1)}}$$

$$(r_p)_{opt}=\left(\frac{1200}{300}\right)^{\frac{1.4}{2(1.4-1)}}=(4)^{1.75}=11.3$$

637. Gas turbines for power generation are normally used :

(a) to supply peak load requirements
(b) to enable start thermal power plant
(c) when other sources of power fail
(d) to supply base load requirements

GWSSB DEE 07.07.2016
GWSSB AAE, 27.12.2015

Ans. (a) : To fulfill peak or excess load requirement gas turbine power generation are used.

638. The maximum temperature in a gas turbine is

(a) 200ºC (b) 500ºC
(c) 700ºC (d) 1000ºC

Sikkim PSC (Under Secretary), 2017
Nagaland PSC CTSE 2017, 2016 Paper -II

Ans. (d) : The maximum temperature of gas turbine is 1000ºC.

639. The Maximum net specific work obtained in an ideal Brayton cycle for max temperature 900 K and minimum temperature 400 K is given by :

(a) $100C_p$ (b) $500C_p$
(c) $800C_p$ (d) $700C_p$

GPSC ARTO Pre 30.12.2018
ESE 2015

Ans. (a) : Given, $T_{max} = 900$ K

$T_{min} = 400$ K

Maximum specific work $= C_p[\sqrt{T_{max}}-\sqrt{T_{min}}]^2$

$= C_p[\sqrt{900}-\sqrt{400}]^2$

$= C_p[10]^2$

$= 100\ C_p$

640. Increasing the number of reheating stages in a gas turbine to infinity, makes the expansion tending:

(a) Reversible adiabatic (b) Isothermal
(c) Isobaric (d) Isochoric

GPSC ARTO Pre 30.12.2018
TSPSC AE 2015

Ans. (b) : • Increasing the number of reheating stages in a gas turbine to infinity makes the expansion tending to isothermal.

• Increasing the intercooling in compressor to infinity also makes the compression tending to isothermal.

641. Work ratio is the ratio of

(a) Net work/turbine work
(b) Turbine work/compressor work
(c) Net work/compressor
(d) Compressor work/net work

Gujarat PSC AE 2019, TNPSC AE 2018

Ans. (a) : Work ratio is the ratio of network to turbine work.

$$\text{Work ratio, } r_w=\frac{W_{turbine}-W_{compressor}}{W_{turbine}}$$

$$W_r=1-\frac{W_{compressor}}{W_{turbine}}$$

$W_r = 1 - W_{br}$

where $W_{br} \rightarrow$ back work ratio

642. For the same compression ratio, the efficiency of the brayton cycle is–

(a) Equal to diesel cycle
(b) Equal to Otto cycle
(c) Equal to dual cycle
(d) Greater than diesel cycle

RPSC IOF & Boiler 20.09.2017
ESE 2020

Ans. : (b) For the same compression ratio the efficiency of Brayton cycle is equal to that of Otto cycle.

$$\text{Otto cycle efficiency } (\eta_{otto})=1-\frac{1}{r_C^{\gamma-1}}$$

$$\text{Brayton cycle efficiency } (\eta_{Brayton})=1-\frac{1}{r_p^{\frac{\gamma-1}{\gamma}}}$$

Search on Telegram @apna_pdf

r_C = Compression ratio
r_p = Pressure ratio
γ = Adiabatic index

643. Thermal efficiency of a gas turbine cycle with ideal regenerative heat exchanger is
(a) Equal to work ratio
(b) Less than work ratio
(c) More than work ratio
(d) Unpredictable

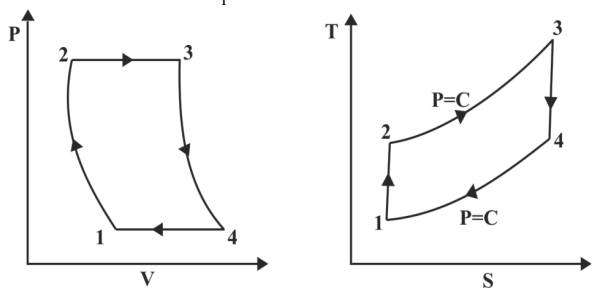
UPPSC AE 12.04.2016 Paper-II
GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Work ratio is defined as the ratio of the network ($W_T - W_C$) to the turbine work developed (W). It is denoted by WR.

$$\text{Work ratio, } r_w = \frac{\text{Net work}}{\text{Turbine work}}$$

$$= \frac{W_T - W_C}{W_T}$$

$$= 1 - \frac{W_C}{W_T}$$



Gas turbine work on Brayton cycle

$$\text{W.R.} = 1 - \frac{C_P(T_2 - T_1)}{C_P(T_3 - T_4)} = 1 - \frac{T_1\left[\frac{T_2}{T_1} - 1\right]}{T_3\left[1 - \frac{T_4}{T_3}\right]}$$

For Otto and Brayton cycle

$$T_1 \times T_3 = T_2 \times T_4$$

then

$$r_P = \frac{P_2}{P_1} = \frac{P_3}{P_4}$$

$$W.R. = 1 - \frac{T_1}{T_3} \times \frac{T_2}{T_1}$$

$$W.R. = 1 - \frac{T_1}{T_3} \times r_P^{\left(\frac{\gamma-1}{\gamma}\right)}$$

So work ratio of gas turbine depends on both pressure ratio and temperature.
Thermal efficiency of a gas turbine cycle with ideal regenerative heat exchanger is equal to work ratio.
Efficiency of ideal regenerative cycle –

$$\boxed{\eta_{\text{ideal Reg.}} = 1 - \frac{T_{\min}}{T_{\max}}\left(r_p\right)^{\frac{\gamma-1}{\gamma}}}$$

$$\eta_{\text{ideal Reg.}} \to \max \quad \text{for} \quad \boxed{r_p = 1}$$

644. The efficiency of a simple gas turbine can be improved by using a regenerator, because the:
(a) Work of compression is reduced
(b) Heat required to be supplied is reduced
(c) Work out put of the turbine is increase
(d) Heat rejected is increased

GPSC Executive Engineer 23.12.2018
MPPSC AE 2016

Ans. : (b) The efficiency of simple gas turbine can be improved by using a regenerator, because the heat required to be supplied is reduced.

645. A gas turbine cycle with heat exchanger and reheating improves
(a) only the thermal efficiency
(b) only the specific power output
(c) both thermal efficiency and specific power output
(d) neither thermal efficiency nor specific power output

GPSC Executive Engineer 23.12.2018
GATE 1993

Ans. (c) : A gas turbine cycle with heat exchanger and reheating improves both thermal efficiency and specific power output.

646. Which of the following cycle is used in aircraft?
(a) Brayton cycle (b) Rankine cycle
(c) Atkinsion cycle (d) Stirling cycle
(e) Carnot cycle

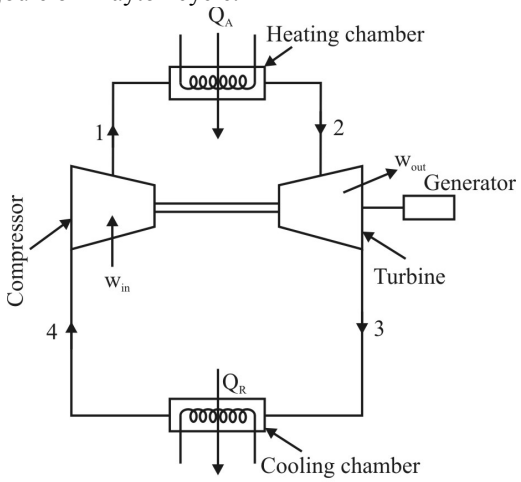
CGPSC ARTO & TSI 07.01.2017
APGENCO AE 2012

Ans. (a) : Brayton cycle -Air craft
Rankine cycle - Power plant

647. A closed cycle gas turbine works on
(a) Carnot cycle (b) Rankine cycle
(c) Ericsson cycle (d) Joule cycle

TSPSC AEE 2015
UKPSC AE 2007 Paper -II

Ans. : (d) Joule cycle:- A close cycle gas turbine works on joule or Brayton cycle.



Close cycle gas turbine

Search on Telegram @apna_pdf

648. Pressure ratio in gas turbines is the ratio of

(a) Compressor pressure ratio
(b) Highest pressure to exhaust pressure
(c) Inlet pressure to exhaust pressure
(d) Pressures across the turbine

Nagaland PSC (CTSE) 2017, 2016, Paper-II

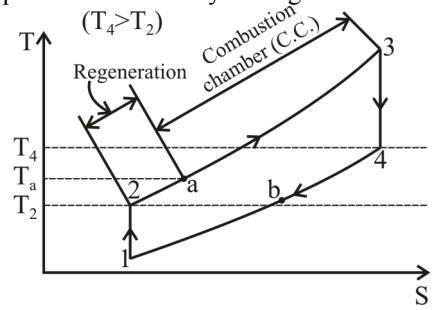
Ans. (a) : Pressure ratio in gas turbines is the ratio of compressor pressure ratio. The pressure ratio of gas turbines ranges from 11 to 16.

649. Thermal efficiency of closed cycle gas turbine plant is increased by the following:-

(a) Reheating (b) Intercooling
(c) Regenerator (d) None of the above

UKPSC AE-2013, 2007 Paper-II

Ans. (c) : Thermal efficiency of closed cycle gas turbine plant is increased by the regenerator.



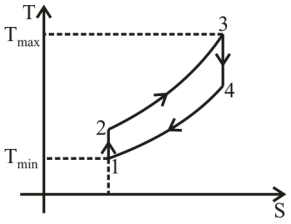
• Effect of regeneration –
W_T-same, W_{net}-same, $Q_S\downarrow$, $Q_R\downarrow$, Specific fuel consumption (sfc)$\downarrow$, $\eta\uparrow$

650. Consider a simple gas turbine (Brayton cycle) and a gas turbine with perfect regeneration. In both the cycles, the pressure ratio is 8 and the ratio of specific heats of working medium is 1.5. The ratio of minimum to maximum temperature is 0.2 (with temperature in K) in the regenerative cycle. The ratio of the thermal efficiency of the simple cycle to that of regenerative cycle is

(a) 0.63 (b) 0.73
(c) 0.83 (d) 0.93

ISRO Scientist/Engineer (RAC) 12.01.2020
GATE 2016

Ans. (c) :



$r_p = 8, \gamma = 1.5$

$$\frac{T_{min}}{T_{max}} = 0.2$$

$$\eta_{cycle} = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}} = 1 - \frac{1}{(8)^{1/3}} = 0.5$$

$$\eta_{ideal\ regeneration} = 1 - \frac{T_{min}}{T_{max}}(r_p)^{\frac{\gamma-1}{\gamma}} = 0.6$$

$$\frac{\eta_{cycle}}{\eta_{ideal\ regeneration}} = \frac{0.5}{0.6} = 0.8333$$

651. The compression ratio of Brayton cycle corresponding to maximum work output for the given temperature limits of T_{min} and T_{max} will be:

(a) $\left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{2(\gamma-1)}}$ (b) $\left(\frac{T_{min}}{T_{max}}\right)^{\frac{\gamma}{2(\gamma-1)}}$

(c) $\left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{(\gamma-1)}}$ (d) $\left(\frac{T_{min}}{T_{max}}\right)^{\frac{\gamma}{(\gamma-1)}}$

GPSC Asstt. Prof. 28.08.2016
GATE 2004

Ans. (a) : To obtain maximum work output for the given temperature limits of T_{min} and T_{max}, the compression ratio should be optimum pressure ratio

$$r_{opt} = \sqrt{r_{max}} = (r_{max})^{1/2}$$

$$r_{opt} = \left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{2(\gamma-1)}}$$

652. Consider the following statements with reference to Gas turbine cycle

1. **Regeneration increases thermal efficiency**
2. **Reheating decreases thermal efficiency**
3. **Cycle efficiency increases when maximum temperature of the cycle is increased.**

Of these statements

(a) 1, 2 and 3 are correct
(b) 2 and 3 are correct
(c) 1 and 2 are correct
(d) 1 and 3 are correct
(e) None of the above

UPSC JWM 2017
CGPSC Poly. Lect. 22.05.2016

Ans. (a) : In gas turbine cycle –
For effect of Regeneration, – Compressor work

- W_C = same
- W_T = same
- W_{net} = same
- $Q_s \rightarrow\downarrow$
- $Q_R -\downarrow$
- $T_{MA}-\uparrow$
- $T_{MR}-\downarrow$
- cycle (η) $-\uparrow$

For effect of Reheating –

- W_c – same
- $W_T -\uparrow$
- $W_{net} -\uparrow$
- $Q_s -\uparrow$

Search on Telegram @apna_pdf

- $Q_R - \uparrow$
- $T_{MA} - \uparrow$
- $T_{MR} - \uparrow\uparrow$
- $P_{mean} - \downarrow$
- $\eta - \downarrow$

Note- But official answer is option (d).

653. A gas turbine cycle with regeneration and reheating improves

(a) only thermal efficiency
(b) only specific power output
(c) both efficiency and power output
(d) Neither efficiency nor power output

TSPSC AEE 2015, GATE 1993

Ans. (c) : A gas turbine cycle with regeneration and reheating improves both efficiency and power output.

654. When a heat exchanger is added to an ideal simple cycle,

(a) power output increases and the efficiency increases
(b) power output decreases, but the efficiency increases
(c) power output increases, but the efficiency decreases
(d) power output remains constant, but the efficiency increases

VIZAG STEEL MT 24.01.2021, Shift-II, Shift-I

Ans. (d) : When a heat exchanger is added to an ideal simple cycle power output remains constant but the efficiency increases.
e.g. Brayton cycle with Regeneration.

655. A gas turbine plant operates on Brayton cycle between T_{min} = 300 K and T_{max} = 1073 K. Find the maximum work done per kg of air (C_p = 1.005 kJ/kg-K)

(a) 27.9 kJ/kg (b) 239.5 kJ/kg
(c) 537.3 kJ/kg (d) 776.8 kJ/kg

RPSC ACF & FRO, 26.02.2021

Ans. (b) : Given,
$T_{max} = 1073$ K
$T_{min} = 300$ K
For air, $C_p = 1.005$ kJ/kg-K

$$W_{max} = C_p\left[\sqrt{T_{max}} - \sqrt{T_{min}}\right]^2$$

$$= 1.005\left[\sqrt{1073} - \sqrt{300}\right]^2$$

$$\boxed{W_{max} = 239.4667} \text{ kJ/kg}$$

656. Gas turbines are suitable for aircraft propulsion because

(a) gas turbines are lightweight
(b) gas turbines are compact in size
(c) gas turbines have a high power to weight ratio
(d) All of the above

Assam PSC AE (IWT) 14.03.2021

Ans. (d) : Gas turbines are particularly suited for aircraft propulsion because they are light weight in size compact and have a high power-to-weight ratio.

657. In a gas turbine plant, heat supplied is 667.2 kJ/kg, and heat rejected is 391.43 kJ/kg. What is the thermal efficiency of the plant?

(a) 57.29% (b) 72.51%
(c) 41.33% (d) 32.83%

ESE 18.07.2021

Ans. (c) : Given,
$Q_{supp.} = 667.2$ kJ/kg
$Q_{rej} = 391.43$ kJ/kg

$$\eta_{th} = \frac{Q_{supp.} - Q_{rej.}}{Q_{supp.}}$$

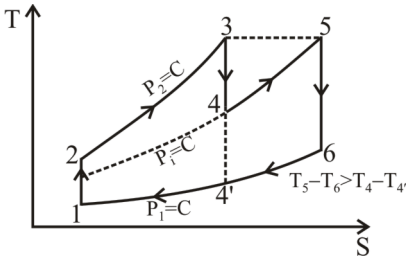
$$\eta = \frac{667.2 - 391.43}{667.2} = 41.33\%$$

658. Which one following statements is incorrect regarding reheating process in gas turbine?

(a) It uses multistage expansion
(b) It reduces moisture which cause erosion of turbine blades
(c) It increases thermal efficiency
(d) It increases specific work output

VIZAG STEEL MT 24.01.2021, Shift-II

Ans. (c) : Reheating in Gas Turbine–Reheating mean expansion of working fluid takes place in more than one stage.



Effect of Reheating–
(1) W_c – Same (2) $W_T - \uparrow$ (3) $W_{net} - \uparrow$
(4) $Q_s - \uparrow$ (5) $Q_R - \uparrow$ (6) $T_{MA} - \uparrow$
(7) $\eta \downarrow$

659. The efficiency of gas power cycle working on Brayton is a function of

(a) pressure ratio only
(b) maximum temperature only
(c) maximum to minimum temperature ratio
(d) pressure ratio and maximum to minimum temperature ratio

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : $\boxed{\eta = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}}}$

$r_p \rightarrow$ Pressure ratio
$\gamma \rightarrow$ Adiabatic index

660. A simple open cycle type gas turbine power plant consists of _____.

(a) turbine, combustion chamber and heat exchanger
(b) compressor, combustion chamber and turbine

Search on Telegram @apna_pdf

(c) turbine, compressor and heat exchanger
(d) turbine, combustion chamber and charge cooler

VIZAG MT, 14.12.2020

Ans. (b) : A simple open cycle gas turbine power plant consist of–
(1) Compressor, (2) Combustion chamber, (3) Turbine

661. For a pressure ratio, the cycle efficiency of a gas turbine can be increased by
(a) increasing the cycle peak temperature
(b) increasing the compressor inlet temperature
(c) decreasing the cycle peak temperature
(d) increasing the compressor output temperature

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : Efficiency of gas turbine can increase by –
(i) Increasing turbine work
(ii) Decreasing heat supplied
(iii) Decreasing compressor work.
The best way to increase turbine work which can achieve by increasing the cycle temperature.

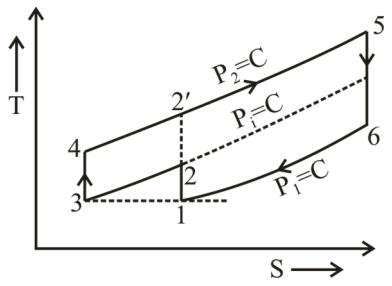
$$\eta_{Brayton} = 1 - \frac{1}{\left(r_p\right)^{\frac{\gamma-1}{\gamma}}}$$

Where, r_p = Pressure ratio
γ = Specific heat ratio

662. The use of inter cooling in gas turbine is mainly for
(a) increasing the pressure ratio
(b) reducing the turbine inlet temperature
(c) increasing overall work output
(d) bringing down combustion chamber temperature

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) :



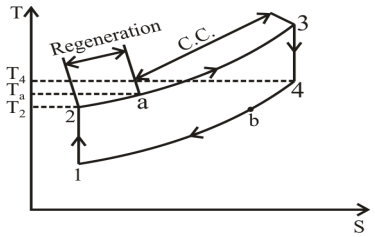
Effect of intercooling,
- W_T = Constant
- $W_C \downarrow$
- $W_{net}\uparrow$; $Q_S\uparrow$; $Q_R\uparrow$; $\eta\downarrow$

Intercooler is used to reduce compressor work, hence increases overall work output and efficiency.

663. Regeneration of exhaust gas energy to incoming gases in gas turbine is done
(a) Before the compressor
(b) After the compressor
(c) After the combustor
(d) Outside the gas turbine

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) Heating the compressed air after compressor using available heat energy from turbine exhaust is called regeneration.



- $W_C = h_2 - h_1$ (Constant)
- $W_T = h_3 - h_4$ (Constant)
- $W_{net} = W_T - W_C$ (Constant)
- $Q_S = (h_3 - h_a)\downarrow$
- $\boxed{\uparrow \eta = \frac{W_{net}}{Q_S \downarrow}}$

664. Air enters the compressor of a gas turbine plant operating on Brayton cycle at 1 bar and 27°C. The pressure ratio in the cycle is 6. If the relation between the turbine work W_T and compressor work W_C is $W_T = 3W_C$ and $\gamma = 1.4$, the cycle efficiency will be nearly
(a) 40% (b) 50%
(c) 60% (d) 70%

ESE 2020

Ans. (a) : Given, P_1= 1 bar
$T_1 = 27^0C = 300$ K

$$\eta = 1 - \left(\frac{1}{r_p}\right)^{\frac{\gamma-1}{\gamma}}$$

$$= 1 - \left(\frac{1}{6}\right)^{\frac{0.4}{1.4}} = 0.4 = 40\%$$

665. Which of the following changes in maximum T_1 and minimum T_2 temperature leads to maximum improvement in the efficiency of an ideal turbine?
(a) $T_1 + \Delta T$
(b) $T_2 + \Delta T$
(c) $T_2 + \Delta T$ and $T_1 - \Delta T$
(d) $T_1 + \Delta T$ and $T_2 - \Delta T$

OPSC AEE 2019 PAPER - II

Ans. : (d) :

666. A gas turbine plant operates on Brayton cycle between temperature limit of 1100 K and 310 K. The maximum work done per kg of air (kJ/kg) and corresponding cycle efficiency (in %) will be:
(a) 301.3 and 51.2 (b) 243.3 and 46.9
(c) 297.6 and 41.2 (d) 26.7 and 57.6

HPPSC ADF 05.03.2019

Ans. (b) :

$$\text{Maximum work}\left(W_{max}\right) = Cp\left[\sqrt{T_{max}} - \sqrt{T_{min}}\right]^2$$

$$= 1.005x\left[\sqrt{1100} - \sqrt{310}\right]^2$$

Search on Telegram @apna_pdf

$\boxed{W_{max} = 243.3 kJ/kg}$

At optimum condition,

$$(r_p)_{opt.} = \left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{2(\gamma-1)}}$$

$$= \left(\frac{1100}{310}\right)^{\frac{1.4}{2\times0.4}}$$

Pressure ratio $\boxed{(r_p)_{opt} = 9.17}$

$$\eta = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}}$$

$$= 1 - \frac{1}{(9.17)^{\frac{0.4}{1.4}}}$$

$$\eta = 0.469$$

$\boxed{\eta = 46.9\%}$

667. Gas turbines are preferred in aircraft propulsion, due to

(a) They are heavy
(b) They have low power to weight ratio
(c) They have high power to weight ratio
(d) They are efficient

JPSC AE PRE 2019

Ans. (c) : Gas turbines are preferred in aircraft propulsion, due to they have high power to weight ratio.

668. An isentropic air-turbine is used to supply 0.1 kg/s of air at 0.1 MN/m^2 and 285 K to a cabin. The pressure at inlet to the turbine is 0.4 MN/m^2. What will be the power developed by the turbine? [Consider C_P = 1 kJ/kg-K. γ = 1.41, $4^{\left(\frac{0.41}{1.41}\right)} = 1.5$]

(a) 14.25 kW (b) 10.25 kW
(c) 6.75 kW (d) 8.25 kW

SJVN ET 2019

Ans. (a) : Given,
$P_2 = 0.4\times10^6$ N/m^2
$P_1 = 0.1\times10^6$ N/m^2
$T_1 = 285$ K
m = 0.1 kg/s

$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_2}{T_1} = \left(\frac{0.4\times10^6}{0.1\times10^6}\right)^{\frac{0.41}{1.41}}$$

$\therefore T_2 = T_1 \times 1.5$
$= 285 \times 1.5$
$= 427.5$ K

Work done = $mc_P (T_2 - T_1)$
$= 0.1\times1\times10^3\times(427.5 - 285)$
$= 14250$ W
$= 14.25$ kW

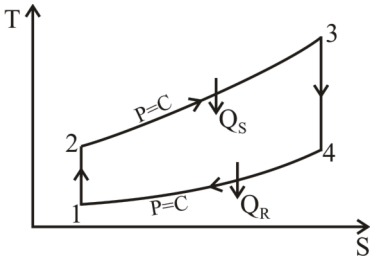
669. The pressure ratio and maximum temperature of Brayton cycle are 5 : 1 and 928 K respectively. Air enters the compressor at 1 bar and 300 K. What will be the net work output of the cycle per kg of air flow?

[consider, C_p = 1.0 kJ/kg-K γ = 1.41, $5^{\left(\frac{0.41}{1.41}\right)} = 1.6$]

(a) 256 kJ/kg (b) 205 kJ/kg
(c) 120 kJ/kg (d) 168 kJ/kg

SJVN ET 2019

Ans. (d) :
P_1= 1 bar
T_1= 300 K
T_3= 928 K
C_p = 1.0 kJ/kg-K
γ = 1.41



$$\eta = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}}$$

$$= \frac{\text{Net work output}}{\text{Heat supplied}}$$

$$\frac{T_2}{T_1} = (r_p)^{\frac{\gamma-1}{\gamma}}$$

$$T_2 = 300\times1.6 = 480 K$$

$$\eta = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}} = \frac{\text{Net work output}}{c_p(T_3 - T_2)}$$

$$1 - \frac{1}{1.6} = \frac{\text{Net work output}}{1\times(928 - 480)}$$

Net work output = 168 kJ/kg

670. Mechanical Efficiency of a gas turbine as compared to internal combustion engine is

(a) higher (b) lower
(c) same (d) unpredictable

TNPSC AE 2019

Ans. (a) : The mechanical efficiency of a gas turbine (95%) is quite high as compared with I.C. engine (85%) since I.C. engine has large number of sliding parts.
The thermal efficiency of a simple gas turbine is low (15 to 20%) as compared with I.C. engine (25 to 30%).

671. The following is (are) the limitation(s) of gas turbines:

(a) They are not self starting
(b) Higher rotor speeds
(c) Low efficiencies at part loads
(d) All of these

OPSC AEE 2019 PAPER - II

Search on Telegram @apna_pdf

Ans. : (d) : Limitations of gas turbines are as follows-
(i) They are not self starting
(ii) Higher rotor speeds
(iii) Low efficiencies at part loads
(iv) The efficiencies depends on the ambient condition (P_a and T_a).
(v) Compressor work required is quite large, which tells upon the efficiency of the plant.

672. Which of the following method (s) can be used to improve the thermal efficiency of open cycle gas turbine plant?
(a) Inter cooling (b) Reheating
(c) Regeneration (d) All of these

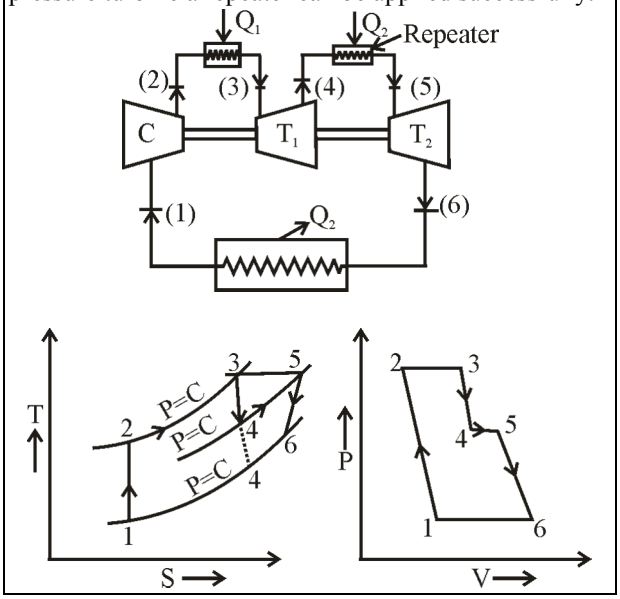
MECON MT 2019

Ans. (d) : The following method (s) can be used to improve the thermal efficiency of open cycle gas turbine plant : Inter cooling, Reheating, Regeneration.

673. Reheating in a gas turbine
(a) Increases the thermal efficiency
(b) Increases the compressor work
(c) Increases the turbine work
(d) Decreases the thermal efficiency

Nagaland PSC (CTSE) 2018, Paper-II
ESE 1998

Ans. (c) : Reheating is applied in a gas turbine in such a way that it increases the turbine work without increasing the compressor work.
When a gas turbine plant has a high pressure and low pressure turbine a repeater can be applied successfully.



674. An open cycle pressure gas turbine uses a fuel of calorific value 40000 kJ/kg with air fuel ratio of 80 : 1 and develops a net output of 80 kJ/kg of air. The thermal efficiency of cycle is :
(a) 12% (b) 16%
(c) 20% (d) 18%

GPSC ARTO Pre 30.12.2018

Ans. (b) : Given, Calorific value = 40000 kJ/kg
AFR = 80 : 1
Net output = 80 kJ/kg of air

$$\eta_{thermal} = \frac{\text{Net Output} \times \text{AFR}}{\text{Calorific value}} = \frac{80 \times 80}{40000} = 0.16 = 16\%$$

675. In a gas turbine plant, compressor power, turbine power and heat input are respectively given as 300 kJ/kg, 500 kJ/kg and 700 kJ/kg. The thermal efficiency and back work ratio of the plant will be:
(a) 71.4%; 0.4 (b) 42.8%; 0.6
(c) 71.4%; 0.6 (d) 28.6%; 0.4
(e) 28.6%; 0.6

CGPSC AE 25.02.2018

Ans. (e) : Data given-
$W_C = 300$ kJ/kg, $W_T = 500$ kJ/kg, $Q_s = 700$ kJ/kg

$$\text{Then, } \eta = \frac{W_T - W_{comp}}{Q_S} = \frac{500 - 300}{700} = \frac{200}{700}$$

$$\eta = 0.286 = 28.6\%$$

$$\text{Back work ratio} = \frac{W_{Comp}}{W_T} = \frac{300}{500} = 0.6$$

676. Gas turbine cycle with regeneration refers to:
(a) Preheating of the air leaving the compressor with the help of turbine exhaust gases
(b) Precooling of the air leaving the compressor with the help of cold water
(c) Heating the exhaust gases between two turbines
(d) Intercooling the air between two compressors
(e) Cooling of the exhaust gases between two turbines

CGPSC AE 25.02.2018

Ans. (a) : Gas turbine cycle with regeneration refers to preheating of the air leaving the compressor with the help of turbine exhaust gases.

677. Statement I: The air-standard efficiency of Brayton cycle depends only on the pressure ratio.
Statement II: For the same compression ratio, the air-standard efficiency of Brayton cycle is equal to that of Otto cycle.

ESE 2018

Ans. (b) : Air standard efficiency of Brayton cycle depends only on pressure ratio.

$$\eta = 1 - \left(\frac{1}{r_c}\right)^{\frac{\gamma-1}{\gamma}}$$

In theoretical point of view both will have same efficiency only when the compression ratio is equal to pressure ratio.

678. Statement I: The air-fuel ratio employed in a gas turbine is around 60:1.
Statement II: A lean mixture of 60:1 in a gas turbine is mainly used for complete combustion.

ESE 2018

Ans. (c) : Air fuel ratio used in gas turbines vary from 50 : 1 to 120 : 1.
Very lean mixtures are used in gas turbine to reduce the peak temperature of the cycle.
Hence statement-II is wrong.

Search on Telegram @apna_pdf

679. For a gas turbine the pressure ratio may be in the range

(a) 18 to 22 (b) 16 to 18
(c) 3 to 5 (d) 2 to 3

GPSC Executive Engineer 23.12.2018

Ans. (a) :

- For a gas turbine the pressure ratio may be in the range 18 to 22.
- Normal air to fuel ratio of gas turbine is 60 : 1 to 100 : 1.
- Temperature at the inlet to turbine is very high (1300K – 1500 K).

680. With the increase in pressure ratio thermal efficiency of a simple gas turbine plant with fixed turbine inlet temperature

(a) Increases
(b) Decreases
(c) First increases and then decreases
(d) First decreases and then increases

GPSC Executive Engineer 23.12.2018

Ans. (a) : With the increase in pressure ratio thermal efficiency of a simple gas turbine plant with fixed turbine inlet temperature increases.

681. The efficiency of Joule cycle is

(a) Greater than Carnot cycle
(b) Less than Carnot cycle
(c) Equal to Carnot cycle
(d) None of these

Sikkim PSC (Under Secretary), 2017

Ans. (b) : The efficiency of Joule cycle is less than Carnot cycle.
In joule cycle air is used as working fluid which have specific volume which may required huge back work from turbine which may lead to decrease in network output of the cycle.

682. In a gas turbine plant, regeneration is done to

(a) increase compression work
(b) decrease turbine work
(c) limit the maximum temperature
(d) improve plant efficiency

GPSC EE Pre, 28.01.2017

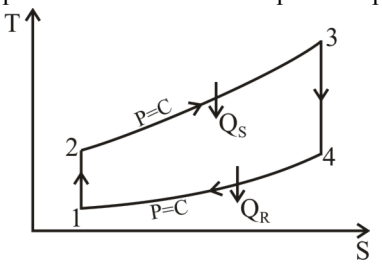
Ans. (d) : In regeneration gas turbine, as an exhaust gas heat exchanger a regenerator recovers heat from the exhaust and uses it do preheat the compressed air combustion thus regenerators can used to increase the thermal efficiencies and power output of gas turbine.

683. Assertion (A) : In constant pressure type gas turbines, large quantity of air is used, in excess of its combustion requirements.
Reason (R) : Excess air is used to compensate for inevitable air-loss due to leakage in the system.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is NOT the correct explanation of a
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

Punjab PSC (Lect.) 06.08.2017

Ans. (c) : In constant pressure type gas turbines, large quantity of air is used, in excess of its combustion requirements. Gas turbine cycle consists of two isentropic process and two constant pressure process.



Process $1 \rightarrow 2$: – Isentropic compression
Process $4 \rightarrow 1$: – Constant pressure heat rejection
Process $3 \rightarrow 4$: – Isentropic expansion
Process $2 \rightarrow 3$: – Constant pressure heat addition

684. The output of a gas turbine is 300 kW and its efficiency is 20 percent, the heat supplied is

(a) 600 kW (b) 6000 kW
(c) 150 kW (d) 15 kW

GPSC Asstt. Director of Transport 05.03.2017

Ans. (*) :

$$\text{Efficiency } (\eta) = \frac{\text{Output}}{\text{Heat supplied}} \Rightarrow 20\% = \frac{300}{\text{Input}}$$

Input = 1500 kW

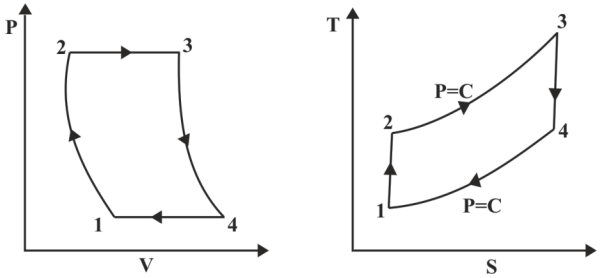
685. The work ratio of a gas turbine is a function of

(a) temperature ratio and pressure ratio
(b) pressure ratio
(c) temperature ratio
(d) none of these

ISRO Scientist/Engineer 17.12.2017

Ans. (a) : Work ratio is defined as the ratio of the network ($W_T - W_C$) to the turbine work developed (W). It is denoted by WR.

$$WR = \frac{\text{Net work}}{\text{Turbine work}} = \frac{W_T - W_C}{W_T} = 1 - \frac{W_C}{W_T}$$



Gas turbine work on Brayton cycle

$$\text{Work ratio } = 1 - \frac{C_P(T_2 - T_1)}{C_P(T_3 - T_4)} = 1 - \frac{T_1\left[\frac{T_2}{T_1} - 1\right]}{T_3\left[1 - \frac{T_4}{T_3}\right]}$$

Search on Telegram @apna_pdf

For Otto and Brayton cycle

$T_1 \times T_3 = T_2 \times T_4$

Then,

$$r_P = \frac{P_2}{P_1} = \frac{P_3}{P_4}$$

$$\text{Work ratio} = 1 - \frac{T_1}{T_3} \times \frac{T_2}{T_1}$$

$$\text{Work ratio} = 1 - \frac{T_1}{T_3} \times r_P^{\left(\frac{\gamma-1}{\gamma}\right)}$$

So, work ratio of gas turbine depends on both pressure ratio and temperature.

686. Efficiency of gas turbines lies between

(a) 85 to 95% (b) 50 to 60%
(c) 30 to 50% (d) 15 to 18%

ISRO Scientist/Engineer 17.12.2017
Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Overall efficiency of gas turbine plant can be about 35%.
Note-Official answer given by ISRO is (d).

687. In an ideal gas turbine cycle with inter-cooling, reheating and regeneration as the number of compression and expansion states are increased, which of the following statements are correct?

I. The Brayton cycle reduces to Ericsson cycle.
II. The Brayton cycle reduces to Stirling cycle.
III. The cycle efficiency becomes equal to Carnot cycle efficiency.

(a) Statement I alone (b) Statement III alone
(c) Statement I and II (d) Statement II and III

ISRO Scientist/Engineer 07.05.2017

Ans. (*) : Note : ISRO's option excluded for evaluation.

688. The amount of energy added by heat transfer to the cycle to produce unit of network output is called

(a) Heat rate (b) Work ratio
(c) Back work ratio (d) Thermal efficiency

TNPSC AE 2017

Ans. (a) : $\text{Heat rate} = \frac{\text{Heat added}}{\text{work done}}$

If work done=1
Then, Heat rate= Heat added

689. In Brayton cycle, heat addition is a _____.

(a) Constant enthalpy process
(b) Constant entropy process
(c) Constant volume process
(d) Constant pressure process

CIL MT 26.03.2017

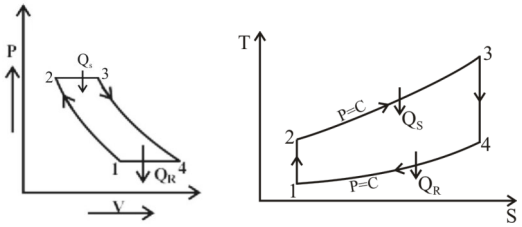
Ans. (d) : Brayton cycle is a theoretical cycle for gas turbines. This cycle consists of two reversible adiabatic or isentropic processes and two constant pressure processes. The heat addition and rejection takes place at constant pressure.

690. The gas in cooling chamber of a closed cycle gas turbine is cooled at

(a) Constant volume
(b) Constant temperature
(c) Constant pressure
(d) None of these

Vizag Steel (MT) 2017

Ans. (c) : The gas in cooling chamber of a closed cycle gas turbine is cooled at constant pressure.



This cycle is known as Joule's cycle or Brayton cycle

691. Consider the following statements in respect of ideal and practical gas turbine cycles:

1. In the ideal cycle case, the cycle efficiency depends on the pressure ratio only.
2. In the practical cycle case (with irreversibilities in the compression and expansion processes), the cycle efficiency depends on the maximum temperature as well as on the pressure ratio.
3. In the practical cycle case, at a given maximum temperature, the maximum efficiency and the maximum work done occur at a same pressure ratio.

Which of the above statements are correct?

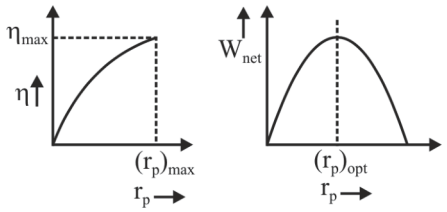
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Ans. (a) : (i) The efficiency of ideal gas turbine cycle depends on the pressure ratio.

$$\eta = 1 - \frac{1}{r_p^{\gamma-1/\gamma}}$$

(ii) The efficiency of turbine and compression came in picture due to irreversibility so final efficiency depend not only pressure ratio but also maximum temperature. Therefore statement (1) and (2) are correct while statement (3) is wrong because maximum efficiency occurs at $(r_p)_{max}$ and maximum work done occurs at $(r_p)_{opt}$



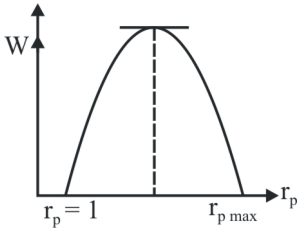
692. For the same efficiency of the Brayton cycle and the Carnot cycle working between temperature limits of T_{max} and T_{min}, the power contribution of the Brayton cycle will be

(a) zero (b) maximum
(c) minimum (d) 50% of the Carnot cycle

ESE 2017

Search on Telegram @apna_pdf

Ans. (a) : If efficiency is same then power contribution of Brayton cycle will be zero.



at $(r_p)_{max}$

$\eta_{brayton} = \eta_{carnot}$

Network is zero as turbine work = compressor work

693. The air-fuel ratio for a gas turbine is generally kept closer to

(a) 20 : 1 (b) 30 : 1

(c) 40 : 1 (d) 60 : 1

BPSC AE Mains 2017 Paper - V

Ans. : (d) : The air-fuel ratio for a gas turbine is generally kept closer to 60 : 1.

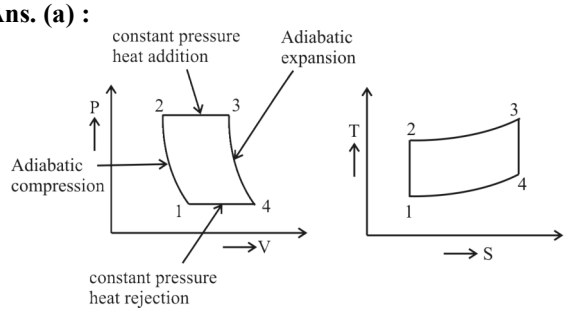
694. An air standard Brayton cycle has air entering the compressor at 27 °C and 100 kPa. The pressure ratio is 10 and maximum allowable temperature in the cycle is 1350 K. The temperature after expansion in the turbine will be :

(a) 699 K (b) 650 K

(c) 630 K (d) 600 K

RPSC ADE 2016

Ans. (a) :



$T_1 = 27 + 273 = 300$ K

$P_1 = 100$ KPa

$r_p = 10 = \dfrac{P_2}{P_1} = \dfrac{P_3}{P_4}$

$T_3 = T_{max} = 1350$ K

$$\frac{T_3}{T_4} = \left(\frac{P_3}{P_4}\right)^{\frac{\gamma-1}{\gamma}} \Rightarrow (10)^{\frac{1.4-1}{1.4}}$$

$$\frac{T_3}{T_4} = (10)^{0.2857} = 1.93$$

$$T_4 = \frac{1350}{1.93} = 699\,\text{K}$$

695. Condenser is not used in

(a) Steam power plant

(b) Vapour compression refrigeration system

(c) Gas turbine power plant

(d) Vapour absorption refrigeration system

RPSC LECTURER 16.01.2016

Ans. (c) : In gas turbine power plant condenser is not used.

Condenser—A condenser is a device or unit used to condense a gaseous substance into liquid state through cooling. In so doing, the latent heat is released by the substance and transferred to the surrounding environment.

696. The maximum net specific work obtainable in an idle Brayton cycle T_{max} = 1600K and T_{min} = 400K is given by:

(a) 400 C_p (b) 500 C_p

(c) 600 C_p (d) 800 C_p

RPSC VPITI 14.02.2016

Ans. (a) : Given $T_{max} = 1600$K

$T_{min} = 400$K

Specific work done $W = C_p\left[\sqrt{T_{max}} - \sqrt{T_{min}}\right]^2$

$= C_p\left[\sqrt{1600} - \sqrt{400}\right]^2$

$= C_p[40 - 20]^2$

$W = 400\ C_p$

697. An open cycle pressure gas turbine uses a fuel of calorific value of 36000 kJ/kg with air-fuel ratio of 60:1 and develops a net output of 60 kJ/kg of air. The thermal efficiency of the cycle is:

(a) 6% (b) 10%

(c) 12% (d) 16%

RPSC VPITI 14.02.2016

Ans. (b) : In an open cycle gas turbine

Given, Calorific value = 36000 kJ/kg

Air-fuel ratio $\left(\dfrac{A}{F}\right) = 60 : 1$

Net output W = 60 kJ/kg

Mass of air = 60 kg

Mass of fuel = 1 kg

$$\eta = \frac{W_{net} \times m}{\frac{F}{A} \times 36000} \times 100$$

$$\eta = \frac{60 \times 60}{1 \times 36000} \times 100$$

$= 10\%$

698. The operating pressure in gas turbine as compared to IC engine is-

(a) Double (b) Same

(c) More (d) Less

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (d) : The operating pressure in gas turbine as compared to IC engine is less.

699. The effective power of gas turbines is increased by adding the following in compressor

(a) Ammonia and water vapour

(b) Carbon dioxide

(c) Nitrogen

(d) Hydrogen

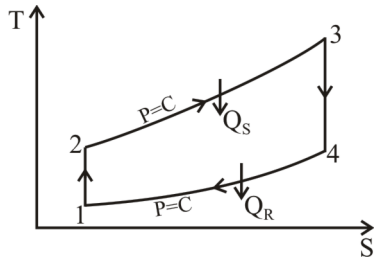
Nagaland PSC (CTSE) 2016, Paper-II

Search on Telegram @apna_pdf

Ans. (a) The effective power of turbine = Power produce by turbine – Power consume by compressor

Power consume by compressor = $h_2 - h_1$

$= \dot{m}C_p(T_2 - T_1)$



The effective power of gas turbine is increased when power consumed by compressor is minimum i.e. C_p value should be minimum for that.

$$(C_p)_{H_2} > (C_p)_{N_2} > (C_p)_{CO_2} > (C_p)_{NH_3 \text{ and } H_2O \text{ vapour}}$$

700. The thermal efficiency of a gas turbine with regenerator is maximum when pressure ratio is :

(a) less than 1.3 (b) more than 1.0

(c) equal to 1.0 (d) zero

HPPSC W.S. Poly. 2016

Ans. : (c) The thermal efficiency of a gas turbine with regenerator no effect on the work output but thermal efficiency increase.

Efficiency of ideal regenerative cycle –

$$\eta_{\text{ideal Reg.}} = 1 - \frac{T_{min}}{T_{max}}\left(r_p\right)^{\frac{\gamma-1}{\gamma}}$$

$\eta_{\text{ideal Reg.}} \rightarrow$ maximum for $\boxed{r_p = 1}$

The thermal efficiency of a gas turbine with regenerator is maximum when pressure ratio is equal to 1.0

701. The ideal efficiency of simple gas turbine cycle depends upon

(a) Pressure ratio (b) Cut-off ratio

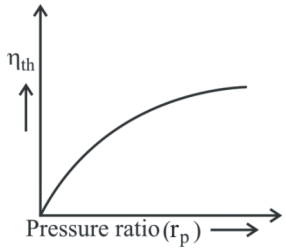
(c) Both (a) and (b) (d) None of the above

UPPSC AE 12.04.2016 Paper-II

Ans. : (a) Thermal efficiency at gas turbine:-

$$\eta_{th} = 1 - \frac{1}{r_p^{(\gamma-1)/\gamma}}$$

Pressure ratio $\left(r_p\right) = P_2 / P_1$



* Optimum pressure ratio for maximum specific output in simple gas turbine.

$$(r_p)_{optimum} = \left(\frac{T_{max}}{T_{min}}\right)^{\frac{\gamma}{2(\gamma-1)}}$$

702. If the temperature at the turbine inlet is kept constant, the net output of a simple gas turbine plant would

(a) Increase with increasing pressure ratio

(b) Decrease with increasing pressure ratio

(c) First increase and then decrease with increasing pressure ratio

(d) remains unaffected with changes in pressure ratio

UPPSC AE 12.04.2016 Paper-II

Ans. : (c) If the temperature at the turbine inlet is kept constant, the net output of a simple gas turbine plant would first increase and then decrease with increasing pressure ratio.

703. Which of the following cycles is the basis for the working of a closed cycle gas turbine?

(a) Otto Cycle (b) Joule Cycle

(c) Brayton Cycle (d) Both B and C

KPCL AE 2016

Ans. (d) : Joule cycle and Brayton cycle is basis for the working for a closed cycle gas turbine.

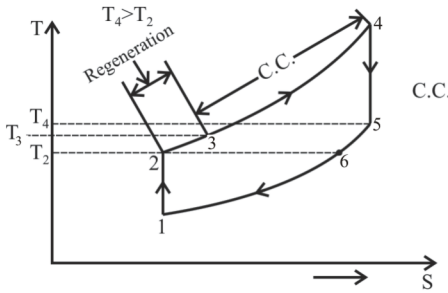
704. The air exit from the compressor and turbine in a gas turbine plant is at T_2 and T_5 respectively, while air enters from regenerator into combustion chamber at T_3. The effectiveness of regenerator is:

(a) $\frac{T_3 - T_2}{T_5 - T_2}$ (b) $\frac{T_5 - T_2}{T_3 - T_2}$

(c) $\frac{T_5 - T_3}{T_5 - T_2}$ (d) $\frac{T_5 - T_3}{T_5 - T_2}$

NPCIL ET, 2015

Ans. (a) :



Effectiveness of regenerator $(\varepsilon) = \frac{T_3 - T_2}{T_5 - T_2}$

705. The efficiency of a Brayton cycle increases with-

(a) Decrease in compression ratio

(b) Decrease in pressure ratio

(c) Increase in pressure ratio

(d) Both increase and decrease of pressure ratio

NPCIL ET, 2015

Ans. (c) : $\uparrow \eta_{\text{Brayton}} = 1 - \frac{1}{\left(\uparrow r_p\right)^{\frac{\gamma-1}{\gamma}}}$

Search on Telegram @apna_pdf

706. Gas turbine used in an aircraft is :

(a) close-cycle turbine
(b) open-cycle turbine
(c) constant-volume turbine
(d) None of the above

BPSC Asstt. Prof. 29.11.2015

Ans. (b) : Gas turbine used in an aircraft is open-cycle turbine. Gas turbine cycle consists of two isentropic process and two constant pressure process.

707. Thermal efficiency of closed cycle gas turbine increase by

(a) reheating (b) intercooling
(c) regenerator (d) all of the above

TSGENCO AE 14.11.2015

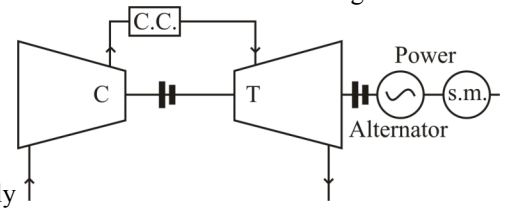
Ans. (c) : Thermal efficiency of closed cycle gas turbine increases by regenerator while decreases thermal efficiency in case of reheating and intercooling.

708. Which of the following is the part of gas turbine plant?

(a) Compressor
(b) Condenser
(c) Pelton turbine
(d) Thermostatic expansion valve
(e) Kaplan turbine

CGPSC AE 26.04.2015 Shift-II

Ans. (a) : Gas Turbine Plant– In the gas turbine power plant air is compressed in a compressor(C). This compressed air then passes through a combustion chamber (C.C.) where the temperature of the compressed air rises. That high pressure and high temperature air is passed through gas turbine (T). In gas turbine (T) compressed air suddenly expended; hence it gains kinetic energy, and because of this kinetic energy the air can do mechanical work for rotating the turbine.



709. The output in a gas turbine cycle is 800kJ/kg. The compressor work is 500kJ/kg whereas heat supplied is 1500kJ/kg. The thermal efficiency of the cycle is

(a) 10% (b) 20%
(c) 40% (d) 60%
(e) 80%

CGPSC AE 26.04.2015 Shift-II

Ans. (b) : Data given as,
$W_T = 800$ kJ/kg , $W_c = 500$ kJ/kg
$Q_s = 1500$ kJ/kg

$$\eta = \frac{W_{net}}{Q_{supplied}} = \frac{800-500}{1500}\times 100 = \frac{300}{1500}\times 100$$

$$\boxed{\eta = 20\%}$$

710. Consider the following statements:

1. **Gas turbine plants are heavier and larger in size than steam turbine plants.**
2. **The speed of rotation of the moving elements of gas turbines is much higher than those of steam turbines.**
3. **Gas turbines require 'cooling water' for its operations.**
4. **Almost any kind of fuel can be used with gas turbine.**
5. **Gas turbine plants are generally used for meeting peak power load.**

Of these, which are correct

(a) 1 and 2 (b) 1 and 3
(c) 1 and 4 (d) 3 and 4
(e) 2, 4 and 5

CGPSC AE 26.04.2015 Shift-II

Ans. (e)
1. Steam turbine plants are heavier and larger in size than gas turbine plants.
2. The speed of rotation of the moving elements of gas turbines is much higher than those of steam turbines.
3. Gas turbine not required 'Cooling water' for its operations.
4. Almost any kind of fuel can be used with gas turbine.
5. Gas turbine plants are generally used for meeting peak power load.

711. Back work ratio of gas turbine plant is:

(a) $\frac{\text{Turbine work}}{\text{Compressor work}}$ (b) $\frac{\text{Turbine work}}{\text{Heat input}}$
(c) $\frac{\text{Compressor work}}{\text{Heat input}}$ (d) $\frac{\text{Compressor work}}{\text{Turbine work}}$
(e) $\frac{\text{Turbine work - Compressor work}}{\text{Turbine work}}$

CGPSC AE 26.04.2015 Shift-II

Ans. (d) : Back work ratio- It is defined as the ratio of negative work to positive work.

$$r_{\text{back ratio}} = \frac{\text{Compressor work}}{\text{Turbine work}}$$

712. Gas turbine as compared to an internal combustion engine

(a) torque produced is uniform
(b) can be driven at high speed
(c) has more efficiency
(d) All the above

TSPSC AEE 2015

Ans. : (d) Gas turbine as compared to an internal combustion engine
(i) Torque produced is uniform
(ii) Can be driven at high speed
(iii) has more efficiency

713. The use of regeneration in a gas turbine cycle increases :

(a) Efficiency but has no effect on output
(b) Output but has no effect on efficiency
(c) Both efficiency and output
(d) None

Kerala PSC Poly. Lect. 09.01.2014

Search on Telegram @apna_pdf

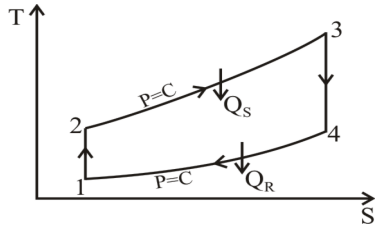
Ans. (a) : The use of regeneration in a gas turbine cycle increases efficiency but has no effect on output.

714. In an ideal gas turbine plant, it is assume that the compression and expansion process are.

(a) isothermal (b) isentropic
(c) isobaric (d) None of these

MPSC Poly. Lect. 2014

Ans. (b) : Ideal gas turbine power plant works on Brayton cycle.



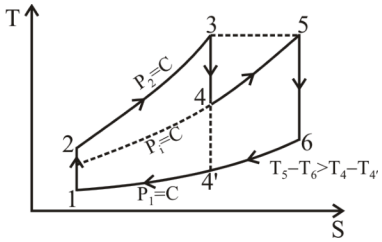
1 – 2– Isentropic compression.
2 – 3– Isobaric heat addition.
3 – 4– Isentropic expansion.
4 – 1– Isobaric heat rejection.

715. In a two-stage gas turbine plant, reheating after first stage

(a) increases work ratio
(b) is less than work ratio
(c) does not affect
(d) in unpredictable

APPSC Poly. Lect. 2013

Ans. (a) : In two-stage gas turbine plant, reheating after first stage increase work ratio.



• Effect of reheating –
W_C-same, $W_T\uparrow$, $W_{net}\uparrow$, $Q_S\uparrow$, $Q_R\uparrow$, $\eta\downarrow$

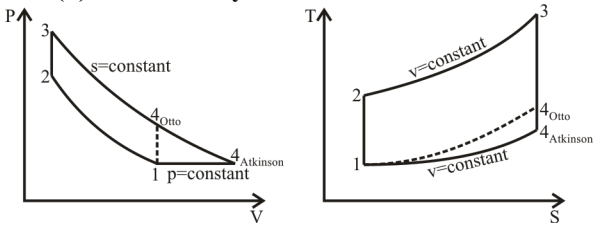
$\because$ Work ratio $(r_w) = \dfrac{W_{net}}{W_T}$

716. Which of the following gas power cycles has unequal expansion and compression strokes?

(a) Stirling cycle (b) Atkinson cycle
(c) Joule cycle (d) Ericsson cycle

RPSC AEN Pre-2013

Ans. (b) : Atkinson cycle-



Atkinson cycle has unequal expansion an compression strokes.

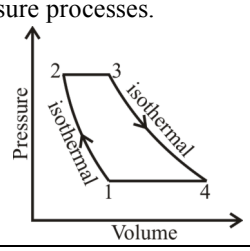
717. Which of the following gas power cycles, in ideal conditions has, thermodynamic efficiency equal to a Carnot cycle operating between the same temperature limits?

(a) Ericsson cycle (b) Joule cycle
(c) Atkinson cycle (d) Dual cycle

RPSC AEN Pre-2013

Ans. (a) : Ericsson cycle in ideal conditions has thermodynamic efficiency equal to a Carnot cycle operating between the same temperature.

• Ericsson cycle consists of two isothermal and two constant pressure processes.



718. Which of the following is not an advantage of gas turbines over IC engines?

(a) The weight of turbines per unit power is much less.
(b) There is no problem of knocking or other abnormal combustion.
(c) No or greatly reduced cooling requirements.
(d) Better part load efficiency.

RPSC AEN Pre-2013

Ans. (d) : Advantage of gas turbine over IC engine-

- The weight of turbines per unit power is much less.
- There is no problem of knocking or other abnormal combustion
- No or greatly reduced cooling requirement.

719. Gas turbine blade material must possess:

(a) High creep rate
(b) Low creep rate
(c) Plasticity at high temperature
(d) Electrical conductivity

SJVN ET 2013

Ans. (b) : Modern turbine blades often use nickel based super alloys that incorporate chromium, cobalt and rhenium.
Gas turbine blade material must possess following properties :

(i) Material must withstand high temperature and high stress.
(ii) It must have low creep rate.
(iii) It must have high resistance to oxidation corrosion and erosion.
(iv) It must neither be brittle at ordinary temperature nor plastic when hot.
(v) It must have good cast ability or forge ability characteristics.
(vi) It must have good machine ability to achieve precise dimension.
(vii) It must have high resistance to fatigue failure.
(viii) It must maintain structural stability when exposed to varying temperature.

Search on Telegram @apna_pdf

720. In a gas turbine plant, fuel can be:
(a) High octane gasoline
(b) Heavy diesel oil
(c) Pulverized Coal
(d) All of these

SJVN ET 2013

Ans. (d) : In a gas turbine, fuel can be :
■ High octane gasoline
■ Heavy diesel oil
■ Pulverized coal

721. An engine working on stirling cycle between the same temperature limits as that of Carnot cycle, has air standard efficiency:-
(a) More than Carnot cycle
(b) Equal to Carnot cycle
(c) Less than Carnot cycle
(d) Depends upon other factor also

UKPSC AE-2013, Paper-II

Ans. (b) : For Carnot cycle–
• The efficiency of all reversible heat engine operating between same temperature limit is same.

722. A gas turbine plant operates between 27°C, minimum temperature and 927°C maximum temperature. Calculate the cycle efficiency:-
(a) 25% (b) 50%
(c) 75% (d) None of the above

UKPSC AE-2013, Paper-II

Ans. (c) : Given, $T_{min} = 27°C = 27 + 273 = 300\ K$
$T_{max} = 927°C = 927 + 273 = 1200\ K$

$$\eta = 1 - \frac{T_{min}}{T_{max}}$$
$$= 1 - \frac{300}{1200}$$
$$= 1 - \frac{1}{4} = \frac{3}{4}$$
$$\eta = 75\%$$

723. The effect of regeneration on efficiency and work output of Brayton cycle is that its:-
(a) Efficiency decreases but work output increases
(b) Efficiency as well as work output increases
(c) Efficiency increases but work output remains same
(d) Efficiency remains same but work output increases

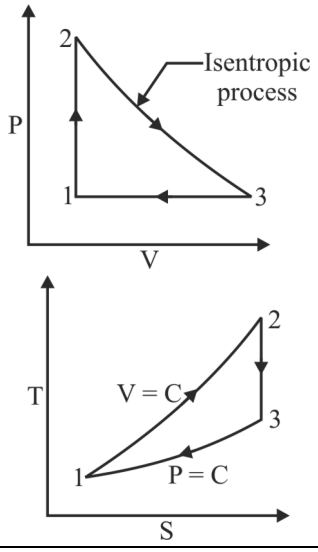
UKPSC AE-2013, Paper-II

Ans. (c) : The effect of regeneration on efficiency and work output of Brayton cycle is that its efficiency increases but work output remains same.

724. Which cycle consists of three processes?
(a) Ericsson cycle (b) Stirling cycle
(c) Atkinson cycle (d) Lenoir cycle

UKPSC AE-2013, Paper-II

Ans. (d) : The Lenoir cycle is an idealized thermodynamic cycle often used to model a pulse jet engine.



725. Constant volume gas turbine works on:-
(a) Joule cycle (b) Carnot cycle
(c) Otto cycle (d) Atkinson cycle

UKPSC AE-2013, Paper-II

Ans. (d) : Constant volume gas turbine works on atkinson cycle.

726. The thermal efficiency of an open cycle gas turbine increases with the:-
(a) Increase in inlet temperature of atmospheric air
(b) Decrease in inlet temperature of atmospheric air
(c) Remain same for all temperatures of inlet air
(d) None of the above

UKPSC AE-2013, Paper-II

Ans. (b) : The thermal efficiency of an open cycle gas turbine increases with the decrease in inlet temperature of atmospheric air.

727. Gas turbine blades are given a rake
(a) equal to zero
(b) in the direction of motion of blades
(c) opposite to the direction of motion of blades
(d) depending on the velocity

BPSC AE 2012 Paper - V

Ans. : (b) : Gas turbine blades are given a rake in the direction of motion of blades.

728. The blades of gas turbine are made of
(a) mild steel
(b) stainless steel
(c) carbon steel
(d) high-nickle alloy (neimonic)

BPSC AE 2012 Paper - V

Ans. : (d) : Turbine blades are made of nickel or rhenium alloys capable of withstanding high heat without distortion.

Search on Telegram @apna_pdf

729. Which of the following statements is not true for gas turbines ?
(a) Low full load thermal efficiency
(b) Costly machines
(c) Self starting unit
(d) Slow in its response to acceleration

UKPSC AE 2012 Paper–II

Ans. (c) : Self starting unit

730. Work ratio is a guide in the determination of
(a) the size of the gas turbine
(b) overall efficiency of the turbine
(c) mechanical efficiency of the turbine
(d) compressor efficiency

UKPSC AE 2012 Paper–II

Ans. (a) : the size of the gas turbine

731. Which phenomenon has the most adverse effect on volumetric efficiency when engine works at high speeds?
(a) Flow friction and choking
(b) Ram effect and choking
(c) Flow friction and charge heating
(d) Charge heating and back flow

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (a) : Volumetric efficiency reduces with increase in temperature. Flow friction and choking causes temperature to rise and hence the volumetric efficiency is adversely affected due to flow friction and choking.
Ram Effect–Ram effect is used or works in a way by using the dynamic air pressure created by the vehicle motion and increasing the static air pressure in combustion chamber it allows a greater mass flow through the engine.
Thus, ram effect pushes more air into the cylinder to increase volumetric efficiency.

732. In a two-stage turbine plant operating on a Brayton cycle with regeneration :
(a) work output increases, but cycle efficiency decreases
(b) work output increases, but cycle efficiency remains unchanged
(c) cycle efficiency increase, but work output remains unchanged
(d) both cycle efficiency and work output increase

DRDO Scientists 2009

Ans. (c) : $\eta = 1 - \frac{1}{(r_p)^{\frac{\gamma-1}{\gamma}}}$
Where, γ = adiabatic index
r_p = pressure ratio

733. The air standard cycle used in gas turbine is called
(a) Otto cycle (b) Lenoir cycle
(c) Stirling cycle (d) None of the above

WBPSC AE, 2007

Ans. (d) : The air standard cycle used in gas turbine is called Brayton cycle.

734. Reheating in gas turbines is done
(a) between compressor stages
(b) between turbine stages
(c) between compressor and turbine
(d) within the combustion chamber

OPSC Civil Services Pre 2006

Ans. (b) : Reheating - between turbine stage
Inter cooling - between compressor stage
Regeneration - between compressor and combustion chamber

6. Jet Propulsion

735. Efficiency of a jet engine is higher at :
(a) lower altitude (b) higher altitude
(c) low speed (d) high speed

RPSC AE 2016, TNPSC ACF 2012
RPSC ACF-2011, ESE 2003

Ans. (b) : The combustion efficiency of most aircraft gas turbine engine at sea level take off conditions is almost 100%. It decreases nonlinearly to 98% at altitude cruise conditions. Air –fuel ranges from 50:1 to 130 : 1

736. Propulsion efficiency of a jet engine is given by (where u is flight velocity and v is jet velocity relative to aircraft)
(a) $\frac{2u}{v-u}$ (b) $\frac{v+u}{2u}$
(c) $\frac{2u}{v+u}$ (d) $\frac{v-u}{2u}$

RPSC AE 2016, UJVNL AE 2016, ESE 1995

Ans. : (c) Propulsive efficiency of jet engine = $\frac{2u}{v+u}$
u = flight velocity
V = Jet velocity.

737. For speed above 3000 km/hour, it is more advantageous to use
(a) Turbojet engine (b) Ramjet engine
(c) Propellers (d) Rockets

Rajasthan AE (Nagar Nigam) 2016 Shift-3
TNPSC ACF 2012, TNPSC AE, 2008

Ans. (b) : For speed above 3000 km/hr, it is more advantageous to use Ramjet engine. Ramjet engine is not self operating to zero flight speed.

738. A rocket engine for the combustion of its fuel
(a) Carries its own oxygen
(b) Uses surrounding air
(c) Uses compressed atmospheric air
(d) Does not require oxygen

Nagaland PSC (CTSE) 2016, Paper-II
TNPSC AE (Industries) 09.06.2013
TNPSC ACF 2012

Ans. (a) : The petroleum used as rocket-fuel is a type a highly refined kerosene, called RP-1 in the United State petroleum fuel are usually used in combination with liquid oxygen as the oxidizer.

Search on Telegram @apna_pdf

739. For a jet propulsion unit ideally the compressor work and turbine work are

(a) unequal
(b) equal
(c) not related to each other
(d) None of the above

UPRVUNL AE 05.07.2021
BPSC Poly. Lect. 2016
J&K PSC Civil Services Per-2010

Ans. : (b) For a jet propulsion unit ideally the compressor work and turbine work are equally.

Jet Propulsion : -

The propulsive work needed for the propulsion of aircraft, missiles and spaceships is generally achieved by

(i) Using an engine or a gas turbine to drive the air screw or the propeller.
(ii) Expending high temperature and high pressure gases that are discharged in the rearward direction as high velocity jet (jet propulsion)

740. The motion of rocket is based on the principal of conservation of

(a) Linear momentum
(b) Angular momentum
(c) Kinetic energy
(d) Mass

TNPSC AE 2019
GPSC EE Pre, 28.01.2017

Ans. (a) : Rocket work on the principal of conservation of linear momentum. Rocket ejaculates gases in backward direction which creates momentum of the gases backward and thus by conservation in the forward direction making it moves forward.

741. The velocity of air entering in a rocket is

(a) less compared to an aircraft
(b) zero compared to an aircraft
(c) more compared to an aircraft
(d) same compared to an aircraft

TNPSC AE 2013, TNPSC ACF 2012

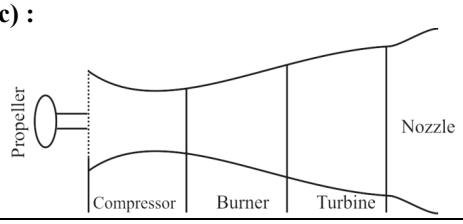
Ans. (b) : The velocity of air entering in a rocket is zero compared to an aircraft.

742. Which one of the following is the correct sequence of the position of the given components in a turboprop?

(a) Propeller, Compressor, Turbine, Burner
(b) Compressor, Propeller, Burner, Turbine
(c) Propeller, Compressor, Burner, Turbine
(d) Compressor, Propeller, Turbine, Burner

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (c) :



743. Propulsive efficiency is defined as the ratio of

(a) Thrust power and fuel energy
(b) Engine output propulsive power
(c) Thrust power and propulsive power
(d) Propulsive power and fuel input

APPSC AEE 2012, TNPSC ACF 2012

Ans. (c) : Propulsive efficiency $= \frac{\text{Thrust Power}}{\text{Propulsive Power}}$

$$\eta_p = \frac{2}{1+\frac{v_e}{v_0}}$$

Where, v_e = exhaust expulsion velocity
v_0= Air speed at the inlet

744. The essential difference between the turbofan engine and turboprop engine is :

(a) the bypass ratio is more for turboprop engine than the turbofan engine
(b) the bypass ratio is low for turboprop engine than the turbofan engine
(c) the turbofan engine uses big propellers
(d) both of them are ramjet engines

CGPSC AE 15.01.2021

Ans. (a) :

745. A radial IC engine arrangement is used in

(a) Turbojet Engines
(b) Aircraft propeller engines
(c) Large marine ships
(d) Formula -1 racing

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : The radial engine is a reciprocating type IC engine configuration in which cylinders radiate outward from a control crank case like the spokes of a wheel,. The radial configuration was commonly used for aircraft engines before gas turbine engines become predominant no unbalance couple generated in radial engine.

746. A nozzle used in Rocket motor is typically

(a) A convergent passage
(b) A divergent passage
(c) A convergent divergent passage
(d) a divergent convergent passage

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Only convergent divergent nozzle gives super sonic speed so rocket used convergent divergent nozzle.

747. In a turbo-prop aircraft, the aircraft speed is 720 km/hr and air leaves from propeller at 1400 km/hr relative to the propeller, Assuming air density 1 kg/m^3 and ignoring pressure effects, calculate the thrust produced by propeller of 2-meter diameter.

(a) 720 π N (b) 1440 π N
(c) 40000 π N (d) 518400 π N

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Velocity of air flow at the propeller disc = C = 720 km/h = 200 m/s

Search on Telegram @apna_pdf

Theoretical value of mass flow rate

$\dot{m} = \rho AC$

$\dot{m} = 1 \times \frac{\pi}{4} \times 2^2 \times 200 = 200\pi$

Thrust = $\dot{m}\left(2C_j - u\right)$

$= 200\ \pi\ (1440 - 720) \times \frac{5}{18}$

$= 200\pi\left(720 \times \frac{5}{18}\right)$

$= 40000\ \pi$ N

748. Specific impulse of a rocket is

(a) Rocket thrust per unit mass of propellant
(b) Rocket thrust integrated over flight time per unit mass of propellant
(c) Maximum rocket thrust divided by mass of vehicle
(d) Average rocket thrust divided by mass of vehicle

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : Specific impulse is a measure of how effectively a rocket uses propellant or a jet engine uses fuel.

749. Difference between turboprop and a turbofan propulsion device is

(a) Use of high pressure for reaction force
(b) Difference in the nature of the fan blades
(c) Location on the aircraft
(d) Presence of a surrounding duct over the inlet fan

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Turboprops consist of a huge propeller in front of the engine core and turbofans have a small fan in front of the core propeller is much move gigantic than the fan. All the gas sucked in a turboprop go through the core and produce power when incident on turbine blades. The turbine power is used to run a propeller. But in turbofan, a certain volume of air bypasses the core.

750. The pressure at the exit of rocket nozzle should be____ for maximum efficiency.

(a) Above atmospheric pressure
(b) Below atmospheric pressure
(c) Equal to atmospheric pressure
(d) Equal to critical pointing pressure

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : The pressure at the exit of rocket nozzle should be equal to atmospheric pressure for maximum efficiency.

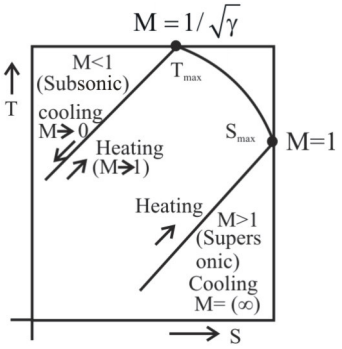
751. Which of the following statement is true for a Rayleigh flow at M = 1?

(a) Enthalpy is maximum
(b) Entropy is maximum
(c) Enthalpy is minimum
(d) Both (b) and (c)

ISRO Scientist/Engineer 12.01.2020

Ans. (b) : Rayleigh flow-

M → Mach No.



Entropy increases heat gain and thus we proceed to the right on the Rayleigh line as heat is transferred to the liquid. The mach no. equal to 1, which is point of maximum entropy.

752. A fluid passes through a well insulated tube of 4.7 cm^2 cross section area and 5 m length. If the pipe friction coefficient is 0.07 and the flow velocity is 3 m/s, then the flow can be represented using?

(a) Rayleigh flow model
(b) Isentropic flow model
(c) Gino flow model
(d) Fanno flow model

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : (i) Fanno flow-

(a) Process is adiabatic
(b) There is friction exist ($\mu \neq 0$)
(c) $h_{01} = h_{02} \Rightarrow T_{01} = T_{02}$
(d) $P_{01} \neq P_{02}$

Fanno flow is the adiabatic flow through a constant area duct where the effect of friction is considered.

(ii) Rayleigh flow:

(a) Heat transfer takes place
(b) Frictionless ($\mu = 0$)
(c) $h_{01} \neq h_{02}$
(d) $P_{01} = P_{02}$

Flow in a constant area duct with heat transfer and without friction is called Rayleigh flow.

753. Which one of the following may be considered as a single cylinder two stroke reciprocating engine running at 2400 rpm to 2700 rpm for rapid chain of impulses?

(a) Turbo jet (b) Pulse jet
(c) Ram jet (d) Athodyd jet

ESE 2020

Ans. (b) : Pulse jet is intermittent flow engine similar to a reciprocating engine and pulse jet operates similar to Otto cycle. Hence, it can be called as a reciprocating engine.

754. In jet propulsion of ships, when the inlet orifices are at right angles to the direction of motion of the ships, the efficiency of propulsion η is

Search on Telegram @apna_pdf

(a) $\frac{2u^2}{V+u}$ (b) $\frac{2Vu}{(V+u)^2}$

(c) $\frac{2u}{(V+u)^2}$ (d) $\frac{2Vu}{V+2u}$

where :
V = Absolute velocity of the issuing jet
u = Velocity of the moving ship

ESE 2020

Ans. (b) : $\frac{2Vu}{(V+u)^2}$

755. Which of the following are essential for a good combustion chamber of turbojet engine?
1. **It should allow complete combustion of fuel.**
2. **It should maintain sufficiently high temperature in the zone of combustion in addition to proper atomization of fuel thus leading to continuous combustion.**
3. **It should not have high rate of combustion.**
4. **The pressure drop should be as small as possible**

(a) 1, 2 and 4 only (b) 1, 2 and 3 only
(c) 1, 3 and 4 only (d) 2, 3 and 4 only

ESE 2020

Ans. (a) : 1, 2 and 4 only

756. Speed of sound in water is equal to (*K*-bulk modulus, ρ-density)

(a) $\sqrt{\frac{K}{\rho}}$ (b) $\sqrt{K\rho}$

(c) $\sqrt{\frac{\rho}{K}}$ (d) $\frac{K}{\rho}$

ISRO Scientist/Engineer 22.04.2018

Ans. (a) : Speed of sound in water $C = \sqrt{\frac{K}{\rho}}$

where, ρ = Density
K = Bulk modulus

757. Consider the following statements regarding a Ram Jet:
1. The engine has neither a compressor nor a turbine
2. It operates at much higher temperature than a gas turbine
3. It cannot operate statically. It needs to be put in flight by some means at sufficiently high speed before it produces any thrust and propels itself.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d)
(i) In Ramjet engine there is no. compressor or turbine. The compression process is achieved by Ram effect and expansion occurs in nozzle.
(ii) In gas turbines the maximum temperature is limited by the metallurgical limits of turbine blades.
(iii) Ramjet engine cannot generate thrust in static conditions. It needs to be put in flight by some means at sufficiently high speed before it produces any thrust.

758. Air enters a turbojet engine at the rate of 40 kg/s with a velocity of 250 m/s relative to an aircraft which is moving at 300 km/hr. Exhaust of the engine has a velocity of 700 m/s relative to the moving aircraft. The thrust developed by the engine is

(a) 24 kN (b) 18 kN
(c) 12 kN (d) 9 kN

ESE 2018

Ans. (b) : Given,
$\dot{m} = 40$ kg/s
Velocity of air entering relative to flight
$V_{inlet} = 250$ m/s
Velocity of exhaust gases relative to flight
$V_{exit} = 700$ m/s
Thrust (F) = $\dot{m}(V_{exit} - V_{inlet})$
$= 40 (700 - 250) = 18000$ N = 18 kN

759. Greater the difference between jet velocity and aeroplane velocity

(a) Less the propulsive efficiency
(b) Greater the propulsive efficiency
(c) Unaffected is the propulsive efficiency
(d) None of the above

GPSC Executive Engineer 23.12.2018

Ans. (a) : Less the propulsive efficiency.

760. Air-fuel ratio in a jet engine will be of the order of

(a) 10 : 1 (b) 15 : 1
(c) 20 : 1 (d) 60 : 1

Nagaland PSC CTSE 2017 Paper-2

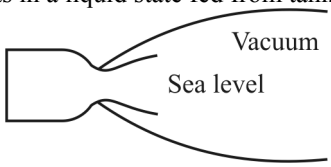
Ans. (d) : Air-fuel ratio in a jet engine, in the order of 60:1
Range (50:1 to 130:1)

761. Which of the following is true with respect to the rocket engines?

(a) They can operate in airless vacuum
(b) They have their own captive oxygen supply
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (c) : With respect to Rocket engine
- They can operate in airless vacuum
- They have their own captive oxygen supply
- Solid-rocket fuels are chemical rockets which are used as propellant in a solid phase.
- Liquid propellant rockets uses one or more propellants in a liquid state fed from tanks.



difference between- a sea- level and vacuum optimised nozzle.

Search on Telegram @apna_pdf

762. Which of the following does not use ambient air for propulsion?
(a) Turbo jet (b) Pulse jet
(c) Turbo-prop (d) Rocket

UPPSC AE 12.04.2016 Paper-II

Ans. : (d) Rocket does not use ambient air for propulsion

Rocket engine :- In a rocket propulsion system, the entire mass of the fuel and oxidizing agent is carried by the rocket body itself. As such, the rocket does not depend on any surrounding air for burning the fuel.

763. Which of the following is recommended for refrigeration of supersonic aircraft?
(a) Reduced ambient system
(b) Simple system
(c) Regenerative system
(d) Bootstrap system

UPRVUNL AE 2016

Ans. (a) : Reduced ambient system is recommended for refrigeration of supersonic aircraft.

764. Modern large turbojet and turbofan engines of aeroplane uses which type of compressor?
(a) Centrifugal compressor only
(b) Combination of radial and centrifugal
(c) Axial flow compressor
(d) Radial flow compressor only

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (c) : Modern turbojet and turbofan engine uses axial flow compressor.
⇒ Used in high speed ship engines.
⇒ Used in small scale powers stations.

765. In open cycle turbo-jet engines used in military aircraft, reheating the exhaust gas from the turbine by Burning more fuel is used to increase.
1. Thrust.
2. The efficiency of engine.
3. The range of aircraft.

Of above statement, which are correct
(a) 1 and 3 (b) 1 and 2
(c) 2 are 3 (d) 1, 2 and 3

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : In open cycle turbojet engines used in military aircraft, reheating the exhaust gas from the turbine by burning, more fuel is used to increase the thrust and range of aircraft.

766. Consider the following statements relating to rocket engines:
1. The combustion chamber in a rocket engine is directly analogous to the reservoir of a supersonic wind tunnel.
2. The stagnation conditions exist at the combustion chamber.
3. The exit velocities of exhaust gases are much higher than those in jet engines.
4. Efficiency of rocket engines is higher than that of jet engines.

Of these statements, which are correct?
(a) 1, 3 and 4 (b) 2, 3 and 4
(c) 1, 2 and 3 (d) 1, 2 and 4

Nagaland PSC CTSE 2015 Paper-II

Ans. (c)

767. In a turbo-prop system, the expansion of gases takes place in the following manner
(a) 80% in turbine and 20% in nozzle
(b) 70% in turbine and 30% in nozzle
(c) 60% in turbine and 40% in nozzle
(d) 50% in turbine and 50% in nozzle

TSGENCO AE 14.11.2015

Ans. (a) : In a turbo-propulsion system, the expansion of gas takes place in the 80% in turbine and 20% in nozzle.

768. The effective jet velocity from a rocket is 4000m/s. The forward velocity is 1500m/s and propellant consumption is 80kg/s. The propulsive efficiency is.
(a) 66% (b) 62%
(c) 63% (d) 61%
(e) 68%

CGPSC AE 26.04.2015 Shift-II

Ans. (a) : Propulsive efficiency for Rocket engine -

$$\eta_p = \frac{2\times\frac{V_e}{V_f}}{1+\left(\frac{V_e}{V_f}\right)^2} = \frac{2\times\left(\frac{4000}{1500}\right)}{1+\left(\frac{4000}{1500}\right)^2}\times 100$$

$$\eta_p = 65.75\% \approx 66\%$$

Propulsive efficiency for Jet Engine

$$\eta_p = \frac{2}{1+\left(\frac{V_e}{V_f}\right)} = \frac{2}{1+\left(\frac{4000}{1500}\right)}\times 100$$

$$\eta_p = 54.55\%$$

769. The following type of aircraft requires longest runway for take off
(a) the aircraft that uses turboprop
(b) the aircraft that uses turbojet
(c) the aircraft that uses piston engine
(d) the aircraft that uses turbofan

TANGEDCO AE 2015

Ans. (b) : The aircraft that uses turbojet requires longest runway for takeoff. Ex.: Boeing 747 uses turbofan engine.

770. A hypersonic airbreathing propulsion requires the following type of combustion chamber
(a) can type gas turbine combustor
(b) annular type gas turbine combustor
(c) ramjet combustor
(d) supersonic combustor

TANGEDCO AE 2015

Ans. (c) : A hypersonic air breathing propulsion requires Ramjet combustor.

771. The thrust coefficient in rocket propulsion is computed by using the following values
(a) Combustion pressure and throat area of nozzle
(b) Combustion pressure and exhaust gas velocity

Search on Telegram @apna_pdf

(c) Combustion pressure, thrust and nozzle throat area
(d) Thrust, effective exhaust velocity and exit area of nozzle

TNPSC AE 2014

Ans. (c) : By using the values of combustion pressure, thrust and nozzle throat area, the thrust coefficient in rocket propulsion is computed.

772. Fuel oxidizer combination for hybrid propellant rockets is
(a) Liquid hydrogen – Liquid oxygen
(b) Lithium hydride (LiH) – chlorine trifluoride (ClF_3)
(c) Hydrazine – Liquid Fluorine
(d) Alcohol - WFNA

TNPSC AE 2014

Ans. (b) : Fuel oxidizer combination for hybrid propellant rockets is Lithium hydride (LiH) – chlorine trifluoride (ClF_3).

773. An aircraft cannot be designed without the part of
(a) Turbine (b) Compressor
(c) Combustion chamber (d) Propeller

TNPSC AE 2014

Ans. (c) : An aircraft cannot be designed without the part of combustion chamber.

774. The inverse of Specific Propellant Consumption (SPC) of rocket engine is called
(a) Impulse to Weight Ratio (IWR)
(b) Specific impulse
(c) Thrust coefficient
(d) Weight flow coefficient

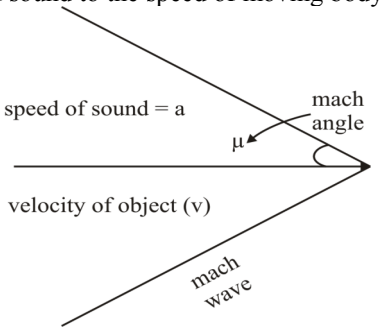
TNPSC AE 2014

Ans. (b) : The inverse of Specific Propellant Consumption (SPC) of rocket engine is called specific impulse. Specific impulse is a measure of how effectively a rocket uses propellant or a jet engine uses fuel.

775. An aircraft moves through the atmosphere with a velocity of 450 m/s. If the speed of sound in this medium is 300 m/s, the mach angle would be
(a) $\cos^{-1}(2/3)$ (b) $\sin^{-1}(2/3)$
(c) $\tan^{-1}(2/3)$ (d) $\cos^{-1}(3/2)$

TNPSC AE 2014

Ans. (b) : Definition of mach angle– Half of the vertex angle of a mach cone whose sine is the ratio of the speed of sound to the speed of moving body.



$$\sin\mu = \frac{a}{v}$$

$$\sin\mu = \frac{1}{M}$$

$$\mu = \sin^{-1}\frac{1}{\left(\frac{450}{300}\right)}$$

$$\boxed{\mu = \sin^{-1}\left(\frac{2}{3}\right)}$$

776. The propulsive efficiency is :
(a) $\frac{m\left(c_j^2 - u^2\right)}{2m_f Q_f}$ (b) $\frac{2\sigma}{1+\sigma}$
(c) $\frac{Q_j - Q_r}{Q_j}$ (d) $\frac{m\left(c_i^2 - u^2\right)}{2m_f Q_f}$

TNPSC AE (Industries) 09.06.2013

Ans. (b) :

777. A jet engine works on the principle of conservation of :
(a) Mass (b) Discharge
(c) Energy (d) Momentum

TNPSC AE (Industries) 09.06.2013

Ans. (d) : A jet engine works on the principle of conservation of momentum.

778. A turbo prop has an additional feature compared to turbo jet in having :
(a) Grid passages (b) Inlet diffuser
(c) Inter cooler (d) Reduction Gear

TNPSC AE (Industries) 09.06.2013

Ans. (d) : Reduction Gear

779. In Rayleigh flow heating process, the heat added is accounted from static or stagnation temperature as
(a) $C_P (T_{02}–T_{01})$ (b) $C_P (T_2–T_1)$
(c) $C_P (T_2–T0_1)$ (d) $C_P (T_{01}–T_{01})$

TNPSC ACF 2012

Ans. (a) : Rayleigh flow- Constant Area duet flow with heat transfer let without friction heat added from static $= C_p(T_{02}–T_{01})$

780. Ramjet engine propels at a Mach number 3 in a atmosphere at high altitude of –11ºC and 0616 bar. The acoustic velocity and light speed measured in metres per second are
(a) 324,5, 1080.2 (b) 324.5, 973.4
(c) 337.2, 1011.6 (d) 300, 900

TNPSC ACF 2012

Ans. (b) : $C = \sqrt{\gamma RT}$

$$C = \sqrt{1.4 \times 287 \times (-11 + 273)}$$

$$\boxed{C = 324.45 \text{ m/s}}$$

$$m = \frac{V}{C}$$

$$3 = \frac{V}{324.45}$$

$$\boxed{V = 973.367 \text{ m/s}}$$

Search on Telegram @apna_pdf

781. Rocket carrying propellants with payload has applications in

(a) carrying passengers and payload
(b) cargo and missiles only
(c) space explorations and communication satellites
(d) Warfare only

TNPSC ACF 2012

Ans. (c) : Rocket carrying propellants with payload has application in space explorations and communication satellites.

782. The turbojet engine takes power for propulsion from

(a) Propeller (b) Turbine
(c) Nozzle thrust (d) Compressor

TNPSC ACF 2012

Ans. (c) : The turbojet engine takes power for propulsion from nozzle thrust.

783. The maximum propulsive efficiency of a turbojet is attained at around speed.

(a) 550 km/hr (b) 1050 km/hr
(c) 1700 km/hr (d) 2400 km/hr

TNPSC ACF 2012

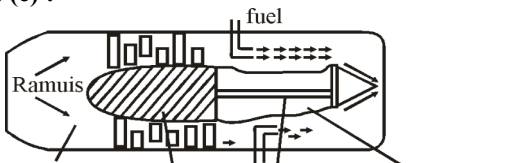
Ans. (d) : The maximum propulsion efficiency of a turbojet is attained at around following speed 2400 km/hr.

784. In jet engines the products of combustion after passing through the gas turbine are discharged into

(a) atmosphere
(b) back to the compressor
(c) discharge nozzle
(d) vacuum

TNPSC ACF 2012

Ans. (c) :



Get exit nozzle

785. In jet engines the compression ratio

(a) varies as square root of the speed
(b) varies linearly to speed
(c) varies as square of the speed
(d) varies as cube of the speed

TNPSC ACF 2012

Ans. (c) : In jet engines the compression ratio varies as square of the speed.

786. Pick up the correct statement :

(a) Closed cycle gas turbine is an I.C. engine
(b) Air-fuel ratio in gas turbine is 100, 1
(c) Ideal efficiency of closed cycle gas turbine plant is more than Carnot cycle efficiency
(d) Thrust in turbojet is produced by nozzle exit gases

TNPSC ACF 2012

Ans. (d) : The turbojet engine consist of a diffuser at the entrance which slows down the entrance air and thereby compresses it, called the ramming effect; a simple open cycle gas turbine and an exit nozzle which expands the gas and converts the thermal energy of the exit. Gas into kinetic energy when emmited by out in the from of jet the increased velocity of air there by produces thrust.

787. The overall efficiency of rocket is maximum when aircraft velocity compared to jet velocity is

(a) same (b) half
(c) double (d) one fourth

TNPSC ACF 2012

Ans. (b) : $\eta_{overall} = \eta_{th} \times \eta_p$

η_{th} = thermal efficiency

η_p = propulsive efficiency

$\eta_{overall}$ efficiency is maximum when

$$\boxed{C_{aircraft} = \frac{C_{jet}}{2}}$$

788. In gas turbine jet propulsion units, when the velocity of discharged jet equals the flight speed, then the propulsion efficiency and thrust become

(a) 100%, zero (b) 100%, maximum
(c) 50%, maximum (d) 0%, maximum

APPSC AEE 2012

Ans. (a) :

(i) Propulsive efficiency $\eta_p = \dfrac{2}{1+\dfrac{V_e}{V_0}} \times 100\%$

If $V_e = V_0$ then $\eta_p = \dfrac{2}{1+1} \times 100$

$$\boxed{\eta_p = 100\%}$$

(ii) Thrust – If the $\dot{m}_e = \dot{m}_0$ and $V_e = V_0$ then thrust $F = \dot{m}_e V_e = \dot{m}_0 V_0$

$F = 0$

789. The critical angle of attack of an aerofoil is the where

(a) the lift becomes zero
(b) the drag becomes zero
(c) the drag begins to rise
(d) the lift begins to drop

APPSC AEE 2012

Ans. (a) : The angle of attack of an aerofoil at which the flow of air about the aerofoil changes abruptly so that lift is sharply reduced and drag is sharply increased also known as stalling angle of attack.

790. Ramjet engine

(a) is self - operating at zero flight speed
(b) is not self-operating at zero flight speed
(c) requires no air for its operation
(d) produces a jet consisting of plasma

TNPSC AE, 2008

Search on Telegram @apna_pdf

Ans. (b) : Ramjet engine is not self operating at zero flight speed. A Ramjet uses this high pressure in front of the engine to force air through the tube, where it is heated by combusting some of it with fuel. It is then passed through a nozzle to accelerate it to supersonic speeds. Ramjet work more efficiently at supersonic speed at M = 3 nearly.

791. A rocket exists exhaust gases with ρ = 0.5 kg/m^3 out a 50 cm diameter nozzle at a velocity of 1200 m/s. The thrust, is

(a) 420 kN (b) 280 kN
(c) 140 kN (d) 90 kN

ISRO Scientist/Engineer 2008

Ans. (c) : ρ = 0.5 kg/m^3
diameter d = 50 cm = 0.5 m
velocity v = 1200 m/s
Thrust = ρAV^2
$= 0.5 \times 0.785 \times 0.25 \times (1200)^2$
= 141300 N
= 141.3 kN

7. Compressors

792. The most efficient method of compressing air is to compress it

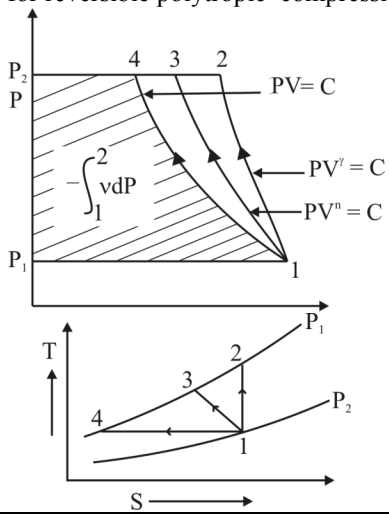
(a) adiabatically (b) isentopically
(c) isothermally (d) isochorically

TNPSC AE 2019
HPPSC Lect. (Auto) 23.04.2016
CGPSC Poly. Lect. 22.05.2016
GPSC Lect. 23.10.2016
J&K PSC Civil Services Pre-2013

Ans. (c) : The work of compression or the steady flow work input to the gas.

$$W_c = \frac{\gamma}{\gamma-1} P_1V_1\left[\left[\frac{P_2}{P_1}\right]^{\frac{\gamma-1}{\gamma}} - 1\right]$$

For reversible adiabatic compression.
Similarly, for reversible polytropic compression



$$W_n = \frac{n}{n-1} P_1V_1\left[\left(\frac{P_2}{P_1}\right)^{\left(\frac{n-1}{n}\right)} - 1\right]$$

For reversible isothermal compression of an ideal gas $W_t = P_1V_1 \ell n (P_2/P_1)$.
So, for same pressure ratio P_2/P_1 the isothermal compression needs the minimum work, whereas adiabatic compression needs the maximum work, while the polytropic compression work lies between isothermal and adiabatic.

793. Which one of the following is the effect of blade shape on the performance of a centrifugal compressor?

(a) Backward curved blades have poor efficiency
(b) Backward curved blades lead to stable performance
(c) Forward curved blades have higher efficiency
(d) Forward curved blades produce lower pressure ratio

RPSC Lect. Tech. Edu. Dept. 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II
Karnataka PSC AE, 10.09.2017
APPSC IOF, 2009, ESE 1996

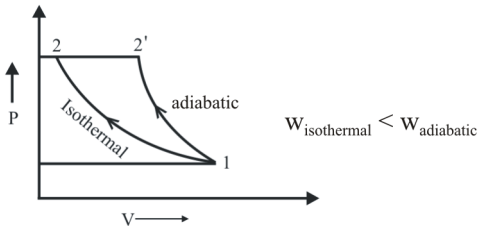
Ans. (d) : Forward curved blades produces lower pressure ratio in centrifugal compressor.

794. The power consumed by a reciprocating air compressor will be minimum, if the compression follows the following thermodynamic process :

(a) isothermal (b) isentropic
(c) adiabatic (d) polytropic

ISRO Scientist/Engineer (RAC), 10.03.2019
GPSC EE PRE 28.01.2017
CGPSC ARTO & TSI 07.01.2017
GMB AAE 25.06.2017
UKPSC AE 2012 Paper–II , ESE 2012

Ans. (a) : isothermal– Compressor work will be least when it is followed by isothermal process.



795. A centrifugal compressor is suitable for

(a) high pressure ratio, low mass flow
(b) low pressure ratio, low mass flow
(c) high pressure ratio, high mass flow
(d) low pressure ratio, high mass flow

JPSC AE, 10.04.2021, Paper-I
Assam PSC AE (PHED), 18.10.2020
BPSC AE Mains 2017 Paper - V,
ISRO Scientist/Engineer 07.05.2017, ESE 2008

Search on Telegram @apna_pdf

Ans. (d) : Centrifugal compressor increases the kinetic energy of the gas with a high speed impeller and then convert this energy into increased pressure in a divergent outlet passage called the diffuser centrifugal compressor are particularly suited for compressing low pressure ratio and high mass flow.

796. The volumetric efficiency of a compressor with increase in pressure ratio-

(a) Increases
(b) Decreases
(c) Remains the same
(d) May increase or decrease depending on the clearance volume

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Punjab PSC (Lect.) 06.08.2017
NPCIL ET, 2015
J&K PSC Civil Services Pre, 2010

Ans. (b) : $\downarrow \eta_{volumetric} = 1 + C - C\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}}_{\uparrow}$

$\frac{P_2}{P_1} = \text{Pressure ratio}$

797. The degree of reaction in an axial flow compressor is defined as the ratio of static enthalpy rise in the

(a) rotor to static enthalpy rise in the stator
(b) stator to static enthalpy rise in the rotor
(c) rotor to static enthalpy rise in the stage
(d) stator to static enthalpy rise in the stage

ISRO Scientist/Engineer 22.04.2018
Karnataka PSC AE, 10.09.2017
TSPSC AEE 2015, APPSC IOF, 2009

Ans. (c) :
Degree of reaction for Axial flow compressor

$$= \frac{\text{Static Enthalpy rise in the rotor}}{\text{Static enthalpy rise in the stage}}$$

798. The pressure of the intercooler in multistage reciprocating air compressor at which work required to compress the air is minimum is given by

(a) $P_2 = P_3P_1$ (b) $P_2 = \frac{P_3}{P_1}$

(c) $P_2 = \frac{P_1}{P_3}$ (d) $P_2 = \sqrt{P_1P_3}$

Where
P_2 = pressure of air in the intercooler
P_1 = initial pressure of air
P_a = delivery pressure of air

ISRO Scientist/Engineer 22.04.2018
Karnataka PSC Lect., 27.05.2017
MPPSC AE 2016
MPSC Dy. Engg. (GWD) 19.05.2013

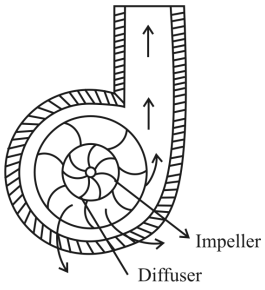
Ans. (d) : $P_2 = \sqrt{P_1P_3}$

799. The stagnation pressure rise in a centrifugal compressor takes place

(a) in the diffuser only
(b) in the impeller only
(c) in the diffuser and impeller
(d) in the inlet guide vanes only

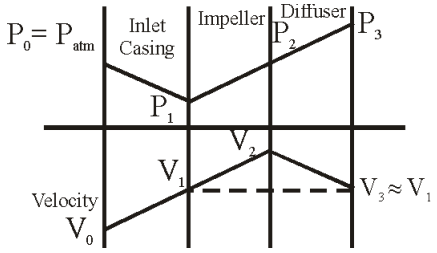
Sikkim PSC (Under Secretary), 2017
HPPSC Asstt. Prof. 18.09.2017
TNPSC AE 2013, ESE 1994

Ans. (c) :



Centrifugal Compressor

The mechanical energy provided by impeller from some external source, as the rotor rotates, it sucks air through it's eye increases it's pressure due to centrifugal force and forces the air to flow over the diffuser. The pressure of air is further increased during its flow over the diffuser.



In the diffusion of centrifugal compressor, the air is decelerated with a rise in static pressure.

800. In a four stage compressor, if the pressure at the first and third stage are 1 bar and 16 bar, then the delivery pressure at the fourth stage will be

(a) 1 bar (b) 16 bar
(c) 64 bar (d) 256 bar

OPSC AEE 2019 PAPER - II
APGENCO AE, 2017
Nagaland PSC (CTSE) 2016, Paper-II
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : We know that in multistage compressor

$$\frac{P_2}{P_1} = \frac{P_3}{P_2} = \frac{P_4}{P_3}$$

Given, $P_1 = 1$ bar
$P_3 = 16$ bar

$$\frac{P_2}{P_1} = \frac{P_3}{P_2}$$

$$P_2 = \sqrt{P_1P_3}$$

$$= \sqrt{16 \times 1}$$

Search on Telegram @apna_pdf

$P_2 = 4$ bar

$$\frac{P_3}{P_2} = \frac{P_4}{P_3}$$

$$P_4 = \frac{P_3^2}{P_2} = \frac{16^2}{4} = 64 \text{ bar}$$

$\boxed{P_4 = 64 \text{ bar}}$

801. A large clearance volume in reciprocating compressor results in

(a) Reduced volume flow rate
(b) Increased volume flow rate
(c) Lower suction pressure
(d) Lower delivery pressure
(e) None of the above

ISRO Scientist/Engg. (RAC) 10.03.2019
CGPSC Poly. Lect. 22.05.2016
KPSC AE 2015, ESE 1995

Ans. (a) : A large clearance volume in low volumetric efficiency and hence large cylinder dimensions increase the contact area between the piston and cylinder and so, increase friction and work.
Volumetric efficiency is given by–

$$\eta_{volumetric} = 1 + C - C\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}}$$

where,
C = clearance ratio

$\left(\frac{P_2}{P_1}\right)$ = pressure ratio

As the clearance ratio increases, the volumetric efficiency of the reciprocating compressor decreases as the pressure ratio increases. The clearance volume reduces the capacity of the compressor and volume flow rate.

802. Losses in centrifugal compressor are due to

(a) Impeller channel losses
(b) diffuser losses
(c) all types of losses
(d) inlet losses

Rajasthan Nagar Nigam AE 2016, Shift-I
BPSC AE 2012 Paper - V, ESE 2012

Ans. (c) : The losses in a centrifugal compressor are almost of the same type as those in a centrifugal pump. However, the following features are to be noted. Frictional losses : A major portion of the losses is due to fluid friction in stationary and rotating blade passages.

803. The usual assumption in elementary compressor cascade theory is that :

(a) axial velocity through the cascade changes
(b) with no change in axial velocity between inlet and outlet, the velocity diagram is formed
(c) axial velocity through the cascade theory does not change
(d) for elementary compressor theory, the pressure rise across the cascade is given by equation of state

APPSC AEE 2012, APPSC IOF, 2009
ESE 1996

Ans. (c) : The usual assumption in elementary compressor cascade theory is that axial velocity through the cascade theory does not change.

804. Stalling of blades in an axial flow compressor is the phenomenon of

(a) airstream blocking the passage
(b) motion of air at sonic velocity
(c) unsteady, periodic and reversible flow
(d) airstream not able to follow the blade contour

Gujarat PSC AE 2019
BPSC AE Mains 2017 Paper - V, ESE 2012

Ans. : (d) : Stalling is flow separation from blade contour profile. This happens when the flow velocity is low or any other reason due to which inlet blade angle deviates from designed value. Under this condition air stream is not able to follow blade contour. Unsteady periodic and flow reversal is surging not stalling.

805. The work done in compressing a gas isothermally is given by:

(a) $\frac{\gamma}{\gamma-1} P_1 V_1 \left[\left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}} - 1\right]$ (b) $mRT_1 \log_e \frac{P_2}{P_1}$

(c) $mC_p(T_2 - T_1)$ (d) $mRT_1\left(1 - \frac{T_2}{T_1}\right)$

MPPSC AE 2016, (UJVNL AE 2016)
Nagaland PSC CTSE 2015 Paper-II

Ans. : (b) (i) Work done during isothermal Compression

$$W = P_1 V_1 \ln\left(\frac{P_2}{P_1}\right) = mRT_1 \ln\left(\frac{P_2}{P_1}\right)$$

$$= mRT_1 \ln\left(\frac{P_2}{P_1}\right)$$

(ii) Work done during polytropic compression (PV^n=C)

$$W = \frac{n}{n-1} \times mRT_2\left(1 - \frac{T_1}{T_2}\right) = \frac{n}{n-1} mR(T_2 - T_1)$$

(iii) Work done during isentropic compression

$$W = \frac{\gamma}{\gamma-1} \times mR(T_2 - T_1) = mC_p(T_2 - T_1)$$

806. Roots blower is an example of :

(a) Reciprocating (positive displacement) compressor
(b) Rotary (positive displacement) compressor.
(c) Centrifugal compressor
(d) Axial compressor.

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017, ESE 2003

Ans. (b) : Roots blower is an example of Rotary (Positive displacement) compressor.
Positive displacement compressor- Rise in pressure is obtained by positively displacing fluid to a lower volume.

Search on Telegram @apna_pdf

807. The choking in compressors implies

(a) no flow of air
(b) fixed mass flow rate regardless of pressure ratio
(c) reducing mass flow rate regardless of pressure ratio
(d) increased inclination of chord with air stream

Punjab PSC (Lect.) 06.08.2017
APPSC AEE Screening Test 2016
GPSC AE 26.07.2015, ESE 1996

Ans. (b) : Choking or Stonewall–The choking occurs in the compressor which operates at a low discharge pressure and maximum flow rate. It is the limit of the performance curve, at this point velocity of the impeller reaches a velocity of sound of the gas at that condition within the compressor (Mach number reaches unity). This point is also known as stonewalling of compressor.
In choking flow rate is maximum and pressure ratio is minimum.

808. With increase in clearance volume, the ideal work of compressing 1 kg of air

(a) increases
(b) decreases
(c) remains same
(d) first increases and then decreases

OPSC AEE 2019 PAPER - II
APPSC Poly. Lect. 2013

Ans. (c) : In a reciprocating air compressor the compression work per kg of air is independent of clearance volume. So, it will be remain the same.

$$W_{comp} = \frac{n}{n-1} P_1 V_{act} \left[\left(\frac{P_H}{P_L} \right)^{\frac{n-1}{n}} - 1 \right]$$

W_{comp} is independent of clearance volume.

809. Surging basically implies

(a) Unsteady periodic and reversed flow
(b) Forward motion of axial speed above sonic velocity
(c) The surging action due to the blast of air produced in compressor
(d) Forward movement of aircraft

RPSC Lect. (Tech. Edu. Dept.) 2011
ESE 1996

Ans. (a) : Surging is the phenomenon of unsteady, Periodic & Reversed flow. It is a momentary back flow through compressor from the discharge to the suction, forward discharge gas will flow backwards through the compressor towards the suction side.

810. In multistage compressor, the isothermal compression is achieved by

(a) Employing intercooler and insulating the cylinder
(b) by only insulating the cylinder
(c) by constant cooling the cylinder
(d) by running the compressor at very low speed

Rajasthan Nagar Nigam AE 2016, Shift-II
APPSC AEE 2012

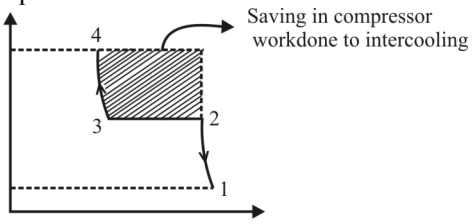
Ans. (d) : Multistaging is simply the compression of air or gas in two or more cylinder in place of a single cylinder compressor.
Isothermal compression is achieved by running the compressor at very low speed.

811. In an air compressor, intercooling is done for the following effect.

(a) to reduce the work input
(b) to reduce coolant temperature
(c) to increase cooling tower efficiency
(d) to increase the work input

J & K PSC Screening, 2006
OPSC Civil Services Pre 2006

Ans. (a) : With the use of inter cooler the work input to the compressor reduces.



812. Reciprocating air compressor is best suited for:

(a) small quantity of air at high pressure
(b) small quantity of air at low pressure
(c) large quantity of air at low pressure
(d) large quantity of air at high pressure.

VIZAG STEEL MT 24.01.2021, Shift-II
GWSSB AAE, 27.12.2015

Ans. (a) :

Compressor	useful for
centrifugal	moderate discharge and head
Axial	low head high discharge
reciprocating	low discharge and high head.

813. If an axial flow compressor is designed for a constant velocity through all stages, then the area of annulus of the succeeding stages will :

(a) progressively increase
(b) progressively decrease
(c) depend upon the number of stages
(d) remain the same

APPSC IOF, 2009, ESE 1998

Ans. (b) : If an axial flow compressor is designed for a constant velocity through all stages, then the area of annulus the succeeding stages will be progressively decrease .

814. For a multistage compressor, the polytropic efficiency is

(a) the efficiency of all stages combined together.
(b) the efficiency of one stage.
(c) constant throughout for all the stages.
(d) a direct consequence of the pressure ratio.

JPSC AE, 10.04.2021, Paper-I
ESE 1996

Ans. (c) : For multistage compressor, the polytropic efficiency is constant throughout for all the stages.

Search on Telegram @apna_pdf

815. The clearance volume of a reciprocating compressor directly affects

(a) Piston speed
(b) Noise level
(c) Volumetric efficiency
(d) Temperature of air after compression

JPSC AE, 10.04.2021, Paper-I
CSE Pre-1998

Ans. (c) : The clearance volume of a reciprocating compressor directly affects volumetric efficiency.

$$\eta_v = 1 + C - C\left(\frac{P_H}{P_L}\right)^{1/n} \Rightarrow \eta_v = 1 - C\left[\left(\frac{P_H}{P_L}\right)^{1/n} - 1\right]$$

816. Reciprocating compressors are provided with

(a) Simple disc plate valve
(b) Poppet valve
(c) Spring-loaded disc valve
(d) Solenoid valve

JPSC AE, 10.04.2021, Paper-I
ESE 2000

Ans. (a) : Reciprocating compressors are provided with simple disc plate valve.

817. In reciprocating air compressor the method of controlling the quantity of air delivered is done by

(a) Throttle control (b) Blow-off control
(c) Clearance control (d) All of the above

JPSC AE, 10.04.2021, Paper-I
ESE 2007

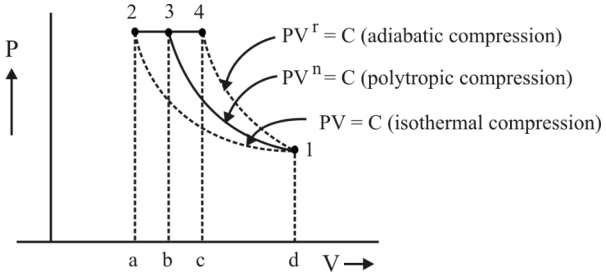
Ans. (d) : In reciprocating air compressor the method of controlling the quantity of air delivered is done by–
(i) Throttle control
(ii) Blow-off control
(iii) Clearance control

818. Work input to the air compressor with n as index of compression:

(a) increases with increase in value of *n*
(b) decreases with increases in value of *n*
(c) remains same whatever the value of *n*
(d) first increase and then decreases with value of *n*

Kerala PSC AE 06.08.2015, (KPSC AE. 2015)

Ans. (a) : Work input to the air compressor with n index of compression increases with increase in value of n.



Work done in increasing order.
(1-4-c-d) < (1-3-b-d) < (1-2-a-d)

819. The main reason for adopting the axial flow compressors instead of centrifugal compressors in aircraft turbine is that :

(a) starting torque for axial flow compressor is high
(b) the frontal area of axial flow compressor is considerably less
(c) the efficiency of middle speed range is higher
(d) pressure ratio per state is high.

Kerala PSC AE 06.08.2015, KPSC AE 2015

Ans. (b) : The frontal area of axial flow compressor is considerably less, this is the main reason of using axial flow compressor instead of centrifugal compressors in aircrafts turbine.
While a centrifugal compressor can achieve greater compression than a single compressor stage in a axial flow engine, the axial flow design allows for multiple compressor stages achieving higher overall compressor of the air and consequently greater efficiency.

820. The suction pressure is 1 bar and delivery pressure is 125 bar. What is the ideal intermediate pressure at the end of first stage for a 3-stage air compressor?

(a) 25 bar (b) 5 bar
(c) 10 bar (d) 20 bar
(e) None of the above

CGPSC Poly. Lect. 22.05.2016, ESE 2008

Ans. (b) : Given, $P_1 = 1$ bar, $P_4 = 125$ bar

$$\frac{P_4}{P_3} = \frac{P_3}{P_2} = \frac{P_2}{P_1} = k$$

$$\frac{P_4}{P_1} = \frac{P_4}{P_3} \times \frac{P_3}{P_2} \times \frac{P_2}{P_1} = k \times k \times k = k^3 = \left(\frac{P_2}{P_1}\right)^3$$

$$P_2 = P_1 \times \left(\frac{P_4}{P_1}\right)^{1/3}$$

$$= 1 \times \left(\frac{125}{1}\right)^{1/3} = 5\,\text{bar}$$

821. Generally, which type of compressor is used in a gas turbine

(a) Reciprocating (b) Centrifugal
(c) Axial flow (d) Lob type

HPPSC AE 2018, ESE 2012

Ans. (c) : Axial Flow Compressor– An axial compressor that can continuously pressurize gases. It is a rotating, aerofoil based compressor in which the gas or working fluid principally flows parallel to the axis of rotation, or axially. The energy level of the fluid increases as it flows through the compressor due to the action of the rotor blades which exert a torque on the fluid. The stationary blades slow the fluid, converting the circumferential component of flow into pressure.
Axial flow compressor produce a continuous flow of compressed gas, and the benefits of high efficiency and large mass flow rate, particularly in relation to their size and cross-section. Axial compressor are integral to the design of large gas turbine such as Jet engines.

822. The isothermal efficiency of a reciprocating compressor is defined as

(a) $\frac{\text{Actual workdone during compression}}{\text{Isothermal workdone during compression}}$

(b) $\frac{\text{Adiabatic workdone during compression}}{\text{Isothermal workdone during compresseion}}$

(c) $\frac{\text{Isothermal workdone during compression}}{\text{Actual workdone during compression}}$

(d) $\frac{\text{Isothermal workdone during compression}}{\text{Actual workdone during adiabatic compression}}$

TNPSC AE 2014, CSE Pre-1994

Ans. (c) : The isothermal efficiency of a reciprocating compressor is defined as

$$\eta_{\text{isothermal}} = \frac{\text{Isothermal workdone during compression}}{\text{Actual workdone during compression}}$$

823. The clearance volume in reciprocating air compressor is provided

(a) to reduce the work done per kg of air delivered
(b) to increase the volumetric efficiency of the compressor
(c) to accommodate the valves in the head of the compressor
(d) to create turbulence in the air to be delivered

ESE 2018, TSGENCO AE 14.11.2015

Ans. (c) : The clearance volume in reciprocating air compressor is provided to accommodate the valves in the head of the compressor.

824. The performance of a reciprocating compressor is expressed by

(a) $\frac{\text{isothermal work}}{\text{indicated work}}$ (b) $\frac{\text{adiabatic work}}{\text{indicated work}}$

(c) $\frac{\text{isothermal work}}{\text{adiabatic work}}$ (d) $\frac{\text{adiabatic work}}{\text{frictionless work}}$

BPSC Poly. Lect. 2016, CSE Pre-2003

Ans. : (a) Isothermal efficiency. OR Compressor efficiency $= \frac{\text{Isothermal work done}}{\text{Indicated work done}}$

825. When the outlet angle from the rotor of a centrifugal compressor is more than 90º, then the blades are said to be?

(a) Forward curved (b) Backward curved
(c) Radial (d) None of these

OPSC AEE 2019 PAPER - II, ESE 1992

Ans. : (a) : When the outlet angle from the rotor of a centrifugal compressor is more than 90º then the blades are said to be forward curved.

826. Why intercooling in multistage compressors is done ?

(a) To minimize the work of compression
(b) To cool the air delivery
(c) To cool the air during compression
(d) None of these

HPPSC Asstt. Prof. 18.09.2017
UKPSC AE 2012, 2007 Paper–II

Ans. (a) : To minimize the work of compression

827. The volumetric efficiency of a reciprocating compressor is equal to:-

(a) $1+K-K(p_2/p_1)$ (b) $1+K-K(p_2/p_1)^n$
(c) $1+K+K(p_2/p_1)^{1/n}$ (d) $1+K-K(p_2/p_1)^{1/n}$

APPSC AEE 2016
UKPSC AE-2013, Paper-II

Ans. (d) : The volumetric efficiency of a reciprocating compressor,

$$\eta_v = 1 + K - K\left[\frac{p_2}{p_1}\right]^{\frac{1}{n}}$$

Where K is clearance ratio

828. The rotary compressors are used for delivering.

(a) Small quantities of air at high pressure
(b) Large quantities of air to high pressure
(c) Small quantities of air at low pressure
(d) Large quantities of air at low pressure

Rajasthan AE (Nagar Nigam) 2016 Shift-3
MPSC Dy. Engg. (GWD) 19.05.2013

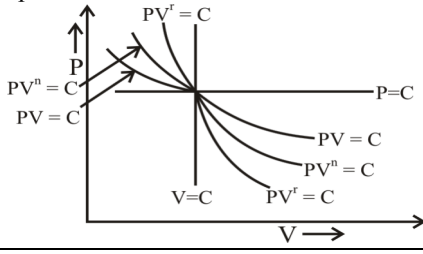
Ans. (d) : The rotary compressors are used for delivering large quantities of air at low pressure.

829. When a gas is to be stored, the type of compression that would be ideal is

(a) Isothermal (b) Adiabatic
(c) Polytropic (d) Constant volume

JPSC AE, 10.04.2021, Paper-I
J & K PSC Screening, 2006

Ans. (a) : When a gas is to be stored, isothermal compression requires minimum work and maximum for isochoric process.



830. In a reciprocating compressor the effect of increase in delivery pressure with fixed clearance volume and suction pressure will be:

(a) increase in volumetric efficiency
(b) decrease in volumetric efficiency
(c) initially volumetric efficiency increases then decreases
(d) There will be no change in volumetric efficiency.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) : In a reciprocating compressor the effect of increase in delivery pressure with fixed clearance volume and suction pressure will decrease in volumetric efficiency.

$$\eta_V = 1 + C - C\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}} \qquad C = \frac{V_c}{V_s} = \frac{\text{Clearance volume}}{\text{Swept volume}}$$

$\eta_V \downarrow$ $P_2 \uparrow$

Search on Telegram @apna_pdf

831. For axial flow compressor, reaction ratio in terms of rotor blade angle at inlet (β_1), at outlet (β_2) and flow coefficient (ϕ) is :

(a) $2\phi (\tan\beta_1 - \tan\beta_2)$
(b) $2\phi (\tan\beta_1 + \tan\beta_2)$
(c) $\phi/2 (\tan\beta_1 - \tan\beta_2)$
(d) $\phi/2 (\tan\beta_1 + \tan\beta_2)$

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) :

$$\text{Degree of reaction} = \frac{\text{Enthalpy increases in rotor}}{\text{Enthalpy increases in stage}}$$

$$R = \frac{C_a}{2U}(\tan\beta_1 + \tan\beta_2)$$

$$\boxed{R = \frac{\phi}{2}(\tan\beta_1 + \tan\beta_2)}$$

$$\phi = \frac{C_a}{U} \text{ (flow coefficient)}$$

C_a = Flow velocity
U = Velocity of rotor at outlet
β_1= Blade angle at inlet
β_2= Blade angle at outlet

832. A fan consume 200 W of electric power and discharge air from a ventilated room at the rate of 1 kg/s. What will be the possible air velocity from the fan?

(a) 200 m/s (b) 20 m/s
(c) 42 m/s (d) 4.2 m/s

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) : $\text{Power} = \frac{1}{2}mV^2$

$$200 = \frac{1}{2}\times 1 \times V^2$$

$$V = \sqrt{200\times 2}$$

$$V = \sqrt{400}$$

$$\boxed{V = 20 m/s}$$

833. Car A.C. compressor shaft gets power from _____.

(a) solenoid (b) multi plate clutch
(c) engine shaft (d) steering gear

HPPSC Workshop Suptd. 08.07.02021

Ans. (c) : engine shaft

834. Work done in compression is maximum if the process is

(a) Isothermal (b) $PV^{1.2} = C$
(c) Adiabatic (d) $PV^{1.5} = C$

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) :

835. An air compressor compresses air from 0.98 bar to 4 bar and has a 4% of stroke clearance volume. If polytropic index is 1.25, volumetric efficiency will be

(a) 91.68% (b) 61.98%
(c) 96% (d) 82.83%

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Given

$$\frac{P_2}{P_1} = \left(\frac{4}{0.98}\right)$$

$$V_C = 0.04V_s$$

$$C = \frac{V_C}{V_s} = \frac{0.04V_s}{V_s} = 0.04$$

$$\eta_v = 1 + C - C\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}}$$

$$= 1 + 0.04 - 0.04\left(\frac{4}{0.98}\right)^{\frac{1}{1.25}}$$

$$\boxed{\eta_v = 0.916 = 91.6\%}$$

836. In a reciprocating compressor, air is compressed from 1 bar to 5 bar. The expansion and compression are isentropic. The clearance volume is 5% of the stroke volume. The volumetric efficiency is _____. (assume 5^(1/1.14) as 3.1)

(a) 84.5% (b) 72.65%
(c) 89.5% (d) 80.05%

VIZAG STEEL MT 24.01.2021, Shift-II, Shift-I

Ans. (c) : Given,
P_1 = 1 bar
P_2 = 5 bar
clearance volume (v_c) 5% of stroke volume

$$\therefore \text{ clearance ratio} = \frac{v_c}{v_s}$$

$$\text{clearance ratio (c)} = \frac{0.05 \cdot v_s}{v_s} = 0.05$$

$$\text{volumetric efficiency } (\eta)_{\text{volumetric}} = 1 + c - c\left(\frac{P_2}{P_1}\right)^{\frac{1}{\gamma}}$$

$$= 1 + 0.05 - 0.05\left(\frac{5}{1}\right)^{\frac{1}{1.14}}$$

$$= 1.05 - 0.05 \times 3.1 \qquad \left[\because 5^{\frac{1}{1.14}} = 3.1\right]$$

$$= 1.05 - 0.155$$
$$= 0.895$$
$$= 89.5\%$$

837. Volumetric efficiency of an ideal air compressor depends on :

(a) clearance ratio and speed
(b) speed and pressure ratio
(c) clearance ratio and pressure ratio
(d) cylinder aspect ratio and pressure ratio

NLC GET 17.11.2020, Shift-II

Search on Telegram @apna_pdf

Ans. (c) : Volumetric efficiency depends on ambient pressure and temperature, suction pressure and temperature. Ratio of clearance to swept volume and pressure limit. Volumetric efficiency increases with decrease in pressure ratio in compressor.

$$\eta_{vol} = 1 + C - C\left[\frac{P_2}{P_1}\right]^{1/n}$$

$$\eta_{vol} = f\left(C, r_p, n\right)$$

838. If the air enters the reciprocating compressor at 2 bar and leaves at 8 bar, the optimal intermediate pressure for two stage compression is :

(a) 3.5 bar (b) 4.0 bar
(c) 6 bar (d) 3.0 bar

NLC GET 17.11.2020, Shift-II

Ans. (b) : Optimum intermediate pressure $= \sqrt{P_1 \times P_2}$

$= \sqrt{2 \times 8}$

$$\boxed{P_{opt} = 4.0\,bar}$$

839. For a large mass flow rate requirement of an engine, which of the following compressors is preferred?

(a) reciprocating compressor
(b) multi-stage centrifugal compressor
(c) axial compressor
(d) centrifugal compressor

VIZAG MT, 14.12.2020

Ans. (c) :

Compressor	useful for
centrifugal	moderate discharge and head
Axial	low head high discharge
reciprocating	low discharge and high head.

For a large mass flow rate requirement axial flow compressors are used.

840. Air is drawn in a compressor at the rate of 0.8 kg/s at a pressure of 1 bar and temperature of 20^0C. Delivering temperature is 90^0C and pressure is 10 bar. The air is delivered through an area of 2×10^{-3} m^2. If R = 287 J/kgK, the air exit velocity is

(a) 41.7 m/s (b) 35.8 m/s
(c) 29.7 m/s (d) 27.3 m/s

UPPSC AE 13.12.2020, Paper-2

Ans. (a)

$T_1 = 293$ K $\quad T_2 = 90^0 = 363$ K

$P_1 = 1$ bar $\quad P_2 = 10$ bar

$m_a = 0.8$ kg/sec

At exit,

$P_2V_2 = m\,RT_2$

$$\frac{10 \times \left(10^5\right)}{287 \times 363} = \rho_2 \qquad \left[\because \rho = \frac{m}{v}\right]$$

Density, $\rho_2 = 9.59$ kg/m^3

Mass flow, $m = \rho_2 A v_2$

$0.8 = 9.59 \times 2 \times 10^{-3} \times v_2$

$v_2 = 41.7$ m/s

841. If maximum of 6 m/s flow velocity is allowed, calculate approximately the inlet pipes are for an air compressor delivering 0.4 kg/s of air coming at 1 bar, 300 K.

(a) 258 cm^2 (b) 566 cm^2
(c) 874 cm^2 (d) 1074 cm^2

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : $\dot{m} = \rho AV \Rightarrow$

$$0.4 = \frac{P}{RT} \times A \times V \qquad \left[\begin{array}{l}\because PV = mRT \\ P = \rho RT \\ \rho = P/RT\end{array}\right]$$

$$0.4 = \frac{1 \times 10^5}{287 \times 300} \times A \times 6$$

$A = 0.0574$ m^2 $= 574$ cm^2

842. The specific internal energy of air leaving an air-compressor is 80 kJ/kg higher than the inlet. Calculate the power to drive the compressor of air flow rate is 0.4 kg/s cooling water absorbs 55 kW

(a) 25 kW (b) 32 kW
(c) 62 kW (d) 87 kW

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Work done = change in internal energy + heat absorb by cooling water

$= 80 \times 10^3 \times 0.4 + 55 \times 10^3$

$= 87000$ J/s

$= 87$ kW

843. The ideal process for the compression of air in an ideal reciprocating compressor is:

(a) adiabatic process (b) isentropic process
(c) polytropic process (d) isothermal process

NLCIL GET 17.11.2020, Shift-II

Ans. (d) : Ideally, there is no heat loss to the surrounding from the air. Both intake and exhaust valve closed. The air is compressed according to isothermal process. Its pressure is increased from P_1 to P_2 and temperature T is constant.

844. A _____ compressor is suitable for very high volume flow rate with low pressure rise.

(a) reciprocating (b) centrifugal
(c) vane (d) axial flow

NLCIL GET 17.11.2020, Shift-II

Ans. (d) : Axial flow compressor is suitable for very high volume flow rate with low pressure.
In the axial-flow compressor the blades are arranged in much the same way as in a reaction turbine and the flow of air is along the axis of compressor. The velocity of air is changed during its passage through the set of blades and pressure lift occurs both in the moving blade passages and in fixed blade passage which act as diffuser.

Search on Telegram @apna_pdf

845. The whirl component of the velocity in the velocity triangle is the component of:

(a) the velocity of the flow in the direction of blade speed
(b) the absolute velocity of the fluid in the direction of blade speed
(c) the absolute velocity of the fluid in the radial direction
(d) the absolute velocity of the flow in the axial direction

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : The whirl velocity is the tangential component of absolute velocity at the blade inlet and outlet. This component of the velocity is responsible for the whirling or rotating of the turbine rotor.

846. In reciprocating air compressors following is NOT a method of controlling the quantity of air delivered

(a) throttle valve (b) blow-off control
(c) clearance control (d) flow control valve

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : Reciprocating Air Compressor– Energy flow in rotary air compressor is continuous but in reciprocating air compressor, it is intermittent.

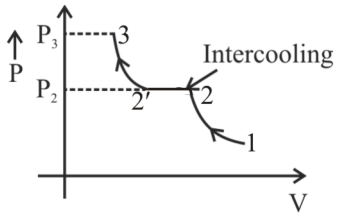
- It is a positive displacement compressor that compresses the air in a fixed volume.
- In reciprocating air compressor flow control valve not a method of controlling the quantity of air delivered.

847. In a P-V diagram of a steady flow compressor, the intercooling can be represented as

(a) Vertical line (b) Horizontal line
(c) Parabolic line (d) None of the above

ISRO Scientist/Engineer 12.01.2020

Ans. (b) :



In a PV diagram of a steady flow compressor the intercooling can be represented by horizontal line.

848. Flow coefficient in axial flow compressor is defined as _____ .[Axial velocity of flow = v_f, Blade velocity at periphery = u]

(a) $\frac{v_f}{u}$ (b) $\frac{u}{v_f}$
(c) $\frac{v_f + u}{u}$ (d) $\frac{u^2}{v_f}$

APPSC Poly Lect. 13.03.2020

Ans. (a) : Flow coefficient (Ψ) in axial flow compressor is defined as the ratio of axial velocity of flow (v_f) to the blade velocity at peripheral (u)

$$\psi = \frac{V_f}{u}$$

849. A single acting two-stage air compressor deals with 4 m^3/min of air at 1.013 bar and 15°C with a speed of 250 rpm. The delivery pressure is 80 bar. If the inter cooling is complete, the intermittent pressure after first stage will be.

(a) 9 bar (b) 8 bar
(c) 7 bar (d) 6 bar

ESE 2020

Ans. (a) : For two stage air compressor

$P_i = \sqrt{P_1 P_2} = \sqrt{1.013 \times 80} = 9\,\text{bar}$

850. Which of the following statement regarding centrifugal compressor is true?

(a) Conversion of dynamic pressure into static pressure takes place in the volute casing due to its convergent shape
(b) In multi stage centrifugal compressor, the width of the blades reduces progressively in the direction of flow
(c) In multi stage centrifugal compressor, the width of the baldes increases progressively in the direction of flow
(d) Multi staging in centrifugal compressors is commonly used for high refrigerant capacity applications

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (b) : Multistage centrifugal compressor is used for high compression ratio, the impeller diameter of all stages remains same, but the width of the impeller or blades becomes progressively in the direction of flow so as to get constant mass flow rate.

851. Which one of the following statements is true?

(a) Compared to reciprocating compressor, the performance of centrifugal compressor is less sensitive to speed
(b) Surging in centrifugal compressor takes place as evaporator pressure increases and condenser pressure decreases
(c) Surging in centrifugal compressor takes place as evaporator presssure decreases and condenser pressure increases
(d) For a given flow rate, frictional losses decreases as the number of blades increases

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (c) : (a) Compared to reciprocating compressor, the performance of centrifugal compressor is more sensitive to speed.

(b) **Surging in Centrifugal Compressor–**Surging is a complete breakdown of steady flow through the compressor due to periodic flow reversal. This reversal of flow occurs during closing of valve in the operating range having mass flow rate less than corresponding to maximum pressure ratio. This reversal of flow causes decrease in efficiency, abnormal sound vibration and the intensity is more, it may lead to mechanical damage. Surging is more likely to occure when the refrigeration load low (i.e. evaporator pressure is low) and the condensing pressure is high.

(d) For a given flow rate, frictional losses decreases as the number of blade decreases.

Search on Telegram @apna_pdf

852. The blade height of axial compressor decreases in axial direction to maintain

(a) Maximum mass flow rate
(b) Lower mass flow rate
(c) Constant speed
(d) Constant mass flow rate

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (d) : Height of blade is decreases from inlet to outlet as pressure increases to get a constant axial flow velocity in order to neutralise axial thrust on the rotor and also maintain constant mass flow rate.

$$\dot{m} = \rho A V_f$$

$$A = \pi D_m H$$

$$D_m = \frac{D_t + D_h}{2}$$

$D_t \rightarrow$ Tip diameter

$D_h \rightarrow$ Hub diameter

So the blade height of axial compressor decreases in axial direction to maintain constant mass flow rate.

853. A two stage centrifugal compressor operating at 3000 rpm is to compress refrigerant R134a from an evaporator temperature of 0°C (h_i = 398.6 kJ/kg) to a condensing temperature of 32°C (h_c = 419.8 kJ/kg). If the impeller diameter of both the stages have to be same, what is the diameter of the impeller?

Assume suction condition to be dry saturated, compression process isentropic, impeller blades radial and refrigerant enters impeller radially

(a) 0.65 m (b) 0.8 m
(c) 1.0 m (d) 1.5 m

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : $W_{total} = (419.8 - 398.6) \times 10^3$ J/kg

$= 21200$ J/kg

Work per stage $= \frac{W_{total}}{2} = u_2^2$

$W_{total} = \phi_s \phi_p \dot{m} U_2^2$

Where, $\phi_s = 1$, $\phi_p = 1$ and $\dot{m} = 1$

(Because two stage centrifugal compressor)

$W_{per\ stage} = 10600$ J/kg

$u_2 = 102.95$ m/sec $= \frac{\pi D_2 N}{60}$

$D_2 = 0.655$ m

854. The centrifugal compressors are generally used for refrigerants that require.

(a) Small displacement and low condensing pressures
(b) Large displacements and high condensing pressures
(c) Small displacements and high condensing pressures
(d) Large displacements and low condensing pressures

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (d) : Large displacements and low condensing pressures

855. In a two stage reciprocating air compressor with a suction pressure of 4 bar and delivery pressure of 16 bar, the ideal intercooler pressure will be:

(a) 10 bar (b) 8 bar
(c) 32 bar (d) 20 bar

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (b) : $P_H = 16$ bar, $P_L = 4$bar

Intercooler Pressure $(P_2) = \sqrt{P_H \times P_L}$

$= \sqrt{16 \times 4}$

$= \sqrt{64}$

$= 8$ bar.

856. Loading coefficient of an axial flow compressor for a given stage work is [where, u is the peripheral, velocity of rotor]

(a) inversely proportional to $\sqrt{u}$
(b) inversely proportional to u^2
(c) directly proportional to u^2
(d) directly proportional to u

SJVN ET 2019

Ans. (b) : The blade Loading coefficient (ψ) for an axial flow compressor can be defined as the ratio of work done to the square of peripheral velocity of rotor therefore,

$$\psi = \frac{\text{Work done}}{(\text{Peripheral velocity of rotor})^2}$$

$$\psi = \frac{W}{u^2}$$

857. The work input in reciprocating air compressor for same inlet state and same exit pressure is minimum when:

(a) Compression follows $Pv^{1.4}$ = Constant
(b) Compression follows Pv = Constant
(c) Compression follow $Pv^{1.3}$ = Constant
(d) Compression follow $Pv^{1.2}$ = Constant

SJVN ET 2019

Ans. (b) : The work input in reciprocating air compressor for same inlet state and same exit pressure is minimum when compression follow Pv = constant

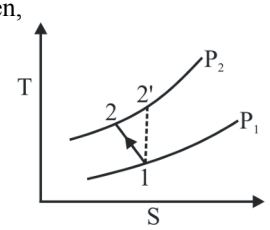
858. A centrifugal compressor develops a pressure ratio of 5 and air consumption of 30 kg/s. The inlet temperature and pressure are 15°C and 1 bar respectively. For an isentropic efficiency of 0.85, the power required by the compressor will be nearly

(a) 5964 kW (b) 5778 kW
(c) 5586 kW (d) 5397 kW

ESE 2019

Search on Telegram @apna_pdf

Ans. (a) : Given,



$\frac{P_2}{P_1} = 5$

$\dot{m} = 30$ kg/s

$T_1 = 15 + 273 = 288$ k

$P_1 = 1$ bar

$\eta = 0.85$

$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}}$$

$$\frac{T_2}{288} = (5)^{\frac{0.4}{1.4}}$$

$T_2 = 456.14$ k

Ideal work $\left(\dot{W}_c\right) = C_p(T_2 - T_1)$

$= 1.005\ (456.14 - 288)$

$= 168.98$ kJ/kg

$$\eta_c = \frac{\dot{W}_c}{\dot{W}_a} = \frac{\text{Ideal work}}{\text{Actual work}}$$

$$\dot{W}_a = \frac{W_c}{\eta_c} = \frac{168.98}{0.85} = 198.8 \text{ kJ/kg}$$

Actual power for compressor

$W_a = \dot{m}_a \dot{W}_a = 30 \times 198.8 = 5964.02$ kW

859. In centrifugal compressors, there exists a loss of energy due to the mismatch of direction of relative velocity of fluid at inlet with inlet blade angle. This loss is known as

(a) frictional loss (b) incidence loss

(c) clearance loss (d) leakage loss

ESE 2019

Ans. (b) : Additional losses that occur in a row of blades in a centrifugal compressor stage on account of incidence (mismatch of direction of relative velocity of fluid of inlet with inlet blade angle) termed as incidence losses. It is conventionally known as shock losses.

860. A compressor delivers 4 m^3 of air having a mass of 5 kg. The specific weight and specific volume of air being delivered will be nearly

(a) 12.3 N/m^3 and 0.8 m^3/kg

(b) 14.6 N/m^3 and 0.4 m^3/kg

(c) 12.3 N/m^3 and 0.4 m^3/kg

(d) 14.6 N/m^3 and 0.8 m^3/kg

ESE 2019

Ans. (a) : Given,

$V = 4\ m^3$, $m = 5$ kg

(i) Specific volume $(v) = \frac{V}{m} = \frac{4}{5} = 0.8\ m^3/kg$

(ii) Specific weight $(w) = \rho g$

$$= \frac{1}{v} g = \frac{9.81}{0.8} = 12.26 \text{ N/m}^3$$

861. An air compressor compresses atmospheric air at 0.1 MPa and 27°C by 10 times of air inlet pressure. During compression, the heat lost to the surrounding is estimated to be 5% of compression work. Air enters the compressor with a velocity of 40 m/s and leaves with 100 m/s. The inlet and exit cross sectional areas are 100 cm^2 and 20cm^2 respectively. The temperature of air at the exit from the compressor will be

(a) 1498 K (b) 1574 K

(c) 1654 K (d) 1726 K

ESE 2019

Ans. (a) : Given,

$P_1 = 0.1$ MPa $P_2 = 10P_1 = 1$ MPa

$T_1 = 300$ k $Q_2 = 5\%\ W_c$

$V_1 = 40$ m/s $A_1 = 100\ cm^2$

$V_2 = 100$ m/s $A_2 = 20\ cm^2$

By continuity equation

$\rho_1 A_1 V_1 = \rho_2 A_2 V_2$

$$\frac{P_1}{RT_1} \cdot A_1 \cdot V_1 = \frac{P_2}{RT_2} \cdot A_2 \cdot V_2$$

$$\frac{0.1}{300} \times 100 \times 40 = \frac{1}{T_2} \times 20 \times 100$$

$T_2 = 1500$ K

862. Which one of the following compressors will be used in vapour compression refrigerator for plants up to 100 tonnes capacity?

(a) Reciprocating compressor

(b) Rotary compressor

(c) Centrifugal compressor

(d) Double-acting compressor

ESE 2019

Ans. (a) : Reciprocating compressors are employed in plants with capacity up to 100 tonnes.
For plants with higher capacities, centrifugal compressors are used.

863. For a centrifugal compressor with radial vanes, slip factor is the ratio of

(a) isentropic work to Euler work

(b) whirl velocity to the blade velocity at the impeller exit

(c) stagnation pressure to static pressure

(d) isentropic temperature rise to actual temperature rise

Gujarat PSC AE 2019, ESE 2013

Ans. : (b) : Slip factor 'ϕ_s' is defined as the ratio of work done (when the number of blades are finite) to the work done under ideal conditions (when the number of bladed are infinite)

$$\phi_s = \frac{\dot{m}U_2 V'_{w2}}{\dot{m}U_2 V_{w2}} = \frac{V'_{w2}}{V_{w2}} = \frac{V'_{w2}}{U_2}$$

864. The incorrect option related to Prewhirl of centrifugal compressor:

(a) To maintain the Mach number less than unity at impeller eye tip

(b) To increase the relative velocity at inlet guide vane

Search on Telegram @apna_pdf

(c) To avoid chocking at compressor inlet
(d) None of these

OPSC AEE 2019 PAPER - II

Ans. : (b) : Prewhirl of centrifugal compressor-
- To maintain the mach number less than unity at impeller eye tip.
- To avoid chocking at compressor inlet.
- To decrease the relative velocity at inlet guide vane.
- The prewhirl reduces the work input of the compressor. The inlet velocity of the impeller eye is inclined by an angle, known as prewhirl.

865. In a centrifugal compressor, an increase in speed at a given pressure ratio causes:
(a) Increase in efficiency
(b) Decrease in flow
(c) Increase in flow
(d) Increase in flow and decrease in efficiency

OPSC AEE 2019 PAPER - II
ESE 2013

Ans. : (d) : Increased in speed gives increases flow. As work of compression increases then it reduces compressor efficiency. (Eddies are formed)

866. A fan supplies 250 CFM air flow rate. It is equal to _____ m^3/s.
(a) 0.095 (b) 0.118
(c) 0.127 (d) 0.175

BHEL ET 2019

Ans. (b) : Given - 250 CFM
Note :– The volumetric flow rate of a liquid or gas in cubic feet per minute
so, 1 CFM = 0.47 litre/sec.
250 CFM = 0.47 × 250 litre/sec.
= 117.5 litre/sec.
= 117.5×10^{-3} m^3/s
= 0.118 m^3/sec.

867. The optimum intermediate pressure P_2 in a two stage air compressor having P_1 = 4 bar and P_3 = 9 bar, as suction and delivery pressure respectively, is equal to :
(a) 13 bar (b) 9 bar
(c) 4 bar (d) 6 bar

BHEL ET 2019

Ans. (d) : Given - Two stage air compressor
$P_1 = 4$ bar
$P_3 = 9$ bar
optimum intermediate pressure
$$P_2 = P_4 = \sqrt{P_1 P_3}$$
$$= \sqrt{4 \times 5}$$
$$= \sqrt{36} = 6 \text{ bar.}$$

868. Statement I: In air-blast injection, a separate compressor is used to create an air blast at a pressure of 6 MPa.
Statement II: The solid injection system is heavier as it needs increasing the fuel pressure to 30 MPa.

ESE 2018

Ans. (c) : In air blast injection, a separate air compressor issued to inject the fuel into the cylinder to increase the pressure of air to 6 MPa.
Solid injection system does not requires a separate compressor hence its weight is less.

869. Air is drawn in a compressor at the rate of 0.8 kg/s at a pressure of 1 bar and temperature of 20 °C, and is delivered at a pressure of 10 bar and temperature of 90 °C. This air delivery is through an exit valve of area 2×10^{-3} m^2. If R is 287kJ/kg-K, the exit velocity of the air is
(a) 41.7 m/s (b) 35.8 m/s
(c) 29.7 m/s (d) 27.3 m/s

ESE 2018

Ans. (a) : Given, $\dot{m}_1 = 0.8$ kg/s
$p_1 = 100$ kPa
$$\dot{v}_1 = \frac{\dot{m}_1 R T_1}{p_1} = \frac{0.8 \times 0.287 \times 293}{100}$$
$$= 0.6727 \text{ m}^3/\text{s}$$
$$\dot{v}_2 = \frac{\dot{m}_1 R T_2}{p_2} =$$
$$\frac{0.8 \times 0.287 \times 363}{1000} = 0.0833 \text{ m}^3/\text{s}$$
$$\dot{v}_2 = A_2 v_2$$
$$v_2 = \frac{\dot{v}_2}{A_2} = \frac{0.0833}{2 \times 10^{-3}} = 41.67 \text{ m/s}$$

870. Which of the following is a "Dynamic compressor"?
(a) Centrifugal compressor
(b) Screw compressor
(c) Root blower
(d) Reciprocating compressor
(e) Vane type compressor

CGPSC AE 25.02.2018

Ans. (a) : Screw compressor, Root blower compressor, reciprocating compressor and vane type compressor are positive displacement compressor whereas centrifugal compressor, and axial flow compressor are "Dynamic compressor"

871. In the axial flow compressor, the efficiency can be maximized by
(a) Increasing the speed
(b) Decreasing the speed
(c) Maintaining the speed constant and moderate
(d) None of these

HPPSC AE 2018

Ans. (a) : In the axial flow compressor, the efficiency can be maximized by increasing the speed of rotor of axial flow compressor.

872. If ε is the clearance ratio for a reciprocating compressor, the volumetric efficiency will be equal to
(a) $1-\varepsilon\left(1+r^{\frac{1}{n}}\right)$ (b) $1+\varepsilon\left(1-r^{\frac{1}{n}}\right)$
(c) $1+\varepsilon\left(1-\frac{1}{r^{\frac{1}{n}}}\right)$ (d) $1-\varepsilon\left(1-r^{\frac{1}{n}}\right)$

HPPSC AE 2018

Search on Telegram @apna_pdf

Ans. (b) : We know that, volumetric efficiency of reciprocating compressor

$$\eta_V = 1 + \varepsilon - \varepsilon\left[\frac{P_H}{P_L}\right]^{\frac{1}{n}}$$

where

$$\frac{P_H}{P_L} = r = \text{(Pressure ratio)}$$

$$\eta_V = 1 + \varepsilon\left[1 - r^{\frac{1}{n}}\right]$$

873. The application of centrifugal compressor in aircraft leads to

(a) Large frontal area of aircraft
(b) Higher flow rate through the engine
(c) Higher aircraft speed
(d) Lower frontal area of aircraft

RPSC Vice Principal ITI 2018

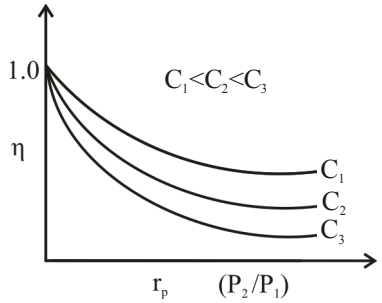
Ans. (a) : Because of higher pressure ratio per stage of centrifugal compressor, the size of impeller is large which leads to increase in frontal area of turbine.

874. Which of the following statement does not apply to the volumetric efficiency of a reciprocating air compressor?

(a) It decrease with increase of inlet temperature
(b) It increase with decrease of pressure ratio
(c) It increase of decrease in clearance ratio
(d) It decrease with increase in clearance to stroke ratio

RPSC Vice Principal ITI 2018

Ans. (a) : The variation of volumetric efficiency with pressure ratio and clearance ratio is show in figure.



$$\eta_v = 1 + C - C\left(\frac{P_2}{P_1}\right)^{1/n}$$

$$= 1 + C\left(1 - \left(\frac{P_2}{P_1}\right)^{1/n}\right)$$

- At constant clearance 'C' and decreases in pressure ratio the volumetric efficiency increases.
- At constant pressure ratio as clearance 'C' reduces. The volumetric efficiency increases.
- Increases in delivery pressure means increases in pressure ratio i.e. decreases in volumetric efficiency.
- Inlet temperature does not affect volumetric efficiency.

875. For actual single stage centrifugal compressor, the maximum power ratio is of the order of

(a) 1 : 1.2 (b) 1 : 2
(c) 1 : 4 (d) 1 : 10

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : The maximum compression ratio in an actual single stage axial flow compressor is of the order of 1:1.2

876. For the same pressure ratio during compression, compressing in two-stage compressor with perfect inter-cooling instead of a single-stage compressor is characterized by:

1. Increase in volumetric efficiency
2. Decrease in work input
3. Decrease in discharge temperature

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

UPSC JWM 2017

Ans. (d) : On comparing two compressor with perfect inter cooling instead of single stage, compressor with perfect inter cooling at same pressure ratio found following characteristics-

- Increase in volumetric efficiency
- Decrease in work input
- Decrease in discharge temperature.

877. Consider the following statements in respect of maximum efficiency of a two-stage reciprocating compressor:

1. The pressure ratios are same for each stage.
2. The work done is same in each stage.
3. The inter cooling is perfect.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Ans. (d) : For ideal two stages reciprocating air compressor the pressure ratio is same in all stages. The work done is same in all stages and for ideal situation inter cooling is perfect.

878. Consider the following statements for single-stage reciprocating compressors:

1. Isothermal process is the most desirable process for compression.
2. The size of clearance volume provided in the compressor has no effect on work done per kg of air delivered.
3. The Volumetric efficiency of the compressor decreases with increasing pressure.

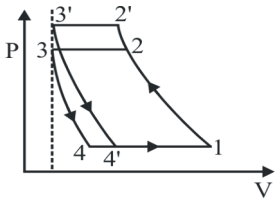
Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Search on Telegram @apna_pdf

Ans. (d)



In this above fig. show that volumetric efficiency decreasing with increase in pressure.

Since the area onto y-axis i.e. $\int Vdp$ being minimum most for isothermal compression $\frac{\text{W.D.}}{\text{Cycle}}$ is least.

$$\frac{\text{Work done}}{\text{Cycle}} = \frac{n}{n-1} P_1 (V_1 - V_4)\left[\left(\frac{P_2}{P_1}\right)^{\frac{n-1}{n}} - 1\right]$$

So work done is independent of clearance volume.

Volumetric efficiency of a reciprocating compressor is

$$\eta_V = 1 + C - C\left(\frac{P_2}{P_1}\right)^{1/n}$$

$$C = \frac{V_C}{V_S} = \text{Clearance ratio}$$

P_2 = Delivery pressure

P_1 = Inlet pressure

As P_2 increases, η_{vol} decreases.

879. Consider the following statements:
The volumetric efficiency of a reciprocating compressor can be improved by
1. decreasing the clearance volume
2. cooling the intake air
3. heating the intake air

Which of the above statements is / are correct?
(a) 2 only (b) 3 only
(c) 1 and 2 (d) 1 and 3

ESE 2017

Ans. (c) : The volumetric efficiency of reciprocating compressor,

$$\eta_v = 1 + C - C\left(\frac{P_2}{P_1}\right)^{1/n}$$

Since pressure ratio $\frac{P_2}{P_1} > 1$ so, by decreasing the clearance volume, volumetric efficiency get increased. Since volumetric efficiency is a geometrical parameter involving expansion exponent 'n' of gas. The value of n is higher at low temperature, so by cooling the intake air volumetric efficiency may increase slightly.

880. In a two-stage reciprocating air compressor, the suction and delivery pressure are 1 bar and 4 bar respectively. For the maximum efficiency, the intercooler pressure is
(a) 1.5 bar (b) 2.5 bar
(c) 2.0 bar (d) 3.0 bar

BPSC AE Mains 2017 Paper - V

Ans. : (c) : For minimum work consumption and maximum efficiency, the intermediate pressure

$P_i = \sqrt{P_1.P_2} = \sqrt{1 \times 4} = 2$ bar

881. High positive incidence in an axial compressor blade leads to
(a) suppression of separation of flow on the blade
(b) choking of the flow
(c) separation of flow on the suction side of the blade
(d) separation of flow on the pressure side of the blade

BPSC AE Mains 2017 Paper-V

Ans. : (c) : Stalling is the separation of flow from the blade surface. At high incidence, flow separation occurs on the suction side of the blades which is referred as positive stalling.

882. The volumetric efficiency of a reciprocating compressor
(a) increases with increasing clearance ratio
(b) increases with increase in compression index
(c) does not change with change in clearance ratio and pressure ratio
(d) decreases both with increasing clearance ratio and pressure ratio

BPSC AE Mains 2017 Paper - V

Ans. : (d) : Volumetric efficiency

$$\eta = 1 - \frac{v_c}{v_s}\left[\left(\frac{P_2}{P_1}\right)^{1/n} - 1\right]$$

$$= 1 - c\left[\left(\frac{P_2}{P_1}\right)^{1/n} - 1\right]$$

$$= 1 + c - c\left(\frac{P_2}{P_1}\right)^{1/n}$$

Hence volumetric efficiency decreases with increasing clearance ratio and pressure ratio both.

883. The mean effective pressure of the compressor is the :
(a) actual volume of air delivered by the compressor when reduced to normal temperature and pressure conditions.
(b) volume of air delivered by the compressor
(c) volume of air sucked by the compressor during its suction stroke
(d) none of the above

Punjab PSC SDE 12.02.2017

Ans. (d) : The mean effective pressure is a quantity relating to the operation of a reciprocating engine and is a valuable measure of an engine's capacity to do work that is independent of engine displacement.

884. Separators are generally used in air compressor installations :
(a) before the intercooler
(b) after the intercooler
(c) between the after cooler and receiver
(d) before first stage suction

Punjab PSC SDE 12.02.2017

Search on Telegram @apna_pdf

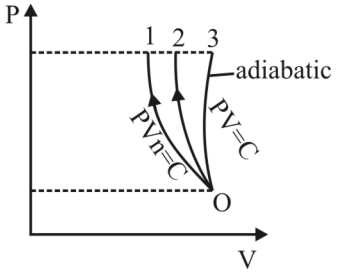
Ans. (c) : Separators are generally used in air compressor installations between the after cooler and receiver.

885. In single stage reciprocating compressor, work done on air will be minimum when compression is:

(a) isothermal (b) isochoric
(c) polytropic (d) adiabatic
(e) isentropic

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Process (0-1)- Isothermal
Process (0-2)- Polytropic
Process (0-3) - adiabatic



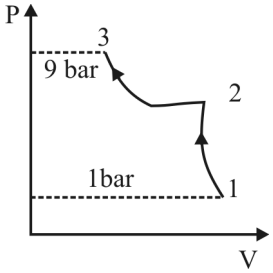
It is clear from the figure.
Isothermal process required minimum work during compression.

886. In two stage reciprocating compressor, suction and delivery pressure are 1 bar and 9 bar respectively. What will be the inter cooling pressure for maximum efficiency?

(a) 2 bar (b) 3 bar
(c) 4.5 bar (d) 5 bar
(e) 3.5 bar

CGPSC ARTO & TSI 07.01.2017

Ans. (b) : $P_{Suction} = 1$ bar
$P_{Delivery} = 9$ bar



$$P_{intermediate} = \sqrt{P_{suc} \times P_{dev}}$$

$$P_{int} = \sqrt{1 \times 9}$$

$$= \mathbf{3\ bar}$$

887. The blade passages in a compressor are_____

(a) converging (b) diverging
(c) constant (d) unpredictable

WBPSC AE, 2017

Ans. (b) : The blade passages in a compressor are diverging.

888. An axial flow compressor has _____

(a) a druth type rotor
(b) a disc type rotor
(c) a drum type or disc type rotor
(d) None of the above

WBPSC AE, 2017

Ans. (c) : An axial flow compressor has a drum type or disc type rotor.

889. Which of the following statements is *wrong*?

(a) In a two-stage reciprocating air compressor with complete intercooling, maximum work is saved.
(b) The minimum work required for a two-stage reciprocating air compressor is double the work required for each stage.
(c) The ratio of the volume of free air delivery per stroke to the swept volume of the piston is called volumetric efficiency.
(d) None of the above

Karnataka PSC AE, 10.09.2017

Ans. (d) : None of the above

890. The compressor capacity is defined as the :

(a) actual volume of the air delivered by the compressor when reduced to normal temperature and pressure conditions.
(b) volume of air delivered by the compressor
(c) volume of air sucked by the compressor during its suction stroke
(d) None of the above

Punjab PSC SDE 12.02.2017

Ans. (b) : The compressor capacity is defined as the volume of air delivered by the compressor.

891. The overall isothermal efficiency of the compressor is defined as the ratio of :

(a) work required to compress the air isothermally to the actual work required to compress the air for the same pressure ratio.
(b) isothermal horse power to the shaft horsepower of B.H.P. of the motor or engine required to drive the compressor
(c) volume of free air delivery per stroke to the swept volume of the piston.
(d) adiabatic horsepower to the horsepower required to drive the compressor.

Punjab PSC SDE 12.02.2017

Ans. (b) : The overall isothermal efficiency of the compressor is defined as the ratio of isothermal horse power to the shaft horsepower or B.H.P. of the motor or engine required to drive the compressor.

892. The volumetric efficiency of a compressor :

(a) increases with decrease in compression ratio
(b) decreases with decrease in compression ratio
(c) increases with increase in compression ratio
(d) decreases with increases in compression ratio

Punjab PSC SDE 12.02.2017

Search on Telegram @apna_pdf

Ans. (a & d) : Volumetric Efficiency (η_V)– It is defined as the ratio of actual volume at the entry of compressor to that of the theoretical swept volume.

$$\eta_V = \frac{\text{Actual volume at entry}}{\text{Theoretical swept volume}} = \frac{V_a}{V_s}$$

$$\eta_V = \frac{V_a}{\frac{\pi}{4} D^2 L \times k \times \frac{N}{60 \times n}}$$

Volumetric efficiency of a reciprocating compressor is,

$$\eta_V = 1 + C - C\left(\frac{P_H}{P_L}\right)^{1/n}$$

- $P_2 \uparrow \rightarrow \downarrow \eta_V = \left[1 - \left[C \uparrow \left(\frac{P_2 \uparrow}{P_1}\right)^{1/n} - 1\right] \uparrow\right] \downarrow$
- $n \downarrow \rightarrow \eta_V \uparrow = \left[1 - \left[C \downarrow \left(\frac{P_2}{P_1}\right)^{\frac{1}{n\downarrow}} - 1\right] \downarrow\right] \uparrow$
- $C \uparrow \rightarrow \eta_V \downarrow = \left[1 - \uparrow C \left[\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}} - 1\right] \uparrow\right] \downarrow$

893. If the flow of air through the compressor is perpendicular to its axis, then it is a :

(a) reciprocating compressor
(b) centrifugal compressor
(c) axial flow compressor
(d) turbo compressor

Punjab PSC SDE 12.02.2017

Ans. (b) : If the flow of air through the compressor is perpendicular to its axis, then it is a centrifugal compressor.

894. Compression efficiency is compared against

(a) Ideal compression
(b) Adiabatic compression
(c) Isentropic compression
(d) Isothermal compression

Nagaland PSC CTSE 2017 Paper-2

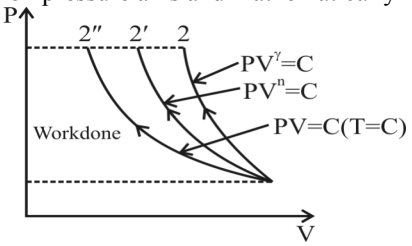
Ans. (d) : Compression efficiency is compared against isothermal compression.

895. Maximum work is done in compressing air when the compression is

(a) Adiabatic (b) Polytropic
(c) Isentropic (d) Isothermal

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (a) : **Open System Work or Steady (Flow) Work–**To obtain this work area under P-V should be projected on pressure axis and mathematically



$W_{open} = -\int v dp$

∴ According to graph maximum work is done in adiabatic compression of air.

So, Maximum work done in compressing air when the compression is adiabatic. In adiabatic system compression will generate heat due to internal friction but heat will not escape since there is no heat transfer and provide more work to resist the compression due to heat generated.

896. Clearance volume of a reciprocating compressor is 120 ml and the volume of cylinder at bottom dead centre is 960 ml. What is the clearance ratio of the compressor?

(a) $\frac{1}{9}$ (b) $\frac{1}{8}$
(c) $\frac{1}{7}$ (d) $\frac{1}{6}$
(e) $\frac{1}{5}$

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (c) : As we know,

$$\text{Clearance ratio} = \frac{\text{Clearance volume}}{\text{Swept volume}}$$

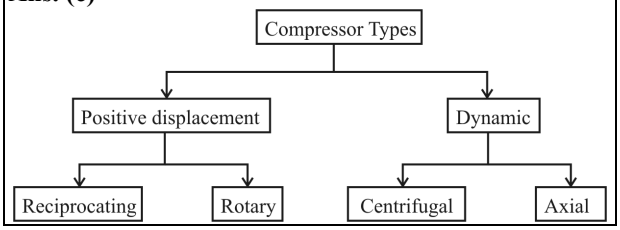
$$= \frac{120}{960 - 120} = \frac{1}{7}$$

897. Which of the following belong to the Roto-dynamic compressor family?

(a) Centrifugal compressors
(b) Axial flow compressors
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (c)



898. What is the double acting compressor?

(a) It is a compressor where air is compressed on both sides of the piston
(b) It is a compressor where air is compressed by two pistons working inside a single cylinder
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (a) : A compressor in which suction, compression and delivery of air take place on both sides of the piston is known as double acting compressor. It has two delivery strokes for such revolution of the crank shaft.

Search on Telegram @apna_pdf

899. In which of the following compressors, the flow of air through the compressor is parallel to its axis?

(a) Axial flow compressor
(b) Centrifugal compressor
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (a) : If the flow of air through the compressor is parallel to its axis, then the compressor is axial flow compressor

900. The degrees of reaction is usually kept ..... for all types of axial flow compressors.

(a) 0.2 (b) 0.3
(c) 0.4 (d) 0.5

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : The degrees of reaction is usually kept 0.5 for all types of axial flow compressors.

901. The volumetric efficiency for reciprocating air compressors is about

(a) 10 to 40% (b) 40 to 60%
(c) 60 to 70% (d) 70 to 90%

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : The volumetric efficiency for reciprocating air compressors is about 70 to 90%.

902. Induced draught fans of a large steam generator have

(a) Backward curved blades
(b) Forward curved blades
(c) Straight of radial blades
(d) Double curved blades
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (a) : Induced draught fan is normally located at the outlet between dust collector and chimney. The fan takes hot flue gases from the boiler through dust collector and delivers it to the chimney into the open atmosphere ID fan creates negative pressure or suction to discharge the gases out after combustion from the furnace. Since ID fans can handle hot flue gases, they have more corrosion and errosion problems even when used with electrostatic precipitaters. The most common type of fan used as ID fans are the backward inclined blade.

903. A multistage compressor is to be designed for a given flow rate pressure ratio. If the compressor consists of axial flow stages followed by centrifugal instead of only axial flow stages then the _____

(a) Axial length of the compersor would be increased
(b) Overall diameter would be increased
(c) Overall diameter would be decreased
(d) Axial length of the compressor would be decreased

UPRVUNL AE 21.08.2016

Ans. : (b) A multistage compressor is to be designed for a given flow rate pressure ratio. If the compressor consists of axial flow stages followed by centrifugal instead of only axial flow stages then the overall diameter would be increased.

904. Cylinder clearance in a compressor should be

(a) as large as possible
(b) as small as possible
(c) about 50% of swept volume
(d) about 40% of swept volume

GPSC Lect. 23.10.2016

Ans. (b) : Cylinder clearance in a compressor should be as small as possible, because the high pressure, is produced and increase its efficiency.

905. Match list 1 with list 2 and select the answer from the code given below:

List-I (Equipment in a refrigeration system)	List-II (Purpose)
A. Compressor	i. Enthalpy remains constant
B. Evaporator	ii. Enthalpy increases
C. Throttle valve	iii. Enthalpy increases but pressure remains constant
D. Condenser	iv. Enthalpy decreases but pressure remains constant

	A	B	C	D
(a)	iii	ii	i	iv
(b)	ii	iii	iv	i
(c)	ii	iii	i	iv
(d)	iv	ii	iii	i

RPSC IOF & Boiler 20.09.2017

Ans. : (c)

A	B	C	D
ii	iii	i	iv

906. The work done in compressing 1 kg of air in compression will be least when the value of index is

(a) 1 (b) 1.1
(c) 1.2 (d) 1.41

BPSC Poly. Lect. 2016

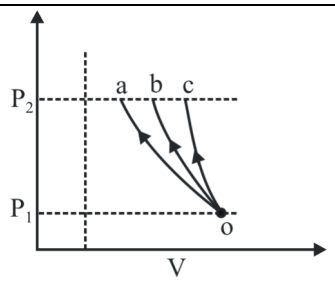
Ans : (a) The work done on the air is minimum when the compression is Isothermal (when n=1) and it is maximum when the Compression is isentropic (when $n=\gamma$) because isothermal line has less slope then isentropic line

$$\left(\frac{dP}{dV}\right)_{T=C} = -\left(\frac{P}{V}\right)$$

$$\left(\frac{dP}{dV}\right)_{Adiabatic} = -\gamma\left(\frac{P}{V}\right)$$

We seen that area under adiabatic curve in P-V diagram is more as compared with isothermal curve in P-V diagram.

Search on Telegram @apna_pdf



process (o-a) → Isothermal process → n = 1
process (o-b) → Polytropic process → n = 1.3
process (o-c) → Adiabatic process → n = 1.4

907. Multistage compression leads to:

(a) decreased vol. efficiency for a given pressure ratio
(b) increased vol. efficiency for a given pressure ratio
(c) more cost
(d) more noise

(HPPSC LECT. 2016)

Ans. : (b) Advantages of multistage compression:-
(i) It improves the volumetric efficiency for the given pressure ratio.
(ii) It reduces the leakage loss considerably
(iii) It gives more uniform torque and hence a smaller size flywheel is required
(iv) It reduces the cost of compressor

908. What will happen to the volumetric efficiency with increasing pressure ratio in case of single stage compression in compressor?

(a) Decreases (b) Increases
(c) Remains unaffected (d) None of these

UPPSC AE 12.04.2016 Paper-II

Ans. : (a) Volumetric efficiency:- It is the ratio of volume of free air delivery per stroke to the swept volume of the piston. The volumetric efficiency of a reciprocating air compressor with clearance volume is given by

$$\eta_{vol} = 1 + C - C\left(P_2/P_1\right)^{1/n}$$

$$C = \text{clearance ratio} = \frac{\text{Clearance volume}}{\text{Swept volume of the piston}}$$

P_1= Initial pressure of air
P_2 = Final pressure of air
n = Polytropic index
if (P_2/P_1) increases then volumetric efficiency decreases.

$$\eta_{vol} \uparrow \text{ when } \left(P_2/P_1\right) \downarrow$$

909. The compression work requirement is minimum in case of compression process being

(a) Adiabatic (b) Isochoric
(c) Isothermal (d) Hyperbolic

UPPSC AE 12.04.2016 Paper-II

Ans. : (c) The compression work requirement is minimum is case of compression process being isothermal.

(i) Work done during adiabatic compression

$$= \frac{\gamma}{\gamma - 1}(p_2 v_2 - p_1 v_1)$$

(ii) Work done during polytrophic compression

$$= \frac{n}{n - 1}(p_2 v_2 - p_1 v_1)$$

(iii) Work done during isothermal compression

$$= p_1 v_1 \ln(p_2/p_1)$$

910. The mass flow rate of air compressed in axial flow compressor is _____ centrifugal compressor.

(a) Less than (b) Equal to
(c) Greater than (d) Unpredictable

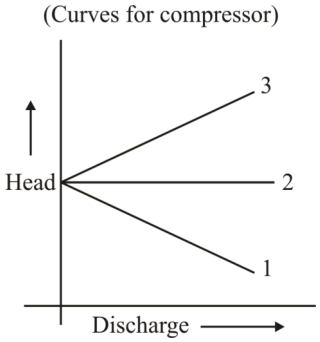
APPSC AEE 2016

Ans. (c) : The mass flow rate of air compressed in axial flow compressor is greater than centrifugal compressor.

911. List - I

(a) $\beta_2 < 90^o$
(b) $\beta_2 = 90^o$
(c) $\beta_2 > 90^o$

List - II



(a) A-1, B-2, C-3 (b) A-1, B-3, C-2
(c) A-2, B-1, C-3 (d) A-3, B-2, C-1

TSPSC AEE 2015

Ans. (a)

Curve	Outlet vane angle (β_2)
1	$\beta_2 < 90^o$
2	$\beta_2 = 90^o$
3	$\beta_2 > 90^o$

912. A three stage compressor with perfect intercooling between stages, compresses air from 1 bar to 27 bar. The optimum pressure in the last inter cooler will be

(a) 1 bar (b) 3 bar
(c) 9 bar (d) 27 bar
(e) $\sqrt{27}$ bar

CGPSC AE 26.04.2015 Shift-II

Ans. (c) : given as,
$\eta = 3$, P_1= 1 bar , P_6= 27 bar
For perfect intercooling

$$\left[\frac{P_2}{P_1}\right]^3 = \left[\frac{P_6}{P_1}\right] = \left[\frac{27}{1}\right]$$

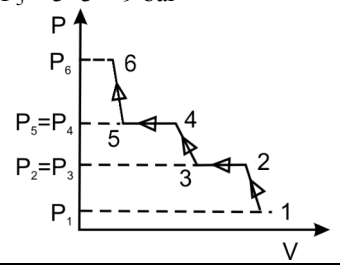
$$\boxed{P_2 = 3\text{bar}}$$

$$\frac{P_4}{P_3} = \frac{P_2}{P_1}$$

Search on Telegram @apna_pdf

$$P_4 = \frac{P_2 \times P_3}{P_1} = \frac{P_2 \times P_2}{P_1} \qquad (P_2 = P_3)$$

$P_4 = P_5 = 3 \times 3 = 9$ bar



913. Consider the following statements. The volumetric efficiency of a reciprocating compressor depends on
(1) Clearance factor
(2) Pressure ratio
(3) Index of expansion
(4) Index of compression
of these statements
(a) (1) and (2) are correct
(b) (1) and (3) are correct
(c) (1), (2) and (3) are correct
(d) (1), (2) and (4) are correct

TSPSC AEE 2015

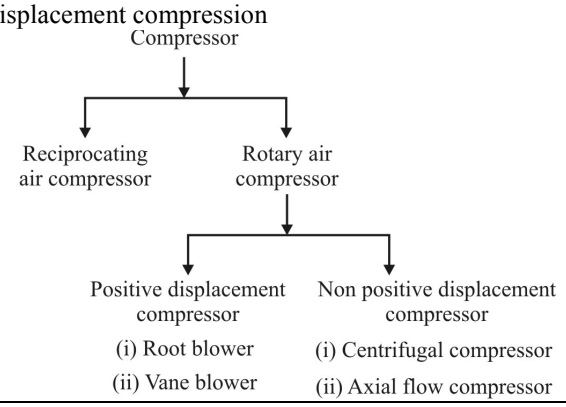
Ans. (c) : The volumetric efficiency of a reciprocating compressor depends on clearance factor, pressure ratio and index of expansion.

$$\eta_v = 1 + C - C\left[\frac{P_H}{P_L}\right]^{\frac{1}{n}}$$

914. The positive displacement compressor is
(a) Roots blower compressor
(b) Axial flow compressor
(c) Centrifugal compressor
(d) Condenser

TSPSC AEE 2015

Ans. : (a) Roots blower compressor is positive displacement compression



915. The volumetric efficiency of a reciprocation compressor depends upon
(a) Clearance volume
(b) Pressure ratio
(c) Index of expansion
(d) All of the above

GPSC AE 26.07.2015

Ans. (d) : $\eta_v = 1 + C - C\left(\frac{P_H}{P_L}\right)^{\frac{1}{n}}$

$\frac{P_H}{P_L} \rightarrow$ Pressure ratio

$C \rightarrow$ Clearance ratio

$\eta \rightarrow$ Polytropic index

916. The capacity of a reciprocating air compressor expressed in m^3/min refers to volume of
(a) Receiver tank
(b) Compressor displacement
(c) Free air delivered
(d) Compressed air discharge

GPSC AE 26.07.2015

Ans. (c) : The capacity of a reciprocating air compressor expressed in m^3/min refers to volume of free air delivered.

917. In axial flow fans and turbines fluid enters and leaves as follows
(a) radially, axially
(b) axially, axially
(c) axially, radially
(d) combination of axial and radial

TNPSC AE 2014

Ans. (b) : An axial flow fans and turbines fluid enters and leaves as axially and axially respectively.

918. Aeroplanes employ following type of compressor :
(a) radial flow (b) axial flow
(c) centrifugal (d) combination of above

J&K PSC Civil Services Pre, 2013

Ans. (b) : Aeroplanes employ following type of compressor axial flow because high discharge at low pressure.

919. A compressor at high altitude will draw :
(a) more power (b) less power
(c) same power (d) none of the above

J&K PSC Civil Services Pre, 2013

Ans. (b) : A compressor at high altitude will draw less power because density of air is decreases.

920. Select the wrong statement about the clearance volume and volumetric efficiency of a reciprocating, air compressor.
(a) The volumetric efficiency decreases with increased clearance volume.
(b) The volumetric efficiency decreases with increased pressure ratio.
(c) The volumetric efficiency increases with increase pressure ratio.
(d) The clearance volume has no effect on work done per kg of air delivered.

RPSC AEN Pre-2013

Search on Telegram @apna_pdf

Ans. (c) : $\eta_{Volumetric} = 1 + c - c\left(\frac{P_2}{P_1}\right)^{\frac{1}{n}}$

$$\eta_{Volumetric} = 1 - c\left[\left(\frac{P_2}{P_1}\right)^{1/n} - 1\right]$$

$r_p = \frac{P_2}{P_1}$ = Pressure ratio

c = clearance volume

- $\eta \downarrow$ with $(r_p) \uparrow$
- $\eta \downarrow$ with $c \uparrow$

921. Screw compressors are used for.

(a) air compression
(b) refrigerant compression
(c) Slurry motion
(d) all of the above

MPSC Dy. Engg. (GWD) 19.05.2013

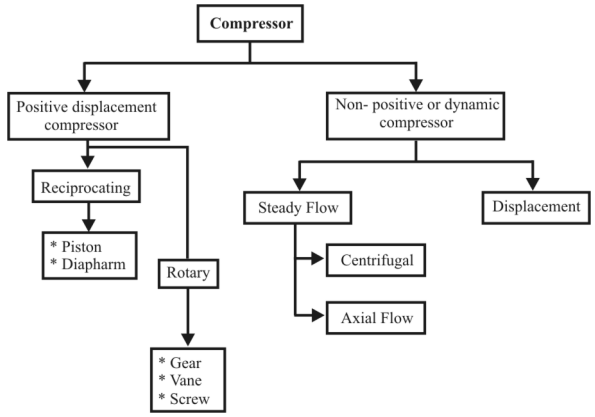
Ans. (b) : Screw Compressor–Screw compressors are used for refrigerant compression. Rotary screw compressors contain two meshed male and female rotors that rotate together in opposite direction. As the air travels through the rotors, the volume of space between the rotors decreases, compressing the refrigerant.

922. Which of the following is a non-positive (Dynamic) type compressor?

(a) Axial flow (b) Vane type
(c) Lobe type (d) Screw type

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : Axial flow is a (non-positive) or rotor dynamic type compressor.



923. Method adopted for increasing isothermal efficiency of compressor.

(a) Water jacketing (b) Inter-cooling
(c) External fins. (d) All of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : Method adopted for increasing isothermal efficiency of compressor.
1. Water jacketing
2. Inter-cooling
3. External fins.

924. A $3m^3$/ min compressor means that it.

(a) Compresses $3m^3$/min of standard air.
(b) Compresses $3m^3$/ min of free air.
(c) delivers $3m^3$/min of compressed air.
(d) delivers $3m^3$/ min of compressed air at delivery pressure.

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : A $3m^3$/min compressor means that it compresses $3m^3$/min of free air.

925. Centrifugal compressor does not have advantage over reciprocating compressor for/in

(a) Considerably high efficiency
(b) Large size compressor needs less floor area
(c) Higher pressure increase per stage
(d) quiet in operation.

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : Advantage of centrifugal compressor over reciprocating compressor.
(1) Centrifugal compressor have better isothermal and isentropic efficiency.
(2) Centrifugal compressor requires less floor area.
(3) Centrifugal compressors are quiet in operating comparatively.

926. The static pressure rise in a centrifugal compressor occurs in

(a) Impeller and diffuser
(b) Diffuser and volute
(c) Impeller and volute
(d) Impeller, diffuser and volute

TNPSC AE 2013

Ans. (a) : The static pressure rise in a centrifugal compressor occurs in impeller, diffuser.

927. The work done factor for an axial compressor varies from

(a) 0.5 to 0.75 (b) 0.6 to 0.8
(c) 0.82 to 0.73 (d) 0.98 to 0.85

TNPSC AE 2013

Ans. (d) : The work done factor for an axial compressor varies from 0.98 to 0.85.

928. The separation of flow from the blade surface

(a) Surging (b) Priming
(c) Stalling (d) Governing

TNPSC AE 2013

Ans. (c) : Stalling– It is a situation of separation of air flow at the aero-foil blades of the compressor. This phenomenon depending upon the blade-profile leads to reduced compression and drop in engine power. Flow separation occur on the suction side of the blade.

929. A blower handles 1 kg/s of air at 20°C and consumes 10 kW of power. If the inlet and exit velocities are 100 m/s and 50 m/s respectively and the specific heat is 1 kJ/kg K, the exit temperature is

(a) 299.25 K (b) 306.75 K
(c) 299.75 K (d) 279.25 K

TNPSC AE 2013

Search on Telegram @apna_pdf

Ans. (a) : Data given as—

$\dot{m}$ = 1 kg/s $T_1 = 20^oC$

$P_i = 10$ kW $T_2 = ?$

$V_1 = 100$ m/s

$V_2 = 50$ m/s

c = 1 kJ/kgK

Power consumes by blower is used to change in kinetic energy and change in internal energy of the air.

$$P_i = \dot{m}c[T_2 - T_1] + \frac{1}{2}\dot{m}[V_2^2 - V_1^2]$$

$$10\times10^3 = 1\times1000\times[T_2 - 20] + \frac{1}{2}\times1\times[50^2 - 100^2]$$

$$10000 = 1000\times[T_2 - 20] - \left(\frac{1}{2}\times150\times50\right)$$

$T_2 = 26.25^oC$

$\boxed{T_2 = 299.25\ K}$

930. A single-stage reciprocating air compressor is required to compress 1 kg of air from 1 bar to 4 bar. The initial temperature is 27 ºC. The work developed during isentropic compression is

(a) 146.96 kJ (b) 146.04 kJ

(c) 146.63 kJ (d) 146.89 kJ

JPSC AE 2013 Paper-V

Ans. (c) :

$$w = \frac{n}{n-1}mRT_1\left[\left(\frac{P_2}{P_1}\right)^{\frac{n-1}{n}} - 1\right]$$

$$= \frac{1.4}{0.4}\times1\times0.287\times300\left[\left(\frac{4}{1}\right)^{\frac{0.4}{1.4}} - 1\right]$$

$$= 146.45\,kJ$$

$$\approx 146.63\,kJ$$

931. What is the minimum work required to compress 1 kg of air from 1 bar, 27 ºC to 16 bar in two stages, if the law of compression is $pv^{1.25}$ =constant and the inter-cooling is perfect?

[Take : R = 287 J/kg-K]

(a) 275.09 kN-m (b) 175.09 kN-m

(c) 375.09 kN-m (d) 475.09 kN-m

JPSC AE 2013 Paper-V

Ans. (a) : In case of perfect intercooling in multi stage compressor

$W_{Total} = n \times W_{each\ stage}$

n = No. of stage

Work done in each stage is same.

Given,

$P_1 = 1$ bar

$P_3 = 16$ bar

m = 1 kg

n = 1.25

$P_2 = \sqrt{P_1.P_3}$

$$P_2 = \sqrt{16\times1}$$

$$= 4\,bar$$

$$W = \frac{n}{n-1}P_1V_1\left[\left(\frac{P_2}{P_1}\right)^{\frac{n-1}{n}} - 1\right]$$

$$= \frac{n}{n-1}mRT_1\left[\left(\frac{P_2}{P_1}\right)^{\frac{n-1}{n}} - 1\right]$$

$$= \frac{1.25}{1.25-1}\times1\times0.287\times300\left[\left(\frac{4}{1}\right)^{\frac{1.25-1}{1.25}} - 1\right]$$

$$= 137.54\,kN-m$$

$$W_{Total} = 2\times W$$

$$= 137.54\times2$$

$$= 275.09\,kN-m$$

932. In centrifugal compressors, pressure ratio may be increased:-

(a) By decreasing slip factor

(b) By increasing slip factor

(c) By making rough blades

(d) By none of the above

UKPSC AE-2013, Paper-II

Ans. (a) : In centrifugal compressors, pressure ratio may be increased by decreasing slip factor.

933. Which of the following compressors has highest capacity?

(a) Reciprocating (b) Centrifugal

(c) Axial flow (d) Fan

UKPSC AE-2013, Paper-II

Ans. (c) : Axial flow compressors has highest capacity.

934. Surging can be reduced by :

(a) Increasing the speed of the fan

(b) Reducing the speed of the fan

(c) Employing fixed guide vanes

(d) Reducing the flow rate

TNPSC AE (Industries) 09.06.2013

Ans. (b) :

935. Centrifugal compressor is suitable for :

(a) Low specific speed, high pressure ratio and low mass flow rate

(b) High specific speed

(c) Low pressure ratio

(d) High specific speed

TNPSC AE (Industries) 09.06.2013

Ans. (c) : Centrifugal compressor is suitable for low pressure ratio.

936. In an aircraft gas turbine, the axial flow compressor is preferred because of :

(a) High pressure rise (b) Low frontal area

(c) High thrust (d) High propulsion

JPSC AE, 10.04.2021 Paper-I

APGENCO AE 2012

Search on Telegram @apna_pdf

Ans. (b) : In an aircraft gas turbine, the axial flow compressor is preferred because of low frontal area. In axial compressors the gas flows parallel to the axis of rotation of the rotor, which many rows of aerodynamically shaped blades extending radially outward.

937. The pressure ratio of an ideal vaned compressor with increase in mass flow rate
(a) increases
(b) decreases
(c) remains constant
(d) first decreases and then increases

BPSC AE 2012 Paper - V

Ans. : (c) : The pressure ratio of an ideal vaned compressor with increase in mass flow rate remains constant.

938. In centrifugal blowers/compressors, the ratio of outlet whirl velocity to the blade velocity is known as
(a) work factor (b) slip factor
(c) degree of reaction (d) pressure coefficient

UKPSC AE 2012 Paper–II

Ans. (b) : In centrifugal blowers/compressors, the ratio of outlet whirl velocity to the blade velocity is known as slip factor.

939. When an impeller has backward curved vanes in a centrifugal blower, then with an increase in flow rate, Euler head H
(a) increases (b) decreases
(c) remains constant (d) none of the above

UKPSC AE 2012 Paper–II

Ans. (b) : decreases

940. Performance of an air compressor at high altitudes as compared to that at sea level is
(a) better
(b) inferior
(c) same
(d) depends on type of compressor

UKPSC AE 2012 Paper–II

Ans. (b) : Performance of an air compressor at high altitudes as compared to that at sea level is inferior.

941. Unstable operation of the compressor manifested by a cycle reversal of pressure gradient and flow in the delivery pipe is known as
(a) Knocking (b) Chocking
(c) Surging (d) none of these

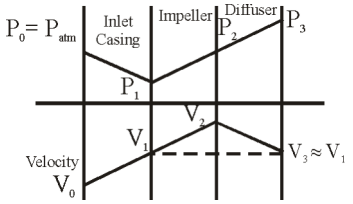
TNPSC ACF 2012

Ans. (c) : Surging- It is phenomenon which is caused due to unsteady periodic and reversal of flow through the compressor when compressor has to operated at less mass flow rate than a predetermined value.

942. In the diffuser of centrifugal compressor, the air is
(a) accelerated with a rise in static pressure
(b) accelerated with a decrease in static pressure
(c) decelerated with a decrease in static pressure
(d) decelerated with a rise in static pressure

TNPSC ACF 2012

Ans. (d)



In the diffusion of centrifugal compressor, the air is decelerated with a rise in static pressure.

943. The capacity of a compressor is specified as 50 cubic metre per minute. It implies that
(a) It is capable of supplying 50 cu. m of compressed air per min
(b) Compressor is capable of compressing 50 cu. m of free air per min
(c) Compressor has storage tank capable of storing 50 cu. m of air
(d) One kg of compressed air as delivered by the compressor would expand to 50 cu.m under NTP conditions

APPSC AEE 2012

Ans. (b) : The capacity of a compressor is specified as 50 Cubic meter/minute, it implies that compressor is capable of compressing 50 Cu. m of free air per min.

944. Degree of reaction of an axial flow compressor is defined as the ratio of
(a) static enthalpy rise in the rotor to that in the whole stage
(b) static enthalpy rise in the whole stage to that in the rotor
(c) static enthalpy decrease in the rotor to that in the whole stage
(d) static enthalpy decrease in the whole stage to that in the rotor.

TNPSC ACF 2012

Ans. (a) : Degree of reaction of an axial flow compressor defined as the ratio of static enthalpy rise in the rotor to that in the whole stage.

$$R_D = \frac{(\Delta h)_{MB}}{(\Delta h)_{stage}} = \frac{(\Delta h)_{MB}}{(\Delta h)_{MB} + (\Delta h)_{FB}}$$

[MB = Moving Blade, FB = Fixed Blade]

945. Which is not true in case of Multi-stage compression ?
(a) Improves overall volumetric efficiency
(b) Reduce total driving power
(c) Requires a big flywheel
(d) Reduces leakage losses

OPSC Civil Services Pre. 2011

Ans. (c) :
- In multistage compression due to low pressure ratio, the volumetric efficiency improves.
- Inter cooling between stages reduces work consumption. since compression is in multi stages, the torque fluctuations will be small i.e. uniform torque. So, small flywheel required.

Search on Telegram @apna_pdf

946. How is the air compressed in a double acting compressor?
(a) In one cylinder
(b) In two cylinders
(c) In a single cylinder on both sides of the piston
(d) In two cylinders on both sides of the piston

VIZAG STEEL MT 2011

Ans. (c) : Air compressed in a single cylinder on both side of piston is called double acting compressor.

947. In a centrifugal compressor the stagnation temperature across the impeller
(a) increases
(b) decreases
(c) does not show a monotonic trend
(d) remains constant

DRDO Scientists 2008

Ans. (a) : In a centrifugal compressor the stagnation temperature across the impeller increases.

948. The performance of reciprocating compressor is compared on the basis of efficiency
(a) volumetric (b) mechanical
(c) overall (d) Isothermal

UKPSC AE 2007 Paper -II

Ans. (d) : Isothermal

949. In a centrifugal compressor the pressure developed depends on
(a) Impeller tip velocity (b) Inlet temperature
(c) Compression index (d) All of the above

UKPSC AE 2007 Paper -II

Ans. (d) : All of the above

950. While measuring the volume flow rate of air in a compressor a drum is added to the system. The objective is :
(a) to increase pressure
(b) to increase mass flow
(c) to increase swept volume
(d) to reduce fluctuations

J & K PSC Screening, 2006

Ans. (d) :

951. The suction pipe diameter of refrigerating unit compressor in comparison to delivery pipe diameter is
(a) larger
(b) smaller
(c) equal
(d) dependant on capacity

J & K PSC Screening, 2006

Ans. (a) : The suction pipe diameter of refrigerating unit compressor in comparison to delivery pipe diameter is larger because during suction refrigerant in form of vapour but during delivery it is in liquid phase.

952. The capacity of a compressor is $5m^3$/ min refers to:
(a) Standard air
(b) Free air delivery
(c) Compressed air
(d) Compressed air at delivery pressure

J & K PSC Screening, 2006

Ans. (b) : The capacity of a compressor is 5m/min refers to free air delivery.

953. In refrigeration, reciprocating compressors are very suitable for
(a) Small displacement and low condensing pressure
(b) Small displacement and high condensing pressure
(c) Large displacement and low condensing pressure
(d) Large displacement and high condensing pressure

OPSC Civil Services Pre 2006

Ans. (b) : Reciprocating compressor are used for high pressure ratio and low discharge (or displacement)

954. If n is the index of compression, then the work done in compressing air is proportional to
(a) n (b) n^2
(c) $\left(\frac{n}{n-1}\right)$ (d) $\left(\frac{n-1}{n}\right)$

OPSC Civil Services Pre 2006

Ans. (c) : Work done during polytropic compression

$$W = \frac{n}{n-1}\left(P_1V_1 - P_2V_2\right)$$

$$W \propto \frac{n}{n-1}$$

8. Nuclear Power Plant

955. The function of a moderator in a nuclear reactor is to
(a) slow down the fast moving electrons
(b) speed up the slow moving electrons
(c) start the chain reaction
(d) transfer heat produced inside the reactor to a heat exchanger

RPSC IOF, 2020, RPSC AE 2016
TNPSC AE 2014
TNPSC AE (Industries) 09.06.2013
TNPSC ACF 2012, RPSC ACF-2011
CSE Pre-2003, 2001

Ans. : (a) The function of a moderator in a nuclear reactor is to slow down the fast moving electrons.
Moderator:- A moderator is a material introduced into the fuel mass in order to slow down the speed of fast moving electrons. the slowing down of fast neutrons is desirable because slow moving electrons are more effective than fast neutrons in triggering fission. A moderator, apart from its high neutron slowing power and low non-productive neutron, should be
(i) Stable under nuclear radiation
(ii) Corrosion resistant
(iii) Good thermal conductor
(iv) Available in adequate

Search on Telegram @apna_pdf

956. In a pressurized water reactor

(a) coolant water is pressurized to work as moderator
(b) coolant water boils in the core of the reactor
(c) coolant water is pressurized to prevent boiling of water in the core
(d) no moderator is used

Nagaland PSC (CTSE) 2016, Paper-II
RPSC AE 2016
TNPSC AE 2014
RPSC ACF-2011
APPSC IOF, 2009

Ans. (a) : The pressurized water reactor (PWR) is a type of nuclear reactor used to the generate electricity and propel nuclear submarines and novel vessels. They make used of light water (Ordinary as opposed to heavy water) as their coolant and neutron moderator. Nuclear fission produces heat inside the reactor.

957. The most commonly used moderator in nuclear power plants is

(a) heavy water (b) graphite
(c) steel (d) concrete and bricks

GPSC DEE Class-2 (GWSSB) 04.07.2021
Assam PSC AE (PHED), 18.10.2020
GPSC Executive Engineer 23.12.2018
ESE 2000

Ans. (a) : The most commonly used moderator in nuclear power plants is heavy water.

958. The combination of fuel and moderator for CANDU reactor is:

(a) Enriched Uranium, Hard water
(b) Natural Uranium, Hard water
(c) Enriched Uranium, Water
(d) Natural Uranium, Water

OPSC AEE 2019 PAPER - II
RPSC AE 2016, RPSC ACF-2011
CSE Pre-2004

Ans. : (b) : The combination of fuel and moderator for CANDU reactor is natural uranium and hard water.

959. In a nuclear reactor the function of a reflector is to:

(a) reduce the speed of the neutrons
(b) stop the chain reaction
(c) reflect the escaping neutrons back into the core
(d) all of the above

RPSC AE 2016
UKPSC AE-2013, Paper-II
RPSC ACF-2011

Ans. (c) : A reflector is a region of unfudded material surrounding the core. It function is to scatter neutrons that leak from the core, thereby returning some of them back into the core. This design feature allows for a smaller core size. In addition, reflectors "smooth out" the power density by utilizing neutrons that would otherwise leak out through fissioning within fuel material located near the core's outer region.

960. Which material is the most commonly used moderator?

(a) Graphite (b) Sodium
(c) Deuterium (d) any of the above

RPSC AE 2016, RPSC ACF-2011
TNPSC AE, 2008

Ans. (a) : Moderator is used to slow down the fast moving neutrons. Most commonly used moderator, are graphite and heavy water (D_2O). Water cannot be used as moderator in a nuclear reactor.

961. A boiling water reactor uses which of the following as fuel?

(a) Enriched uranium (b) Plutonium
(c) U^{234} (d) U^{235}

BPSC AE Mains 2017 Paper - V
TNPSC AE 2013
BPSC AE 2012 Paper - V

Ans. : (a) : Boiling water reactors must use enriched uranium as their nuclear fuel, due to their use of light water. This is because light water absorbs too many neutrons to be used with natural uranium, so the fuel content of fissile uranium 235 must be increased.

962. The first nuclear power plant in India is located at

(a) Kota (b) Kalapakkam
(c) Tarapur (d) Bareilly

TNCSC AE 2020
GWSSB AAE, 27.12.2015
BPSC AE 2012 Paper - V

Ans. : (c) : The first nuclear power plant in India is located at Tarapur (Maharashtra)

963. If k is the ratio of the rate of production of neutrons to the rate of loss of neutrons, the reactor is called a critical reactor when -

(a) $k = 1$ (b) $0 < k < 1$
(c) $k = 0$ (d) $k > 1$

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
BPSC AE Mains 2017 Paper - V
CSE Pre-2003

Ans. (a) : The multiplication factor is

$$k = \frac{\text{Rate of production of neutrons}}{\text{Rate of loss of neutrons}}$$

If $k = 1 \rightarrow$ Critical reactor
$k > 1 \rightarrow$ Explosion occurs
$k < 1 \rightarrow$ The chain reaction comes to half

964. The function of control rods in nuclear power plant is to:

(a) Control absorption of neutrons
(b) Control temperature
(c) Control the fuel consumption
(d) None of the above.

ISRO Scientist/Engineer (RAC) 22.04.2018
RPSC AE GWD, 2011

Ans. (a) : Control rods are used in nuclear reactors to control the fission rate of uranium and plutonium. They are composed of chemical elements such as boron, silver, indium and cadmium that are capable of absorbing neutrons without themselves fissioning.

Search on Telegram @apna_pdf

965. The function of a moderator is to

(a) Absorb the part of the Kinetic energy of the neutrons
(b) Extract the heat
(c) Reflect back some of the neutrons
(d) Start the reactor

Nagaland PSC (CTSE) 2017, 2016 Paper-II
RPSC AE GWD, 2011

Ans. (a) : Function of moderator is used to slow down the neutrons by absorbing some of the kinetic energy of neutrons by direct collision, which result the increasing the chances of fission.

966. Enriched uranium is required as a fuel in a nuclear reactor, if light water is used as a coolant and a moderator, because light water has :

(a) high neutron absorption cross-section.
(b) low moderating efficiency
(c) low neutron absorption cross -section
(d) high neutron scatter cross-section.

RPSC ACF & FRO, 26.02.2021
ESE 1994

Ans. (b) : Enriched uranium is required as a fuel in a nuclear reactor, if light water is used as moderator and coolant, because light water has low moderating efficiency.

967. The energy released during the fission of one atom of uranium-235 in million electron volt is about

(a) 100 (b) 200
(c) 300 (d) 400

Assam PSC AE (PHED), 18.10.2020
ESE 1999, 1995, 1993

Ans. (b) : The total energy released in fission of an atomic nucleus varies with the precise break up, but average about 200 million electron volt.
For U-235 or 3.2×10^{-11} joule. This is about 82 TJ/kg that from U-233 is about the same, and that from P_u -239 is about 210 million electron volt per fission.

968. Fast breeder reactions use

(a) water as moderator
(b) carbon dioxide as moderator
(c) graphite as moderator
(d) no moderator

TNPSC AE, 2008, CSE Pre-2002

Ans. (d) : No moderator is used in the breeder reactor since fast neutrons are more efficient in transmitting U-238 to PU-239. At this concentration of U-235, the cross-section for fission with fast neutrons is sufficient to sustain the chain reaction. Using water as coolant would slow down the neutrons, but the use of liquid sodium avoids that moderation and provides a very efficient heat transfer medium.

969. Assertion (A) : Pressurised water reactor (PWR) nuclear power plant use superheated steam.
Reason (R) : An increase in superheat at constant pressure increases the cycle efficiency.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is NOT the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

Punjab PSC (Lect.) 06.08.2017
CSE Pre-2001

Ans. (a) : Both (A) and (R) are true and (R) is the correct explanation of (A).

970. Which one of the following pairs of materials is used as moderators in nuclear reactors?

(a) Cadmium and heavy water
(b) Heavy water and zirconium
(c) Zirconium and beryllium
(d) Beryllium and heavy water
(e) Cadmium and beryllium

CGPSC AE 26.04.2015 Shift-II
CSE Pre-1995

Ans. (d) : Beryllium and heavy water, pairs of materials is used as moderators in nuclear reactors.

971. Shielding in a nuclear reactor is generally done to protect against

(a) excess electrons
(b) X-rays
(c) α and β rays
(d) neutron and gamma rays

BPSC AE Mains 2017 Paper - V
CSE Pre-2000

Ans. : (d) : The shielding of charged particle radiation is therefore much less severe problem and shielding is done to protect against highly energetic neutron and gamma rays.

972. In nuclear reactors, control rod is made of

(a) lead and tin
(b) boron and cadmium
(c) graphic
(d) zinc

TNPSC AE (Industries) 09.06.2013
TNPSC AE, 2008

Ans. (b) : Control rods are used in nuclear reactors to control the fission rate of Uranium and Plutonium. They are composed of chemical elements such as Boron, Cadmium, silver and Indium that are capable of absorbing many neutrons without themselves fissioning.

973. Fast breeder reactors are best suited for India because of :

(a) large thorium deposits
(b) large uranium deposits
(c) large plutonium deposits
(d) all of the above

RPSC AE 2016, RPSC ACF-2011

Search on Telegram @apna_pdf

Ans. (a) : Fast breeder reactors are most suitable in India, because of largest thorium deposits.

974. Thermal shielding is provided to :
(a) protect the walls of the reactor from radiation damage
(b) prevent melt down of the core of the reactor
(c) protect the operating personnel from exposure to radiation
(d) all of the above

RPSC AE 2016, RPSC ACF-2011

Ans. (d) : Thermal shielding is provided to –
(i) Protect the walls of the reaction from radiation damage.
(ii) Prevent melt down of the case of the reactor.
(iii) Protect the operating personnel from exposure to radiations.

975. Fission chain reaction is possible when :
(a) fission produces the same number of neutrons which are absorbed
(b) fission produces more electrons than are absorbed
(c) fission produces less electrons than are absorbed
(d) none of the above

RPSC AE 2016, RPSC ACF-2011

Ans. (b) : In nuclear fission, an unstable atoms splits into two or more smaller pieces that are more stable and releases energy in the process, the fission process also releases extra neutrons, which can then split additional atoms resulting in a chain reaction that releases a lot of energy.

976. The conversion ratio of a breeder reactor is :
(a) equal to unity (b) more than unity
(c) less than unity (d) none of the above

RPSC AE 2016, RPSC ACF-2011

Ans. (b) : In a breeder reactor the conversion ratio is higher than 1. Break-even is achieved when the conversion ratio reaches 1.0 and the reactor produces as much fissile material as it uses.

977. Which is not a preferable property of coolant used in nuclear reactor?
(a) Must have low boiling point
(b) Must have low melting point
(c) Must not absorb neutrons
(d) Must be non-oxidising

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Ans. (a) : Nuclear reactor have certain specific requirements of coolant–
(1) High specific heat thermal conductivity and low viscosity.
(2) Low corrosive and errosive effects on all the reactor materials.
(3) High boiling and low melting point.
(4) High thermal and radiation resistance.
(5) Low neutron absorption & low neutron activation.

978. When the control rods are inserted into the reactor, K (Multiplication factor) becomes
(a) 0 (b) >1
(c) 1 (d) <1

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (d) : When the control rods are inserted into the reactor i.e. neutron production is less than losses due to obsorbtion and leakage, then the reactor is subcritical and the multiplication factor becomes less than 1.

979. The function of coolant is to
(a) Extract heat from reactor
(b) Slow down neutrons
(c) Control the reaction
(d) Reflect the neutrons

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (a) : The function of coolant is to extract heat from reactor and provide system at stable temperature.

980. Reactors designed for propulsion applications uses.
(a) Natural uranium (b) Any uranium
(c) Pure uranium (d) Enriched uranium

RPSC ACF & FRO, 26.02.2021

Ans. (d) : Reactors designed for propulsion applications are designed for enriched uranium.

981. The correct sequence for radioactive isotopes in decreasing half life time :
(a) U^{239} Pu^{239} U^{233} (b) U^{233} Pu^{239} U^{233}
(c) U^{239} Pu^{233} U^{239} (d) U^{233} Pu^{239} U^{239}

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : $U^{233} > Pu^{239} > U^{239}$

982. The correct combination for moderator and reactor are :

(1) Graphite		(I) Pressurised water
(2) Water		(II) Liquid metal cooled
(3) No moderator		(III) Breeder

	(1)	(2)	(3)
(a)	III	II	I
(b)	I	II	III
(c)	II	III	I
(d)	II	I	III

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : Graphite → Liquid metal cooled
Water → Pressurized water
No moderator → Breeder

983. Boiling water reactor and pressurized water reactor are
(a) nuclear reactors (b) solar reactors
(c) OTEC (d) biogas reactors

Assam PSC AE (IWT) 14.03.2021

Ans. (a) : Boiling water reactor and pressurized water reactor are nuclear reactors. A boiling water reactor is a type of light water nuclear reactor used for the generation of electric power. The main difference between a BWR and PWR is that in a BWR, the reactor core heats water. Which turns to steam and then drives a steam turbine. In a PWR the reactor core heats water, which does not boil.

Search on Telegram @apna_pdf

984. With reference to nuclear fuels, U-238 has a _____ half life than U-235.

(a) longer
(b) same
(c) shorter
(d) incorrect equation, one is non-radioactive

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) :
Half life of U- 235 = 700 million years = 7×10^8 years
Half life of U- 238 = 4.46×10^9 years

985. The rate of nuclear fission reaction is varied by changing

(a) Coolant temperature
(b) Control rod position
(c) Amount of fuel
(d) Pressure relief valve setting

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : The rate of nuclear fission reaction is varied by changing control rod position.

986. A moderator, in nuclear power plants, is a medium introduced into the fuel mass in order to-

(a) Slow down the speed of fast moving neutrons
(b) Control the reaction
(c) Reduce the temperature
(d) Extract heat from nuclear reaction

MECON MT 2020

Ans. (a) : A moderator, in nuclear power plants, is a medium introduced into the fuel mass in order to slow down the speed of fast moving neutrons.

987. The nuclear radiators shielded are

(a) Electrons
(b) α, β and γ rays
(c) Neutrons and gamma rays
(d) Protons decay

TNCSC AE 2020

Ans. (c) : The nuclear radiators produced in a reactor which must be shielded are neutron and gamma rays. Depleted uranium is used for shielding of a reactor care can be provided by materials of reactor pressure vessel, reactor internals (neutron reflector).

988. U_{233} is produced

(a) artificially
(b) as basic raw material
(c) when thorium is irradiated by neutrons
(d) by fission of U_{238}

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Uranium-233 is produced by the neutron irradiation of thorium-232. When thorium-232 absorbs a neutron. It becomes thorium-233, which as a half-life of only 22 minutes. Thorium-233 decays into protactinium-233 through beta decay.

989. A nuclear reaction is said to be critical when the neutron population in the reactor core is

(a) rapidly increasing leading to the point of explosion
(b) decreasing from the specified value
(c) reduced to zero
(d) constant

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Criticality means that a reactor is controlling a sufficient number of neutrons to maintain an ongoing series of reactions this is the normal state of nuclear power generation.

990. Reactors for propulsion applications are designed for

(a) any form of uranium (b) natural uranium
(c) enriched uranium (d) plutonium

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Reactors for propulsion applications are designed for enriched uranium.

991. Enriched uranium may contain fissioinable contents from

(a) 1 to 40% (b) 10 to 50%
(c) 1 to 80% (d) 1 to 99%

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Natural uranium is 99.284% U^{238} isotope with U^{235} only constituting about 0.711% of its mass. U^{235} is the only nuclide existing in nature that is fissile with thermal neutrons.

992. The main function of shielding in nuclear reactor is provide protection against:

(a) α-rays (b) β-rays
(c) γ-rays (d) None of these

PTCUL AE 25.06.2017

Ans. (c) : Shielding in nuclear reactor is provided to protect against all the harmful radiation but the highly penetrating neutrons and gamma rays are majorly focused.

993. A nuclear fission produces energy

(a) 20 Mev (b) 200 MeV
(c) 2000 MeV (d) 20,000 MeV

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : One fission event results in the release of about 200 MeV of energy.

994. The efficiency of a nuclear power plant in comparison to a conventional thermal power plant is

(a) Same (b) More
(c) Less
(d) May be less or more depending on size

Nagaland PSC CTSE 2017 Paper-2

Ans. (c) : The efficiency of nuclear power plant in comparison to conventional thermal power plant is less.
Typically :- Nuclear power plant efficiency– 33-37%
conventional thermal power plant (fossil fueled power plant) efficiency– 45%

Search on Telegram @apna_pdf

995. In nuclear plants, MOX fuels are

(a) Blend of plutonium and natural or depleted uranium
(b) Blend of carbon and depleted uranium
(c) Blend of metal fuels and natural uranium
(d) Blend of natural uranium and uranium carbide

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : In nuclear Plant, MOX (mixed oxide fuel), commonly that contain more than one oxide of material consisting of plutonium blended with natural uranium, reprocessed uranium, or depleted uranium.

996. Gas cooled reactors use the following materials as moderator and coolant respectively :

(a) Heavy water and CO_2
(b) Graphite and air
(c) Graphite and hydrogen
(d) Graphite and CO_2

Karnataka PSC AE, 10.09.2017

Ans. (d) : Gas cooled reactors use the following materials as moderator and coolant respectively graphite and CO_2.

997. Thorium breeder reactors are more promising for India essentially because

(a) They develop more power
(b) The technology there of is simple
(c) Thorium deposit are abundantly available in the country
(d) These can be easily designed

UPSC JWM 2017

Ans. (c) : Thorium deposit are abundantly available in India that's why thorium breeder reactors are more promising for India.

998. The presence of reflector in nuclear power plant results in

(a) Increase production of neutrons
(b) Controlled production of neutrons
(c) Decreases leakages of neutrons
(d) Decreases the speed of neutrons

RPSC VPITI 14.02.2016

Ans. (c) : Reflector, which is medium of flow neutron absorption and high neutrons scattering cross actions.
Some of the neutrons leaking out of the core are scattered back into it by reflector nuclei. This reduces the neutron leakage.

999. How many stable isotopes does uranium has?

(a) Two (b) Eight
(c) Twenty six (d) None of these

KPCL AE 2016

Ans. (d) : Uranium ($_{92}U$) is naturally occurring radioactive element that has no stable isotope. It has three primordial isotopes, uranium- 238, uranium- 235 and uranium-234 that have long half-life and are found in appreciable quantity in the earth curst. The decay product uranium- 234 is also found.

1000. Which of the following elements are used in control rods that are used in nuclear reactors to control the fission rate?

(a) Cadmium (b) Boron
(c) Indium (d) All the above

KPCL AE 2016

Ans. (d) : Control rods are used in nuclear reactors to control the fission rate of uranium or plutonium. Their compositions includes chemical elements such as boron, cadmium, silver or indium, that are capable of absorbing many neutrons without themselves fissioning.

1001. Which of the following is not used as moderator

(a) Water (b) Heavy water
(c) Graphite (d) Boron

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : Moderator used in nuclear reactors–
(1) Light water (H_2O)
(2) Heavy water (D_2O)
(3) Graphite (C)

- Boron is a primary neutron absorber used in construction of control rods in the core of a nuclear reactor. The control rods includes chemical elements such as boron, cadmium, silver, hafnium or indium.

1002. The reactor performs the following function as that of ..... in a steam power plant.

(a) Furnace (b) Turbine
(c) Electric generator (d) Boiler

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : The reactor produces and controls the release of energy from splitting the atoms of certain elements, the energy released is used as heat to make steam to generate electricity, like the furnace in a steam power plant.

1003. Which of the followings is not the desirable feature of moderator in nuclear reactor?

(a) It has low thermal conductivity
(b) It slows down the neutron
(c) It is non corrosive
(d) It has good chemical stability

RPSC LECTURER 16.01.2016

Ans. (a) : Modertor—The moderator, which is of importance in thermal reactors, is used to moderate, that is, to slow down, neutron from fission to thermal energies.

Key properties of moderator—

- High melting and boiling point
- High specific heat capacity
- Low viscosity
- Low corrosive
- Cheap
- Good chemical stability

1004. Which of the following is not the component of nuclear power plant

(a) Steam generator (b) Steam turbine
(c) Nuclear reactor (d) Penstock

RPSC LECTURER 16.01.2016

Search on Telegram @apna_pdf

Ans. (d) : Steam generator, steam turbine, nuclear reactor are the components of nuclear power plant whereas penstock is the main part of hydro-electric-power plant.

1005. Which process is responsible for production of energy in the Sun

(a) Nuclear fission reaction
(b) Nuclear fusion reaction
(c) Exothermal chemical reaction
(d) All of the above

UPPSC AE 12.04.2016 Paper-II

Ans. : (b) Nuclear fusion reaction is responsible for production of energy in the sun.
Nuclear fusion : In Nuclear physics, Nuclear fusion is a reaction in which two or more atomic nuclei come close enough to form one or more different atomic nuclei and subatomic particles (neutrons and/or protons). The difference in mass between the products and reactions is manifested as the release of large amounts of energy. This difference in mass arises due to the difference in atomic "binding energy' between the atomic nuclei before and after the reaction. Fusion in the process that powers active or "main sequence" starts, or other high magnitude starts.

1006. The working fluid used in an MHD system coupled to a fast breeder reactor is

(a) Hot flue gases (b) Seeded inert gas
(c) Liquid metal inert gas (d) Liquid metal only

UPPSC AE 12.04.2016 Paper-II

Ans. : (d) The working fluid used in an MHD system coupled to a fast breeder reactor is liquid metal only.

1007. Which impurity in water requires critical attention on very high pressure boilers

(a) Hydrogen (b) Ammonia
(c) Silica (d) Dissolved salts

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : Silica in high-pressure water voltilizers and pressure over with steam to the turbine as the steam expands and drops in pressure and temperature the silica condenses and deposits on the turbine blade, cutting the machine efficiency.

1008. If B is magnetic field strength, the theoretical power output of MHD generator is proportional to:-

(a) B (b) B^2 (c) B^3 (d) $\sqrt{B}$

UKPSC AE-2013, Paper-II

Ans. (b) :

1009. The gas which is used as a coolant in a nuclear power plant is:-

(a) Freon (b) Ammonia
(c) Helium (d) Chlorine

UKPSC AE-2013, Paper-II

Ans. (c) : Helium is used as a coolant in a nuclear power plant.

1010. From the view point of moderating ratio only, which of the following is best moderator?

(a) Ordinary water (b) Carbon
(c) Heavy water (d) Beryllium

RPSC AEN Pre-2013

Ans. (c) : Heavy water (D_2O) is best moderator in nuclear power plant.

1011. Which of the following statements is not correct about MHD power generation ?

(a) Lesser thermal pollution
(b) No moving parts
(c) High operation efficiency
(d) No direct conversion of heat into electrical energy

UKPSC AE 2012 Paper–II

Ans. (d) : No direct conversion of heat into electrical energy

1012. The controls rods in the control system of nuclear reactors are used to

(a) absorb excess neutrons
(b) control fuel consumption
(c) control temperature
(d) none of these

TNPSC ACF 2012

Ans. (a) : Cadmium rod is used as an absorbing material to control the reaction rate of neutron.

1013. Spent fuel from the nuclear thermal reactor contains

(a) plutonium (b) unused fuel
(c) fission products (d) All of the above

APPSC AEE 2012

Ans. (d) : Spent fuel from the nuclear reactor contains-
- Plutonium
- Unused fuel
- Fission products

1014. Breeder reactor employs liquid-metal coolant, because it

(a) acts as good moderator
(b) produces maximum steam
(c) transfer heat from core at a fast rate
(d) increases rate of reaction in core

BPSC AE 2012 Paper - V

Ans. : (c) : Breeder reactors employ liquid metal coolant because it transfer heat from core at a fast rate. It has a large specific heat so that it is an efficient heat transfer fluid. In practice those reactors which have used liquid metal coolants have been fast-neutron reactors.

1015. Solid fuel for nuclear reactions may be fabricated into various small shapes, such as

(a) plates (b) pallets
(c) pins (d) any one of the above

BPSC AE 2012 Paper - V

Ans. : (d) : Solid fuel for nuclear reactions may be fabricated into various small shapes, such as plates, pallets and pins.

1016. The coolant used in boiling water reactor is

(a) CO_2
(b) Pressurised water
(c) mixture of water and steam
(d) liquid metal

BPSC AE 2012 Paper - V

Search on Telegram @apna_pdf

Ans. : (c) : A boiling water reactor (BWR) used demineralized water as a coolant and neutron moderator. Heat is produced by nuclear fission in the reactor core and this causes the cooling water to boil, producing steam.

1017. What type of energy is derive from Ocean ground water?

(a) Solar energy (b) Geo-thermal energy

(c) Nuclear energy (d) OTEC

RPSC AE GWD, 2011

Ans. (d) : OTEC (Ocean thermal energy conversion) is derived from ocean ground water.

1018. Isotope that can be fissioned by neutrons of all energies is :

(a) Pu – 239 (b) Pu – 240

(c) U – 238 (d) Th –238

OPSC Civil Services Pre. 2011

Ans. (a) : Pu - 239, isotope can be fissioned by neutrons of all energies.

1019. The false statement is :

(a) Alpha particles are helium nuclei

(b) Beta decay is accompanied by emission of neutrino and gamma radiation

(c) Neutron is converted into a proton in a positive beta decay

(d) Gamma ray is emitted from the nucleus while X–ray is emitted from the atom

OPSC Civil Services Pre. 2011

Ans. (c) : Neutron is converted into a proton in a positive beta decay.

1020. Graphite is used as a moderator in :

(a) Boiling water reactor

(b) Pressurized water reactor

(c) Light water reactor

(d) Gas cooled reactor

OPSC Civil Services Pre. 2011

Ans. (d) : Graphite is used as a moderator in gas cooled reactor.

1021. Operating charges for same power output are minimum for :

(a) gas turbine plant (b) hydroelectric plant

(c) thermal plant (d) nuclear plant

RPSC ACF-2011

Ans. (b) : Hydroelectric power plant has lowest running cost because it does not needs any fuel and can be operated by few number of persons. Nuclear plant and thermal power plant requires fuels also the handling cost of fuels is added with total cost.

1022. Heavy water is used in atomic power plants as

(a) Fuel (b) Source of energy

(c) Lubricant (d) Moderator

ISRO Scientist/Engineer 2008

Ans. (d) : Heavy water is used in atomic power plants as moderator.

1023. The size of the reactor is said to be critical when

(a) chain reaction can be initiated

(b) it becomes uncontrollable

(c) it explodes

(d) it produces no power

TNPSC AE, 2008

Ans. (a) : When the atom-splitting reactor of a nuclear power plant is operating normally, it is said to be critical or in a state of critically. Critically means that a reactor is controlling a sustained fission chain reaction, where each fission event release a sufficient number of neutrons to maintain on ongoing series reactions.

1024. The most practical fuel for a thermonuclear reactor, both from economical and nuclear considerations, is

(a) Plutonium (b) Uranium

(c) Deuterium (d) Thorium

TNPSC AE, 2008

Ans. (c) : Most commercial nuclear reactors use normal water (also called light water) as a neutron moderator.

Some reactor designs, such as the CANDU reactor, use heavy water.

A heavy water molecule contains deuterium (Hydrogen-$_1D^2$), which is an isotope of hydrogen that has a neutron in its nucleus in addition to the proton.

1025. Which of the following is the primary fuel in nuclear power?

(a) U^{233} (b) U^{238}

(c) U^{235} (d) Pu^{239}

UKPSC AE 2007 Paper -II

Ans. (c) : The primary fuel used in nuclear power plants Uranium (U_{235}).

* Isotopes of uranium are U_{234}, U_{235} and U_{238} etc.

* The secondary fuel used in nuclear power plants is U_{235} and plutonium (Pu_{239}.).

1026. In MHD power generation system, the electrical conductivity of air is increased by

(a) Heating it to very high temperatures

(b) Seeding

(c) Both (a) and (b)

(d) None of these measures

UKPSC AE 2007 Paper -II

Ans. (c) : Both (a) and (b)

1027. A reactor that produces more fissionable material than it consumes is called

(a) breeder reactor (b) fast breeder reactor

(c) water cooled reactor (d) nuclear reactor

OPSC Civil Services Pre 2006

Ans. (b) : If the reactor is configurated to produce more fissionable material (Plutonium) than it consumes is called Fast Breeder Reactor (FBR).

03.

Refrigeration and Air-Conditioning

1. Introduction to Refrigerating machine

1. Consider a refrigerator and a heat pump working on the reversed carnot cycle between the same temperature limits. Then:

(a) COP of Heat Pump=COP of Refrigerator
(b) COP of Heat Pump=COP of Refrigerator–1
(c) COP of Heat Pump=COP of Refrigerator+1
(d) COP of Heat Pump= 1/(COP of Refrigerator)

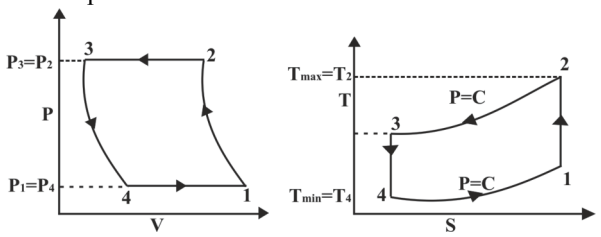
GPSC Lect. 23.10.2016
UKPSC AE-2013, Paper-II
OPSC Civil Services Pre. 2011, TNPSC AE, 2008

Ans. (c) : Bell-Coleman Cycle—The Bell-Coleman cycle (also called as the Joule or "reverse" Brayton cycle) is a refrigeration cycle where the working fluid is a gas that is compressed and expanded, but does not change phase. Air is most often this working fluid. As there is no condensation and evaporation intended in this gas cycle, components corresponding to the condenser and evaporator in a vapour compression cycle are the hot and cold gas-to-gas heat exchangers.

This cycle may be thought of as a modification of reversed Carnot cycle, as the two isothermal processes of Carnot cycle are replaced by two isobaric heat transfer processes.



Process 1-2: Isentropic Compression

The air drawn from the refrigerator to air compressor cylinder where it compressed isentropically (constant entropy). No heat transfer by the air. During compression, the volume decreases while the pressure and temperature of air increases.

Process 2-3: Constant pressure heat rejection

The warm compressed air is then passed through cooler, where it cooled down at constant pressure. The heat rejected per kg of air during this process is equal to: $Q_{(2-3)} = C_p (T_2 - T_3)$

Search on Telegram @apna_pdf

Process 3-4: Isentropic expansion
No heat transfer takes place. The air expands isentropically in expander cylinder. During expansion, the volume increases, Pressure P_3 reduces to P_4. Temperature also falls during expansion from T_3 to T_4.

Process 4-1: Constant pressure heat addition
Heat transfer from the refrigerator to air. The temperature increases from T_4 to T_1. Volume increases to V_1 due to heat transfer. Heat absorbed by air per kg during this process is equal to: $Q_{(4\text{-}1)} = C_p (T_1\text{-}T_4)$

3. One ton of refrigeration corresponds to :

(a) 210 kJ/min (b) 210 kJ/h
(c) 335 kJ/min (d) 335 kJ/h

Ans. (c) : A house refrigerator with its door open is switched on in a closed room, the temperature of the room increases.

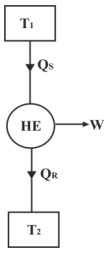
9. Efficiency of Carnot engine is given as 80%. If the cycle direction is reversed, what will be the value of COP of reversed Carnot cycle

(a) 1.25 (b) 0.5

(c) 0.25 (d) none of the above

RPSC IOF, 2020
ISRO Scientist/Engineer (RAC) 22.04.2018
ISRO Scientist/Engineer (RAC) 29.11.2015
ISRO Scientist/Engineer 12.05.2013
SJVN ET 2013

Ans. (c) :



$$\eta_{\text{carnot}} = 0.8 = 1 - \frac{T_2}{T_1}$$

or $\frac{T_2}{T_1} = 0.2, \frac{T_1}{T_2} = 5$

$$(COP)_{\text{carnot}} = \frac{T_2}{T_1 - T_2}$$

$$\therefore \quad (COP)_{\text{carnot}} = \frac{1}{\frac{T_1}{T_2} - 1} = \frac{1}{4} = 0.25$$

10. If a Carnot cycle has coefficient of performance 4, the ratio of maximum temperature to minimum temperature will be

(a) 0.25 (b) 1.25

(c) 5 (d) 3

HPPSC AE 2018
UKPSC AE-2013, Paper-II
CSE Pre-2003, APPSC AEE 2012
ESE 1999

Ans. (b) : We know that

$$[COP]_{\text{carnot cycle}} = \frac{T_L}{T_H - T_L}$$

$$\frac{T_L}{T_H - T_L} = 4$$

$$\frac{1}{\left[\frac{T_H}{T_L}\right] - 1} = 4$$

$$\frac{T_H}{T_L} - 1 = \frac{1}{4} = 0.25$$

$$\left[\frac{T_H}{T_L}\right] = 1.25$$

11. In an ideal refrigeration cycle, the condenser and evaporator temperatures are 27^0C and -13^0C respectively. The COP of cycle is :

(a) 6.5 (b) 7.5

(c) 10.5 (d) 15

OPSC AEE 2015 Paper-II
APPSC Poly Lect. 2013
OPSC Civil Services Pre. 2011
UKPSC AE 2007 Paper-II, ESE 1997

Ans. (a) : Given

$T_1 = 27^0\text{C} = 300$ K

$T_2 = -13^0\text{C} = 260$ K

$$\text{COP} = \frac{T_2}{T_1 - T_2} = \frac{260}{300 - 260} = \frac{260}{40}$$

$\boxed{\text{COP} = 6.5}$

12. While designing the refrigeration system of an aircraft, the prime consideration is that the

(a) system has high C.O.P

(b) H.P./ton is low

(c) weight of refrigerant circulated in the system is low

(d) weight of the refrigeration equipment is low

ISRO Scientist/ Engineer (RAC) 10.03.2019
APGENCO AE, 2017

Search on Telegram @apna_pdf

HPPSC Asstt. Prof. 20.11.2017
Nagaland PSC CTSE 2015 Paper-II, ESE 1993

Ans. (d) : While designing the refrigeration system of an aircraft, the prime consideration is that the weight of the refrigeration equipment is low.

13. A heat pump working on a reversed Carnot cycle has C.O.P. of 5. If it works as a refrigerator taking 1 kW of work input, the refrigerating effect will be

(a) 4 kW (b) 3 kW
(c) 1 kW (d) 2 kW

OPSC AEE 2019 Paper-II, TSPSC AEE 2017
Kerala PSC Poly. Lect. 09.01.2014
UKPSC AE 2007 Paper-II, ESE 1993

Ans. (a) : We know, $COP_{HP} = 1 + COP_R$

$5 = 1 + COP_R$

$COP_R = 4$

$$COP_R = \frac{R.E}{W_{in}}$$

$$4 = \frac{R.E}{1}$$

$$\boxed{R.E = 4\,kW}$$

14. When the lower temperature of refrigerating machine is fixed then the coefficient of performance can be improved by:

(a) Operating the machine at high speed
(b) Operating the machine at low speed
(c) Raising the higher temperature
(d) Lowering the higher temperature

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II
Rajasthan Nagar Nigam AE 2016 Shift-I
ESE 1992

Ans. (d) : $\boxed{(COP)_{RE} = \frac{T_L}{T_H - T_L}}$

If T_L is fixed

$T_H \uparrow$ then $(COP)_{RE} \downarrow$

$T_H \downarrow$ then $(COP)_{RE} \uparrow$

15. Air refrigeration cycle is generally employed in

(a) domestic refrigerator
(b) commercial refrigerator
(c) air-conditioning
(d) gas liquefaction

Assam PSC AE (PHED), 18.10.2020
Nagaland PSC (CTSE) 2018, Paper-II
APPSC Poly Lect. 2013, ESE 2006, 1998

Ans. (d) : The processes are used for industrial and commercial purposes.

Many gases can be put into a liquid state at normal atmospheric pressure by simple cooling.

Gas cycle refrigeration system find applications in air craft cabin cooling and also in the liquefaction of various gases.

16. A refrigerator working on a reversed Carnot cycle has a COP of 4. If it works as a heat pump and consumes 1 kW, the heating effect will be

(a) 1 kW (b) 4 kW
(c) 5 kW (d) 6 kW

UPPSC AE 13.12.2020, Paper-2
Assam PSC CCE Pre 2015
UKPSC AE 2012 Paper-II, ESE 2003

Ans. (c) : Given,

$(COP)_R = 4$

$(COP)_{HP} = 1 + (COP)_R$

$\Rightarrow 1 + 4 = 5$

If $P_{consumed} = 1$ kW

$$(COP)_{HP} = \frac{\text{Heating Effect}}{P_{consumed}} \Rightarrow 5 = \frac{\text{Heating Effect}}{1}$$

$$\boxed{\text{Heating Effect} = 5\,kW}$$

17. Air-refrigerator works on

(a) Carnot cycle (b) Rankine cycle
(c) Brayton cycle cycle (d) Bell-Coleman

CGPSC AE 15.01.2021
Nagaland PSC CTSE 2015 Paper-II
J&K PSC Civil Services Pre, 2013
OPSC Civil Services Pre 2006

Ans. (d) : Air refrigeration works on Bell-Coleman cycle which is also known as reversed Brayton or Joule cycle.

18. In air-conditioning of aeroplanes, using air as a refrigerant, the cycle used is

(a) reversed Carnot cycle
(b) reversed Joule cycle
(c) reversed Brayton cycle
(d) reversed Otto cycle

Nagaland PSC (CTSE) 2018, Paper-II
Nagaland PSC (CTSE) 2017, 2016 Paper-II
TNPSC ACF 2012

Ans. (c) : In air conditioning of aeroplanes using air as a refrigerant, the cycle is reversed Brayton cycle.

19. Which of the following theories is related to the theory of thermocouple?

(a) Piezoelectric effect (b) Skin effect
(c) Seebeck effect (d) Faraday's law

Assam PSC AE (PHED), 18.10.2020
Vadodara Muncipal Corp. DEE, 2018
GPSC Lect. (Auto) 16.10.2016

Ans. (c) : The seebeck effect is when electricity is created between a thermocouple when the ends are subjected to a temperature difference between them.

Piezoelectric effect- Piezoelectricity is the electric charge that accumulates in certain solid materials in response to applied mechanical stress. The word piezoelectricity means electricity resulting from pressure and latent heat.

Search on Telegram @apna_pdf

Skin effect- Skin effect is the tendency of an alternating electric current (AC) to become distributed within a conductor such that the current density is largest near the surface of the conductor and decreases exponentially with greater depths in the conductor.

Faraday's Law- Faraday's law of induction is a basic law of electromagnetism predicting how a magnetic field will interact with an electric circuit to produce an electromotive force.

20. In a one ton capacity water cooler, water enters at 30 °C at the rate of 200 litre/hour. Taking specific heat of water as 4.16 kJ/kg K, the outlet temperature of water will be

(a) 3.5 °C (b) 6.3 °C
(c) 23.7 °C (d) 15 °C

Assam PSC AE (PHED) 18.10.2020
UKPSC AE 2012 Paper–II, ESE 2003

Ans. (d) : Given,

$Q = 1\ \text{Ton} = 3.5\ \text{kW}$

$T_1 = 30°C$

$C_{pw} = 4.16\ \text{kJ/kg K}$

Volume flow rate $\dot{Q} = 200\ \text{litre/hour}$

$$= \frac{200 \times 10^{-3}}{3600}\ m^3/\text{sec}$$

$$\dot{Q} = \frac{1}{18000}\ m^3/\text{sec}$$

$$\therefore \quad \dot{m}_w = \rho A V$$

$$= \rho \dot{Q} \qquad [\because \ \dot{Q} = AV\ ]$$

$$= 1000 \times \frac{1}{18000}\ \text{kg/sec}$$

$$\dot{m}_w = \frac{1}{18}\ \text{kg/sec}$$

$$Q = \dot{m}_w C_{pw} \Delta T$$

$$3.5 = \frac{1}{18} \times 4.16 \times (30 - T_2)$$

$$63 = 124.8 - 4.16T_2$$

$$4.16T_2 = 124.8 - 63$$

$$4.16T_2 = 61.8$$

$$T_2 = \frac{61.8}{4.16} = 14.85$$

$$T_2 \approx 15°C$$

21. The COP of a refrigerator which operates on reversed Carnot cycle whose highest temperature is 27°C and lower temperature is –23°C.

(a) 0.2 (b) 5
(c) 5.75 (d) 6

RPSC IOF & Boiler 20.09.2017
TNPSC AE 2013, TRB Asst. Prof. 2012

$$[COP]_{Ref.} = \frac{T_L}{T_H - T_L}$$

$$= \frac{(-23 + 273)}{[(273 + 27) - (-23 + 273)]}$$

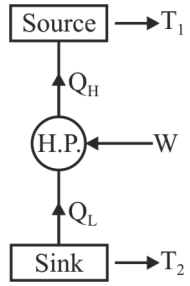
$$= \frac{250}{50} = 5$$

22. If T_1 and T_2 be the highest and lowest absolute temperatures encountered in a heat pump operating on a reversed Carnot cycle, then its COP is equal to

(a) $\frac{T_1 - T_2}{T_1}$ (b) $\frac{T_1 - T_2}{T_2}$
(c) $\frac{T_2}{T_1 - T_2}$ (d) $\frac{T_1}{T_1 - T_2}$

CGPSC AE 15.01.2020
Nagaland PSC CTSE 2015 Paper-II
RPSC AE 2008

Ans. (d) : Given,



$$(COP)_{HP} = \frac{\text{High temperature}}{\text{High temperature} - \text{low temperature}}$$

$$(COP)_{HP} = \frac{T_1}{T_1 - T_2}$$

23. A Carnot refrigerator works between the temperatures of 200 K and 300 K. If the refrigerator receives 1 kW of heat, the work requirement will be

(a) 0.5 kW (b) 0.67 kW
(c) 1.5 kW (d) 3 kW

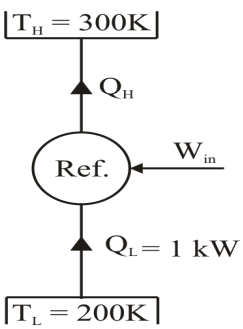
TNPSC 2019
RPSC Vice Principle ITI 2018
CSE Pre-2000

Ans. (a) : For Carnot refrigerator

$$[COP]_{ideal} = [COP]_{actual}$$

$$\frac{T_L}{T_H - T_L} = \frac{Q_L}{W_{in}}$$

$$W_{in} = \frac{1}{\left[\frac{200}{300 - 200}\right]}$$



$$W_{in} = 0.5\text{kW}$$

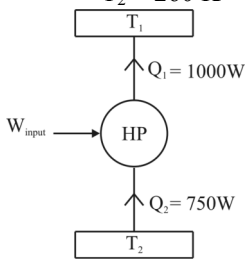
Search on Telegram @apna_pdf

24. An industrial heat pump operates between the temperatures of 27°C and -13°C. The rates of heat addition and heat rejection are 750 W and 1000 W respectively. The COP for the heat pump is

(a) 7.5 (b) 6.5
(c) 4.0 (d) 3.0

Gujarat PSC AE 2019
PSPCL AE, 2012, GATE 2003

Ans. : (c) : Given $Q_1 = 1000$ W
$Q_2 = 750$ W
$T_1 = 300$ K
$T_2 = 260$ K



$$\therefore (COP)_{HP} = \frac{Q_1}{\text{work input}}$$

$$= \frac{1000}{Q_1 - Q_2}$$

$$= \frac{1000}{1000 - 750}$$

$$= \frac{1000}{250}$$

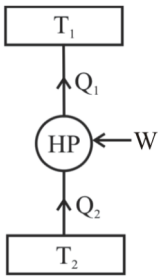
$$\boxed{(COP)_{HP} = 4}$$

25. An ideal refrigerator is operating between a condenser temperature of 37°C and an evaporator temperature of –3°C. If the machine is functioning as a heat pump, its coefficient of performance (COP) will be

(a) 6.0 (b) 6.75
(c) 7.0 (d) 7.75

BPSC AE Mains 2017 Paper - V
UKPSC AE 2012 Paper-I, ESE 2010

Ans. : (d) : Given,
$T_1 = 37°C = 310K$
$T_2 = -3°C = 270K$



$$(COP)_{HP} = \frac{T_1}{T_1 - T_2} = \frac{310}{310 - 270}$$

$$= 7.75$$

26. The relative Coefficient of Performance (COP) is

(a) Actual COP - Theoretical COP
(b) Actual COP /Theoretical COP
(c) Actual COP x Theoretical COP
(d) Theoretical COP/ Actual COP

Nagaland PSC (CTSE) 2018, Paper-II
Rajasthan AE (Nagar Nigam) 2016 Shift-3
NPCIL ET, 2015

Ans. (b) : The ratio of the actual COP to the theoretical COP is known as relative coefficient of performance, mathematically,

$$(COP)_{Relative} = \frac{\text{Actual COP}}{\text{Theoretical COP}}$$

27. One ton of refrigeration is equal to the refrigeration effect corresponding to melting of 1000 kg of ice in

(a) 10 minute (b) 10 hour
(c) 12 hours (d) 24 hours

GPSC Executive Engineer 23.12.2018
Rajasthan Nagar Nigam AE 2016, Shift-I
TRB Asstt. Prof., 2012

Ans. (d) : Unit of Refrigeration (TR)- 1 Ton of refrigeration means the amount of heat that is to be removed from 1 American tonne (2000/bs = 907 kg) of water at 0^0C is order to convert it into ice at 0^0 in 1 day (24 hours).

Therefore ton of refrigeration represents heat transfer rate but not mass.

$$1 \text{ TR} = \frac{907 \times 334}{24 \times 3600} = 3.5 \text{ kW}$$

1 TR = 3.5 kJ/sec
1 TR = 210 kJ/min.
1 TR = 50 k-cal/min. (1 k-cal = 4.18 cal)

Note-1 British tonne = 2220 lbs = 1000 kg)

28. A carnot-refrigerator has a COP of 6. What is the ratio of the lower to the higher absolute temperature?

(a) 1/6 (b) 7/8
(c) 6/7 (d) 1/7

APPSC Poly Lect. 13.03.2020
AAI Jr. Executive 29.11.2018
ESE 2006

Ans. (c) : Given; $(COP)_{Ref} = 6$

$$(COP)_{Ref} = \frac{T_L}{T_H - T_L}$$

$$\frac{T_H - T_L}{T_L} = \frac{1}{(COP)_{Ref}} = \frac{1}{6}$$

$$\frac{T_H}{T_L} - 1 = \frac{1}{6} \Rightarrow \frac{T_H}{T_L} = \frac{7}{6} \Rightarrow \boxed{\frac{T_L}{T_H} = \frac{6}{7}}$$

29. A 1 ton capacity water cooler cools water steadily from 35^0C to 20^0C. The specific heat of water is 4.18 kJ/kg-K. The water flow rate will be nearly

Search on Telegram @apna_pdf

(a) 13.33 liter/hr (b) 33.3 liter/hr
(c) 200 liter/hr (d) 250 liter/hr

Nagaland PSC CTSE 2016 Paper-II
Haryana PSC Civil Services Pre, 2014, ESE 2001

Ans. (c) Water cooler capacity = 1 ton

RE = 1 ton = 1 × 3.5 kW

$3.5 = \dot{m}\, Cp\,(T_2 - T_1)$

$3.5 = \dot{m} \times 4.18 \times (308 - 293)$

$\dot{m} = 0.05582$ kg/sec.

$\dot{m} = \rho V$

$0.05582 = 1000 \times V$

$V = 5.582 \times 10^{-5}\ m^3/sec.$

$$= \frac{5.582 \times 10^{-5} \times 10^3}{\frac{1}{3600}} \text{ liter}$$

$$\boxed{V = 200 \text{ liter/hr}}$$

30. The ratio of heat extracted in the refrigerator to the work done on refrigerant is called :

(a) Coefficient of performance of heat pump
(b) Coefficient of performance of refrigeration
(c) Refrigerating efficiency
(d) Compressor efficiency

CGPSC AE 15.01.2021, Punjab PSC SDE 12.02.2017
CGPSC AE 16.10.2016

Ans. (b) : The ratio of heat extracted in the refrigerator to the work done on refrigerant is called coefficient of performance of refrigeration.

$$\boxed{COP = \frac{\text{Refrigeration Effect}}{\text{Work done}}}$$

31. A Bell Coleman cycle is a reversed

(a) Brayton cycle (b) Akinson cycle
(c) Ericsson cycle (d) Carnot cycle

J & K PSC Screening, 2006, ESE 2005

Ans. (a) : A Bell Coleman cycle is a reversed Brayton Cycle.

32. The COP of a domestic refrigerator

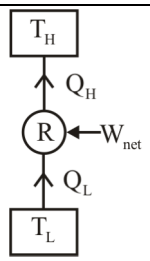
(a) Is more than 1
(b) Is less than 1
(c) Is equal to 1
(d) Depends upon the weather conditions

Rajasthan Nagar Nigam AE 2016, Shift-I
UKPSC AE 2007 Paper-II

Ans. (a) Coefficient of Performance–The performance of refrigerators and heat pumps is expressed in terms of the coefficient of performance (COP), defined as.

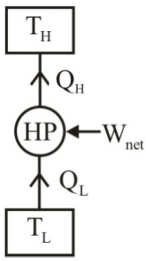
$$(COP)_{Ref.} = \frac{\text{Desired Output}}{\text{Required input}} = \frac{\text{Cooling Effect}}{\text{Work Input}}$$

$$= \frac{Q_L}{W_{net}}$$



$$(COP)_{HP} = \frac{\text{Desired Output}}{\text{Required Input}} = \frac{\text{Heating Effect}}{\text{Work Input}}$$

$$= \frac{Q_H}{W_{net}}$$



Both $(COP)_R$ and $(COP)_{HP}$ can be greater than 1.
For fixed values of Q_L and Q_H

$$\boxed{(COP)_{HP} = (COP)_R + 1}$$

33. A refrigerating machine having coefficient of performance equal to 2 is used to remove heat at the rate of 1200 kJ/min. What is the power required for this machine?

(a) 80 kW (b) 60 kW
(c) 20 kW (d) 10 kW

RPSC IOF, 2020, ESE 2007

Ans. (d) : Given,

$Q_2 \Rightarrow$ heat removed = 1200 kJ/min

$$= \frac{1200}{60} \text{kJ/sec}$$

$Q_2 = 20$ kW

$(COP)_R = 2$

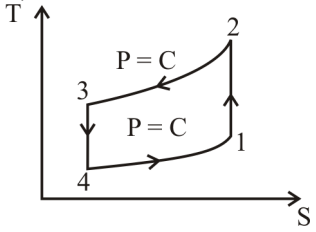
$$(COP)_R = \frac{Q_2}{\text{Power input (P)}}$$

$$2 = \frac{20}{P}$$

$$P = \frac{20}{2}$$

Power required P = 10 kW

34. The thermodynamic cycle shown below (T-S diagram) indicates

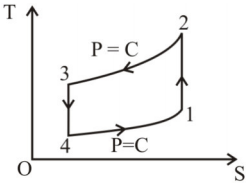


Search on Telegram @apna_pdf

(a) Reversed Carnot cycle
(b) Vapor compression cycle
(c) Reversed Brayton cycle
(d) Vapor absorption cycle

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (c) : Reversed Brayton cycle



Reverse Brayton cycle
1-2 Isentropic compression
2-3 Isobaric heat rejection
3-4 Isentropic expansion
4-1 Isobaric heat absorption

35. A boot strap air cooling system has-
(a) One heat exchanger
(b) Two heat exchangers
(c) Three heat exchangers
(d) Four heat exchangers

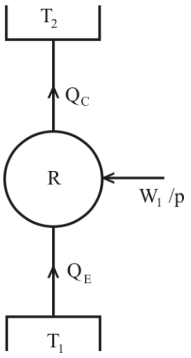
GMB AAE 25.06.2017, JPSC AE 2013 Paper-V

Ans. (b) : Boot strap air cooling system has two heat exchanges one is air cooler and another is after cooler. The air bled from the compressor and gets cooled by the first heat exchanger. Then the air is compressed at high temperature and pressure in turbine. A substantial amount of heat is removed in the second heat exchanger and air is further cooled through the turbine.

36. The Heat Rejection Factor (HRF) is given by -
(a) $1+COP$ (b) $1-COP$
(c) $1+\frac{1}{COP}$ (d) $1-\frac{1}{COP}$

Nagaland PSC (CTSE) 2018, Paper-II
GMB AAE 25.06.2017

Ans. (c) : Heat Rejection factor or ratio-
Q_C = Heat of condenser
RE = Refrigeration effect



It is defined as the ratio of heat rejected in condenser to the refrigeration effect.

$$H.R.F. = \frac{Q_{condenser}}{RE}$$

$$= \frac{RE + W}{RE}$$
$$= 1 + \frac{W}{RE}$$
$$= 1 + \frac{1}{(COP)_R} \quad \left[COP = \frac{RE}{W}\right]$$

37. If a Carnot refrigeration cycle is to have a COP of 5 the ratio of maximum temperature to minimum temperature in the cycle should be :
(a) 1.2 (b) 1.5
(c) 2.0 (d) 2.5

GPSC EE Pre 28.01.2017
J&K PSC Civil Services Pre, 2010

Ans. (a) : Given -
$(COP)_{ref} = 5$

$$(COP)_{ref} = \frac{T_L}{T_H - T_L}$$

$$= \frac{T_L}{T_L\left[\frac{T_H}{T_L} - 1\right]} = 5$$

$$\frac{1}{\left(\frac{T_H}{T_L} - 1\right)} = 5$$

$$\left(\frac{T_H}{T_L} - 1\right) = \frac{1}{5}$$

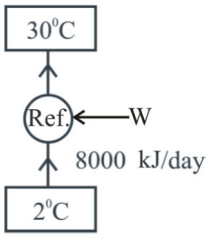
$$\frac{T_H}{T_L} = \frac{1}{5} + 1 = \frac{6}{5}$$

$$\frac{T_H}{T_L} = 1.2$$

38. A domestic refrigerator, set at 2^0C, handles on an average a thermal load of 8000 kJ per day. The ambient temperature is 30^0C and the COP of the refrigerator is 0.15 times that of a Carnot refrigerator. The daily electricity consumption in kWh is approximately.
(a) 1.47 (b) 1.51
(c) 3.28 (d) 2.86

Nagaland PSC CTSE 2016 Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (b) : $T_L = 2 + 273 = 275$ K
$T_H = 30 + 273 = 303$ K
(COP) of refrigerator = 0.15 × COP of Carnot refrigerator



Search on Telegram @apna_pdf

$$= 0.15 \times \frac{T_L}{T_H - T_L}$$

$$= 0.15 \times \frac{275}{303 - 275}$$

$$(COP) = 1.4732 = \frac{RE}{\text{work input}}$$

$$\text{Work input } W = \frac{8000}{1.4732}$$

$$W = 5430.355 \text{ kJ/day}$$

$$W = \frac{5430.355}{24 \times 60 \times 60}$$

$$= 0.0628 \text{ kW}$$

Daily consumption in kWhr

$$W = 0.0628 \times 24$$

$$= 1.51 \text{ kWhr}$$

39. COP of a reversed Carnot cycle refrigerator working between higher temperature T_2 and lower temperature T_1

(a) will increase with increase in T_1 keeping T_2 fixed

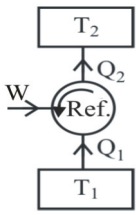
(b) will decrease with increase in T_1 keeping T_2 fixed

(c) will first increased with increase in T_1 and then decrease with increase in T_1 keeping T_2 fixed

(d) none of the above

Nagaland PSC (CTSE) 2016 Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (a)



$$COP = \frac{T_1}{T_2 - T_1}$$

$T_1 \uparrow \rightarrow$ COP $\uparrow$ and T_2 is fixed

40. The heat removal rate from a refrigerated space is 7.2 kW and the power input to the compressor is 1.8 kW. The coefficient of performance (COP) of the refrigerator is

(a) 4 (b) 5

(c) 1.25 (d) 0.25

ISRO Scientist/Engineer 22.04.2018
GPSC Executive Engineer 23.12.2018

Ans. (a) :

$$[COP]_{ref} = \frac{Heat\ removed\ from\ space}{Work\ done}$$

$$= \frac{7.2}{1.8}$$

$$[COP]_{ref} = 4$$

41. The COP of gas refrigeration cycle [r = pressure ratio]

(a) increases with increase in pressure ratio

(b) decreases with increase in pressure ratio

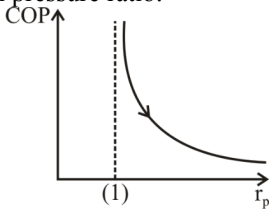
(c) remains constant with increase in pressure ratio

(d) is given by, COP $= \frac{1}{\left(r^{\gamma}\right) - 1}$

(e) is given by, COP = $= \frac{1}{\left(r^{1/\gamma}\right) - 1}$

CGPSC 25 Apr. (Shift II) 2018
CGPSC AE 25.02.2018

Ans. (b) : The COP of gas refrigeration cycle decreases with increase in pressure ratio.



42. Thermal efficiency of a Carnot engine is 30%. If the engine is reversed to operate as heat pump with same operating conditions, what will be the COP of the heat pump?

(a) 0.3 (b) 1.33

(c) 2.33 (d) 3.33

UKPSC AE-2013, Paper-II, CSE Pre-1995, 1994

Ans. (d) : Given as, $\eta_{carnot} = 30\%$

For same temperature limit, $[COP]_{HP} = \frac{1}{\eta_{carnot}} = \frac{100}{30}$

$$[COP]_{HP} = 3.33$$

43. If the capacity of a refrigerating machine is one ton, then the rate of heat abstraction is equal to:-

(a) 50 kcal/min (b) 100 kcal/min

(c) 150 kcal/min (d) 500 kcal/min

Rajasthan AE (Nagar Nigam) 2016 Shift-3
UKPSC AE-2013, Paper-II

Ans. (a) : One ton = 210 kJ/min

1 calories = 4.18 J

Then the rate of heal abstraction $= \frac{210}{4.18}$ kcal/min

$= 50.239$ kcal/min $\simeq 50$ kcal/min

44. A refrigerator storage is supplied with 3600 kg of fish at a temperature of 27°C. The fish has to be cooled to – 23°C for preserving it for a long period without deterioration. The cooling takes place in 10 hours. The specific heat of fish is 2.0 kJ/kg K above freezing point of fish and 0.5 kJ/kg K below freezing point of fish, which is –3°C. The latent heat of freezing is 230 kJ/kg. What is the power to drive the plant if the actual COP is half that of the ideal COP?

(a) 30 kW (b) 15 kW

(c) 12 kW (d) 6 kW

Nagaland PSC CTSE 2015 Paper-II, CSE Pre-2002

Search on Telegram @apna_pdf

Ans. (c) : Net Refrigeration Effect (NRE)

$$= mC_p\Delta T + mL + mC'_p\Delta T'$$

$$= \frac{m}{3600\times10}\left[C_P\left(T_1 - T_f\right) + \left(L + C_P\left(T_f - T_2\right)\right)\right]$$

$$= \frac{1}{10}\left[2\times30 + 230 + 10\right]$$

$$= 30 \text{ kW}$$

$$(COP)_{carnot} = \frac{T_2}{T_1 - T_2} = \frac{273-23}{(273+27)-(273-23)}$$

$$= 5$$

$$(COP)_{actual} = \frac{1}{2}(COP)_{ideal} = \frac{1}{2}\times\frac{T_2}{T_1 - T_2} = \frac{1}{2}\times\frac{250}{300-250}$$

$$= 2.5$$

$$(COP)_{actual} = \frac{NRE}{W}$$

$$\therefore W = \frac{NRE}{(COP)_{actual}} = \frac{30}{2.5} = 12\,kW$$

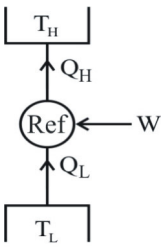
45. The C.O.P of a refrigerator working on the reversed carnot cycle is

(a) $\frac{T_L}{T_H - T_L}$ (b) $\frac{T_H - T_L}{T_L}$

(c) $\frac{T_H}{T_H - T_L}$ (d) $\frac{T_L}{T_L - T_H}$

GPSC Executive Engineer 23.12.2018
TSPSC AEE 2015

Ans. : (a)



$$(C.O.P.)_{ref} = \frac{T_L}{T_H - T_L}$$

$$(C.O.P.)_{ref} = \frac{\text{Refrigeration effect}}{\text{work input}}$$

46. The power (kW) required per ton of refrigeration is N/COP. Where COP is the coefficient of performance then N is equal to

(a) 2.75 (b) 4.75

(c) 5.25 (d) 3.50

UPRVUNL AE 21.08.2016, CSE Pre-2001

Ans. : (d)

$$COP = \frac{\text{Refrigeration effect}}{\text{Work input}} = \frac{3.5}{W_{in}}$$

$$COP = \frac{3.5\times COP}{N}$$

$$\boxed{N = 3.5}$$

47. Heat rejection ratio of the condenser is 1.2. The COP of this refrigeration plant will be:

(a) 3 (b) 4

(c) 5 (d) 6

(e) 2

CGPSC AE 25.02.2018

Ans. (c) : Heat Rejection Ratio- It is defined as the ratio of heat rejected by condenser to refrigeration effect produce.

$$HRR = \frac{Q_{cond.}}{Q_{R.E.}} > 1$$

$$HRR = \frac{Q_{R.E.} + W_{in}}{Q_{R.E.}} = 1 + \frac{W_{in}}{Q_{R.E.}} = 1 + \frac{1}{[COP]_{Ref}}$$

$$1.2 = 1 + \frac{1}{[COP]_{Ref}} \Rightarrow \boxed{(COP)_{Ref} = 5}$$

48. In aircraft, air refrigeration is used because of

(a) low weight per ton of refrigeration

(b) high heat transfer rate

(c) low temperature at high altitudes

(d) higher coefficient of performance

ISRO Scientist/Engineer (RAC) 07.05.2017
ESE 1995

Ans. (a) : Due to low weight per ton of refrigeration air is used as a refrigerant in aircraft.

49. The COP of a domestic refrigerator as compared to that of an air conditioner is in general :

(a) High

(b) Low

(c) Same

(d) COP depends on dry bulb temperature

WBPSC AE 2017, TSPSC Managers, 2015

Ans. (b) : The COP of domestic refrigerator is less than the COP of air conditioner because the lower temperature maintained in the refrigerator is less than the temperature maintained in the air conditioner.

$$\boxed{(COP)_{Ref.} = \frac{T_L}{T_H - T_L}}$$

$T_L \downarrow \quad (COP)_{Ref.} \downarrow$

50. The ratio of high temperature to low temperature for reversed Carnot refrigerator is 1.25. The COP will be

(a) 2 (b) 3

(c) 4 (d) 5

OPSC Civil Services Pre 2011
TNPSC AE, 2008

Ans. (c) :

Let, T_H = High temperature of reversed Carnot refrigerator.

T_L = Low temperature of reversed Carnot refrigerator.

Given ; $\frac{T_H}{T_L} = 1.25$

Search on Telegram @apna_pdf

$$\therefore (COP)_R = \frac{T_L}{T_H - T_L} = \frac{1}{\frac{T_H}{T_L} - 1} = \frac{1}{1.25 - 1}$$

$$= \frac{1}{0.25} = \frac{100}{25}$$

$$(COP)_R = 4$$

51. A cold storage is to be maintained at –5°C while the surroundings are at 35°C. The heat leakage from the surroundings into the cold storage is estimated to be 29 kW. The actual COP of the refrigeration plant used is $\frac{1}{3}$rd that of an ideal plant working between the same temperatures. The power required to drive the plant will be

(a) 13 kW (b) 14 kW
(c) 15 kW (d) 16 kW

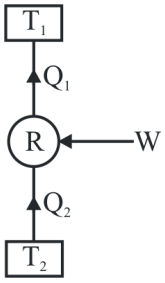
ESE 2020, 2019

Ans. (a) : Given,

$T_1 = 35 + 273 = 308$ K

$T_2 = -5 + 273 = 268$ K

$Q_2 = 29$ kW



$$(COP)_{ideal} = \frac{T_2}{T_1 - T_2}$$

$$= \frac{268}{308 - 268} = 6.7$$

$$(COP)_{actual} = \frac{1}{3}(COP)_{ideal}$$

$$= 2.23$$

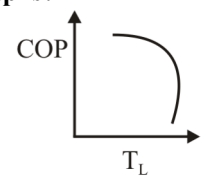
$$(COP)_{actual} = \frac{RE}{W_{input}} = \frac{Q_2}{W}$$

$$W = \frac{Q_2}{(COP)_{actual}} = \frac{29}{2.23}$$

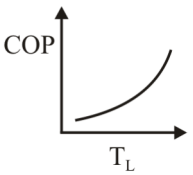
$W = 12.987 \Rightarrow 13$ kW

52. For a given value of T_H (source temperature) for a reversed Carnot cycle, the variation of T_L (sink temperature) for different values of COP is represented by which one of the following graphs?

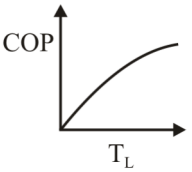
(a)



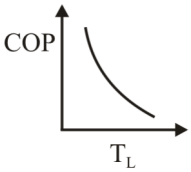
(b)



(c)



(d)



UPPSC AE 13.12.2020, Paper-2, ESE 2009

Ans. (b)

$$COP = \frac{T_L}{T_H - T_L}$$

As, T_H is constant

$$COP = \frac{1}{\left(\frac{T_H}{T_L} - 1\right)}$$

$COP \propto T_L$

So, As T_L, increases COP increases

53. A cold coffee shop uses a refrigerator with COP 2.5 for cooling drinking water at 0.42 litre/min from 18°C to 10°C. The specific heat capacity of water is 4.18 kJ/kg-K. Power consumption by refrigerator will be:

(a) 85W (b) 75W
(c) 92.9W (d) 120W

AAI Jr. Executive 26.03.2021

Ans. (c) : Given, COP = 2.5, V = 0.42 litre/min

$(C_p)_{water} = 4.18$ kJ/kg-K

$$Q = \dot{m} C_p dT$$

$$Q = \frac{0.42 \times 10^{-3} \times 10^3 \times 4.18 \times (18 - 10)}{60}$$

$Q = 0.23408$ kW

$$COP = \frac{Q}{\text{Power consumption}}$$

$$2.5 = \frac{0.23408}{P}$$

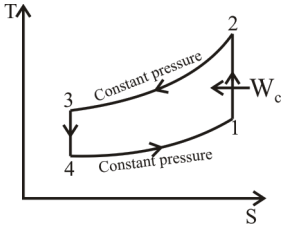
$$\boxed{P = 92.9\,W}$$

54. Air enters the compressor of an ideal gas refrigeration cycle at 10 °C and 80 kPa. The maximum and minimum temperature in cycle are 250 °C and –50°C. Assuming the value of specific heat at constant pressure as equal 1.0 kJ/kgK, the compressor work is (nearest) :

(a) 170 kJ/kg (b) 190 kJ/kg
(c) 240 kJ/kg (d) 220 kJ/kg

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) :



$T_1 = 10°C + 273 = 283$ K

Search on Telegram @apna_pdf

$T_2 = 250°C + 273 = 523\ K$
$T_4 = -50°C + 273 = 223\ K$
$C_p = 1\ kJ/kg\text{-}K$
$W_c = mC_p(T_2 - T_1)$
$= 1 \times 1 \times [523 - 283]$
$= 240\ kJ/kg$

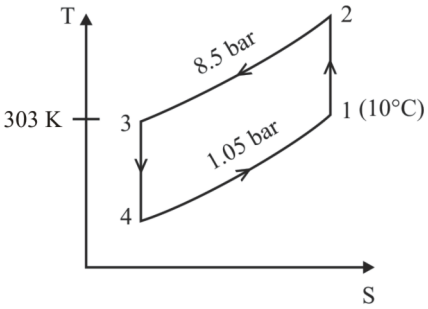
55. A refrigerator working on Bell-Coleman cycle operates between pressure limits of 1.05 bar and 8.5 bar. Air is drawn from the cold chamber at 10°C, compressed and then it is cooled to 30°C before entering the expansion cylinder. The expansion and compression follow the $pV^{1.3}$ = constant. Assuming $\gamma = 1.4$, the COP of the system will be :

(a) 1.87 (b) 1.3
(c) 1.03 (d) 1.62

CGPSC AE 15.01.2021

Ans. (b) : Given,

$T_3 = 30°C = 303\ K$
$T_1 = 10°C = 283\ K$



$$\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{n-1}{n}} \qquad [\because\ n = 1.3]$$

$$\frac{T_2}{283} = \left(\frac{8.5}{1.05}\right)^{\frac{1.3-1}{1.3}} \Rightarrow T_2 = 458.54\,K$$

$$\frac{T_3}{T_4} = \left(\frac{P_3}{P_4}\right)^{\frac{n-1}{n}}$$

$$\frac{303}{T_4} = \left(\frac{8.5}{1.05}\right)^{\frac{1.3-1}{1.3}} \Rightarrow T_4 = 187\,K$$

$$COP = \frac{(T_1 - T_4)}{\frac{n}{n-1} \times \left(\frac{\gamma - 1}{\gamma}\right)\left[(T_2 - T_1) - (T_3 - T_4)\right]}$$

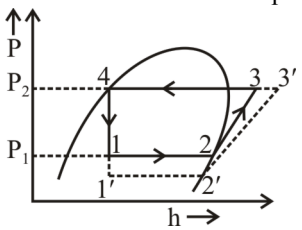
$$COP = \frac{(283 - 187)}{\frac{1.3}{1.3-1} \times \left(\frac{1.4-1}{1.4}\right)\left[(458.54 - 283) - (303 - 187)\right]} = 1.3$$

56. On reduction in suction pressure, the refrigerating effect and COP___.

(a) increase (b) decrease
(c) remain constant (d) become zero

UPRVUNL AE 05.07.2021

Ans. (b) : Effect of decrease in suction pressure–



RE_1 = 1-2 $(W_{in})_1$ = 2-3
RE_2 = 1′-2′ $(W_{in})_2$ = 2′-3
$RE_1 > RE'_2$ $(W_{in})_2 > (W_{in})_1$

Hence, from above we conclude that on decreasing suction pressure both RE and COP decreases.

57. When compared to vapour compression refrigeration, the gas cycle refrigeration system has the following feature.

(a) Higher COP
(b) Low power requirement
(c) Pressurization at high altitude difficult
(d) Light weight and compact.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : • Gas cycle refrigeration system are light weight than vapour compression refrigeration system.
• $(COP)_{VCRS} > (COP)_{gas/air\ refrigeration.}$
• $(Power\ requirement)_{gas} > (Power)_{VCRS}$

58. A refrigerator system operating on reversed cannot cycle has a refrigeration temperature of 258 K and the cooling water temperature is 308 K. The capacity of the system is 10 tonnes. The power required to un the unit is _____.

(a) 6.78 kW (b) 5.68 kW
(c) 6.43 kW (d) 9.46 kW

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (a) : Given-
$T_L = 258\ K$
$T_H = 308\ K$
COP of Reverse Carnot cycle.

$$(COP)_{ref} = \frac{T_L}{T_H - T_L}$$

$$(COP)_{ref.} = \frac{258}{308 - 258} = \frac{258}{50}$$

$(COP)_{ref.} = 5.16$
And given refrigeration effect
(RE) = 10 tonne
$= 10 \times 3.5\ kW$
$= 35\ kW$

$$\therefore (COP)_{ref.} = \frac{\text{Refrigeration effect (RE)}}{\text{power input}}$$

$$5.16 = \frac{35}{P_{input}}$$

$$\text{or } P_{input} = \frac{35}{5.16} = 6.78\ kW$$

Search on Telegram @apna_pdf

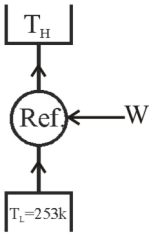
59. A refrigerating machine works on a reversed Carnot cycle. It consumes 6 kW and the produces a refrigerating effect of 100 kJ/min. The sink temperature is 233 K. The COP-coefficient of performance of the engine is ____.

(a) 2.78 (b) 3.26
(c) 2.48 (d) 2.38

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (a) : Given- work input to the refrigerator, Win = 6 kW

Refrigeration effect, (RE) = 1000 kJ /min
= 16.666 kJ/sec
(RE) = 16.666 kW



$$(COP)_{Ref.} = \frac{RE}{W_{input}} = \frac{16.66}{6}$$

$$= 2.777$$

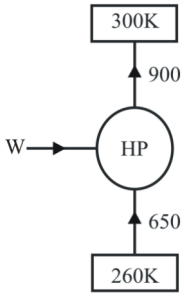
$$(COP)_{ref.} = 2.78$$

60. A heat pump operates between the temperature of 27°C and – 13°C. The rates of heat addition and heat rejection are 650 W and 900 W, respectively. The COP for the heat pump is :

(a) 7.5 (b) 6.5
(c) 3.6 (d) 2.6

RPSC ACF & FRO, 26.02.2021

Ans. (c) :



Work input, W = 900 – 650
= 250 W

$$(COP)_{actual} = \frac{\text{Desired effect}}{\text{work input}}$$

$$= \frac{900}{250}$$

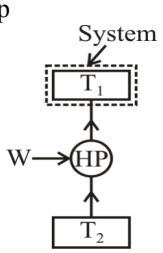
$$\boxed{(COP)_{actual} = 3.6}$$

61. Which is the case where low grade (heat) be more than the high grade (work) is the possibility?

(a) Heat Pump (b) Refrigerator
(c) Heat Engine (d) Heat Exchanger.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) : Heat Pump



Heat supply in the system is more than workdone.

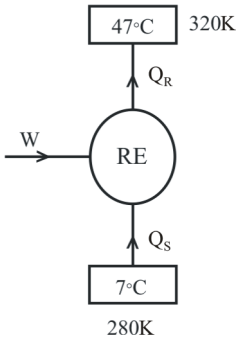
62. A refrigerating system of 1TR capacity operates between temperature range of 7 °C and 47 °C. The minimum amount of heat rejected to the surrounding will be

(a) 3 kW
(b) 3.5 kW
(c) 4 kW
(d) Not possible to determine with given data

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) : Given,

$Q_S = 1$ TR
$= 1 \times 3.5$
$Q_S = 3.5$ kW



$$\frac{Q_S}{Q_R} = \frac{T_S}{T_R}$$

$$Q_R = \frac{3.5 \times 320}{280} = 4\,kW$$

63. If the efficiency of engine is 40%, then $(COP)_{HP}$ is :

(a) 0.5 (b) 1.5
(c) 2.5 (d) 3.5

CGPSC AE 15.01.2021

Ans. (c) : Given,

$\eta_E = 40\% = 0.4$

$$(COP)_{HP} = (COP)_R + 1 = \frac{1}{\eta_E}$$

$$(COP)_{HP} = \frac{1}{0.4} = 2.5$$

Search on Telegram @apna_pdf

64. The refrigerating capacity of 165 litres domestic refrigerator is approximately equal to:

(a) 0.1 tonne (b) 1.15 tonnes
(c) 5 tonnes (d) 8 tonnes

CGPSC AE 15.01.2021

Ans. (a) : The refrigerating capacity of 165 litres domestic refrigerator is approximately equal to 0.1 tonne.

65. In Bell-Colemann refrigerator for the same temperature range

(a) COP of dense air system is higher than COP of open air system.
(b) COP of dense air system is lower than COP of open air system.
(c) COP of dense air system is equal to COP of open air system.
(d) COP of dense air system may be higher or lower than COP of open air system depending upon pressure ratio.

JPSC AE, 10.04.2021, Paper-I

Ans. (a) : In Bell-Colemann refrigerator for the same temperature range COP of dense air system is higher than COP of open air system.

66. An air cooled condenser has 6 m^2 of surface with a removal of 50 kJ hr^{-1}. m^{-2}.°C^{-1}. What is the refrigerant temperature to dissipate 5235 kJ/hr, if the room temperature is 25°C?

(a) 24.31°C (b) 35.82°C
(c) 42.45°C (d) 56.94°C

ESE 18.07.2021

Ans. (c) : Given, Area = 6 m^2

The removal rate of condenser = $50\frac{\text{kJ}}{\text{hr.m}^2.^\circ\text{C}}$

$\therefore$ Total removal rate = $(50\times 6) = 300 \text{ kJ/hr.°C}$

Heat to be removed = 5235 kJ/hr

$$\therefore \quad \Delta T = \frac{5235}{300} = 17.45^\circ\text{C}$$

$$(T - T_{room}) = 17.45^\circ\text{C}$$

$$T = (17.45 + 25) = 42.45^\circ\text{C}$$

67. The actual and theoretical COP of rolling piston compressor are 3.6 and 4.7 respectively. What is the relative COP?

(a) 8.3 (b) 16.92
(c) 1.3 (d) 0.76

ESE 18.07.2021

Ans. (d)

$$(COP)_{rel} = \frac{\text{Actual COP}}{\text{Theoretical COP}}$$

$$= \frac{3.6}{4.7} = 0.76$$

68. A refrigerator operates on Reversed Carnot cycle. What is the power required to drive the refrigerator between temperatures of 42°C and 4°C, if heat at the rate of 2 kJ/s is extracted from the low temperature region?

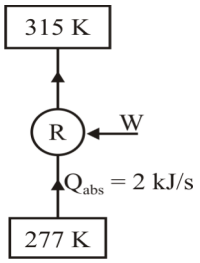
(a) 0.174 kW (b) 0.374 kW
(c) 0.274 kW (d) 0.474 kW

ESE 18.07.2021

Ans. (c) : Given,

$T_H = 42°C = 315 \text{ K}$

$T_L = 4°C = 277 \text{ K}$



$$COP = \frac{Q_{abs}}{W}$$

$$\frac{T_L}{T_H - T_L} = \frac{Q_{abs}}{W}$$

$$\frac{277}{315 - 277} = \frac{2}{W}$$

$$W = 0.274 \text{ kW}$$

69. Ice is formed at 0°C from water at 20°C temperature of the brine is –8°C. The refrigeration cycle used is perfect reversed Carnot cycle. Latent heat of ice = 335 kJ/kg, and C_{pw} = 4.18 kJ/kgK The ice formed per kWh will be nearly

(a) 81.4 kg (b) 76.4 kg
(c) 71.8 kg (d) 68.8 kg

ESE 2020

Ans. (a) : $Q_{Ref} = 335\times m + 4.18(20-0)m$

So,

$$(COP)_{ideal} = \frac{(-8+273)}{[(273+20)-(-8+273)]} = \frac{265}{28}$$

$$\because (COP)_{ideal} = \frac{Q_{Ref}}{\text{Power Input}}$$

$$\frac{265}{28} = \frac{335\times m + 4.18\times 20\times m}{3600}$$

$$m = \frac{265\times 3600}{28\times(335 + 4.18\times 20)} = 81.39$$

$$\approx 81.4 \text{ kg}$$

70. A domestic food freezer maintains a temperature of –15°C. The ambient air temperature is 30°C. If heat leaks into the freezer at the continuous rate of 1.75 kJ/s, the least power necessary to pump this heat out continuously will be nearly

(a) 0.1 kW (b) 0.2 kW
(c) 0.3 kW (d) 0.4 kW

ESE 2020

Ans. (c) :

$$(COP)_{max.} = \frac{T_2}{T_1 - T_2} = \frac{Q_2}{W_{min}} = \frac{258}{303 - 258} = \frac{1.75}{W_{min}}$$

$$W_{min} = 0.305 \text{ kW}$$

Search on Telegram @apna_pdf

71. The power per tonne of refrigeration (in kW) is

(a) 3.5/COP (b) COP/3.5

(c) 3.5 × COP (d) None of these

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : $COP = \frac{\text{Desired effect}}{\text{Work input}}$

$$COP|_{\text{refrigeration}} = \frac{\text{Refrigeration effect}}{\text{Work input}} = \frac{RE}{W_{in}}$$

R_e = 1 tonne = 3.5 kW

$$W_{in} = \frac{RE}{(COP)_R} = \frac{3.5}{(COP)_R}$$

72. Gas refrigeration cycles

(a) operate with simple and light components

(b) Cannot incorporate regeneration

(c) have higher COPs than vapour compression cycles operating between the same temperature limits

(d) are not suitable for cryogenic applications

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (a) : Gas refrigeration cycles operate with simple and light components.

73. For high C.O.P.

(a) Critical temperature in general should be low

(b) Critical temperature in general should be high

(c) Critical temperature is insignificant

(d) Critical pressure is important

RPSC IOF, 2020

Ans. (b) : A high critical temperature yields higher COP due to smaller compressor superheat and smaller flash gas losses on the other hand since the vapour pressure will be low when critical temperature is high, the volumetric capacity will be lower for refrigerants with high critical temperature.

74. The refrigeration cycle suitable for aircraft applications is _____.

(a) vapour absorption refrigeration

(b) vapour compression refrigeration

(c) air compression refrigeration

(d) vapour absorption refrigeration

NLCIL GET 17.11.2020, Shift-II

Ans. (c) : The refrigeration cycle suitable for aircraft applications is air compression refrigeration.

75. A house requires 60 M cal/hr in winter for heating. Heat pump absorbs heat from cold air outside and requires 8 Mcal/hr of work. The COP will be

(a) 0.75 (b) 6.5

(c) 7.5 (d) 10

RPSC IOF, 2020

Ans. (c) : Given, Q_1 = 60 Mcal/hr.

W = 8 Mcal/hr.

$$COP = \frac{Q_1}{W}$$

$$COP = \frac{60}{8} = 7.5$$

76. A Carnot refrigerator operating between –10°C and 25°C will have a COP of :

(a) 2.5 (b) 5.3

(c) 7.5 (d) 8.1

NLC GET 17.11.2020, Shift-II

Ans. (c) : Given,

$T_1 = 25°C = 298K$

$T_2 = -10°C = 263K$

We know when Carnot refrigeration operating between T_2 and T_1

$$(COP)_{Ref} = \frac{T_2}{T_1 - T_2}$$

$$= \frac{263}{298 - 263}$$

$$(COP)_{Ref} = 7.5$$

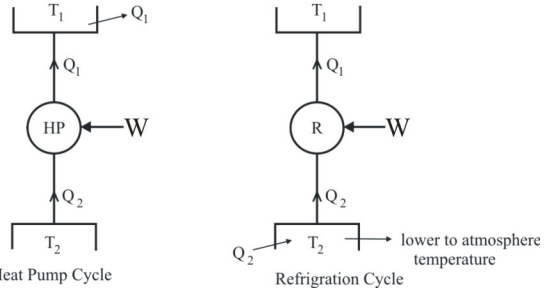
77. If a refrigerator and heat pump operate between the same temperature limits, then the difference between the COP of heat pump and refrigerator is:

(a) 2 (b) 1

(c) 4 (d) 3

NLC GET 17.11.2020, Shift-II

Ans. (b) : According to question,



We know that

$$COP = \frac{\text{desired effect}}{\text{work input}} \quad \text{[For reversible]}$$

$$(COP)_{Heat\ Pump} = \frac{T_1}{T_1 - T_2} \quad \text{[For reversible]}$$

$$(COP)_{\text{Refrigation}} = \frac{T_2}{T_1 - T_2}$$

$$(COP)_{\text{H.P.}} - (COP)_R = \frac{T_1}{T_1 - T_2} - \frac{T_2}{T_1 - T_2}$$

$$= \frac{T_1 - T_2}{T_1 - T_2}$$

$$\boxed{(COP)_{HP} - (COP)_{\text{Ref}} = 1}$$

Search on Telegram @apna_pdf

78. A refrigerator operates between the temperature of –23°C and 27°C. If one TR = 3.5 kW, the minimum power required (in kW) per TR to operate the refrigerator is

(a) 0.5 (b) 0.7
(c) 0.9 (d) 1.0

Assam PSC AE (PHED), 18.10.2020

Ans. (b) : Given-

$Q_2 = 3.5$ kW

$T_L = -23°C = 250$ K

$T_H = 27°C = 300$ K

$$(COP)_R = \frac{T_L}{T_H - T_L}$$

$$= \frac{250}{300 - 250}$$

$(COP)_R = 5$

$$(COP)_R = \frac{Q_2}{W}$$

$$W = \frac{Q_2}{(COP)_R}$$

$$W = \frac{3.5}{5} = 0.7$$

79. For a refrigerator working on ideal Carnot cycle, having evaporator coil at 240 K and the condenser coil at 300 K, what is approximately the theoretical COP?

(a) 0.5 (b) 2.0
(c) 4.0 (d) 5.0

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : $$COP = \frac{T_2}{T_1 - T_2} = \frac{\text{Heat absorbed}}{\text{Work done}}$$

$$COP = \frac{240}{300 - 240} = 4$$

80. One tonne refrigeration machine means:

(a) One tonne of water is converted into ice
(b) One tonne of ice melts from 0°C in 24 hours
(c) Mass of the machine
(d) One tonne of refrigerant is used

CIL MT 27.02.2020

Ans. (b) : A tonne is the cooling capacity of an air conditioning system. One tonne is equal to the amount of heat required to melt one tonne of ice in a 24-hour period.

81. If the cooling rate in the refrigeration cycle is 420 kJ/min, then the ton of refrigeration is:

(a) 8 (b) 6
(c) 4 (d) 2

NLCIL GET 17.11.2020, Shift-II

Ans. (d)

1 ton of refrigeration = 3.5 kJ/sec = 210 kJ/min

$$\text{Cooling rate} = \frac{420}{210} = 2 \text{ TR}$$

82. The ideal gas-refrigeration cycle is the same as the

(a) Brayton cycle
(b) Reversed Brayton cycle
(c) Vapour compression refrigeration cycle
(d) Vapour absorption refrigeration cycle

ESE 2020

Ans. (b) : Reversed Brayton cycle

83. For refrigeration system work done per kg of air is 30 kcal and heat extracted per kg of air is 45 kcal. Amount of refrigerant used is 10 kg. The coefficient of performance of system is:

(a) 6.52 (b) 1.50
(c) 10.56 (d) 0.67

HPPSC ADF 05.03.2019

Ans. (b) : Given-

Work done (W_{in}) = 30 k cal.

Heat extracted (Q) = 45 k cal

$$COP = \frac{\text{Heat extracted}}{W_{in}} = \frac{45}{30} = 1.50$$

84. A reversed Carnot engine is used for heating a building. It supplies 210×10^3 kJ/hr of heat to the building at 20°C. The outside air is at –5°C. The heat taken from the outside will be nearly

(a) 192×10^3 kJ/hr
(b) 188×10^3 kJ/hr
(c) 184×10^3 kJ/hr
(d) 180×10^3 kJ/hr

ESE 2019

Ans. (a) : Given,

$T_1 = 20 + 273 = 293$ K

$T_2 = -5 + 273 = 268$ K

$Q_1 = 210 \times 10^3$ kJ/hr

$$\frac{Q_1}{Q_2} = \frac{T_1}{T_2} \Rightarrow \frac{210 \times 10^3}{Q_2} = \frac{293}{268}$$

$Q_2 = 192 \times 10^3$ kJ/hr

85. If a Carnot refrigerator and a Carnot heat pump are operating between the same two thermal reservoirs, and the COP of the refrigerator is 2.5, then COP of the heat pump will be :

(a) 4.5 (b) 1.5
(c) 2.5 (d) 3.5

BHEL ET 2019

Ans. (d) : Given $(COP)_{Ref} = 2.5$

$(COP)_{HP} = 1 + (COP)_{Ref} = 1 + 2.5$

$(COP)_{HP} = 3.5$

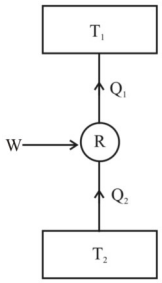
86. A refrigerator with a COP of 2 removes the heat from the refrigerated space at the rate of 100 kJ/min. The amount of heat rejected to surrounding will be:

(a) 2.0 kW (b) 3.0 kW
(c) 1.5 kW (d) 2.5 kW

SJVN ET 2019

Search on Telegram @apna_pdf

Ans. (d) : Given,



COP = 2

Q_2 = 100 kJ/min

$= \frac{100}{60} = 1.67$ kJ/sec

$COP = \frac{Q_2}{W}$

$W = \frac{1.67}{2} = 0.834$ kJ/sec

$Q_1 = W + Q_2$

$W = Q_1 - Q_2$

$Q_1 = 0.834 + 1.67 = 2.50$ kJ/sec

87. If the operating temperatures for a Carnot pump is –3 °C and 27 °C, then its COP is:

(a) 10 (b) 8

(c) 4 (d) 6

AAI Jr. Executive 29.11.2018

Ans. (a) : $COP = \frac{\text{Desired effect}}{W_{input}}$

$(COP)_{HP} = \frac{T_H}{T_H - T_L} = \frac{300}{300-270} = \frac{300}{30}$

$(COP)_{HP} = 10$

88. A computer lab having a load of 450 MJ/day is cooled round the clock. It requires an air-conditioning plant of capacity about:

(a) 2 ton (b) 1.5 ton

(c) 1.75 ton (d) 2.75 ton

AAI Jr. Executive 29.11.2018

Ans. (b) : In a air conditioning, load of refrigeration = 450 MJ / day

$= \frac{450 \times 1000}{24 \times 3600} = 5.2083 \text{ kJ/sec} = 5.2083 \text{ kW}$

[$\because$ 1 Tonne of refrigeration = 3.5 kW]

So,

Load required capacity of air conditioning =

$\frac{5.2083}{3.5} = 1.488 \approx 1.5$ Tonne

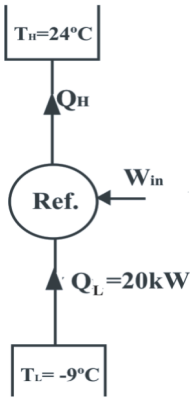
89. The operating temperature of a cold storage is -9ºC and load for the refrigeration plant is 20 kW for ambient temperature of 24ºC. The actual COP of the plant used is one forth that of ideal plant working between the same temperature. The power required to drive the plant is:

(a) 2.5 kW (b) 5 kW

(c) 10 kW (d) 3 kW

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (c) : COP of ideal refrigeration



$(COP)_{\text{ideal Ref.}} = \frac{T_L}{T_H - T_L}$

$(COP)_{\text{Ideal Ref.}} = \frac{(-9+273)}{(24+273)-(-9+273)}$

$(COP)_{\text{Ideal Ref.}} = 8$

$(COP)_{\text{actual Ref.}} = \frac{(COP)_{\text{ideal Ref.}}}{4} = \frac{8}{4}$

$2 = \frac{20}{W_{in}}$

$\boxed{W_{in} = 10\text{kW}}$

90. A Carnot refrigerator working between 300 K and 250 K has the cooling capacity of 10 TR. Rate of heat rejected to the high temperature reservoir will be:

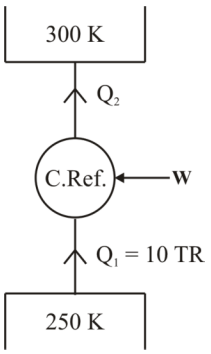
(a) 35.1 kW (b) 7.02 kW

(c) 42.12 kW (d) 28 kW

(e) 30 kW

CGPSC AE 25.02.2018

Ans. (c) :



$[COP]_{Ref} = [COP]_{actual}$

[1 TR = 3.51685 kW]

$\frac{250}{300-250} = \frac{10 \times 3.51685}{Q_2 - 10 \times 3.51685} = 5$

$\boxed{Q_2 = 42.12 \text{ kW}}$

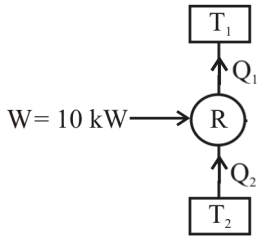
Search on Telegram @apna_pdf

91. A refrigerator working on a reversed Carnot cycle absorb 10 kW power and has a COP of 4. What will be the quantity of heat delivered to a building if it works as a heat pump?

(a) 30 kW (b) 40 kW
(c) 50 kW (d) 60 kW

RPSC Vice Principal ITI 2018

Ans. (c)



$(COP)_{Ref} = 4$

$$4 = \frac{RE}{W}$$

$RE = 4 \times 10 = 40$ kW

Hence heat supplied to building

$= 40 + 10 = 50$ kW

92. A cold storage has capacity for food preservation at a temperature of –3 °C when the outside temperature is 27°C. The minimum power required to operate with a cooling load of 90 kW is

(a) 20 kW (b) 15 kW
(c) 10 kW (d) 5 kW

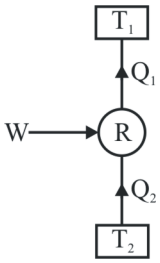
ESE 2018

Ans. (c) : Given,

$Q_2 = 90$ kW

$T_2 = -3 + 273 = 270$ K

$T_1 = 27 + 273 = 300$ K



minimum power is when COP is maximum and maximum COP is Carnot COP

$$(COP)_R = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$$

$$(COP)_{carnot} = \frac{T_2}{T_1 - T_2} = \frac{270}{300 - 270} = 9$$

$$(COP)_{carnot} = \frac{Q_2}{W}$$

$$W = \frac{90}{9} = 10 \text{ kW}$$

93. An ideal refrigerator working on a reversed Rankine cycle has a capacity of 3 tons. The COP of the unit is found to be 6. The capacity of the motor required to run the unit is (take 1 tonn = 210 kJ/min)

(a) 1.85 kW (b) 1.75 kW
(c) 1.65 kW (d) 1.50 kW

ESE 2018

Ans. (b) : Given,

Refrigerating effect (RE) = $3 \times 210 = 630$ kJ/min

$(COP)_R = 6$

$$(COP)_R = \frac{RE}{W}$$

$$W = \frac{RE}{(COP)_R} = \frac{630}{6} = 105 \text{ kJ/min} = 1.75 \text{ kW}$$

94. The Bell Coleman cycle consists of:

(a) Two adiabatic processes and two constant pressure processes
(b) Two adiabatic processes and two constant volume processes
(c) Two isothermal processes and two adiabatic processes
(d) Two constant volume processes and two constant pressure processes

PTCUL AE 25.06.2017

Ans. (a) : The Bell Coleman cycle consists of two adiabatic processes and two constant pressure processes.

95. In a boot-strap air evaporative cooling system, the evaporator is provided

(a) between the combustion chamber and the first heat exchanger
(b) between the first heat exchanger and the secondary compressor
(c) between the secondary compressor and the second heat exchanger
(d) between the second heat exchanger and the cooling turbine

Karnataka PSC AE, 10.09.2017

Ans. (d) : Evaporator is placed between the second heat exchanger and the cooling turbine.

96. Which of the following conditions clearly indicates the difference between a refrigerator and a heat pump?

(a) COP of refrigerator > 1 and COP of heat pump < 1
(b) COP of refrigerator < 1 and COP of heat pump > 1
(c) COP of refrigerator ≥ 1 and COP of heat pump ≤ 1
(d) COP of refrigerator < or > 1 and COP of heat pump > 1

Karnataka PSC AE, 10.09.2017

Ans. (d) (COP) Refrigerator is > or < 1

$(COP)_{VCRS} > 1$

$(COP)_{VARS} < 1$

$(COP)_{HP} > 1$

Search on Telegram @apna_pdf

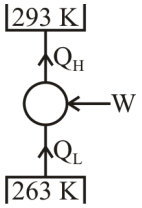
97. A perfect reversed heat engine is used for making ice at –5°C from water available at 20° C. The temperature of brine is –10°C. If the specific heat for ice is 2 kJ/kg and latent heat of ice is 335 kJ/kg, then the quantity of ice formed per kW hour will be (Specific heat of water = 4.2 kJ/kg)

(a) 94 kg (b) 74 kg
(c) 88 kg (d) 86.4 kg

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Given, $T_H = 273 + 20 = 293$ K

$T_L = 273 - 10 = 263$ K



$$COP = \frac{263}{293-263} = 8.76$$

Heat extracted $= mC_p\Delta T + mL$

$= m[4.2 \times 20 + 335 + 2 \times 5]$

$Q_L = m[84 + 335 + 10]$

$Q_L = m[429]$

Work input, W = 1 kWhr = 3600 kJ

$$COP = \frac{Q_L}{W} = \frac{m \times 429}{3600}$$

$$8.76 = \frac{m \times 429}{3600}$$

$m = 73.51 \simeq 74$ kg

98. A room contains 25 kg of air at 100 kPa and 14°C. The room has a 250 W refrigerator and 1 kW electric resistance heater. During a cold winter day, it is observed that both the refrigerator and the heater are running continuously, but the air temperature in the room remains constant. The rate of heat loss from the room during that day is

(a) 3600 kJ/hr. (b) 1250 kJ/hr.
(c) 4500 kJ/hr. (d) 2700 kJ/hr.

ISRO Scientist/Engineer 07.05.2017

Ans. (c) : To keep the temperature of the room as constant, the heat loss must be equal to the total heat dissipated in room.

Total heat generated in the room $= Q_R + Q_{heater}$

$= 250 + 1000 = 1250$W

$$= \frac{1250 \times 3600}{1000} = 4500 \text{kJ/hr}$$

99. An ideal refrigerator has a capacity of 6 tons, with a COP of 6. The capacity of the prime mover to run the machine should be at least

(a) 2.5 kW (b) 3.5 kW
(c) 4.5 kW (d) 5.5 kW

JWM 2017

Ans. (b) : Coefficient of Performance, COP = 6

Refrigeration capacity = 6 tons.

$= 6 \times 3.5$ kW

$$COP = \frac{\text{Refrigeration capacity}}{\text{Power input}}$$

$$6 = \frac{6 \times 3.5}{P_{input}}$$

$P_{input} = 3.5$ kW

100. 'COP' of a reversible heat pump is 1.2. If it is reversed to run as reversible heat engine then its efficiency shall be

(a) 0.833 (b) 0.2
(c) 1.2 (d) 0.5

TNPSC AE 2017

Ans. (a) : $[COP]_{H.P.} = 1.2$

We know that for same temperature limits,

$$\eta_{H.E.} = \frac{1}{[COP]_{H.P.}}$$

$$\eta_{H.P.} = \frac{1}{1.2} = 0.833$$

$\boxed{\eta_{H.E.} = 83.3\%}$

101. A heat pump working on a reversed Carnot cycle has a COP of 5. If it works as a refrigerator and consumes 2 kW power, the heat absorbed by the refrigerator will be

(a) 6 kW (b) 7 kW
(c) 8 kW (d) 9 kW

JWM 2017

Ans. (c) : COP of heat pump, $COP_{HP} = 5$

COP of Refrigerator, $COP_{Ref.} = COP_{HP} - 1$

$= 5 - 1 = 4$

$$COP = \frac{\text{Refrigerating effect}}{\text{Work done}}$$

Refrigerating effect $= COP_{Ref.} \times$ Work done

Heat absorbed by refrigerator $= 4 \times 2 = 8$ kW

102. The refrigeration system of an ice plant working between temperatures of -5°C and 25°C produces 20kg of ice per minute from water at 20°C. The specific heat of water is 4.2 kJ/kg and latent heat of ice is 335 kJ/kg. The refrigeration capacity of the refrigeration plant is

(a) 9040 kJ/min (b) 8750 kJ/min
(c) 8380 kJ/min (d) 8010 kJ/min

ESE 2017

Ans. (c) : Given,

$T_H = 25°C$ $(\dot{m})_{ice} = 20$ kg/min

$T_L = -5°C$ $T_{initial} = 20°C$

$(C_P)_{water} = 4.2$ kJ/kg

$(L)_{ice} = 335$ kJ/kg

Refrigeration capacity $= \dot{m} C_P \Delta T + \dot{m}L$

$= 20 \times 4.2 \times (20 - 0) + 20 \times 335 = 8380$ kJ/min

Search on Telegram @apna_pdf

103. Consider the following statements for refrigeration and air-conditioning :

1. In a refrigerating machine, the heat exchanger that absorbs heat is connected to a conditioned space.
2. A refrigerating cycle operating reversibly between two heat reservoirs has the highest coefficient of performance.
3. The lower the refrigeration required and the higher the temperature of heat rejection to the surroundings, the larger the power consumption.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Ans. (d) : All three statements are correct.
For lower refrigeration requirement and higher heat rejection, work input required will get increase because of high compression ratio.

104. In a refrigerator, the evaporator and condenser coil temperatures are -33°C and 27°C, respectively. Assuming that the maximum COP is realized, the required power input for a refrigerating effect of 4 kW is

(a) 8 kW (b) 4 kW
(c) 2 kW (d) 1 kW

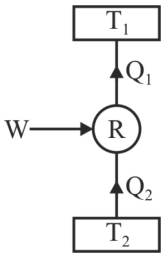
ESE 2017

Ans. (d) : Given,

$Q_2 = 4$ kW

$T_1 = 27 + 273 = 300$ K

$T_2 = -33 + 273 = 240$ K



$$(COP)_R = \frac{\text{Refrigerating effect}}{\text{Work input}}$$

$$(COP)_R = \frac{Q_2}{W} = \frac{T_2}{T_1 - T_2}$$

$$= \frac{240}{300 - 240} = \frac{240}{60} = 4$$

$$(COP)_R = \frac{Q_2}{W} = \frac{4}{W}$$

$$W = \frac{4}{4} = 1 \text{ kW}$$

105. Which of the following statements is true for throttling process?

(a) Enthalpy remains constant during throttling process.
(b) Entropy remains constant during throttling process.
(c) Pressure remains constant during throttling process.
(d) It is a reversible process.
(e) It is an isentropic process.

CGPSC ARTO & TSI 07.01.2017

Ans. (a) :Throttling Process :- When the air or gas flowing through an small opening then enthalpy remains constant. It is known as isenthalpic or throttling Process.

Note :- In throttling process

- There is no work and heat transfer.
- Pressure always decreases.
- During throttling process temperature may or may not be increase or decrease or remains constant but for an ideal gas temperature remain constant.

S.No.	Process	Parameter Remains Constant
1.	Isobaric Process	P (Pressure)
2.	Isochoric Process	V (Volume)
3.	Isothermal Process	T (Temperature)
4.	Isentropic Process	S (Entropy)
5.	Throttling Process	h (Enthalpy)

106. A Carnot cycle refrigerator operates between 250 K and 300 K. Its co-efficient of performance is

(a) 6.0 (b) 1.2
(c) 5.0 (d) 0.8

GPSC ARTO 01.05.2016

Ans. (c) : Lower temperature, $T_L = 250$K
Higher temperature, $T_H = 300$K

$$(Cop)_{refrigerato} = \frac{T_L}{T_H - T_L} = \frac{250}{300 - 250} = 5$$

107. A refrigeration cycle operates between condenser temperature of 27 deg C and evaporator temperature of -23 deg C. The carnot efficiency of performance of cycle will be

(a) 1.2 (b) 0.16
(c) 0.6 (d) 6

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (b) Given-

$T_H = 27 + 273 = 300$ K

$T_L = -23 + 273 = 250$ K

$$(COP)_R = \frac{T_L}{T_H - T_L}$$

$$= \frac{250}{300 - 250} = \frac{250}{50} = 5$$

$$\eta_{carnot} = \frac{1}{1 + (COP)_R} = \frac{1}{1+5} = \frac{1}{6}$$

$$\eta_{carnot} = 0.16$$

Search on Telegram @apna_pdf

108. Air – conditioning load for a vehicle is lower when it is moving and higher when it is at stationary condition. Choose appropriate option.

(a) False
(b) True
(c) It depends upon ambient conditions and speed of the vehicle
(d) Incomplete information

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : For moving vehicle load on vehicle AC is less as compared stationary condition.

109. What is one ton of refrigeration equal to?

(a) approximately 12,000 BTU/hr
(b) approximately 120 BTU/hr
(c) approximately 12 BTU/hr
(d) none of these

KPCL AE 2016

Ans. (a) : 1TR = 12000 BTU/hr
= 200 BTU/min
(BTU- British Thermal unit)

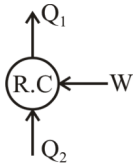
110. A ton of refrigeration is defined as_____

(a) the heat of fusion absorbed by melting 1 ton of pure ice at 32ºC in 24 hours
(b) the heat of fusion absorbed by melting 1 ton of pure ice at 0ºC in 1 hour
(c) the heat of fusion absorbed by melting 1 ton of pure ice at 0ºC in 24 hours
(d) none of these

KPCL AE 2016

Ans. (c) : A ton of refrigeration is defined as the heat of fusion observed by melting 1 ton of pure ice at 0ºC in 24 hours.
1 Ton = 3.5 kW = 210 kJ/min

111. Observe the figure below and choose the correct option



(a) $COP_{Refrigerator} = \frac{Q_1}{W}$

(b) $COP_{Refrigerator} = \frac{Q_1 - Q_2}{W}$

(c) $COP_{Heat\ pump} = \frac{Q_2}{W}$

(d) $COP_{Heat\ pump} = \frac{Q_1}{W}$

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : $COP_{Heat\ pump} = \frac{Q_1(High)}{Work\ Input} = \frac{Desired\ effect}{Work\ Input}$

112. A domestic food freezer maintains a temperature of –23ºC. The ambient air temperature is 27ºC. If heat leaks into the freezer at continuous rate of 2kJ/sec. What is the least power is necessary to pump this heat out continuously

(a) 40 W
(b) 400 W
(c) 2100 W
(d) 210 W

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : $T_L = 250K$, $T_H = 300K$, $Q = 2kJ/sec$,

$$COP = \frac{250}{300-250} = \frac{250}{50} = 5$$

$$COP = \frac{Q}{W_{in}} \Rightarrow W_{in} = \frac{2\times1000}{5} = 400\,W$$

113. 1.5 kW per tonne of refrigeration is required to maintain the temperature of –40ºC in the refrigerator. If the refrigerator cycle works on Carnot cycle, determine the temperature of the sink.

(a) 233 K
(b) 333 K
(c) 240 K
(d) 340 K

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : $W_{in} = 1.5kW$, $Q = 3.5kW$, $T_L = 233K$

$$COP = \frac{3.5}{1.5} = 2.33$$

$$COP = \frac{T_L}{T_H - T_L} \Rightarrow T_H - 233 = \frac{233}{2.33}$$

$$T_H = 100 + 233 = 333K$$

114. The capacity of a refrigerator is 200 TR when working between –6°C and 25°C. Determine the mass of ice produced per day from water at 25°C. Assume that the cycle operates on reversed Carnot cycle and latent heat of ice is 335 kJ/kg.

(a) 137.55 tonnes
(b) 127.83 tonnes
(c) 187.34 tonnes
(d) 157.78 tonnes
(e) None of these

CGPSC AE 16.10.2016

Ans. (a) : Q = 200 TR, $T_1 = –6°C = 267$ K, $T_2 = 25°C$
$h_{fg} = 335$ kJ/kg
Heat extraction capacity = 200 × 210
= 42000 kJ/min
Heat removed from 1 kg,
= mCdT + mh_{fg}
= 1 × 4.186 (25 – 0) + 1 × 335 = 439.7 kJ/kg
Mass of ice produced per min

$$= \frac{42000}{439.7} = 95.52\,kg/min$$

Mass per day = 95.52 × 60 × 24
= 137.55 tonnes

115. Carnot refrigeration cycle absorbs heat at 270 K and rejects heat at 300 K. If the cycle is absorbing 1130 kJ/min at 270 K, how many kJ of work is required per second?

(a) 1.8 kJ/s
(b) 2.1 kJ/s
(c) 3.4 kJ/s
(d) 4.8 kJ/s
(e) None of these

CGPSC AE 16.10.2016

Search on Telegram @apna_pdf

Ans. (b) : $COP_R = \frac{T_1}{T_2 - T_1} = \frac{270}{300 - 270} = 9$

W_R = Work per second

$Q_1 = 1130$ kJ/min = 18.83 kJ/s

$$COP_R = \frac{Q_1}{W_R}$$

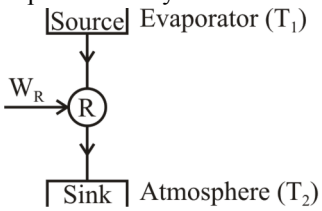
$$W_R = \frac{18.83}{9} = 2.1 kJ/s$$

116. With regard to a refrigeration system, which of the following statements is correct?

(a) It rejects energy to a low temperature body
(b) It removes heat from a high temperature body and delivers it to a low temperature body
(c) It removes heat from a low temperature body and delivers it to a high temperature body
(d) All of the above
(e) None of the above

CGPSC AE 16.10.2016

Ans. (c) : With regards to a refrigeration system. It removes heat from a low temperature body and delivers it to a high temperature body.



117. Which one is incorrect statement?

(a) $COP_{HP} = COP_R + 1$
(b) Efficiency of carnot cycle is given by $\eta_0 = 1 - \frac{T_2}{T_1}(T_1 > T_2)$
(c) Efficiency of Brayton cycle is given by $\eta_{brayton} = 1 - \frac{1}{(r_p)^{\frac{\gamma}{\gamma-1}}}$
(d) Efficiency of Otto cycle is given by $\eta_{Otto} = 1 - \frac{1}{r^{\gamma-1}}$
(e) None of these

CGPSC AE 16.10.2016

Ans. (c) : We know that,

$COP_{HP} = COP_R + 1$

Efficiency of carnot cycle is,

$$\eta_c = 1 - \frac{T_2}{T_1}$$

Efficiency of otto cycle

$$\eta_{otto} = 1 - \frac{1}{r_p^{\gamma-1}}$$

Efficiency of Brayton cycle

$$\eta_{Brayton} = 1 - \frac{1}{r_p^{\left(\frac{\gamma-1}{\gamma}\right)}}$$

118. The capacity of a refrigerator is one tone. This means that the heat removing capacity of the refrigerator is

(a) 1000 kCal/hr (b) 2000 kCal/hr
(c) 3000 kCal/hr (d) 4000 kCal/hr

APPSC AEE Screening Test 2016

Ans. (c) : The capacity of a refrigeration is one tonne

1 ton = 3.5 kW = 210 kJ/min = 50 kcal/min

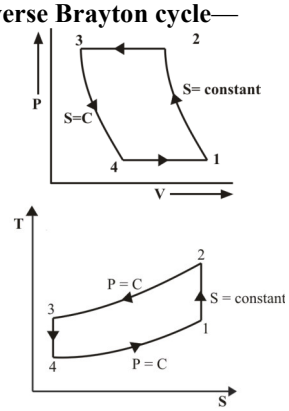
$$\Rightarrow \quad \frac{50 kcal}{\frac{1}{60} hr} = 3000 kcal/hr$$

119. Which of the following is not true for reverse Brayton cycle?

(a) It has very low COP relative to vapour compression cycle
(b) It consists of two constant pressure process and two isentropic process
(c) It's working fluid is generally ecofriendly
(d) Heat transfer in evaporator is at constant temperature

UPRVUNL AE 2016

Ans. (d) : Reverse Brayton cycle—



Reverse Bryton cycle consists of two constant pressure process and two isentropic process.
Heat transfer in evaporator is at constant pressure.

120. Which of the following is not true for heat pump?

(a) Low temperature reservoir is environment
(b) Low temperature reservoir is conditioned space
(c) It is a cyclic device
(d) Work done is negative

UPRVUNL AE 2016

Ans. (b) : Heat pump is a cyclic device which consume work to maintain a space above the surrounding temperature. In which low temperature reservoir is environment.

121. HP/TR of refrigeration system is:

(a) Inversely proportional to the COP of refrigeration system
(b) Directly proportional to the COP of refrigeration system
(c) Independent of COP of refrigeration system
(d) 1+ { COP of refrigeration system}

UPRVUNL AE 2016

Search on Telegram @apna_pdf

Ans. (a) : We know that

$$(COP)_{ref.} = \frac{\text{Desired effect}}{\text{Work done}} = \frac{TR}{HP}$$

So, HP/TR of refrigeration system inversely proportional to the COP of refrigeration.

122. 500 kg of fruits are supplied to a cold storage at 20°C. The cold storage is maintained at 5°C and the fruits get cooled to the storage temperature in 10 hr. The latent heat of freezing is 105 kJ/kg and specific heat of fruit is 1.256 kJ/kgk. Find the refrigeration capacity of the plant.

(a) 0.82 TR (b) 0.91 TR
(c) 0.13 TR (d) 0.54 TR
(e) None of these

CGPSC AE 16.10.2016

Ans. (e) m = 500 kg, $T_2 = 20°C = 293$ K, $T_1 = 278$ K

$h_{fg} = 105$ kJ/kg, $C_f = 1.256$ kJ/kg-K

$Q_1 = mC_f(T_2 - T_1)$

$= 500 \times 1.256 \times (20 - 5) = 9420$ kJ

$Q_2 = m.h_{fg} = 500 \times 105 = 52500$ kJ

Total heat removed in 10 hr.

$Q = Q_1 + Q_2 = 9420 + 52500$

$= 61920$ kJ

Total heat removed in one min.

$$= \frac{61920}{10 \times 60} = 103.2\,\text{kJ/min}$$

Refrigeration capacity,

$$= \frac{103.2}{210} = 0.4914\,\text{TR}$$

123. The working temperatures in evaporator and condenser coils of a refrigerator are –25°C and 30°C, respectively. The COP of the refrigerator is 0.85 of the maximum COP for a power input of 2 kW. The refrigeration effect produced will be

(a) 7.6 kW (b) 9 kW
(c) 10.2 kW (d) 12 kW

ISRO Scientist/Engineer 03.07.2016

Ans. (a) : $T_c = -25 + 273$

$= 248$ K

$T_E = 30 + 273 = 303$ K

$$COP = \frac{T_L}{T_H - T_L}$$

$$= \frac{248}{303 - 248} = \frac{248}{55} = 4.5$$

$(COP)_{Actual} = 0.85 \times 4.5$

$$(COP)_A = \frac{Q(\text{Ref. effect})}{W}$$

$Q = 3.825 \times 2$

$\boxed{Q = 7.6\,\text{kW}}$

124. Assertion (A) : Heat pump used for heating is a definite advancement over the simple electric heater.

Reasons (R) : The heat pump is far more economical in operation than electric heater.

(a) Both A & R are correct and R is correct explanation of A.
(b) Both A & R are correct ad R is not correct explanation of A.
(c) A is true R is false
(d) A is false R is true

TSPSC Managers, 2015

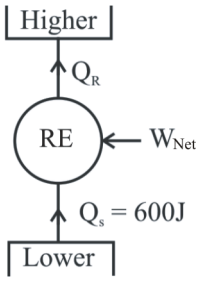
Ans. (a) : Heat pump used for heating is a definite advancement over the simple electric heater because the heat pump is more economical in operation than electric heater.

125. A refrigerator does 150 J of work to transfer 600 J of heat from its cold compartment. Calculate the refrigerator's COP and heat exhausted in J.

(a) 4.00 & 700 (b) 4.65 & 435
(c) 5.62 & 650 (d) 2.34 & 800

NPCIL ET, 2015

Ans. (*) : Given-



Net Work (W_{Net}) = 150 J

$Q_R = Q_s + W_{Net}$

$Q_R = 600 + 150$

$Q_R = 750$ J

$$(COP)_{Ref} = \frac{600}{150} = 4$$

126. Relation between coefficient of performance [COP] of refrigeration and heat engine efficiency (η) working in between same environment is :

(a) $\eta = 1 - COP$ (b) $COP = 1 + \eta$
(c) $1 + COP = \frac{1}{\eta}$ (d) $COP = \frac{1}{\eta}$

KPSC ADF 2015

Ans. (c) : Relation between coefficient of performance $(COP)_{ref}$ of refrigeration and heat engine efficiency (η_{HE}) is–

$$\boxed{1 + (COP)_{Ref} = \frac{1}{\eta_{HE}}}$$

127. Horse power per ton of refrigeration is expressed as

(a) $\frac{4.75}{COP}$ (b) $\frac{COP}{4.75}$
(c) $4.75 \times COP$ (d) $\frac{47.5}{COP}$

Nagaland PSC CTSE 2015 Paper-II

Search on Telegram @apna_pdf

Ans. (a) : We know that,

$$COP = \frac{RE}{W_{in}} \Rightarrow \frac{W_{in}}{RE} = \frac{1}{COP}$$

$\therefore$ Horse power per ton of refrigeration

$$= \frac{1}{COP} \times \left(\frac{3500}{746}\right) = \frac{4.7}{COP}$$

(1 ton = 210 kJ/min = 3.5 kW, 1 HP = 746 Watt)

128. A water chiller with a capacity of 30 tons of refrigeration cools 20 m^3/hr of water entering at 12°C. What is the temperature of water leaving the chiller?

(a) 5°C (b) 6°C
(c) 7°C (d) 7.5°C

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : Given,

$Q = 30 \times 3.5167$
$= 105.5$ kW

$Q = M_w \times C_p (T_i - T_{outlet})$

$$105.5 = \frac{20 \times 1000}{3600} \times 4.18(12 - T_{outlet})$$

$T_{outlet} = 7.456 \approx 7.5°C$

129. A cold storage plant of 20 tonne of refrigerator capacity operates between 200 and 300 K. The power required to run the plant if the plant has half COP of a Carnot cycle (Tonne of refrigeration= 3.5 kW) is

(a) 50kW (b) 60kW
(c) 70kW (d) 80kW

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (c) COP of Carnot refrigerator is given as

$$(COP)_c = \frac{T_L}{T_H - T_L} = \frac{200}{(300 - 200)} = 2$$

$$(COP)_{Actual\ ref.} = \frac{(COP)_C}{2} = \frac{2}{2}$$

$(COP)_{actual\ ref.} = 1$

$$(COP)_{act.\ ref.} = 1 = \frac{\text{Ref. capacity}}{\text{work done}(W)/\text{sec.}}$$

Power = 20 × 3.5
Power = 70 kW

130. A refrigerator operates on a reverse Carnot cycle between 900K and 300K. If heat at the rate of 3 kJ/s is extracted from the low temperature space, then the power required to drive the refrigerator-

(a) 3kW (b) 6kW
(c) 9kW (d) 4kW

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans. : (b) $[COP]_{Ref} = \frac{T_L}{T_H - T_L} = \frac{\text{Refrigeration effect}}{\text{work done}}$

$$= \frac{300}{900 - 300} = \frac{3}{W}$$

$\boxed{W = 6\ kW}$

131. A refrigerator with a COP of 3 uses 2.4 kg/min refrigerant extracting 150 kJ/kg heat in the evaporator. Assuming compressor efficiency of 80% the minimum size of the motor is

(a) 1.5 kW (b) 2.5 kW
(c) 6 kW (d) 4.5 kW

TSPSC AEE 2015

Ans. (b) : Data given-

COP = 3 m = 2.4 kg/min
Extracting heat = 150 kJ/kg
$\eta_c = 80\%$

$$COP = \frac{\text{Refrigeration capacity}}{W_{in}} = \frac{2.4 \times 150}{W_{in} \times 60} = 3$$

$\boxed{W_{in} = 2kW}$

We know that

$$\eta_c = \frac{W_{in}}{[W_{in}]_{act.}}$$

$$[W_{in}]_{act.} = \frac{2 \times 100}{80} = 2.5\ kW$$

132. A Carnot refrigerator rejects 3000 kJ of heat at 400 K while using 1000 kJ of work. The lowest operating temperature in the cycle should be about :

(a) 288 K (b) 300 K
(c) 267 K (d) 273 K

Kerala PSC Poly. Lect. 09.01.2014

Ans. (c) : Given, $Q_R = 3000$ kJ, W = 1000 kJ
$Q_a = 3000 - 1000 = 2000$ kJ
$T_H = 400$ K, $T_L = ?$

$$(COP)_{Ref.} = \frac{T_L}{T_H - T_L} = \frac{Q_a}{W}$$

$$\frac{T_L}{400 - T_L} = \frac{2000}{1000}$$

$T_L = 2 \times (400 - T_L)$
$T_L = 800 - 2T_L$
$3T_L = 800$
$T_L = 266.67$ K

133. A domestic refrigerator of 0.75 tonne capacity is found to have a Co-efficient of performance of 7.5. It's power consumption is

(a) 750 W (b) 550 W
(c) 350 W (d) 150 W

MPPSC State Forest Service Exam, 2014

Ans. (c) : $COP = \frac{Q_H}{W}$

So, 0.75 tonne capacity means, 0.75 × 3.51 = 2.63 kW
COP = 7.5

So, $W = \frac{2.63 \times 10^3}{7.5} = 350\ W$

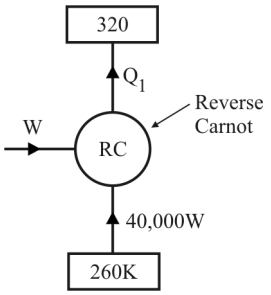
134. A reversed Carnot cycle removes 40,000 W from a heat sink. The temperature of the heat sink is 260 K and the temperature of the heat reservoir is 320 K. The COP of the engine is :

Search on Telegram @apna_pdf

(a) 2.33 (b) 3.33
(c) 4.33 (d) 5.33

MPSC Poly. Lect. 2014

Ans. (c) : $COP = \frac{T_L}{T_H - T_L} = \frac{260}{320 - 260} = 4.33$



135. A condenser of a refrigeration system rejects heat at rate of 150 kW, while its compressor consumes 60 kW power. What would be the coefficient of performance of the system?

(a) 1 (b) 1.5
(c) 2 (d) 2.5

UPRVUNL AE 2014

Ans. : (b) Coefficient of performance (COP)

$$= \frac{\text{Refrigeration Effect}}{\text{Work done}}$$

$$COP = \frac{150 - 60}{60} = \frac{90}{60} = 1.5$$

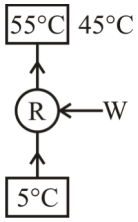
COP= 1.5

136. The surrounding air temperature in summer is 45°C in a locality. The refrigeration temperature is 5°C. Assume 10°C temperature difference in the heat exchanger that exchanges heat with surroundings. The COP of the Carnot refrigerator under these conditions, will be:-

(a) 6.95 (b) 7.95
(c) 6.56 (d) 5.56

UKPSC AE-2013, Paper-II

Ans. (d) :



$$(COP)_R = \frac{(273+5)}{(273+55)-(273+5)} = 5.56$$

137. A heat pump operating on Carnot cycle pumps heat from a reservoir at 300 K to a reservoir at 600 K. The coefficient of performance is

(a) 1.5 (b) 0.5
(c) 2 (d) 1

APPSC Poly. Lect. 2013

Ans. (c) : Heat pump

$$(COP)_{HP} = \frac{T_H}{T_H - T_L} = \frac{600}{600 - 300}$$

$$(COP)_{HP} = \frac{600}{300} = 2$$

138. A loaded domestic refrigerator consumes 1.0 kWh of energy during a certain period. The internal energy of the system drops by 5000 kJ. The quantity of heat transferred from the system to the surroundings will be

(a) 86 MJ (b) 860 MJ
(c) 8.6 MJ (d) 0.86 MJ

Vizag Steel MT (Re-Exam) 24.11.2013

Ans. (c) : W_{input} = 1 kW-hr = 3600 kJ

$\Delta U = -5000$ kJ

$\delta Q = \Delta U + \delta W$

$\delta Q = -5000 - 3600 = -8600 = -8.6$ MJ

The heat transferred from the system to the surrounding is 8.6 MJ.

139. Thermo electric refrigeration system is based on :

(a) Joule effect
(b) Peltier effect
(c) Joule – Thomson effect
(d) Adiabatic demagnetisation

TNPSC AE (Industries) 09.06.2013

Ans. (b) : Peltier Effect–The peltier effect is the reverse phenomenon of the see beck effect. The peltier effect occurs when a temperature difference is created between the junctions by applying a voltage difference across the terminals.

Thermoelectric refrigeration is the process of pumping heat energy out of insulated chamber in order to reduce the temperature of the chamber below that of the surrounding air.

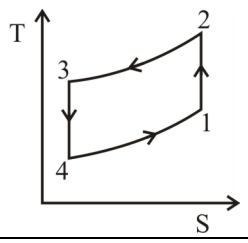
Thermoelectric refrigeration uses a principal called the peltier effect to pump heat electronically.

140. The ratio of temperatures at the beginning and end of isentropic expansion process in Bell-Coleman air refrigeration cycle is 1.25. What is the COP

(a) 0.25
(b) 4.0
(c) 5.0
(d) The data are insufficient.

RPSC AEN Pre-2013

Ans. (b) :



Search on Telegram @apna_pdf

Given,

$$\frac{T_3}{T_4}=\frac{T_2}{T_1}=\left(r_p\right)^{\frac{\gamma-1}{\gamma}}=1.25$$

$$(COP)_{Bell-Coleman}=\frac{1}{\left(r_p\right)^{\frac{\gamma-1}{\gamma}}-1}$$

$$=\frac{1}{1.25-1}=4$$

141. The main characteristic feature of Air Refrigeration System is
(a) High COP
(b) throughout the cycle the refrigerant remains in gaseous state
(c) Weight of air circulate is less
(d) High Refrigerating cost

TNPSC AE 2013

Ans. (b) : The main characteristic feature of Air Refrigeration System is throughout the cycle the refrigerant remains in gaseous state.

142. A refrigerator (COP=2.5) removes energy by heat transfer from freezer at 0°C at a rate of 9000 kJ/hr and rejects energy to the surroundings. Determine power input to the refrigerator:-
(a) 614.3 kJ/hr (b) 3600 kW
(c) 659.3 kJ/hr (d) 1 kW

UKPSC AE-2013, Paper-II

Ans. (d) : Given,
COP = 2.5
Refrigeration effect = 9000 kJ/hr

$$=\frac{9000}{3600}=2.5\,kW$$

$$COP=\frac{\text{Refrigeration effect}}{W_{net}}$$

$$W_{net}=\frac{2.5}{2.5}=1\,kW$$

143. A Carnot refrigerator operates between 300.3K and 273K. The fraction of cooling effect required as work input is:-
(a) 20% (b) 10%
(c) 50% (d) Cannot be calculated

UKPSC AE-2013, Paper-II

Ans. (b) : $T_1 =$ 300.3 K
$T_2 = 273$ K

$$(COP)_{Ref}=\frac{T_2}{T_1-T_2}=\frac{273}{300.3-273}=\frac{273}{27.3}=10$$

We know that

$$(COP)_{Ref}=\frac{Q_2}{W_{input}}$$

$$W_{input}=\frac{Q_2}{(COP)_{Ref}}=\frac{Q_2}{10}$$

$$W_{input}=\frac{Q_2}{10}$$

$$W_{input}=0.1\,Q_2$$

$$\boxed{W_{input}=10\%Q_2}$$

144. The refrigeration system works on:-
(a) Zeroth law of thermodynamics
(b) First law of thermodynamics
(c) Second law of thermodynamics
(d) None of the above

UKPSC AE-2013, Paper-II

Ans. (c) : The refrigeration system works on second law of thermodynamics.

145. Two reversible refrigerators are arranged in series and their COP are 4 and 5 respectively. The COP of the composite refrigeration system would be
(a) 1.5 (b) 2
(c) 3 (d) 4.5

UKPSC AE 2012 Paper–II

Ans. (b) : The COP of the composite refrigeration system $=\frac{[COP]_1\times[COP]_2}{1+[COP]_1+[COP]_2}=\frac{4\times5}{1+4+5}=\frac{20}{10}=2$

146. The Bell-Coleman refrigeration cycle uses _____ as the working fluid.
(a) Hydrogen (b) Carbon dioxide
(c) Air (d) Any inert gas

UKPSC AE 2012 Paper–II

Ans. (c) : The Bell-Coleman refrigeration cycle uses air as the working fluid.

147. Effects of heat pump and refrigeration respectively are obtained at
(a) compressor and condenser
(b) evaporator and condenser
(c) condenser and evaporator
(d) compressor and evaporator

UKPSC AE 2012 Paper–II

Ans. (c) : Effects of heat pump and refrigeration respectively are obtained at condenser and evaporator.

148. A carnot engine with an efficiency of 0.6 drives a carnot refrigerator, having a COP of 5. The energy absorbed from the cold body by the refrigerator for each kJ energy absorbed from the source by the engine is :
(a) 2 kJ (b) 8 kJ
(c) 0.12 kJ (d) 3 kJ

APGENCO AE 2012

Ans. (d) : Given, $\eta = 0.6$, $Q_s = 1$ kJ
$(COP)_{ref.} = 5$

$$(COP)_{carnot}=\frac{Q_{cold\ side}}{W_{net}}$$

$$5=\frac{Q_c}{W_{net}}$$

$$\because\quad \eta_{carnot}=\frac{W_{net}}{Q_s}=0.6=\frac{W_{net}}{1}$$

$W_{net} = 0.6$ kJ
$Q_{cold} = W_{net} \times 5 = 0.6 \times 5$
$= 3$ kJ

Search on Telegram @apna_pdf

149. A refrigerator removes heat from a refrigerated space at -5°C at a rate of 0.35 kJ/s and rejects it to an environment at 20°C. The minimum required power input is

(a) 30W (b) 33W
(c) 56W (d) 124W

ISRO Scientist/Engineer 2012

Ans. (b) : In Refrigerator,

$T_L = -5°C, Q = 0.35$ kJ/sec

$T_L = 273 - 5$

$T_L = 268K$

$T_H = 20°C$

$= 273 + 20 = 293K$

$$(COP)_{Ref} = \frac{Desired\ effect}{Work\ input}$$

$$= \frac{T_L}{T_H - T_L}$$

$$= \frac{268}{293-268} = \frac{268}{25} = 10.72$$

$$\therefore \quad (COP)_{ref.} = \frac{Q}{P}$$

$$P = \frac{0.35}{10.72} \times 1000W$$

$= 32.65$ W = 33W

150. A domestic refrigerator maintains a temperature of -20^0C. The ambient air temperature is 25^0C. If heat leaks into the refrigerator at the continuous rate of 1 kJ/s, the least power required to pump this heat out from the refrigerator continuously is :

(a) 18 watt (b) 180 watt
(c) 1.8 kilowatt (d) 18 kilowatt

OPSC Civil Services Pre. 2011

Ans. (b) : Given as,

$Q_2 = 1$ kJ/s = 1000 J/s

$T_1 = 25°C = 298K$

$T_2 = -20°C = 253K$

$$\Rightarrow \frac{Q_2}{W} = \frac{T_2}{T_1 - T_2}$$

$$\Rightarrow \frac{1\times1000}{W} = \frac{253}{298-253}$$

$$\Rightarrow W = \frac{45\times1000}{253} = 177.7 \text{ watt}$$

$\boxed{\approx 180 \text{ watt}}$

151. 1 ton of refrigerant is

(a) the SI unit used in refrigeration problem
(b) the cooling effect produced by melting 1 ton of ice
(c) the refrigeration effect to freeze 1 ton of water at 0°C into ice at 0°C in 24 hrs.
(d) the refrigeration effect to produce 1 ton of ice at NTP condition

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (c) : One ton of refrigeration in the amount of heat that is needed to extracted from 1 ton of water at 0°C to convert to ice at 0°C in 24 hrs. Latent heat from 0°C water to 0°C ice only.

$\therefore$ 1 TR = 210 kJ/min. = 3.5 kW = 50 kcal/min

152. A Carnot heat pump is used to heat a house in winter months. The average outside temperature is –3°C and indoor temperature is maintained at 27°C. If the power required by the heat pump is 10 kW, the heat supplied to the house is :

(a) 25 kW (b) 50 kW
(c) 75 kW (d) 100 kW

UPSC JWM Advt. No.-52/2010

Ans. (d) : Given, $T_L = -3°C + 273 = 270$ K

$T_H = 27°C + 273 = 300K$

Power Required by heat pump (P) = 10 kW = W_{input}

$$\therefore \quad (COP)_{HP} = \frac{T_H}{T_H - T_L} = \frac{300}{300-270} = \frac{300}{30}$$

$$(COP)_{HP} = 10 = \frac{Q_1}{W_{input}}$$

$\Rightarrow \quad Q_1 = 10 \times 10$

$\boxed{Q_1 = 100 \text{ kW}}$ $\rightarrow$ Heat supplied to the house.

153. A 2-ton capacity water cooler has water entering at 30° C and leaving at 15° C. What is the water flow rate in Lph?

(a) 40 (b) 66.6
(c) 402 (d) 502

UPSC JWM Advt. No.-50/2010

Ans. (c) : As we know,

Capacity = 2 Ton

$t_{in} = 30°C$

$t_{out} = 15°C$

$\dot{m} = ?$

$Q = \dot{m}C_p\Delta t$

$$2\times3.5\times10^3\times3600 = \dot{m}\times4186\times15$$

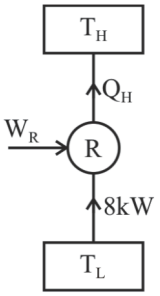
$\dot{m} = 402$ Lph

154. A refrigerating unit has a COP of 5. It extracts 480 kJ of heat from the cold reservoir in one minute. As a heat pump, how much heat it would deliver to the environment ?

(a) 1.6 kW (b) 6.67 kW
(c) 9.6 kW (d) 576 kW

UPSC JWM Advt. No.-50/2010

Ans. (c) : Desired effect $= \frac{480}{60} = 8$kW



Search on Telegram @apna_pdf

$$(COP)_R = \frac{\text{Desire Effect}}{W}$$

$$(COP)_R = \frac{8}{W} = 5$$

$W_R = 1.6\ kW \Rightarrow W_R = Q_H - Q_R$

$Q_H = Q_R + W$

$Q_H = 8 + 1.6 = 9.6\ KW$

155. A Carnot refrigerator requires 1.5 kW/ton of refrigeration to maintain a region at a temperature of –30°C. The COP of the Carnot refrigerator is :

(a) 1.42 (b) 2.33
(c) 2.87 (d) 3.27

APPSC IOF, 2009

Ans. (b) : 1 ton = 3.51 kW

So, COP will be $= \frac{\text{Desired effect}}{\text{Work input}} = \frac{3.51}{1.5} = 2.34$

156. It is proposed to heat a house in the winter with a heat pump. The house is to be maintained at 20°C at all times. When the ambient temperature out side drops to –10°C the rate at which heat is lost from the house is estimated to be 25 kW. The minimum electrical power required to drive the heat pump is :

(a) 2.56 kW (b) 4 kW
(c) 5 kW (d) 3.56 kW

APPSC IOF, 2009

Ans. (a) : Minimum power if we assume a Carnot cycle,

$$\dot{Q}_H = Q_{leak} = 25\,kW$$

$$COP = \frac{\dot{Q}_H}{W_{in}} = \frac{T_H}{T_H - T_L} = \frac{293}{30} = 9.767$$

$$W_{in} = \frac{25}{9.767} = 2.56\,kW$$

157. The coefficient of performances of Carnot refrigerator operating between the reservoirs at -10^0C and 40^0C is

(a) 0.526 (b) 5.26
(c) 52.6 (d) 526.0

TNPSC AE, 2008

Ans. (b) : Given, $T_L = -10^0C + 273 = 263$ K

$T_H = 40^0C + 273 = 313$ K

$$(COP)_R = \frac{T_L}{T_H - T_L} = \frac{263}{313 - 263} = \frac{263}{50} = \frac{26.3}{5}$$

$$(COP)_R = 5.26$$

158. Air refrigeration works on which cycle?

(a) Rankine
(b) Bell-Coleman cycle
(c) Reversed Carnot cycle
(d) Both (b) and (c)

UKPSC AE 2007 Paper -II

Ans. (d) : Both (b) and (c)

159. A simple refrigeration system operates between a condenser temperature of 40ºC and evaporator temperature of 0ºC respectively. The maximum C.O.P. is

(a) 7.8 (b) ∞ (Infinity)
(c) 0 (Zero) (d) 6.8

OPSC Civil Services Pre 2006

Ans. (d) : Maximum COP of refrigerator

$$COP = \frac{T_2}{T_1 - T_2} = \frac{273}{40} = 6.825$$

160. 'TR', Ton of Refrigeration, is the unit of refrigeration. (1 TR = 3.5 kW). Ten (10) kg of water is cooled from 20ºC to ice at 0ºC (Twenty ºC to Zero ºC) in one hour by an ice-making plant. The capacity of refrigeration of the ice-making plant in 'TR' is

(a) 0.33 TR (b) 1.15 TR
(c) 10 TR (d) 0.1 TR

OPSC Civil Services Pre 2006

Ans. (a) : Given, m = 10 kg, $\Delta T = 20°C$, 1 TR = 3.5 kW

Latent heat for water (L_f) = 334.4 kJ

$Q = mc\Delta T + mL_f$

$= m(c\Delta T + L_f)$

$= 10(4.18 \times 20 + 334.4)$

$Q = 4180$ kJ

$$Q = \frac{4180}{3600} = 1.1611\ kW$$

$$\text{Capacity of refrigeration} = \frac{1.1611}{3.5}$$

$= 0.331$ TR

2. Vapour Compression Refrigeration System

161. During a refrigeration cycle, heat is rejected by the refrigerant in a :

(a) condenser (b) compressor
(c) evaporator (d) expansion valve

CGPSC AE 15.01.2021
JPSC AE 10.04.2021 Paper-I
GPSC DEE, Class-2 (GWSSB) 04.07.2021
Sikkim PSC (Under Secretary), 2017
GPSC Lect. 23.10.2016
GPSC Lect. (Poly.) 07.12.2014
UKPSC AE 2007 Paper-II
OPSC Civil Services Pre 2006

Ans. (a) : During a refrigeration cycle, heat is rejected by the refrigerant in condenser and heat is absorbed by refrigerant in evaporator.

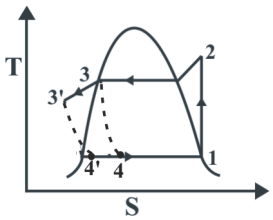
Search on Telegram @apna_pdf

162. The effect of Sub cooling in a refrigeration cycle will result in

(a) More COP
(b) Less COP
(c) No change in COP
(d) More power consumption

PPSC Asstt. Municipal Engineer 15.06.2021
ISRO Scientist/Engineer (RAC) 22.04.2018
Sikkim PSC (Under Secretary), 2017
OPSC AEE 2015 PAPER-II
TANGEDCO AE 2015

Ans. (a) : The effect of Sub cooling in a refrigeration cycle will result in more COP.



Cycle 1-2-3-4-1 without sub-cooling.
So refrigeration effect
$= (h_1 - h_4)$
Cycle 1-2-3-3'-4'-4-1 with sub-cooling
Refrigeration effect = $h_1 - h_{4'}$

$$COP = \frac{\text{Ref. effect}}{\text{Work input}}$$

$\uparrow COP \propto$ Refrigeration effect $\uparrow$

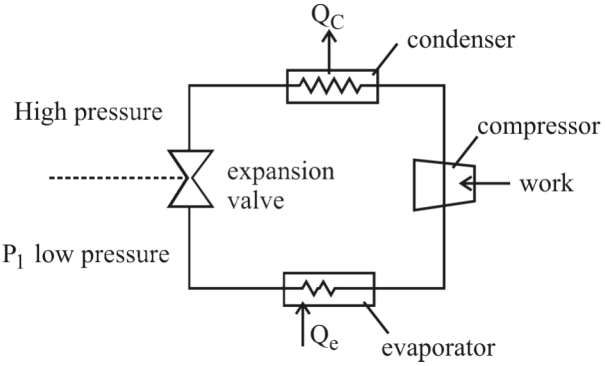
where compression work will be same in both cases
So, COP will be more in sub-cooling cycle as compared without sub-cooling cycle.

163. Where does the lowest temperature occur in a vapour compression cycle?

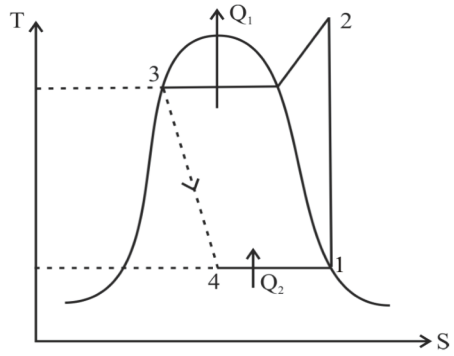
(a) Evaporator (b) Condenser
(c) Expansion valve (d) Compressor

CIL MT 27.02.2020, WBPSC AE, 2017
Kerala PSC Asstt. Prof. 27.09.2016
Rajasthan Nagar Nigam AE 2016, Shift-II
Kerala PSC Asstt. Prof. 27.09.2016
RPSC Lect. (Tech. Edu. Dept.) 2011
UKPSC AE 2007 Paper-II

Ans. (a) :



In vapour compression cycle lowest temperature occur in evaporator.

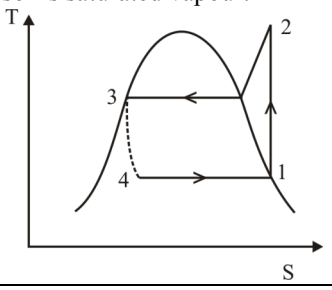


164. In a vapour compression refrigeration system the condition of refrigerant before entering the compressor is :

(a) wet vapour
(b) dry saturated vapour
(c) superheated vapour
(d) saturated liquid

CGPSC AE 15.01.2021
TSPSC Manager Engg. HMWSSB 12.11.2020
TRB Polytechnic Lecturer 2017
Nagaland PSC CTSE 2017, 2016, 2015 Paper-II
Kerala PSC AE (Irrigation) 05.04.2017
Punjab PSC SDE 12.02.2017
UKPSC AE 2007 Paper-II

Ans. (b) : In vapour compression refrigeration system, the condition of refrigerant before entering the compressor is saturated vapour.



165. What is the idea behind replacing an expander with a throttle valve in vapour compression refrigeration systems?

(a) Because it considerably reduces the system weight
(b) Because it improves the COP as the condenser is small
(c) Because the positive work in Isentropic expansion of liquid is very small
(d) Because it leads to significant cost reduction

HPPSC Asstt. Prof. 18.09.2017
UPRVUNL AE 2014, APPSC AEE 2012
UKPSC AE 2007 Paper-II, ESE 1996

Ans : (c) The idea behind is replacing an expander with a throttle valve in vapour compression refrigeration systems because the positive work in Isentropic expansion of liquid is very small and the work output does not justify the cost of expander.

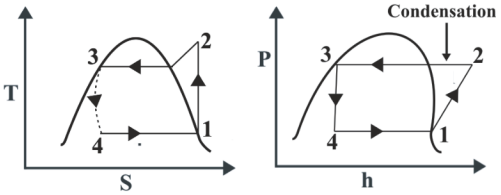
Search on Telegram @apna_pdf

166. In vapour compression system, the condition of refrigerant before passing through the condenser is

(a) Saturated liquid
(b) wet vapour
(c) Dry saturated vapour
(d) superheated vapour

Nagaland PSC (CTSE) 2018, Paper-II
ISRO Scientist/Engineer (RAC) 07.05.2017
VIZAG STEEL MT 2017
RPSC IOF & Boiler 20.09.2017

Ans. (d) : In vapour compression system, the condition of refrigerant before passing through the condenser is super heated vapour.



Process (1-2) - Adiabatic compression
Process (2-3) - Condensation
Process (3-4) - Throttling
Process (4-1) - Evaporation

167. Coefficient of performance (COP) of vapour compression refrigeration system with T_e as evaporator temperature and T_c as condenser temperature.

(a) Increases with increase in T_e at constant T_c
(b) Does not change with variation of T_e at constant T_c
(c) Increases with increase in T_c at constant T_e
(d) Increases with decrease in T_e at constant T_c

Oil India Ltd. Sr. Engg. (Production) 30.11.2019
CGPSC AE 25.02.2018
RPSC LECTURER 16.01.2016

Ans. (a) : We know that,
Coefficient of performance of vapour Compression refrigeration system.

$$(COP)_{VCRS} = \frac{T_e}{T_c - T_e}$$

$\therefore \quad (COP)_{VCRS} = f(T_c, t_e)$

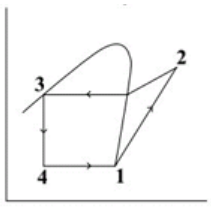
If T_c is constant.

$$(COP)_{VCRS} \uparrow = \frac{T_e \uparrow}{(T_c - T_e \uparrow)\downarrow}$$

Then

$$T_e \uparrow \Rightarrow (COP)_{VCRS} \uparrow$$

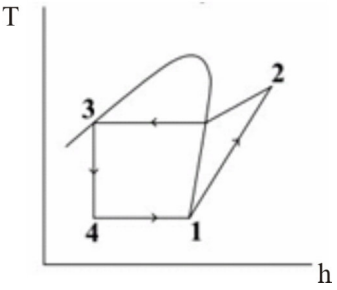
168. The vapour compression refrigeration cycle is represented as shown in the figure below, with state 1 being the exit of the evaporator. The coordinate system used in this figure is



(a) p-h (b) T-s
(c) p-s (d) T-h

UPPSC AE 13.12.2020, Paper-2
Gujarat PSC AE 2019
BEL PE 2015, GATE 2005

Ans : (d)



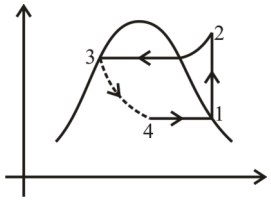
Reasons-
(i) The throttling process 3-4 is vertical i.e., at constant enthalpy. So abscissa must be enthalpy.
(ii) Condensation process (P = constant) 2-3 is not horizontal so ordinate does not represented by pressure but temperature.

169. In an ideal vapour compression refrigeration cycle, the specific enthalpy of refrigerant in kJ/kg at the following states is given as
Inlet of condenser : 283
Exit of condenser : 116
Exit of evaporator : 232
The COP of the cycle is

(a) 2.27 (b) 2.75
(c) 3.27 (d) 3.75

ISRO Scientist/Engineer (RAC) 12.01.2020
HPPSC Asstt. Prof. 18.11.2016
UPPSC AE 12.04.2016 Paper-II
GATE 2009

Ans. (a)



Enthalpy at inlet of condenser (h_2) = 283 kJ/kg enthalpy at exit of evaporator (h_1) = 232kJ/kg enthalpy as exit of condenser (h_3) = enthalpy as inlet of evaporator (h_4) = 116 kJ/kg

$h_3 = h_4 = 116$ kJ/kg

$$COP = \frac{h_1 - h_4}{h_2 - h_1} = \frac{232 - 116}{283 - 232} = 2.274$$

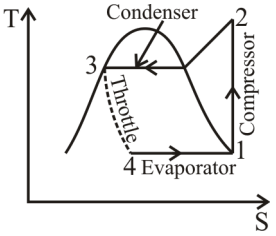
Search on Telegram @apna_pdf

170. In a refrigeration cycle, the heat is absorbed by a refrigerant in a

(a) Evaporator (b) Condenser
(c) Compressor (d) Expansion valve

RPSC VPITI 14.02.2016
MPPSC State Forest Service Exam, 2014
UKPSC AE 2012 Paper-II
J&K PSC Civil Services Pre, 2010

Ans. (a) :



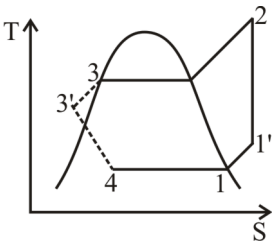
1-2 is the process of heat addition to the refrigerant; the heat is absorbed before compression in the evaporator.

171. Sub-cooling heat exchanger is used in a refrigeration cycle. The enthalpies at condenser outlet and evaporator outlet are 78 kJ/kg and 182 kJ/kg respectively. The enthalpy at outlet of isentropic compressor is 230 kJ/kg and enthalpy of sub-cooled liquid is 68 kJ/kg. The COP of the cycle is

(a) 3.25 (b) 2.16
(c) 3.0 (d) 3.5

Nagaland PSC CTSE 2016 Paper-II
Haryana PSC Civil Services Pre, 2014
TRB Asst. Prof. 2012, ESE 2002

Ans. (c)



Given,
$h_3 = 78$ kJ/kg
$h_1 = 182$ kJ/kg
$h_2 = 230$ kJ/kg
$h_4 = h_{3'} = 68$ kJ/kg

Degree of subcooling = Degree of superheating

$$h_3 - h_{3'} = h_{1'} - h_1$$

$$78 - 68 = h_{1'} - 182$$

$$\boxed{h_{1'} = 192\,kJ/kg}$$

$$COP = \frac{h_1 - h_4}{h_2 - h_{1'}}$$

$$COP = \frac{182 - 68}{230 - 192}$$

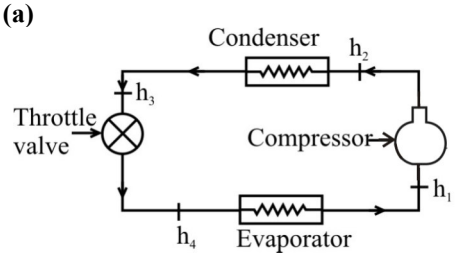
$$\boxed{COP = 3}$$

172. A simple saturated refrigeration cycle has the following state points, enthalpy after compression = 425 kJ/kg, enthalpy after throttling = 125 kJ/kg, enthalpy before compression = 375 kJ/kg. The COP of cycle will be :

(a) 5 (b) 3.5
(c) 6 (d) 10

GPSC DEE, Class-2 (GWSSB) 04.07.2021
HPPSC W.S. Poly. 2016
UKPSC AE 2012 Paper-II

Ans : (a)



$h_2 = 425$kJ/kg
$h_4 = 125$ kJ/kg
$h_1 = 375$ kJ/kg

$$COP = \frac{\text{Refrigeration effect}}{\text{work input}} = \frac{h_1 - h_4}{h_2 - h_1}$$

$$COP = \frac{375 - 125}{425 - 375}$$

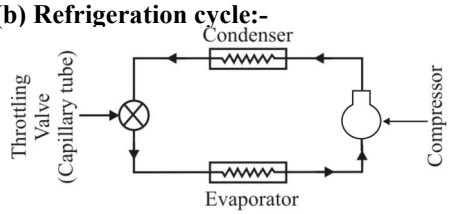
$$COP = 5$$

173. The throttling operation in a refrigeration cycle is carried out in

(a) evaporator (b) capillary tube
(c) discharge valve (d) expansion valve

(KPSC AE 2015), Assam PSC CCE PRE. 2015
UKPSC AE 2012 Paper-II

Ans : (b) Refrigeration cycle:-



The throttling operation in a refrigeration cycle is carried out in capillary tube.

174. In a vapour compression system, the condition of refrigerant before entering the expansion or throttle valve is

(a) high pressure saturated liquid
(b) wet vapour
(c) very wet vapour
(d) dry vapour

OPSC AEE 2019 Paper-II
Nagaland PSC (CTSE) 2018, Paper-II
Punjab PSC SDE 12.02.2017

Ans. (a) : In a vapour compression system the condition of refrigerant before entering the expansion or throttle valve is high pressure saturated liquid.

⇒ After leaving the expansion valve the condition of refrigerant is low pressure saturated liquid and vapour mixture.

Search on Telegram @apna_pdf

175. The pressure at the inlet of a refrigerant compressor is called

(a) Suction pressure (b) Discharge pressure
(c) Critical pressure (d) Back pressure

CGPSC AE 15.01.2021
Nagaland PSC (CTSE) 2018, Paper-II
JPSC AE 2013 Paper-V

Ans. (a) : The pressure at the inlet of a refrigerant compressor is called suction pressure in case of a compressor, the pressure in the line connected to the inlet (suction) of the compressor determines the pressure at the suction of the compressor.

176. When the discharge pressure is too high in a refrigeration system, high pressure control is installed to

(a) stop the cooling fan
(b) stop the water pump
(c) regulate the flow of cooling water
(d) stop the compressor

UPRVUNL AE 2014
APPSC Poly. Lect. 2013, ESE 1996

Ans. (d) : When the discharge pressure is too high in a refrigeration system, high pressure control is installed to stop the compressor.

177. The flash chamber in a single stage simple vapour compression system

(a) increases the refrigerating effect
(b) decreases the refrigerating effect
(c) increases the work of compression
(d) has no effect on refrigerating effects

GPSC ARTO Pre 30.12.2018
TSPSC AEE 2015, ESE 1998

Ans. (d) : Flash chamber separates the liquid from vapour refrigerant and sends only liquid refrigerant to evaporator & vapour to compressor by passing evaporator coil.

178. In a vapour compression cycle the condition of refrigerant is saturated liquid :

(a) before entering the compressor
(b) before passing through the condenser
(c) after passing through the condenser
(d) after passing through the expansion valve.

Kerala PSC AE 06.08.2015
KPSC AE 2015, TNPSC ACF 2012

Ans. (c) : Vapour Compression cycle- In vapour compression cycle, after passing through the condenser the refrigerant is saturated liquid.

179. The vapour compression refrigerator employs the following cycle-

(a) Carnot (b) Reversed Carnot
(c) Rankine (d) Reversed Rankine

GPSC Executive Engg. 23.12.2018
Kerala PSC AE (Irrigation) 05.04.2017
ISRO Scientist/Engineer (RAC) 29.11.2015

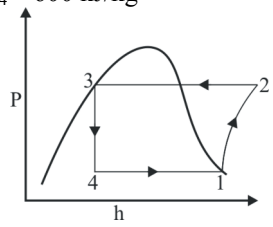
Ans : (d) The vapour compression refrigerator employs reversed Rankine cycle

180. For simple vapour compression cycle, enthalpy at suction = 1600kJ/kg, enthalpy at discharge from the compressor = 1800kJ/kg, enthalpy at exit from condenser = 600 kJ/kg. What is the COP for his refrigeration cycle?

(a) 3.3 (b) 5.0
(c) 4.0 (d) 4.5

MPPSC AE 2016, ESE 2008

Ans : (b) $h_1 = 1600$ kJ/kg
$h_2 = 1800$ kJ/kg
$h_3 = h_4 = 600$ kJ/kg



$$(COP)_{ref} = \frac{\text{Refrigeration effect}}{\text{Work input}}$$

$$(CoP)_{ref} = \frac{1600-600}{1800-1600} = \frac{1000}{200} = 5$$

$$\boxed{(COP)_{ref} = 5}$$

181. In refrigeration, if the vapour is not superheater after compression it is

(a) Dry Compression
(b) Wet Compression
(c) Superheated Compression
(d) Saturated Compression

UPRVUNL AE 05.07.2021
TNPSC AE 2013

Ans. (b) : It is an isentropic compression process of the refrigerant where work is supplied to the compressor to increase the pressure. If the refrigerant is found in both liquid and vapour from at this stage, it is called wet compression. If the refrigerant is purely in a vapour from, it is called dry compression.

182. The performance of which of the following units in a vapour compression system is adversely affected by the presence of moisture?

(a) Condenser (b) Expansion valve
(c) Evaporator (d) Compressor

OPSC AEE 2015 Paper-II
OPSC Civil Services Pre. 2011

Ans. (b) : Presence of moisture in a refrigerant affects the working of expansion valve.

183. Co-efficient of performance is always

(a) more than unity
(b) less than unity
(c) equal to unity
(d) none of these

GPSC ARTO 01.05.2016
TNPSC AE (Industries) 09.06.2013

Ans. (a) : Coefficient of performance (COP) > 1

Search on Telegram @apna_pdf

184. The formation of frost on cooling coils in a refrigerator.

(a) Increases the heat transfer
(b) Improves the C.O.P. of the system
(c) Increases the power consumption
(d) Reduces the power consumption

ISRO Scientist/Engineer (RAC) 22.04.2018
GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : The formation of frost on cooling coils in a refrigerator reduces the heat transfer, hence for same heat transfer rate work required will increased hence power consumption increased.

185. The C.O.P. of Carnot refrigerator in winter will be _____ as compared to C.O.P. if summer.

(a) Lower (b) Higher
(c) Same (d) Unpredictable

OPSC AEE 2019 Paper - II
GPSC Lect. (Poly.) 07.12.2014

Ans. (b) : $(COP)_R = \dfrac{T_L}{T_H - T_L}$

$= \dfrac{1}{\dfrac{T_H}{T_L} - 1}$

(T_H) summer > (T_H) winter

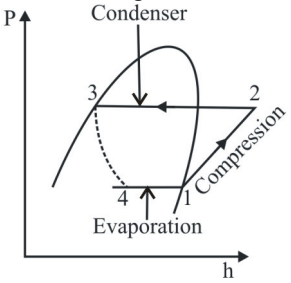
i.e. surrounding temperature in summer is more than the winter hence $[(COP)_R]_{winter} > [(COR)_R]_{summer}$

186. The enthalpies at the beginning of compression, at the end of compression and at the end of condensation are respectively 185kJ/kg, 210kJ/kg and 85kJ/kg. What is COP of VCRS?

(a) 0.25 (b) 5.4
(c) 4 (d) 1.35
(e) 5

CGPSC ARTO & TSI 07.01.2017
ESE 2005

Ans. (c) : $h_1 = 185$ kJ/kg
$h_2 = 210$ kJ/kg
$h_4 = h_3 = 85$ kJ/kg



$COP = \dfrac{h_1 - h_4}{h_2 - h_1}$

$COP = \dfrac{185 - 85}{210 - 185}$

$COP = \dfrac{100}{25}$

$COP = 4$

187. The sub-cooling is a process of cooling the refrigerant in vapor compression refrigeration system

(a) Before compression (b) After compression
(c) Before throttling (d) After throttling

GPSC DEE, Class-2 (GWSSB) 04.07.2021
TNPSC AE (Industries) 09.06.2013

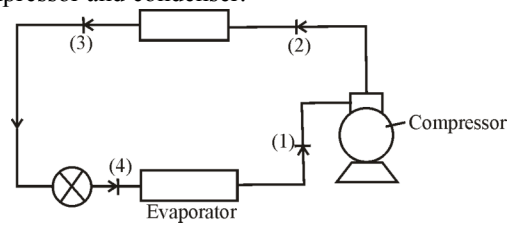
Ans. (c) : The sub-cooling is a process of cooling the refrigerant in vapor compression refrigeration system before throttling.

188. In mechanical refrigeration system, the refrigerant has the maximum temperature

(a) in evaporator
(b) before expansion valve
(c) between compressor and condenser
(d) between condenser and evaporator

Nagaland PSC (CTSE) 2018, Paper-II
UKPSC AE 2012 Paper–II

Ans. (c) : In mechanical refrigeration system the refrigerant has the maximum temperature between compressor and condenser.

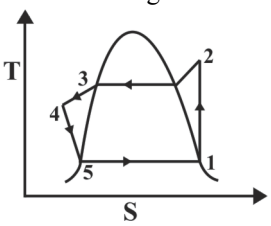


189. In refrigeration cycle, sub cooling occurs when

(a) Latent heat from refrigerant is removed
(b) Sensible heat from refrigerant is removed
(c) Refrigerant has low latent heat removed
(d) Refrigerant has high thermal conductivity

ISRO Scientist/Engineer (RAC) 07.05.2017
BPSC AE 2012 Paper-V

Ans. (b) : In refrigeration cycle, sub cooling occurs when sensible heat from refrigerant is removed.



In above figure process 3-4, show sub-cooling which remove sensible heat from refrigerant.

Process 1-2 → compression
Process 2-3 → condensation
Process 3-4 → sub-cooling
Process 4-5 → throttling
Process 5-1 → evaporation

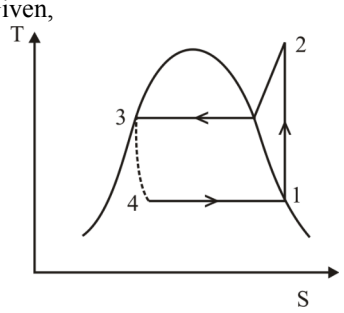
190. In a vapor compression refrigeration plant, the refrigerant leaves the evaporator at 195 kJ/kg and the condenser at 65 kJ/kg. For every kg of refrigerant the plant can supply per second a cooling load of :

Search on Telegram @apna_pdf

(a) 70 kW (b) 100 kW
(c) 130 kW (d) 160 kW

GPSC ARTO Pre 30.12.2018, ESE 2005

Ans. (c) : Given,



$h_1 = 195$ kJ/kg

$h_3 = h_4 = 65$ kJ/kg

$\dot{m} = 1$ kg/s

Cooling load, $\Rightarrow RE = \dot{m}(h_1 - h_3)$

$= 1(195 - 65)$

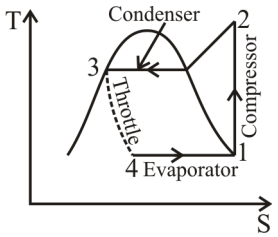
$= 130$ kW

191. In a VCR plant, the refrigerant leaves the compressor and evaporator with enthalpy of 205 kJ/kg and 177 kJ/kg respectively. Enthalpy of the refrigerant leaving the condenser is 105 kJ/kg. If the mass flow rate of the refrigerant is 0.2 kg/s, the refrigeration effect will be

(a) 12.2 kW (b) 14.4 kW
(c) 16.4 kW (d) 20.2 kW

GPSC ARTO Pre 30.12.2018
GPSC EE Pre, 28.01.2017

Ans. (b) :



Throttling device so,

$h_3 = h_4 = 105$ kJ/kg

$h_1 = 177$ kJ/kg, $h_2 = 205$ kJ/kg

$R.E = \dot{m}(h_1 - h_4)$

$= 0.2(177 - 105)$

$= 0.2 \times 72$

$= 14.4$ kW

192. In a vapour compression refrigeration system, liquid to suction heat exchanger is used to

(a) Keep the COP constant.
(b) Prevent the liquid refrigerant from entering the compressor.
(c) Sub-cool the liquid refrigerant leaving the condenser.
(d) Sub- cool the vapour refrigerant from the evaporator.

Karnataka PSC Lect., 27.05.2017
HPPSC Asst. Prof. 18.11.2016

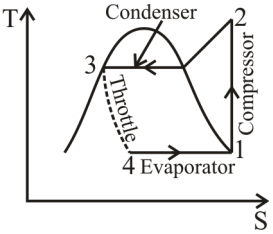
Ans. (c) : In a vapour compression refrigeration system liquid to suction heat exchanger is used to sub-cool the liquid refrigerant leaving the condenser.

193. The condition of a refrigerant after passing through the expansion or throttle valve in a vapour compression refrigeration system is

(a) High pressure saturated liquid
(b) Very wet vapour
(c) Dry vapour
(d) None of the above

Karnataka PSC Lect., 27.05.2017
CSE Pre-2002

Ans (b) :



The refrigerant in VCRS immediately after expansion is wet vapour as shown below:
Point '4' shows the wet vapour after expansion valve.

194. The lowest temperature during the cycle in a vapour compression system occurs after.

(a) Compression (b) Expansion
(c) Condensation (d) Evaporation

ISRO Scientist/Engineer (RAC), 10.03.2019
Nagaland PSC (CTSE) 2018, Paper-II

Ans. (b) : Expansion– Lowest temperature during the cycle in vapour compression system occurs after (expansion).

195. In simple saturated vapour compression refrigeration cycle the following results were obtained. Heat rejected in condenser = 160 kJ/kg, compressor work = 32 kJ/kg. The COP of refrigeration is :

(a) 5
(b) 4
(c) 6
(d) not possible to find with this data

UKPSC AE 2013 Paper-II, APPSC IOF, 2009

Ans. (b) : $COP = \dfrac{\text{Ref. effect}}{\text{Compressor work}} = \dfrac{160 - 32}{32}$

$= \dfrac{128}{32} = 4$

196. The COP of a vapour compression plant in comparison to vapour absorption plant is :

(a) more
(b) less
(c) same
(d) more/less depending on size of plant

OPSC AEE 2019 Paper-II
J & K PSC Screening, 2006

Ans. (a) : COP of vapour compression plant – 4 to 6
COP of vapour absorption plant – 0.8 to 1.2

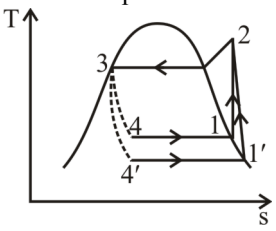
Search on Telegram @apna_pdf

197. If the evaporator temperature of a plant is lowered keeping the condenser temp. constant, the power input of compressor required will be

(a) same (b) more
(c) less (d) unpredictable

ISRO Scientist/Engineer (RAC) 22.04.2018
RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : If the evaporator temperature of a plant is lowered, by keeping condenser temperature constant, it means you are increasing effort by compressor. So, compressor required more power for desired output.



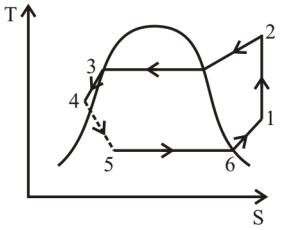
$$(W_{comp.})_{1-2} < (W_{comp.})_{1'-2}$$

198. The effects of superheating of vapour in the evaporator and sub-cooling of condensate in the condenser :

(a) Decrease the COP
(b) Increase the COP
(c) Superheating increases COP, but sub-cooling decrease COP
(d) Superheating decrease COP, but sub-cooling decreases COP

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
ESE 2010

Ans. (b) :



When superheating of vapour in the evaporator and sub-cooling of condensate in the condenser is done simultaneously then it is known as Grindley cycle and it's sole effect to increase the COP.

199. Which of the following statement is wrong?

(a) The performance of the vapour compression refrigerator varies considerably with both vaporising and condensing temperatures.
(b) In vapour compression cycle, the useful part of the heat transfer is at the condenser.
(c) In ammonia hydrogen (Electrolux) refrigerator, no compressor is required.
(d) The effect of under cooling the refrigerant is to decrease the coefficient of performance.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II

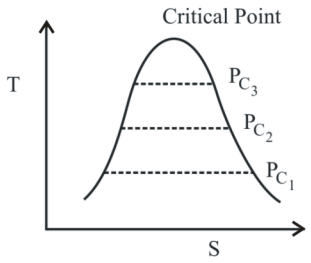
Ans. (d) : The effect of under cooling the refrigerant is to increase the coefficient of performance.

200. In a vapour compression refrigeration cycle for making ice, the condensing temperature for higher COP.

(a) should be near the critical temperature of the refrigerant
(b) should be above the critical temperature of the refrigerant
(c) should be much below the critical temperature of the refrigerant.
(d) could be of any value as it does not affect the COP.

RPSC ACF & FRO, 26.02.2021, ESE 2006

Ans. (c) :



$P_C \rightarrow$ Critical pressure

As critical pressure or critical temperature increases, the refrigeration effect decreases and work input increases. So the condensing temperature should be much below the critical temperature.

201. The highest temperature during the cycle, in a vapor compression refrigeration system, occurs after

(a) Compression (b) Condensation
(c) Expansion (d) Evaporation

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : The highest temperature during the cycle, in a vapor compression refrigeration system, occurs after compression.

202. Wet compression vapor compression refrigeration cycle means

(a) Vapor compression takes place in wet region
(b) Vapor compression in dry region, but evaporation in wet region
(c) Vapor compression in wet region, but leaves in super heated region
(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Wet compression vapor compression refrigeration cycle means vapor compression takes place in wet region.

203. The order in which main components of vapor compression of refrigeration system are used is

(a) Compressor-Evaporator-Condenser-Throttle valve
(b) Compressor-Condenser-Evaporator-Throttle valve
(c) Compressor-Condenser-Throttle valve-Evaporator
(d) Compressor-Throttlevalve-Evaporator-Condenser

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) :

Search on Telegram @apna_pdf

204. The flow rate of refrigerant R-12 in a refrigerator is 0.03 kg/s. The refrigerant enters the compressor as saturated at 150.9 kPa. After adiabatic compression, it enters the condenser as superheated vapour at 500 kPa and 100°C and leaves the condenser as saturated liquid at the same pressure.

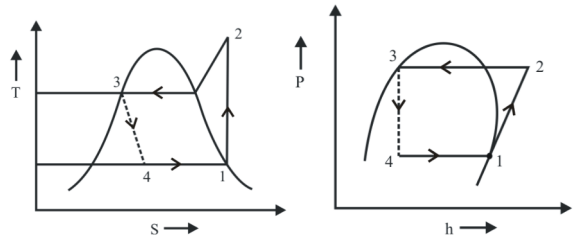
Pressure (kPa)	Temperature (°C)	Specific enthalpy	
		h_ℓ (kJ/kg)	h_g (kJ/kg)
150.9	–20	17.82	178.74
500	15.6	50.64	195.01
For the saturated vapour at 500 kPa and 100 °C, h = 252.05 kJ/kg.			

Using the data given above, the refrigeration effect in kW will be :

(a) 3.70 (b) 3.84
(c) 4.00 (d) 3.25

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) :



Refrigeration effect (RE) = m [$h_1 - h_4$]
= m [$h_1 - h_3$]
$h_3 = h_4$ (Isenthalpic process)
= 0.03 [178.74 – 50.64]
RE = 3.84 kW

205. The flash chamber intercooler allows the refrigerant to enter the 2nd state of compressor of vapour compression refrigeration system at the state of :

(a) Dry saturated vapour
(b) Saturated liquid
(c) Wet vapour
(d) Superheated vapour

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

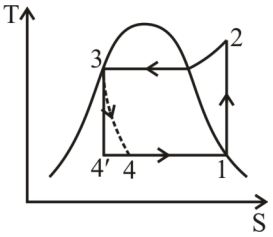
Ans. (b) : Flash chamber is a device which is used to separate the liquid refrigerant from a mixture of refrigerant at the entry of evaporator, It allows only the liquid refrigerant to enter into evaporator which results in absorption of heat.

206. In vapour compression refrigeration system, if expansion cylinder is used in place of throttle valve, the COP will

(a) increase
(b) decrease
(c) will remain same
(d) not be predictable unless refrigerant used is known

JPSC AE, 10.04.2021, Paper-I

Ans. (a)



- When we use throttle valve,

$$(COP)_1 = \frac{\text{Desired effect}}{\text{Power input}} = \frac{h_1 - h_4}{h_2 - h_1}$$

- When we use expansion cylinder (isentropic expander)

$$(COP)_2 = \frac{\text{Desired effect}}{\text{Power input}} = \frac{h_1 - h_{4'}}{h_2 - h_1}$$

$(COP)_2 > (COP)_1$ because desired effect while using throttle valve is more than desired effect when we use expansion cylinder.

In VCRS if expansion cylinder is used in place of throttle valve the COP will increase.

207. Freon-12 is used in a simple saturation cycle, with suction saturation temperature of – 10°C and condensing saturation temperature of 30°C. If the clearance volume is 6% of the stroke volume, what is the volumetric efficiency? (Consider specific volume at suction and discharge to be 0.07815 m^3/kg) and 0.025 m^3/kg respectively)

(a) 87.24% (b) 71.31%
(c) 64.85% (d) 55.43%

ESE 18.07.2021

Ans. (a)

Volumetric efficiency (η_v)

$$= 1 + C - C\frac{V_{suction}}{V_{discharge}}$$

$$C = \text{Clearance factor} = \frac{\text{Clearance volume}}{\text{Swept volume}} = 0.06$$

Stroke volume = swept volume

$$\therefore \eta_v = 1 + C - C\left(\frac{V_{suction}}{V_{discharge}}\right)$$

$$= 1 + 0.06 - \left(0.06 \times \frac{0.07815}{0.025}\right)$$

= 0.8724 = 87.24%

208. The heat rejection factor in vapour compression refrigeration system will be

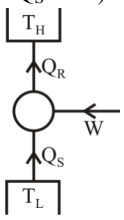
(a) equal to 1
(b) more than 1
(c) less than 1
(d) depends on cooling medium of the condenser

ISRO Scientist/Engineer (RAC) 12.01.2020

Search on Telegram @apna_pdf

Ans. (b) : Heat rejection ratio $(HRR) = \frac{Q_R}{Q_S}$

$Q_R > Q_S$ $(Q_R = Q_S + W)$



So HRR in vapour compression refrigeration system will be more than one.

Alternate solution,

$$\boxed{HRR = 1 + \frac{1}{COP}}$$

COP of VCRS is always greater than one

So, $\boxed{HRR > 1}$

209. The power consumption of Vapour Compression Refrigeration System (VCRS) with air cooled condenser compared to VCRS with water cooled system will be higher due to

(a) High discharge temperature
(b) High condensing temperature
(c) Low suction temperature
(d) High refrigeration load

ISRO Scientist/Engineer (RAC) 12.01.2020

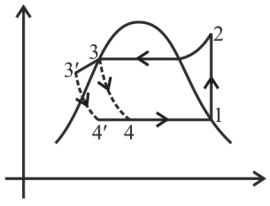
Ans. (a) : The power consumption of Vapour Compression Refrigeration System (VCRS) with air cooled condenser compared to VCRS with water cooled system will be higher due to 'High discharge temperature', VCRS with water is high efficient than VCRS with air.

210. Liquid sub cooler in Vapour Compression Refrigeration System will

(a) Prevent the entry of liquid into compressor
(b) Increases Net Refrigeration Effect
(c) Reduce work of compression
(d) Increase work of compression

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (b) :



VCRS cycle with subcooling ⇒ 1–2–3–4

VCRS cycle with subcooling ⇒ 1–2–3′–4′

It is clear from the graph, liquid subcooler increases net refrigeration effect and it does not affect the work of compression.

211. A refrigerator is operating on ideal vapour compression cycle with R-134a as working fluid at flow rate of 0.1 kg/s. Data given are :

Enthalpy at the inlet of the compressor = 240 kJ/kg

Enthalpy at the outlet of the compressor = 280 kJ/kg

Enthalpy at the outlet of the condenser = 100 kJ/kg

What will be the refrigeration capacity and COP of the refrigerator, respectively?

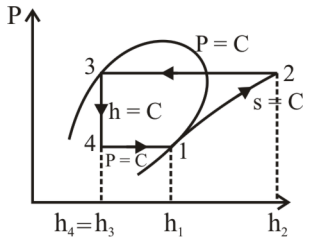
(a) 14 kW, 3.5 (b) 4 kW, 4
(c) 10 kW, 2 (d) 5 kW, 3.5

APPSC Poly Lect. 13.03.2020

Ans. (a) : Given, $h_1 = 240 kJ/kg$, $h_2 = 280$ kJ/kg,

Mass of refrigerant $(m_{ref}) = 0.1$ kg/sec,

$h_3 = h_4 = 100$ kJ/kg



$$COP = \frac{\text{Refrigerating Effect (R.E.)}}{\text{Work input } (W_{in})}$$

$$= \frac{h_1 - h_4}{h_2 - h_1}$$

$$= \frac{240 - 100}{280 - 240}$$

COP = 140 / 40 = 3.5

Now,

Refrigeration capacity (RC) = R.E. × $\dot{m}_{ref}$

$$RC = (h_1 - h_4) \times \dot{m}_{ref}$$

$\because$ RC = (240–100) × 0.1

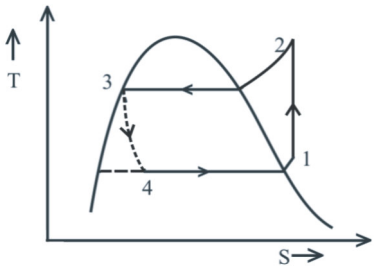
RC = 14 kW

212. Which one of the following is the effect of suction vapour superheat?

(a) Decreases the refrigeration effect
(b) Decreases the specific volume
(c) Decreases the energy for compression
(d) Increases the refrigeration effect

UPPSC AE 13.12.2020, Paper-2

Ans. (d)



The effect of suction vapour superheat increases the refrigeration effect.

Search on Telegram @apna_pdf

213. For a vapor compression refrigeration cycle, compressor work for the same cooling capacity could be reduced by

(a) Superheating in evaporator
(b) Subcooling in condenser
(c) Reducing condenser pressure
(d) Increasing evaporator pressure

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) :

214. A Freon 12 simple saturation cycle operates at temperature of 35°C and –15°C for the condenser and evaporator. If the refrigeration effect produced by the cycle is 111.5 kJ/kg and the work required by the compressor is 27.2 kJ/kg, the value of COP will be nearly

(a) 4.1 (b) 3.6
(c) 3.1 (d) 2.6

ESE 2020

Ans. (a) :

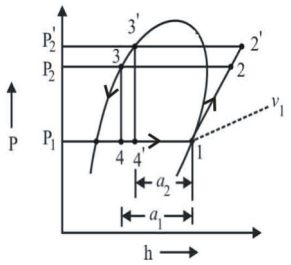
$$COP = \frac{RE}{W} = \frac{111.5}{27.2} = 4.099$$

215. In vapour compression refrigeration system, increase in compressor delivery pressure :

(a) decreases the heat rejection.
(b) increases the refrigeration effect.
(c) decreases the refrigeration effect
(d) increases the heat rejection.

NLC GET 17.11.2020, Shift-II

Ans. (c) :



An increase in condensing pressure result in a decrease of the refrigerating capacity (h_1–h_4) and increase in power consumption as seen From the cycle 1-2-3-4 changed to cycle 1-2'-3'-4' shows decrease in refrigerating capacity effect and volumetric efficiency. The increase in power consumption is due to the increased mass Flow due to decreased refrigerating effect and an increase in specific work due to increased pressure ratio although the isentropic line remains the same.

216. If the pressure range of compressor is low, then the COP will be

(a) low
(b) high
(c) remains unchanged
(d) Cannot be determined

JPSC AE PRE 2019

Ans. (b) : If the pressure range of compressor is low, then the COP will be high.

217. The principle of vapour compression system is that fluids absorb heat while changing from a :

(a) Vapour phase to liquid phase and give up heat in changing from liquid phase to vapour phase
(b) Liquid phase to vapour phase and give up heat in changing from a vapour phase to liquid phase
(c) Vapour phase to liquid phase only
(d) Liquid phase to solid state phase and give up heat in changing from a solid state to liquid phase

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (b) : VCRS system absorb heat during change of liquid phase to vapour phase (In evaporator) and release heat in changing from vapour phase to liquid phase in condenser.

218. In vapour compression refrigeration system, heat rejected as compared to heat absorbed is

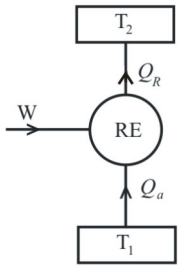
(a) More
(b) Less
(c) Equal
(d) Depends on the refrigerant used

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) : In VCRS system Heat rejected is more as compared to heat absorbed.

$$Q_R = Q_a + w$$

$$\boxed{Q_R > Q_a}$$



219. The coefficient of performance of vapour compression refrigeration system:

(a) decreases with the decrease in evaporator temperature at fixed condenser temperature
(b) Increases with the increase in condenser temperature at fixed evaporator temperature
(c) Remains constant with the decrease in evaporator temperature at fixed condenser temperature
(d) Increases with the decrease in evaporator temperature at fixed condenser temperature

SJVN ET 2019

Ans. (a) : Effect of decrease in evaporator pressure-

- Refrigerating effect will decrease.
- COP will decrease.
- Volumetric efficiency will decrease.
- Work done will increase.
- Effect of increase in condense pressure
- Refrigeration effect will decrease.
- COP will decrease.
- Volumetric efficiency will decrease.
- Work done will increase.

Search on Telegram @apna_pdf

220. The compressor of an ammonia refrigerating machine has a volumetric efficiency of 85% and swept volume of 0.28m^3/min. Ammonia having a dry specific volume of 0.25m^3/kg enters the compressor with a dryness fraction of 0.7. The mass flow rate of ammonia through the machine is

(a) 1.28 kg/min (b) 1.36 kg/min
(c) 1.42 kg/min (d) 1.57 kg/min

ESE 2018

Ans. (b) : $\eta_{vol.} = \dfrac{\text{Actual volume}}{\text{Theoretical swept volume}}$

$= \dfrac{m_r . v_1}{v_s}$

$\dot{m}_r \times v_1 = \eta_{vol.} \times V_s$

$\dot{m}_r \times x \times v_1 = \eta_{vol.} \times V_s$

$\dot{m}_r \times 0.7 \times 0.25 = 0.85 \times 0.28$

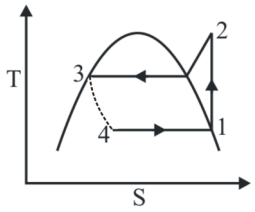
$\boxed{\dot{m}_r = 1.36 \text{ kg/min}}$

221. The following data refer to a vapour compression refrigerator:
Enthalpy at compressor Inlet = 1200 kJ/kg
Enthalpy at compressor Outlet = 1400 kJ/kg
Enthalpy at condenser Outlet = 200 kJ/kg
The COP of the refrigerator is

(a) 7 (b) 6
(c) 5 (d) 4

ESE 2018

Ans. (c) : Given,



$h_1 = 1200$ kJ/kg
$h_2 = 1400$ kJ/kg
$h_3 = h_4 = 200$ kJ/kg

Because of constant enthalpy expansion take place

$$COP = \frac{h_1 - h_4}{h_2 - h_1} = \frac{1200 - 200}{1400 - 1200} = 5$$

222. Consider the following statements:

1. The operation of a refrigerator unit at more than one temperature can be accomplished by using different throttling valves and a separate compressor for each 'temperature range'.
2. The refrigerated space must be maintained above the ice point to prevent freezing.
3. In domestic refrigerators, the refrigerant is throttled to a higher pressure in the freezer followed by full expansion in the refrigerated space.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

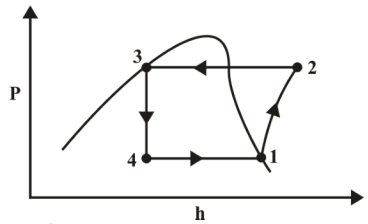
Ans. (a) : In domestic refrigerators refrigerant is throttled to lower pressure in freezer when compared to refrigerator, statement-3 is wrong. Hence by elimination method only option (a) is true.

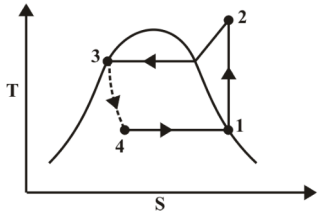
223. Which one of the following expansion process takes place in a vapour compression cycle?

(a) Polytropic process with change in temperature
(b) Adiabatic process with work transfer
(c) Isentropic process with change in enthalpy
(d) Adiabatic process with constant enthalpy

RPSC AE 2018

Ans. (d) : Adiabatic process with constant enthalpy expansion process takes place in a vapour compression cycle.





Process (1 - 2) → Isentropic compression process
Process (2 -3) → Constant pressure heat rejection process
Process (3 - 4) → Adiabatic process with constant enthalpy
Process (4 - 1) → Constant pressure heat addition process

224. In Vapour Compression Refrigeration System (VCRS), throttle valve is used in place of isentropic expander because:

(a) throttling process in throttle valve is reversible.
(b) throttling valve improves the refrigeration effect.
(c) positive work in throttle valve is very large.
(d) it reduces the compressor work.
(e) it leads to cost reduction.

CGPSC ARTO & TSI 07.01.2017

Ans. (e) : Isenthalpic expansion is used in place of isentropic expansion of liquid is very less and the work output does not justify the cost expander.
Hence isenthalpic expansion is used in place of isentropic expansion and it leads to cost reduction.

225. Refrigerant entering the compressor of Vapour Compression Refrigeration System is:

(a) superheated to reduce the work input of compressor.
(b) superheated to reduce the refrigerating effect.

Search on Telegram @apna_pdf

(c) superheated to ensure dry compression of refrigerant.
(d) subcooled to reduce the work input of compressor.
(e) subcooled to reduce the refrigerating effect.

CGPSC ARTO & TSI 07.01.2017

Ans. (c) : Refrigerant entering the compressor of Vapour Compression Refrigeration System is superheated to ensure dry compression of refrigerant.

226. Which of the following statements is wrong?
(a) The value of C.O.P. is always greater than one.
(b) In a vapour compression system, the condition of refrigerant before entering the compressor is dry saturated vapour
(c) The space between the saturated liquid line and saturated vapour line in a pressure enthalpy chart is the wet vapour region.
(d) None of the above

Karnataka PSC AE, 10.09.2017

Ans. (a) :
(COP) Refrigerator is > or < 1
$(COP)_{VCRS} > 1$
$(COP)_{VARS} < 1$
$(COP)_{HP} > 1$

227. An ideal vapour compression refrigerator operates between a condenser pressure p_1 and an evaporator pressure p_2. Which of the following changes would increase its COP?
(a) Increasing p_1 by Δp and keeping p_2 constant
(b) Decreasing p_2 by Δp and keeping p_1 constant
(c) Adopting wet compression
(d) Sub cooling the refrigerant

GPSC EE Pre, 28.01.2017, ESE 2012

Ans. (d) : COP decreases with the decreases pressure of evaporator and increasing condenser pressure. The (COP) increases by installed a sub-cooling process between the condenser and expansion value. The sub cooling reduce flashing of the liquid during expansion and increases refrigeration effect.

228. In system A vapour are superheated by 10°C in the evaporator while in system B vapour are superheated by 10°C in a liquid vapour regenerative heat exchanger, other conditions being the same. Then :
(a) COP of A = COP of B
(b) COP of both A and B > COP of Reversed Carnot Cycle.
(c) COP of A > COP of B
(d) COP of A < COP of B

HPPSC Asstt. Prof. 20.11.2017

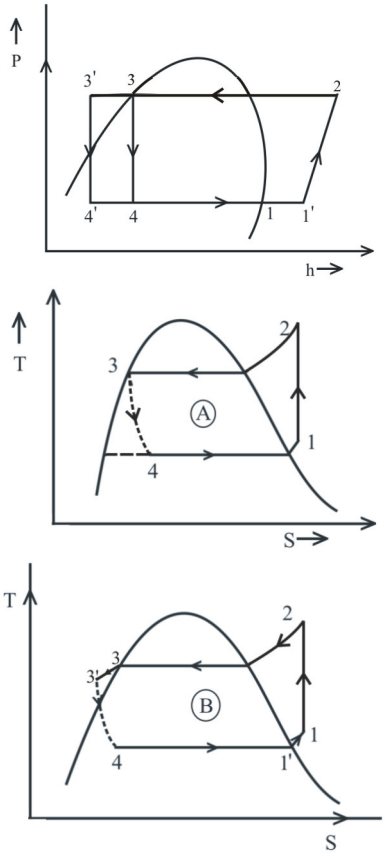
Ans. (a) : Method : 1–

$$h_1' - h_1 = h_3 - h_3'$$

For Regeneration as

$$h_1' - h_4 = h_1 - h_4'$$

$\therefore$ COP is same.



Method : 2–

$RE = h_1 - h_4 \qquad W_{net} = h_2 - h_1$

The heat gain in liquid vapour heat exchanger causes equivalent sub-cooling in refrigerator.

$$h_1 - h_1' = h_3 - h_3'$$

$$RE = h_1' - h_4 = h_1 - h_4$$

$$W = h_2 - h_1$$

229. The C.O.P. of a refrigerator cycle with increase in evaporator temperature, keeping the condenser temperature constant will
(a) Increase
(b) Decrease
(c) Remain unaffected
(d) May increase or decrease depending upon the type of refrigerant used

Nagaland PSC CTSE 2017 2nd Paper

Ans. (a) : The C.O.P. of a refrigerator cycle with increase in evaporator temperature, keeping the condenser temperature constant will increase.

230. In a vapour compression system, superheating of the refrigerant decreases COP, the reason being:
1. Increase of work input to the compression
2. It does not depend on refrigeration effect

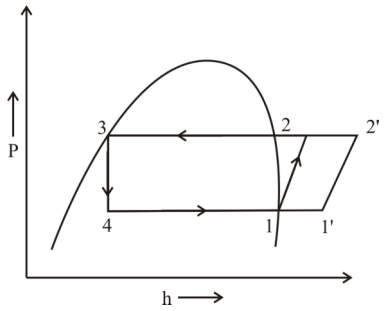
Which of the above statements is/are correct?
(a) 1 only (b) 2 only
(c) Both 1 and 2 (d) Neither 1 nor 2

JWM 2017

Search on Telegram @apna_pdf

Ans. (a) : COP of vapour compression system

$$= \frac{h_1 - h_4}{h_2 - h_1}$$



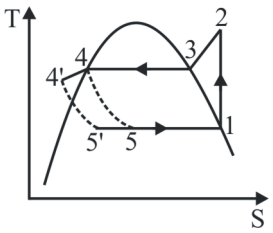
Super heating effect-

- Refrigerating effect will increase
- Work done will be directly proportional to inlet temperature and COP is inversely proportional to the work done. So, as a result of increase of work input to the compression, it will decrease the COP.

231. **Statement (I):** Sub-cooling of a refrigerant liquid increases the coefficient of performance of a refrigeration cycle.
Statement (II): Sub-cooling reduces the work requirement of the refrigeration cycle.

ESE 2017

Ans. (c) :



Process 4–4' → Subcooling
Process 1–2 → Work requirement
The subcooling increases refrigerant effect from ($h_1 - h_5$) to ($h_1 - h_{5'}$) and no work requirement.

232. **Statement (I):** Use of non-azeotropic mixtures used as the refrigerant in a vapour-compression system improves the coefficient of performance.
Statement (II): The increase in this coefficient is attributable to reduction in volume.

ESE 2017

Ans. (c) : The evaporation takes place over a temperature range increasing direction. Hence mean temperature of evaporation increases and condensation takes place over a temperature range in decreasing direction. Mean temperature of heat rejection decreases which results in increased COP not reduction in volume.
So, statement-II is wrong.
The non-azeotropic mixtures are non isothermal refrigerant i.e. temperature of refrigerant varies during heat rejection and addition.

233. **In the working of a vapour-compression refrigeration plant, the following enthalpies are recorded at salient points in the cycle:**

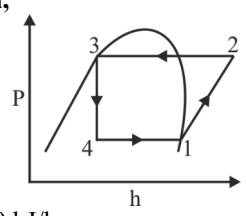
1. Enthalpy at inlet to compressor (saturated vapour), h_1=300kJ/kg.
2. Enthalpy at outlet of compressor (after isentropic compression), h_2=330kJ/kg.
3. Enthalpy at exit of condenser (saturated liquid), h_3=150 kJ/kg.

What is the COP of the plant?

(a) 3 (b) 4
(c) 5 (d) 6

ESE 2017

Ans. (c) : Given,

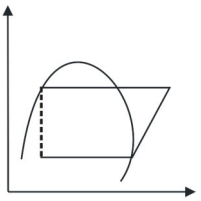


$h_1 = 300$ kJ/kg
$h_2 = 330$ kJ/kg
$h_3 = h_4 = 150$ kJ/kg

$$(COP)_{VCRS} = \frac{\text{Refrigerating effect (RE)}}{\text{Work Input}(W_{in})} = \frac{h_1 - h_4}{h_2 - h_1}$$

$$= \frac{300 - 150}{330 - 300} = \frac{150}{30} = 5$$

234. **The ordinates and abscissa of the diagram given for the vapour-compression refrigeration cycle represent**



(a) pressure and volume
(b) temperature and entropy
(c) enthalpy and entropy
(d) pressure and enthalpy

ESE 2017

Ans. (d) : The given cycle is vapour compression refrigeration cycle. The left side vertical process shown by dotted line is throttling.
So ordinate is pressure and abscissa is enthalpy.

235. **In compound compression system with intercooling in a refrigeration cycle the suction vapour to the second stage of compression is :**

(a) Superheated (b) Wet
(c) Dry saturated (d) Subcooled

HPPSC W.S. Poly. 2016

Ans : (c) In compound compression system with intercooling in a refrigeration cycle the suction vapour to the seconds stage of compression is dry saturated.

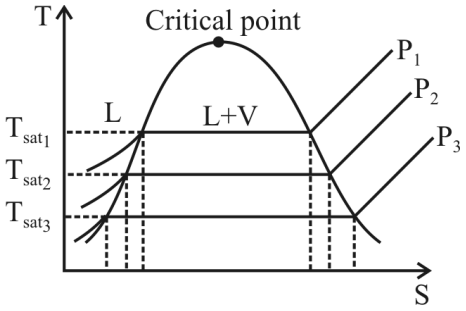
236. **At least pressure and temperature, the latent heat of vaporisation of a refrigerant**

(a) Depends on other factor
(b) Increases
(c) Decreases
(d) Remains same

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Search on Telegram @apna_pdf

Ans. (b) : According to graph as temperature and pressure decreases, the latent heat of vaporisation of refrigerant increases.



$P_1 > P_2 > P_3$, $T_{sat_1} > T_{sat_2} > T_{sat_3}$

So, at least pressure and temperature latent heat of vaporisation maximum (increases).

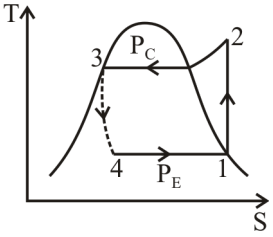
Note-At critical point latent heat vaporisation of substance is zero.

237. Refrigerant vapor enters into the compressor of a standard vapor compression cycle at -10^0C (h = 402 kJ/kg) and leaves the compressor at 50^0C (h = 432 kJ/kg). It leaves the condenser at 30^0C(h = 237 kJ/kg). The COP of the cycle is ---

(a) 4 (b) 3.5
(c) 6 (d) 5
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (e) : Given,



$h_1 = 402$ kJ/kg
$h_2 = 432$ kJ/kg
$h_3 = 237$ kJ/kg

$$(COP)_{cycle} = \frac{h_1 - h_3}{h_2 - h_1}$$

$$= \frac{402 - 237}{432 - 402}$$

$$= \frac{165}{30} = 5.5$$

238. Replacing a water-cooled condenser with an air-cooled one in a vapor compression refrigeration system with constant evaporator pressure result in

(a) Decrease in pressure ratio
(b) Increase in condensation pressure
(c) Increase in pressure ratio
(d) Increase in condensation temperature

UPRVUNL AE 21.08.2016

Ans. : (d) Replacing a water-cooled condenser with an air-cooled one in a vapour compression refrigeration system with constant evaporator pressure result increase in condensation temperature.

239. In a vapour compression cycle, a good refrigerator should have a

(a) Large latent heat of vaporization at condenser pressure.
(b) Large latent heat at evaporator pressure
(c) Condenser pressure close to critical
(d) Low critical pressure

UPPSC AE 12.04.2016 Paper-II
ESE 2013

Ans. : (b) In a vapour compression cycle, a good refrigerator should have a large latent heat at evaporator pressure.

240. COP of air refrigerator is related with COP of vapour compression refrigerator as

(a) $(COP)_{air} > (COP)_{vap.c}$
(b) $(COP)_{air} < (COP)_{vap.c}$
(c) $(COP)_{air} = (COP)_{vap.c}$
(d) None of the above

UPPSC AE 12.04.2016 Paper-II

Ans. : (b) COP of air refrigerator is related with COP of vapour compression refrigerator as

$$\boxed{(COP)_{air} < (COP)_{vap.c}}$$

241. Specific isentropic work of compression in vapour compression refrigeration system decreases with

(a) Decrease in evaporator temperature at constant condenser temperature
(b) Increase in evaporator temperature at constant condenser temperature
(c) Increase in condenser temperature at constant evaporator temperature
(d) Decrease in evaporator temperature and increase in condenser temperature

RPSC Lecturer 16.01.2016

Ans. (b) : Specific isentropic work of compression in vapour compression refrigeration system decreases with increase in evaporator temperature at constant condenser temperature.

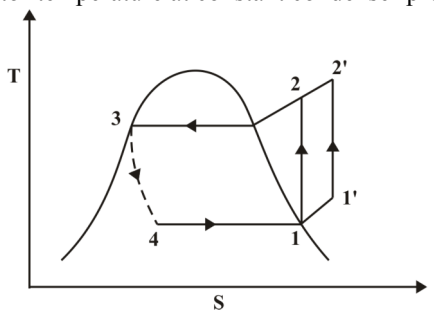
242. Refrigerating effect in vapour compression refrigeration system increases with

(a) Increase in evaporator temperature at constant condenser pressure
(b) Decrease in evaporator pressure at constant condenser pressure
(c) Increase in condenser temperature at constant evaporator temperature
(d) Increase in mass flow rate of refrigerant in the system

RPSC Lecturer 16.01.2016

Search on Telegram @apna_pdf

Ans. (a) : Refrigerating effect in vapour compression refrigeration system increases with increase in evaporator temperature at constant condenser pressure.

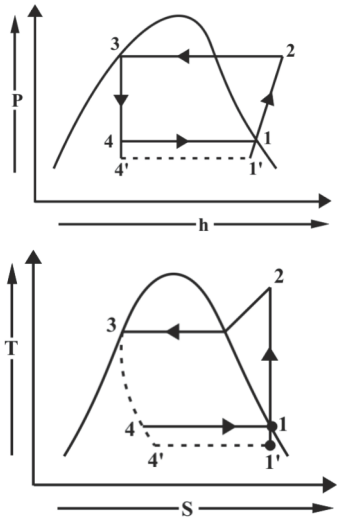


Refrigeration effect
4 - 1' > 4 - 1

243. At constant condenser pressure, reduction in evaporator pressure of vapour compression refrigeration cycle does not lead to:
(a) Decrease in evaporation temperature
(b) Decrease in refrigeration effect
(c) Increase in specific volume of suction vapour
(d) Decrease in specific compressor work

UPRVUNL AE 2016

Ans. (d) : Specific compressor work increase, if condenser pressure remain constant, reduction in evaporator. Pressure of vapour compression refrigeration cycle.

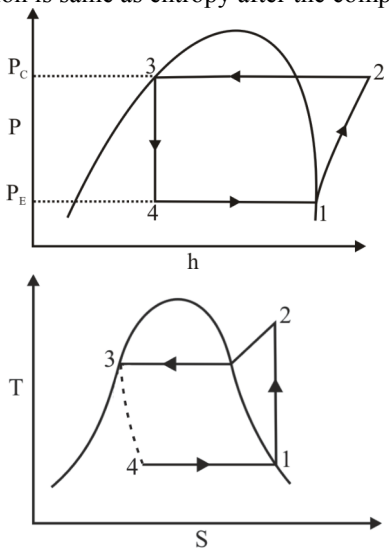


COP ↓, Refrigeration effect ↓

244. In the compression process of vapour compression refrigeration system
(a) Enthalpy before compression is same as enthalpy after the compression
(b) Internal energy before compression is same after the compression
(c) Temperature before compression is same as temperature after the compression
(d) Entropy before compression is same as entropy after the compression

APPSC AEE MAINS 2016 PAPER-III

Ans. (d) : In the compression process of vapour compression refrigeration system entropy before compression is same as entropy after the compression.



From T–S diagram
$S_2 = S_1$ = constant
compression process (1 – 2)

245. In a refrigeration system, expansion valve is incorporated between-
(a) evaporator and compressor
(b) condenser and evaporator
(c) compressor and condenser
(d) superheater and subcooler

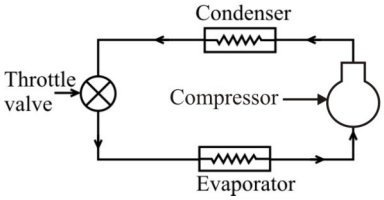
RPSC IOF & Boiler 20.09.2017

Ans : (b) In a refrigeration system, expansion valve is incorporated between condenser and evaporator.

246. A refrigerant moving in a refrigerator follows:
(a) open system
(b) closed system
(c) both open and closed system exists
(d) none of the above

(HPPSC LECT. 2016)

Ans : (b) A refrigerant moving in a refrigerator follows close system.



247. In case of a refrigerator higher COP can be achieved with
(a) lower evaporator temperature and higher condenser temperature
(b) higher evaporator temperature and lower condenser temperature
(c) higher evaporator temperature and higher condenser temperature
(d) lower evaporator temperature and lower condenser temperature

GPSC ARTO 01.05.2016

Search on Telegram @apna_pdf

Ans. (b) : COP of refrigerator

$$\frac{T_E}{T_C - T_E}$$

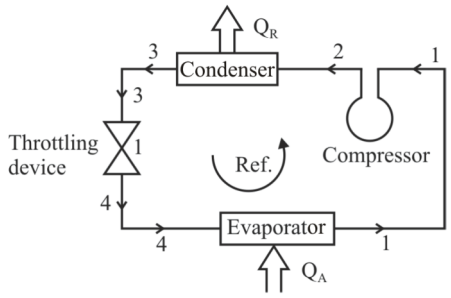
for higher COP of Refrigerator $T_E \uparrow$ & $T_C \downarrow$es

248. In a refrigeration cycle heat is ---------- by a refrigerant in evaporator and heat is ---------- by refrigerant in a condenser.

(a) Absorbed, Absorbed (b) Absorbed, Rejected
(c) Rejected, Absorbed (d) Rejected, Rejected

APPSC AEE Screening Test 2016

Ans. (b) : In a refrigeration cycle heat is absorbed by a refrigerant in evaporator and heat is rejected by refrigerant in a condenser.



249. Dry compression is preferred due to:

(a) High volumetric efficiency
(b) High mechanical efficiency
(c) Less chance of damage of the compressor
(d) All of the above

OPSC AEE 2015 PAPER - II

Ans : (c) Dry compression is preferred due to less chance of damage of the compressor.

250. Most of the domestic refrigerators work on the following refrigeration system

(a) vapour absorption
(b) Electrolux refrigerator
(c) dual cycle
(d) vapour compression

GWSSB AAE, 27.12.2015

Ans. (d) : Electrolux – No need of electricity
Vapour absorption – little electricity for pump
Vapour compression – Now a days

251. Highest temperature encountered in refrigeration cycle should be

(a) Near critical temperature of refrigerant
(b) Above critical temperature
(c) At critical temperature
(d) Much below critical temperature

Nagaland PSC CTSE 2015 Paper-II

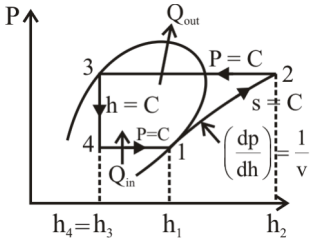
Ans. (d) : Highest temperature encountered in refrigeration cycle should be much below critical temperature.

252. The lower horizontal line of the refrigeration cycle plotted on pressure-enthalpy diagram represents

(a) Condensation of the refrigerant vapour
(b) Evaporation of the refrigerant liquid
(c) Compression of the refrigerant vapour
(d) Metering of the refrigerant liquid

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : In given P-h diagram there are four process
Process 1-2 : Reversible adiabatic compression
Process 2-3 : Constant pressure heat rejection
Process 3-4 : Throttling (Isenthalpic expansions in throttle valves
Process 4-1 : Constant pressure heat absorption or evaporation of refrigerant in evaporator.



The lower horizontal line of the refrigeration cycle plotted on pressure enthalpy diagram represents evaporation of refrigerant liquid.

253. Consider the following statements pertaining to a vapour compression type refrigerator.

1. The condenser rejects heat to the surroundings from the refrigerant.
2. The evaporator absorbs heat from the surroundings to be cooled.
3. Both the condenser and evaporator are heat exchangers with refrigerant as a common medium.
4. The amount of heat exchanged in condenser and evaporator are equal under steady conditions.

Which of the above statements are correct?

(a) 1 and 2 (b) 1, 2 and 3
(c) 1, 2 and 4 (d) 2, 3 and 4

Nagaland PSC CTSE 2015 Paper-II

Ans. (b)
(1) The condenser rejects heat to the surroundings from the refrigerant.
(2) The evaporator absorbs heat from the surroundings to be cooled.
(3) Both the condenser and evaporator are heat exchangers with refrigerant as a common medium.

254. Match List-I with List-II and select the correct answer :

List-I	List-II
A. Bell Coleman refrigeration	1. Expansion cylinder
B. Reversed carnot cycle	2. Heat Pump
C. Milk chilling plant	3. Decreases COP
D. Superheating in refrigeration cycle	4. Compressor
	5. Brine
	6. Vortex refrigerator
	7. Increases COP

Search on Telegram @apna_pdf

	A	B	C	D		A	B	C	D
(a)	1	6	5	3	(b)	4	2	3	7
(c)	1	2	5	3	(d)	4	6	3	7

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-2006

Ans. (c) :

Bell Coleman refrigeration	–	Expansion cylinder
Reversed carnot cycle	–	Heat Pump
Milk chilling plant	–	Brine
Superheating in refrigeration cycle	–	Decreases COP

255. In a vapour compression refrigeration system, the compressor capacity is 420 kJ/min and refrigerating effect is 2100 kJ/minute and heat rejection factor is 1.2. What will be the heat rejected from the condenser and C.O.P respectively?

(a) 5040 kJ/minute and 5
(b) 2520 kJ/minute and 5
(c) 2520 kJ/minute and 4
(d) 2540 kJ/minute and 4

Nagaland PSC CTSE 2015 Paper-II

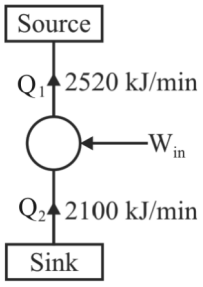
Ans. (b) : Given, W_{in} = 2100 kJ/min, G = 1.2

$$\text{Heat rejection factor (G)} = \frac{\text{Heat rejected in condenser}}{\text{Refrigeration effect}}$$

$$1.2 = \frac{Q_1}{2100}$$

$$Q_1 = 1.2 \times 2100$$

$$= 2520 \text{ kJ/min}$$



$$W_{in} = Q_1 - Q_2$$

$$= 2520 - 2100$$

$$= 420 \text{ kJ/min}$$

$$COP = \frac{2100}{420}$$

$$COP = 5$$

256. In ammonia vapour compression system, the temperature of ammonia after compression will be

(a) 0º to 40ºC (b) 40º to 50ºC
(c) 50º to 70ºC (d) 70º to 110ºC

MPPSC AE 08.11.2015

Ans. (d) : In ammonia vapour compression system, the temperature of ammonia after compression will be 70ºC to 110ºC.

257. In two-stage compression system with flash gas removal

(a) Refrigerant mass flow rates in both low and high stage compressors are equal
(b) Refrigerant mass flow rates in high stage compressors is smaller than that in low stage compressor
(c) Mass flow rates in low and high stage compressors are equal if the pressure ratios are equal
(d) Refrigerant mass flow rates in high stage compressors is greater than that in low stage compressor
(e) Mass flow rates in low and high stage compressors equal if the entropy are equal

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : In two-stage compression system with flash gas removal refrigerant mass flow rates in high stage compressor is smaller than that in low stage compressor.

258. Multi-evaporator systems with a single compressor and a pressure reducing valve:

(a) Yield very high COPs compared to multi-evaporator, single stage systems
(b) Yield lower compressor discharge temperature compared to single stage systems
(c) Yield slightly higher refrigeration effect in the low temperature evaporator
(d) Yield slightly higher refrigeration effect in the high temperature evaporator compared to single stage systems
(e) Yield slightly lower refrigeration effect in the high temperature evaporator compared to single stage systems

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d): Multi-evaporator system with a single compressor and a pressure reducing valve yield slightly higher refrigeration effect in the high temperature evaporator compared to single stage systems.

259. Consider the following in cascade systems:

1. Different refrigerants are used in individual cascade cycles
2. There is no mixing of refrigerants and no migration of lubricating oil
3. Higher COPs compared to multi-stage systems can be obtained
4. Operating pressures need not be too high or too low

(a) 1 and 2 (b) 1 and 3
(c) 1 and 4 (d) 1, 2 and 3
(e) 1, 2 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) : The cascade refrigeration system is a freezing system that use two kinds of refrigerants having different boiling points, which run through their own independent freezing cycle and are joined by a heat exchanger. This system is employed to obtain temperature of -40 to -80^{0}C or ultra – low temperature lower than them.

Search on Telegram @apna_pdf

260. For a two-stage cascade system working on Carnot cycle and between low and high temperatures of -90^{0}C and 50^0 C, the optimum cascade temperature at which the COP will be maximum is given by:

(a) -20^{0}C (b) -30^{0}C
(c) -67^{0}C (d) -78^{0}C
(e) 0^{0}C

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : $T_H = 50^0C = 323K$
$T_L = -90^0C = 183K$
For Cascade, optimum Cascade Temperature for maximum COP

$$T_{c.c.\ opt.} = \sqrt{T_H \times T_L}$$

$$T_{c.c.\ opt.} = \sqrt{323 \times 183} = 243.123\ K$$

$$T_{c.c.\ opt} = -29.87 \approx -30^0C$$

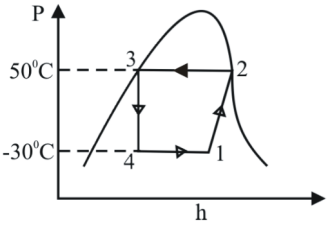
261. A refrigerator based on ideal vapour compression cycle operates between the temperature limits of –30°C and 50°C. The refrigerant enters the condenser as saturated vapour and leaves as saturated liquid. The enthalpy and entropy values at these temperatures are given in the table below. The refrigeration effect per kg of refrigerant (kJ/kg) is around

T(°C)	h_f (kJ/kg)	h_{fg} (kJ/kg)	S_f (kJ/kgK)	S_{fg} (kJ/kg)
-30	**22**	**161**	**0.07**	**0.66**
50	**82**	**123**	**0.31**	**0.38**

(a) 174 (b) 67
(c) 87 (d) 91
(e) 69

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) : We know that,



$h_3 = h_4 = 82$ kJ/kg
$S_1 = S_2 = [S_f + x\ S_{fg}]_2$
$S_2 = 0.31 + 1 \times 0.38$
$S_2 = 0.69$ kJ/kgK
$S_1 = [S_f + xS_{fg}]$
$0.69 = 0.07 + x \times 0.66$
$\boxed{x = 0.9393}$

$$h_1 = h_{f_1} + xhf_{g_2}$$

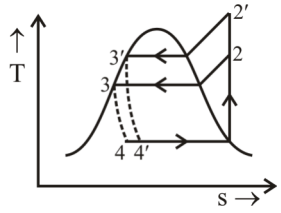
$h_1 = 22 + 0.9393 \times 161 = 173.22$ kJ/kg
Then,
Ref. Effect = $h_1 - h_4 = 173.22 - 82 = 91.22$ kJ/kg

262. In a vapour compression refrigeration plant, if the condenser temperature increases, the power input to the compressor will

(a) Decrease (b) Increase
(c) Remain the same (d) Be unpredictable

MPPSC State Forest Service Exam, 2014

Ans. (b)



1-2 : Compressor
2-3 : Condenser
3-4 : Expansion
4-1 : Evaporator
As condenser temperature increases, the power input to the compressor will increases. ($W_{1-2'} > W_{1-2}$)
The refrigeration effect decreases ($RE_{1-4} > RE_{1-4'}$)

263. Which of the following is used in vapour compression refrigeration system?

(a) Throttle valve
(b) Expansion cylinder
(c) Both throttle valve and expansion cylinder
(d) Pump

UPRVUNL AE 2014

Ans: (a) Throttle valve is used in vapour compression refrigeration system. In throttle valve enthalpy is constant (i.e. $h_1 = h_2$).

264. Which of the following statements are correct?

I. Practically all common refrigerants have approximately the same COP and power requirement.
II. Ammonia mixes freely with lubricating oil and this helps lubrication of compressors.
III. Dielectric strength of refrigerants is an important property in hermetically sealed compressor units.
IV. Leakage of ammonia can be detected by halide torch method.

Choose the correct answer from the options given below.

(a) I and II (b) I and III
(c) III and IV (d) I, II, III and IV

UPRVUNL AE 2014

Ans : (b) (I) Practically all common refrigerants have approximately the same COP and power requirement. (III) Dielectric strength of refrigerants is an important property in hermetically sealed compressor units.

265. Consider the following for the evaporator of a vapour compression refrigeration system:

1. A low temperature is maintained so that heat can flow from the external fluid
2. Refrigeration effect is produced as the refrigerant liquid vapourizes
3. A low pressure is maintained so that the compressor can run

Of the above, which is correct

(a) 1 (b) 2
(c) 3 (d) 1 and 2
(e) 1 and 3

CGPSC AE 26.04.2015 SHIFT-II

Search on Telegram @apna_pdf

Ans. (d) : The evaporator of a vapor compression refrigeration system maintained a low temperature so that heat can flow from the external fluid and produce refrigeration effect as the refrigerant liquid vapourizes.

266. Match List I with List II and select the correct answer using the codes given below the lists:

List I	List II
A. Bell Coleman refrigeration	i. Compressor
B. Vapour compression	ii. Generator
C. Absorption refrigeration	iii. Flash chamber
D. Jet refrigeration	iv. Expansion cylinder

Code :

	A	B	C	D
(a)	i	iv	iii	ii
(b)	iv	i	iii	ii
(c)	i	iv	ii	iii
(d)	iv	i	ii	iii

APPSC Poly. Lect. 2013

Ans. (d) : List-I **List-II**
i) Bell Coleman refrigeration- Expansion cylinder
ii) Vapour compression refrigeration- Compressor
iii) Absorption refrigeration- Generator
iv) Jet refrigeration- Flash chamber

267. Choose the correct statement about the effect of changing various operating conditions of a vapour compression refrigeration cycle.
(a) Lowering the evaporator pressure will always increase the COP.
(b) Increasing the condenser pressure will always result in increase the COP.
(c) Superheating the suction vapour always increases the COP.
(d) Lowering the evaporator always decreases the COP.

RPSC AEN Pre-2013

Ans. (d) : Note- Deleted by commission.

268. The process of cooling the liquid refrigerant below the condensing temperature
(a) Super cooling (b) Sub-cooling
(c) Condensation (d) Saturation

TNPSC AE 2013

Ans. (b) : The term subcooling also called undercooling refers to a liquid existing at a temperature below its normal boiling point.

269. In case of multi-stage vapour compression system, flash intercooling is beneficial in case of those refrigerants only for which:-
(a) Latent heat of vapourization is more
(b) Latent heat of vapourization is less
(c) Thermal conductivity is high
(d) Thermal conductivity is low

UKPSC AE-2013, Paper-II

Ans. (a) : In case of multi-stage vapour compression system, flash intercooling is beneficial in case of those refrigerants only for which latent heat of vapourization is more.

270. In an ammonia vapour compression system, wet compression process is used instead of dry compression. The C.O.P.:-
(a) Will increase
(b) Will decrease
(c) Can increase or decrease
(d) Remains unaffected

UKPSC AE-2013, Paper-II

Ans. (a) : In an ammonia vapour compression system, wet compression process is used instead of dry compression. The C.O.P. will increase because compressor work in wet compression is less.

271. Vapour compression cycle using R-12 gives maximum COP when:-
(a) Suction state to compressor is in wet region
(b) Suction state to compressor is in superheat region
(c) Suction state to compressor is dry saturated
(d) None of the above

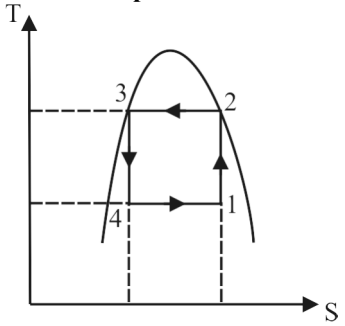
UKPSC AE-2013, Paper-II

Ans. (b) : Vapour compression cycle using R-12 gives maximum COP when suction state to compressor is in superheat region.

272. During which of the following process does heat rejection take place in Carnot Vapour Cycle?
(a) Constant volume (b) Constant pressure
(c) Constant temperature (d) Constant entropy

PSPCL AE, 2012

Ans. (c) : Constant temperature –



1 – 2 Process = Reversible adiabatic compression.
2 – 3 Process = Constant temperature heat rejection.
3 – 4 Process = Reversible adiabatic expansion.
4 – 1 Process = Constant temperature heat addition.

273. In case of ejector–compression system the power input is in the form of
(a) electric power (b) heat
(c) mechanical work (d) steam power

UKPSC AE 2012 Paper–II

Ans. (d) : steam power

274. Pressure drop in capillary tube (used in refrigeration systems) takes place due to
(a) friction
(b) change in momentum
(c) both (a) & (b) above
(d) none of the above

UKPSC AE 2012 Paper–II

Ans. (c) : both (a) & (b) above

Search on Telegram @apna_pdf

275. In a refrigeration cycle the effect of superheating on COP is :

(a) Decrease (b) Remains change
(c) Increase (d) None of these

J&K PSC Civil Services Pre, 2010

Ans. (d) : Effect of superheating–

(1) Refrigeration effect of superheating increases if superheating occurs in evaporator.
(2) Work input to the compressor increases because, it is function of inlet temperature to the compressor.
(3) COP may increase or decrease depending upon the refrigerant. For example, in case of R-12 refrigerant supercharging would result increase in COP whereas in case of ammonia superheating would result a decrease in COP.

276. A vapour compression refrigerator having a COP of 5 rejects 30 kW of heat in the condenser. The refrigerating effect is :

(a) 20 kW (b) 25 kW
(c) 30 kW (d) 35 kW

UPSC JWM Advt. No.-52/2010

Ans. (b) : Explanation- Given; $(COP)_R = 5$

(For VCR system)

Rejected heat $(Q_R) = 30$ kW

Let; RE = Refrigerating effect

$$(COP)_R = \frac{R.E}{W_{input}} = \frac{Q_2}{Q_1 - Q_2}$$

Q_1 = Heat absorbed by Evaporator = RE

Q_1 = Heat rejected to condenser

$$\therefore \quad 5 = \frac{Q_2}{30 - Q_2} \Rightarrow 150 - 5Q_2 = Q_2$$

$$\Rightarrow 6Q_2 = 150 \quad \Rightarrow Q_2 = 25kW$$

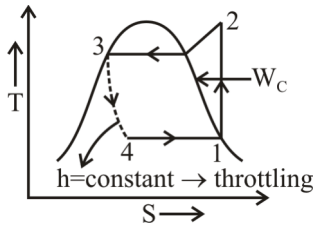
$$\boxed{\because \quad R.E. = Q_2 = 25\ kW}$$

277. In a vapour-compression refrigerator, the design pressure at the condenser will depend on

(a) Type of compressor
(b) Refrigerant used
(c) Its capacity
(d) Its coefficient of performance

UPSC JWM Advt. No.-50/2010

Ans. (a)



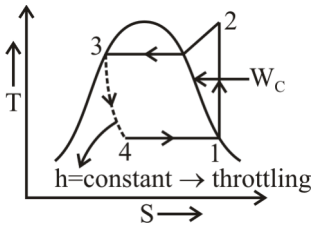
Pressure at a point '2', P_2 is the designed pressure in a VCRS system, which is depend upon the type of compressor used for the compression of refrigerant.

278. In a vapour-compression refrigeration system, the thermodynamic process which the refrigerant undergoes while passing through the expansion valve is

(a) Isentripic (b) Adiabatic
(c) Throttling (d) Free expansion

UPSC JWM Advt. No.-50/2010

Ans. (c) :



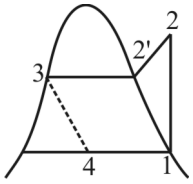
As we know, in a VCRS, the thermodynamic process, which the refrigerant undergoes while passing through the expansion value is throttling, which is highly irreversible.

279. In a vapour-compression refrigeration cycle, if h_1 and h_2 denote the enthalpies at inlet and exit of the compressor, respectively, h_3 is the enthalpy at the exit of the condenser and h_4 is the enthalpy at the inlet of the evaporator, then COP for the cycle is :

(a) $\frac{h_1 - h_3}{h_2 - h_3}$ (b) $\frac{h_1 - h_4}{h_2 - h_3}$
(c) $\frac{h_1 - h_3}{h_2 - h_1}$ (d) $\frac{h_2 - h_1}{h_1 - h_4}$

DRDO Scientists 2009

Ans. (c) :



$$\text{COP} = \frac{\text{Refrigerant effect}}{\text{Work done on compressor}}$$

$$\frac{h_1 - h_4}{h_2 - h_1}$$

Since process 3-4 is an isenthalpic throttling process

$\therefore \quad h_3 = h_4$

Hence

$$\text{COP} = \frac{h_1 - h_3}{h_2 - h_1}$$

280. In vapour compression cycle, heat rejected is 65 kW and work done in compression is 10 kW, the COP of refrigerator will be

(a) 6.5 (b) 5.5
(c) 5.0 (d) None of the above

UKPSC AE 2007 Paper -II

Search on Telegram @apna_pdf

Ans. (b)

$$COP = \frac{\text{desired effect}}{\text{work input}}$$

$$= \frac{65-10}{10}$$

=5.5

281. Super heating in a refrigeration cycle

(a) increases COP
(b) decreases COP
(c) COP remains unaltered
(d) other factors decide COP

J & K PSC Screening, 2006

Ans. (d) : COP may increase or decrease depending on the retrigerant.

For R12, R134 → COP↑

And For Freon, R22, NH_3 → COP↓

282. In vapour compression refrigeration system, the refrigerant is superheated mainly to

(a) Increase the volumetric efficiency of the compressor
(b) Avoid wet compression
(c) Decrease compressor work input
(d) Decrease load on the condenser

OPSC Civil Services Pre 2006

Ans. (b) : By superheating specific volume at inlet to compressor and work of compression increases and COP increases or not depends upon the relative increase in refrigerating effect and work of compression which is depends upon the nature of the refrigerant used.

A minimum amount of superheat is desirable as it prevents the entry of liquid droplet into the compressor. Compressor are designed to handle the vapour not liquid.

3. Refrigerants and Components of Refrigeration System

283. Which of the following refrigerant has the maximum ozone depletion potential in the startophere?

(a) Ammonia (b) Carbon dioxide
(c) Sulphur dioxide (d) Flourine

UJVNL AE 12.09.2021
OPSC AEE 2019 Paper-II
Nagaland PSC (CTSE) 2018, Paper-II
RPSC Vice Principal ITI 2018
HPPSC Asst. Prof. 20.11.2017
GPSC Asst. Prof. 28.08.2016
PSPCL AE, 2012, ESE 1992

Ans. (d) : Fluorine has the maximum ozone depletion potential in the stratosphere. R-11 or CFC 11 has the maximum potential amongst chlorocarbons because of the presence of three chlorine atoms in the molicule.

284. In the window air conditioner, the expansion device used is :

(a) Capillary tube
(b) Thermostatic expansion valve
(c) Automatic expansion valve
(d) Float valve

Nagaland PSC CTSE 2017 paper-II
TSPSC AEE 2017
HPPSC Asstt. Prof. 18.11.2016
UPPSC AE 12.04.2016, APGENCO AE 2012
VIZAG STEEL MT 10.06.2012, GATE 2004

Ans. (a) : Capillary tube is used as expansion device in the window air conditioner.

- **Thermostatic expansion valve** is a throttling device used in refrigerator and air conditioning which controls the amount of refrigerant liquid injected into a system's evaporator based on the evaporator outlet temperature and pressure called superheat.
  Automatic Expansion Valve–A valve designed to maintain a constant pressure in the evaporator and to meter the refrigerant by using a pressure sensing device. Also called a constant pressure expansion valve.
- **Float valve** are used in domestic water system. A float valve maintains the level in the cold water header tank which regulates the pressure of the hot water system.

285. The color of the flame of halide torch, in case of leakage of Freon refrigerant, will change to:

(a) bright green (b) yellow
(c) red (d) orange

Nagaland PSC (CTSE) 2018, Paper-II
GPSC ARTO Pre 30.12.2018
RPSC Vice Principal ITI 2018
OPSC Civil Services Pre.2011
J&K PSC Civil Services Pre, 2010
UKPSC AE 2007 Paper-II, CSE Pre-1996

Ans. (a) : The colour of the flame of halide torch, in case of leakage of Freon refrigerant, will change to bright green. The flame of the torch will change to a green color when it is exposed to a refrigerant with chlorine. The intensity of the change in the flame will vary depending on the size of the leaks.

286. For Ammonia refrigeration system, the pipe for carrying refrigerant shall be made of following material:

(a) brass (b) copper
(c) steel or wrought iron (d) aluminium

ISRO Scientist/Engineer (RAC) 22.04.2018
Kerala PSC Poly. Lect., 2017
Sikkim PSC (Under Secretary), 2017
GPSC EE Pre, 28.01.2017
GPSC ARTO 01.05.2016, ESE 2012, CSE Pre-1998

Ans. (c) : Ammonia react with copper pipes because of corrosive in nature. Aluminium is generally used in air cooling coils and not for liquids. So steel is most commonly used for ammonia system.

Search on Telegram @apna_pdf

287. The chemical formula of Freon-12 is -

(a) CCl_2F (b) CCl_2F_2

(c) CCl_2F_3 (d) $CClF$

RPSC IOF 2020, GMB AAE 25.06.2017
OPSC AEE 2015 Paper-II
APPSC IOF 2009
UKPSC AE 2012, 2007 Paper-II
CSE Pre-1994

Ans. (b) : The chemical formula of F – 12 $C_mH_nF_p\ Cl_q$

for Hydro carbon R_{012} $n + p + q = 2m + 2$

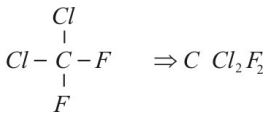
$C_{m-1}\ H_{n+1}\ F_n$ …(i) R (m–1) (n+1)p

$m-1=0 \quad \Rightarrow m=1$

$n+1=1 \quad \Rightarrow n=0 \qquad 0 + 2 + q = 2 \times 1+2$

$p=2 \quad \Rightarrow p=2 \qquad q = 2$

$C_1H_0F_2Cl_2$



$\Rightarrow C\ Cl_2F_2$

288. Environment friendly refrigerant R 134a is used in the new generation domestic refrigerators. Its chemical formula is

(a) $CHCIF_2$ (b) $C_2CI_3F_3$

(c) $C_2CI_2F_4$ (d) $C_2H_2F_4$

UPPSC AE 13.12.2020, Paper-2
APPSC Poly Lect. 13.03.2020
Nagaland PSC CTSE 2017 2nd Paper
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 2004

Ans. (d)

R-134a

For saturated hydrocarbon refrigerators

$\therefore$ $R – (m – 1) (n + 1)p$

$m – 1 = 1 \Rightarrow m = 2$

$n + 1 = 3 \Rightarrow n = 2$

$p = 4$

And $n + p + q = 2m + 2$

$2 + 4 + q = 2 \times 2 + 2$

$q = 0$

$\therefore$ $C_mH_nF_p\ Cl_q$

Put the values R-134a $\Rightarrow C_2H_2F_4$

289. In milk chilling plants, the usual secondary refrigerant is

(a) ammonia solution (b) sodium silicate

(c) glycol (d) brine

TNPSC AE 2018, GPSC ARTO Pre. 30.12.2018
OPSC AEE 2015 Paper-II, APPSC Poly. Lect. 2013
APPSC AEE 2012, ESE 1998

Ans. (d) : In milk chilling plants, the usual secondary refrigerant is brine solution & primary refrigerant is ammonia.

290. The leaks in a refrigeration system using Freon are detected by:

(a) A halide torch which on detection produces greenish flame light

(b) Sulphur sticks which on detection gives white smoke

(c) Using reagents

(d) Sensing reduction in pressure

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II
RPSC VPITI 14.02.2016
MPPSC AE 2016, ESE 2006

Ans. (a)

1. Freon compound leaks are detected by Halide torch test (in the presence of Freon leaks the colour of light will change from blue to bluish green).
2. NH_3 leaks are detected by sulphur stick method. In the presence of NH_3 leaks white fumes of ammonium sulphite is formed.
3. SO_2 leaks are detected by ammonia swab test.
4. Halocarbon compound leak are detected by soap bubble method.

291. Domestic refrigerator working on vapour compression cycle uses which one of the following type of expansion device?

(a) Capillary tube

(b) Thermostatic valve

(c) Electrically operated throttling valve

(d) Manually operated valve

Rajasthan AE (Nagar Nigam) 2016 Shift-3
GWSSB DEE 07.07.2016, TANGEDCO AE 2015
GWSSB AAE, 27.12.2015, CSE Pre-2002

Ans. (a) : Capillary tube is a tiny narrow hollow copper tube with an internal diameter range from 0.5 to 2.0 mm. The refrigeration system work on vapour compression cycle comprising of evaporator compressor, condenser and expansion device

292. The refrigerant commonly used in commercial ice plants

(a) CO_2 (b) Air

(c) Ammonia (d) Freon-12

KPSC AE 2015
MPPSC State Forest Service Exam, 2014
J&K PSC Civil Services Pre.2013
UKPSC AE 2012 Paper-II

Ans. (c) : Ammonia is a refrigerant so called halogen free chemicals, it perhaps the most common refrigerant in industrial. Cooling plants and among the oldest ones.

293. Dry ice is

(a) Ice free from water

(b) Ice free from dissolved air or gases

(c) Ice prepared from filtered water

(d) Solid carbon dioxide

Gujarat PSC AE 2019, WBPSC AE, 2017
TNPSC AE 2014, UKPSC AE 2012 Paper–II

Ans. (d) : Solid carbon dioxide (CO_2) is also known as ice free from water.

Search on Telegram @apna_pdf

294. A refrigerant should have:

(a) Low specific heat of liquid
(b) High boiling point
(c) High latent heat of vaporisation
(d) Higher critical temperature

OPSC AEE 2019 PAPER - II
UKPSC AE 2013 Paper-II
J&K PSC Civil Services Pre, 2013
J &K PSC Screening 2006

Ans. : (c) : <u>Properties of Refrigerant</u>

- Low boiling point.
- High latent heat.
- Low freezing point.
- High critical temperature.
- Positive evaporator and condenser pressures, high density.
- Low specific volume.
- High thermal conductivity.
- Low viscosity.
- Low specific heat.

295. The capacity of a domestic refrigerator is in the range of

(a) 0.1 to 0.3 ton (b) 1 to 3 tons
(c) 3 to 5 tons (d) 5 to 7 tons

JPSC AE, 10.04.2021, Paper-I
Assam PSC AE (PHED), 18.10.2020
RPSC IOF 2020
Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : The capacity of domestic refrigerator is in the range of 0.1 to 0.3 ton the capacity of domestic refrigerator is generally rated in litre. Thus litre capacity indicates the volume or space to be cooled by the domestic refrigerator. On the other hand the AC capacity is given by the term Ton of refrigeration.

296. The deposition of frost on evaporator tubes of an air conditioner will result in :

(a) Decreases in heat transfer
(b) Increases in heat transfer
(c) No change in heat transfer
(d) Increase in capacity of evaporator

RPSC Vice Principal ITI 2018, TNPSC AE 2017
PSPCL AE, 2012, ESE 1992

Ans. (a) : A decrease in heat transfer happens due to the addition of the frost layer around the evaporator.
Evaporator is a industrial apparatus for converting liquid into vapour.
Condenser is a device for converting gaseous into liquid.
Evaporator and condenser are opposite in nature.

297. The flow of refrigerant in a refrigeration cycle is controlled by

(a) Compressor (b) Condenser
(c) Evaporator (d) Expansion valve

Gujarat PSC AE 2019, HPPSC ADF 05.03.2019
Rajasthan AE Nagar Nigam 2016 Shift-I
OPSC AEE 2015 Paper - II

Ans. (d) : Refrigerant flow is controlled by expansion valve. The refrigerant vaporize from the heat it absorbs heat in the evaporator flow control device (expansion valve). This controls the flow of the liquid refrigerant into the evaporation. Control device usually are thermostatic, meaning that they are responsive to the temperature of the refrigerant.

298. The boiling point of ammonia is :

(a) 0 ºC (b) –50 ºC
(c) –33.3 ºC (d) 33.3 ºC

JPSC AE Pre. 2019
Nagaland PSC (CTSE) 2018, Paper-II
Rajasthan AE Nagar Nigam 2016 Shift-III
J&K PSC Civil Services Pre, 2013

Ans. (c) : The boiling point of ammonia is –33.3 ºC.

299. Which of the following refrigerant has the highest critical point pressure?

(a) Freon- 11 (b) Freon- 12
(c) Freon- 22 (d) Ammonia

CGPSC AE 15.01.2021
RPSC Lect. (Tech. Edu. Dept.) 2011
J&K PSC Civil Services Pre.2010

Ans. (d) :

	Refrigerant	Critical Pressure (bar)
(i)	R-11	43.8
(ii)	R-12	41.2
(iii)	R-22	49.38
(iv)	R-717 (Ammonia)	113.86

300. Which of the refrigerant has the least freezing point

(a) Freon-12 (b) Freon-22
(c) CO_2 (d) NH_3

Nagaland PSC (CTSE) 2018, Paper-II
Rajasthan Nagar Nigam AE 2016, Shift-I
UKPSCE AE 2007 Paper-II

Ans. (b) : Freon–22

- Refrigerants in increasing order of freezing point
  $CO_2 > NH_3 > R–11 > R–12 > R–22$
- Refrigerants in decreasing order of critical temperature
  $R–11 > NH_3 > R–12 > R–22 > CO_2$
- Refrigerants in decreasing of critical pressure
  (113–86) $NH_3 > CO_2$ (73.8) $> R–22 > R–11 > R–12$ (41.2)
- Refrigerants in decreasing of COP
  $R–11 > NH_3 > R–12 > R–22 > CO_2$

Refrigerant	Freezing point	Boiling point
R-12 (CF_2Cl_2)	157.8 ºC	29.8 ºC
NH_3 (R-717)	77.8 ºC	33.3 ºC
CO_2 (R744)	56.7 ºC	78.0 ºC
R22 ($CHClF_2$)	160.0 ºC	41.3 ºC

Search on Telegram @apna_pdf

301. Which one of the following refrigerants has the highest critical temperature?

(a) H_2O (b) CO_2
(c) R-12 (d) NH_3

Nagaland PSC (CTSE) 2016 Paper-II
Haryana PSC Civil Services Pre, 2014
CSE Pre-1996

Ans. (a) : H_2O has highest critical temperature

Refrigerant		Critical Temperature (^{0}C)
H_2O	–	374.4
NH_3	–	132.4
R-12	–	112
CO_2	–	31.0

302. In a domestic vapour compression refrigerator the refrigerant used is

(a) CO_2 (b) Freon-12
(c) Ammonia (d) All of the above

JPSC AE, 10.04.2021, Paper-I
MECON MT 2019, MPPSC 08.11.2015

Ans. (b) : In a domestic vapour compression refrigerator the refrigerant used is freon-12.

Refrigerants	Application
NH_3	Cold storage, ice plants
H_2O	Li-Br absorption system
CO_2	Used as dry ice in transport
R-11	Central air conditioning
R-12	Domestic refrigerator
R-22	Window type air conditioner
R-113	Air conditioning

303. A good refrigerant should have :

(a) High latent heat of vaporization and low freezing point
(b) High operating pressure and low freezing point
(c) High specific volume and high latent heat of vaporization
(d) Low COP and low freezing point

ISRO Scientist/ Engineer (RAC) 10.03.2019
Nagaland PSC (CTSE) 2018, Paper-II, PSPCL AE, 2012

Ans. (a) : High latent heat of vaporization and low freezing point.

– The refrigerant should have low boiling point and low freezing point .
– It must have low specific heat and high latent heat because high specific heat decreases the refrigerating effect per kg of refrigerant and high latent heat at low temperature increase refrigeration effect per kg of refrigerant.
– It should have low specific volume to reduce the size of compressor.
– It should have high critical pressure and temperature to avoid large power requirements.

304. The significant advantage of using ammonia as a refrigerant is its :

(a) characteristic odor (b) high latent heat
(c) solubility (d) inflammability

GPSC ARTO Pre 30.12.2018
UKPSC AE-2013, Paper-II
CSE Pre-1996

Ans. (b) : The significant advantage of using ammonia as a refrigerant is its high latent heat.

Properties of good refrigerants–
(i) Low boiling point
(ii) High critical temperature
(iii) High latent heat of vaporization
(iv) Low specific heat of liquid
(v) Non-corrosive to metal
(vi) Non-flammable
(vii) Non-explosive

305. Which of the following properties of a refrigerant is undesirable?

(a) high critical temperature
(b) low specific heat of liquid
(c) low specific volume vapour
(d) high boiling point

Kerala PSC AE 06.08.2015
Nagaland PSC CTSE 2015 Paper-II
KPSC AE 2015

Ans. (d) : Desirable Propenties of Refrigerents are –

→ high critical temperature
→ low specific volume vapour
→ low specific heat of liquid
→ low freezing point
→ High latent heat of vapourisation
→ large conductivity to reduce size of condenser and evaporator.
→ Non-corrosive
→ Non-toxic
→ Low boiling point
→ Non-flammable and on-explosive
→ low cost and easily available
→ To liquefy at moderate pressure and temperature low viscosity.

306. Ammonia refrigerant is

(a) Non-toxic
(b) Non-inflammable
(c) Toxic and non-inflammable
(d) Highly toxic and inflammable

VIZAG STEEL MT 2011
Nagaland PSC (CTSE) 2018, Paper-II
UKPSC AE 2007 Paper -II

Ans. (d) : Highly toxic and inflammable

307. A thermostatic expansion valve in refrigeration system :

(a) Ensures the evaporator completely filled with refrigerant of the load.
(b) Is suitable only for constant load system
(c) Maintains different temperatures in evaporator in proportion to load
(d) None of the above

Nagalanad PSC CTSE 2015 Paper-II
PSPCL AE, 2012, ESE 1992

Search on Telegram @apna_pdf

Ans. (a) : A thermostatic expansion valve is a component in refrigeration and air conditioning systems that controls the amount of refrigerant released in to the evaporator there by keeping superheat that is the difference between the current refrigerant.

308. The domestic refrigerator uses the following type of compressor:

(a) Centrifugal
(b) Axial
(c) Piston type reciprocating moved no box
(d) Screw

OPSC AEE 2019 PAPER - II
Nagaland PSC CTSE 2017 Paper-II
J&K PSC Screening 2006

Ans : (c) : The domestic refrigerator uses reciprocating type compressor. The compressor constructs the refrigerant vapour raising its pressure and temperature and pushes it into the coils of the condenser on the outside of the refrigerator. The refrigerant absorbs the heat inside the fridge when it flows through the evaporator coils, cooling down the air inside the fridge.

309. The thermostatic expansion valve operates based on

(a) temperature of the evaporator
(b) pressure in the evaporator
(c) degree of superheat at exit of evaporator
(d) degree of super heat at exit of the compressor

ISRO Scientist/Engineer (RAC) 12.01.2020
OPSC AEE 2019 PAPER - II
ESE 2005

Ans. (c) : Thermostatic Expansion Valve–It is used to maintain constant degree of superheat in the evaporator irrespective of load.

310. Global warming is caused by

(a) ozone (b) carbon dioxide
(c) nitrogen (d) carbon monoxide

TRB Poly. Lect., 2012, GATE 2000

Ans. (b) : Global warming is caused by CO_2 & other air pollutant & green house gas.

311. A good refrigerant should have:

(a) High Latent heat
(b) High Thermal conductivity
(c) Low Specific heat and Low Viscosity
(d) All of these

GMB AAE 25.06.2017
RPSC VPITI 14.02.2016

Ans. (d) : A good refrigerant should have-
1. Latent heat should be high
2. Its thermal conductivity should be high
3. Its specific heat should be low in liquid phase but high in vapour phase
4. Its viscosity should be low.

312. Chemical formula of R-22 is given by :

(a) CCl_4F (b) CCl_2F_2
(c) $CHCl_2F$ (d) $CHClF_2$

APPSC Poly Lect. 13.03.2020
APGENCO AE 2017

Ans. (d) : Chemical formula of R–22 is $\rightarrow CHClF_2$
Saturated hydro carbon
$C_m H_n F_p Cl_q$ .....(i) & $n + p + q = 2m + 2$
Given,
$R_{22} \Rightarrow R_{022}$ compared with $R(m-1)(n+1)p$
$m - 1 = 0$
$\boxed{m = 1}$
$n + 1 = 2$
$\boxed{n = 1}$
$p = 2$
Put the value of m and n in given equation
$n + P + q = 2m + 2$
$1 + 2 + q = 2 \times 1 \times 2$
$3 + q = 4$
$\boxed{q = 1}$
Putting the value of m, n, p & q in equation (i)
Formula become CH Cl F_2 .

313. The refrigerant used in steam jet refrigeration is

(a) Brine (b) Ammonia
(c) Freon-12 (d) Water

GPSC Executive Engineer 23.12.2018
TSPSC AEE 2017

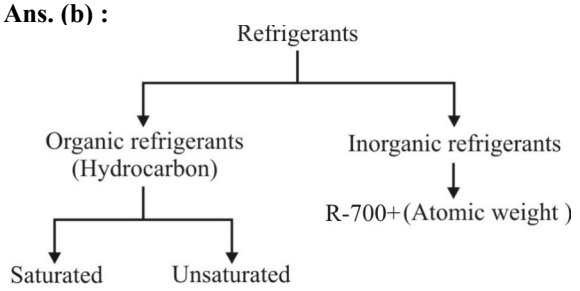
Ans. (d) : Steam jet or Ejector refrigeration system works on low grade energy, uses water as refrigerant. It uses the basic principle of boiling of liquid at lower temperature by reducing pressure on its surface.

314. Refrigerant R-717 is

(a) Air (b) Ammonia
(c) Carbon dioxide (d) Freon-12

UPPSC AE 13.12.2020, Paper-2
OPSC AEE 2015 Paper-II

Ans. (b) :



Refrigerants	Chemical formula
Carbon dioxide	R - 744
Carbon mono-oxide	R-728
Ammonia	R-717

315. When two refrigerants are mixed in proper proportions, the mixture forms a third refrigerant called

(a) Auxiliary refrigerant (b) An azeotrope
(c) Synthetic refrigerant (d) None of these

MPPSC State Forest Service Exam, 2014
J&K PSC Civil Services Pre, 2013

Search on Telegram @apna_pdf

Ans. (b) : Azeotrope–Mixture of refrigerants which behaves like pure substance. Their designation started with R-500.

316. Ozone depletion by CFC occurs by breakdown of:

(a) Chlorine atoms from refrigerant by UV radiation and reaction with Ozone in troposphere
(b) Fluorine atoms from refrigerant by UV radiation and reaction with Ozone in troposphere
(c) Chlorine atoms from refrigerant by UV radiation and reaction with Ozone in stratosphere
(d) Fluorine atoms from refrigerant by UV radiation and reaction with Ozone in stratosphere

GPSC ARTO Pre 30.12.2018, ESE 2002

Ans. (c) : Ozone depletion by CFC occurs by breakdown of chlorine atoms from refrigerant by UV radiation and reaction with ozone in stratosphere.

317. The use of refrigerant R-22 for temperature below –30°C is not recommended due to its

(a) good miscibility with lubricating oil
(b) poor miscibility with lubricating oil
(c) low evaporating pressure
(d) high compressor discharge temperature

MPPSC AE 08.11.2015, GATE 1993

Ans. (d) :

318. Presence of moisture in Freon refrigeration system causes

(a) Ineffective refrigeration
(b) Damage to compressor
(c) Freezing at automatic regulating valve
(d) None of the above

GPSC Asstt. Director of Transport 05.03.2017
APPSC AEE Screening Test 2016
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (c) : Moisture that enters the system can cause many and serious problems, such as moisture freezing in the refrigerant control orifice, acid and oil sludging. In Freon refrigeration system causes freezing at automatic regulating valve.

319. A good refrigerant should have-

(a) Large latent heat of vaporization and low operating pressures
(b) Small latent heat of vaporization and high operating pressures
(c) Large latent heat of vaporization and high operating pressures
(d) Small latent heat of vaporization and low operating pressures

RPSC AE 2018, ESE 1992

Ans. (a) : Desirable properties of refrigerants—
Thermodynamics Property—

1. **Critical Temperature**—The critical temperature of the refrigerant should be as high as possible.
2. **Specific heat**—The specific heat of the vapour should be high.
3. **Enthalpy of vaporization**—It should be as high as possible.
4. **Thermal conductivity**—It should be high as possible because it decrease size of evaporator.

$$Q = kA\frac{dT}{dx}$$

$$k \propto \frac{1}{A}$$

5. **Condensing pressure and high evaporator pressure**—Both should be positive if the evaporator pressure is less than atmospheric pressure then possibility of leakage of air their for evaporator pressure should be kept almost equal to atmospheric pressure where as condenser pressure should have some moderate value.
6. **Freezing point**—Low freezing point is desirable.

Chemical properties

1. **Toxicity**—The refrigerants should be non-poisonous to humans and food stuff.
2. **Flammability**—It should be non-flammable in nature.

Action with oil

Refrigerants + Fully miscible with oil $\rightarrow$ R-11, R-12
Refrigerants + Fully Immiscible with oil $\rightarrow$ NH_3, CO_2
Refrigerants + Partially miscible $\rightarrow$ R-22

There are some refrigerants with fully immiscible with oil and some refrigerant which are fully miscible does not create problem but the refrigerant like R-22 which are partially miscible with oil create problems and most chocking problems are occurs with R-22.

Physical properties

1. **Cost**—It should be low cost.
2. **Viscosity**—It should be low for easy flow of the refrigerant.
3. **Leak detection**—First of all they should not be leakage of refrigerant at any cost but it leaks out then its detection should be fast as possible by the simple method.

320. Azeotropes are:

(a) mixture of refrigerant and lubricating oil
(b) mixture of primary and secondary refrigerant
(c) mixture of refrigerants with unique boiling point
(d) mixture of refrigerant with glide in temperature
(e) mixture of refrigerant of low latent heat of vaporization

CGPSC AE 25.02.2018

Ans. (c) : Mixture of refrigerants with unique boiling point called Azeotropes.

321. Refrigerant CF_3 Br is designated as:

(a) R131 (b) R13B1
(c) R23B1 (d) R11B1
(e) R717

CGPSC AE 25.02.2018

Ans. (b) : Refrigerant CF_3Br is designated as R13B1

Search on Telegram @apna_pdf

322. Pull-down period in refrigeration system is:
(a) the time for which the compressor is not working
(b) the time required to reach the specified temperature inside the cabinet after switching on the unit
(c) the time required for charging the refrigerant in the system
(d) time required to leak the refrigerant from system
(e) time required by the system to consume 1 unit of electricity

CGPSC AE 25.02.2018

Ans. (b) : Pull-down period in refrigeration system is the time required to reach the specified temperature inside the cabinet after switching on the unit.

323. Which of the following is 'HCFC' refrigerant?
(a) R11 (b) R290
(c) R12 (d) R717
(e) R22

CGPSC AE 25.02.2018

Ans. (e) : Hydro chlorofluorocarbons or HCFC and chemicals that are mainly used as refrigerant unfortunately, releases of HCFC (R-22) deplete the earth's protective ozone layer and contribute to climate change. R-22 is an HCFC refrigerant that is often used in air conditioning equipments.

324. Environmental protection agencies advise against the use of chlorofluoro carbon refrigerants since these react with :
(a) Water vapour and cause acid rain
(b) Plants and cause green house effect
(c) Oxygen and cause its depletion
(d) Ozone layer

OPSC Civil Services Pre. 2011, ESE 2008

Ans. (d) : In chloro fluoro-carbon, chlorine atom reacts with ozone in upper atmosphere and causes its depletion.

325. Which of the following refrigerant characteristics change constantly during the cooling cycle?
(a) Pressure and phase
(b) Phase and flow
(c) Flow and temperature
(d) Temperature and pressure

Nagaland PSC CTSE 2017 2nd Paper
BPSC AE 2012 Paper - V

Ans : (d) : Temperature and pressure refrigerant characteristics change constantly during the cooling cycle.

326. Which of the following is the desirable property of refrigerant in vapor compression refrigeration system?
(a) Low vapor density
(b) Low freezing temperature
(c) Low latent heat of vaporization
(d) Condenser and evaporator pressure should be below atmospheric pressure
(e) GWP and ODP should be high

CGPSC AE 25.02.2018

Ans. (b) : Low freezing temperature is the desirable property of refrigerant in vapor compression refrigeration system.

327. The refrigerant used for absorption refrigerator working on solar heat is a mixture or water and
(a) Carbon dioxide (b) Freon 12
(c) Lithium bromide (d) Sulphur dioxide

APPSC AEE 2012, ESE 1996

Ans. (c) : Refrigerant used for absorption refrigerator working an solar heat – Water – Refrigerant
Lithium bromide – absorbent

328. Which of the following element in the refrigerant is the main contributing factor for ozone depletion of the stratosphere?
(a) Carbon (b) Chlorine
(c) Fluorine (d) Hydrogen

ISRO Scientist/Engineer (RAC) 12.01.2020
ESE 2009

Ans. (b) : The chlorine element which is present in commonly used refrigerant attacks the ozone layer which is located in stratosphere, if filters out the harmful ultraviolet (UV) radiations which were emitted by the sun and the chlorine element reduces the thickness of ozone layer. Therefore we have to use those refrigerant which are having lower value of ozone depletion (ODP). The other alternatives are fluorocarbon, hydrocarbon etc.

329. In a flooded type evaporator of a refrigerator, an accumulator at suction of the compressor is used to :
(a) collect liquid refrigerant and prevent it from going to compressor
(b) detect liquid in vapour
(c) superheat the vapour
(d) collect vapours

ESE 2018
J&K PSC Civil Services Pre, 2013

Ans. (a) : In a flooded type evaporator of a refrigerator, an accumulator at suction of the compressor is used to collect liquid refrigerant and prevent it from going to compressor.

330. For large tonnage (more than 200 tons) air conditioning applications, which one of the compressors is recommended?
(a) Reciprocating (b) Rotating
(c) Centrifugal (d) Screw

TSPSC AEE 2017, APPSC Poly. Lect. 2013

Ans. (c) : For large tonnage (more than 200 tons) air-conditioning applications, the compressor recommended is centrifugal compressor.

331. The capacity of refrigerating machine is expressed as
(a) inside volume of cabinet
(b) lowest temperature attained
(c) gross weight of machine in tons
(d) rate of abstraction of heat from the space being cooled

Assam PSC AE (PHED), 18.10.2020
Assam PSC CCE Pre-2015

Search on Telegram @apna_pdf

Ans. (d) : The capacity of refrigerating machine is expressed as the rate of abstraction of heat from the space being cooled.
The commonly used unit for expressing the capacity of a refrigerating machine is ton of refrigeration to freeze one metric ton of water at 0ºC into ice in 24 hours.

332. What is hunting of thermostatic expansion valve?
(a) A variation of evaporative load with degree of superheat
(b) A variation of pressure of the evaporator with variation of load
(c) Alternate overfeeding and starving of refrigerant flow in the evaporator
(d) This is used in connecting with expansion valve.

GPSC ARTO Pre 30.12.2018
ESE 2008

Ans. (c) : Hunting of thermostatic expansion valve is alternate overfeeding and starving of refrigerant flow in the evaporator.

333. Thermostatic expansion valve is called as
(a) Constant superheat valve
(b) Constant pressure valve
(c) Constant temperature valve
(d) Constant flow rate valve

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (a) : Thermostatic expansion valve is called as constant superheat valve.

334. The capillary tube used as expansion device in vapour compression system works on the principle of
(a) Isothermal expansion causing pressure drop
(b) Adiabatic expansion causing pressure drop
(c) Flow through pipe with friction causing pressure drop
(d) Throttle expansion causing pressure drop

Nagaland PSC (CTSE) 2017, 2016, Paper-II

Ans. (c) : The capillary tube used as expansion device in vapour compression system works on the principle of flow through pipe with friction causing pressure drop.

335. Flooded evaporator is used in A.C. Units of capacity
(a) < 3 tons (b) < 10 tons
(c) > 10 tons (d) None

Nagaland PSC (CTSE) 2017, 2016, Paper-II

Ans. (c) : Flooded evaporator is used in A.C. Units of capacity is greater than 10 tons.

336. Consider the following statements:
1. In Freon 22 system, moisture choking generally does not occur.
2. Freon 11 is mainly used in large capacity air-conditioning plants with centrifugal compressors.
3. Presence of lubricating oil in evaporator will increase the heat transfer coefficient.
4. Refrigerants that are completely miscible with oil, do not cause oil choking.

Of these statements
(a) 1, 2 and 3 are correct
(b) 1, 2 and 4 are correct
(c) 2, 3 and 4 are correct
(d) 1, 3 and 4 are correct

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-1999

Ans. (b) : True statements are–
1. In Freon 22 system, moisture choking generally does not occur.
2. Freon 11 is mainly used in large capacity air-conditioning plants with centrifugal compressors.
3. Refrigerants that are completely miscible with oil, do not cause oil choking.

337. In on-off control refrigeration system, which one of the following expansion devices is used?
(a) Capillary tube
(b) Thermostat
(c) Automatic expansion valve
(d) Float valve

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-2004

Ans. (a) : In on-off control refrigeration system, which one of the following expansion devices is used capillary tube.

338. A valve which maintains a constant degree of superheat at the end of the evaporator coil, is called
(a) automatic expansion valve
(b) high side float valve
(c) thermostatic expansion valve
(d) low side float valve

Nagaland PSC CTSE 2015 Paper-II
ESE 1993

Ans. (c) : A valve which maintains a constant degree of superheat at the end of the evaporator coil, is called thermostatic expansion valve.

339. The formation of frost on cooling coils in a refrigerator
(a) Increases heat transfer
(b) Improves C.O.P. of the system
(c) Reduces power consumption
(d) Increases power consumption

RPSC AE 2018
APPSC AEE Screening Test 2016

Ans. (d) :
The formation of frost on cooling coils in a refrigerator increases power consumption.

340. The capillary tube as an expansion device, is used in
(a) Domestic refrigeration (b) Water cooler
(c) Room cooler (d) All of these

Vizag Steel (MT) 2017
UKPSC AE 2007 Paper -II

Search on Telegram @apna_pdf

Ans. (d) : In the air conditioner the expansion device used for constant enthalpy expansion process. Here the capillary tube is used as an expansion device in the following :-
i. Domestic refrigeration,
ii. Water cooler,
iii. Room air conditioners,
iv. Freezer.

341. Superheating in a refrigeration cycle
(a) Decreases COP
(b) Increases COP
(c) COP remains unchanged
(d) Unpredictable

Nagaland PSC CTSE 2017 2nd Paper
(KPSC AE 2015)

Ans : (d) Superheating in a refrigeration cycle unpredictable COP.
Effect of super heating:-
1. Refrigeration effect will increase
2. Work done will be directly proportional to inlet temperature than work done will increase.
3. COP will depend on refrigerating substance. for R-12 it will increase and for NH_3 it will decrease
4. Volumetric efficiency will remain almost constant.

342. A hermetically sealed unit implies
(a) Compressor motor is sealed
(b) Compressor is sealed
(c) Refrigerant cycle is sealed
(d) Compressor and motor are sealed

OPSC AEE 2015 Paper-II
RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (d) : A hermetically sealed compressor is one in which both compressor and motor are confined in a single outer welded steel shell.
It is used for electrical components (compressor and motor) that must be secure against water vapour & foreign bodies to maintain proper function and reliability.

343. The moisture in a refrigerant is removed by
(a) Safety relief valve (b) Driers
(c) Expansion valves (d) Evaporator

Rajasthan AE (Nagar Nigam) 2016 Shift-3
UKPSC AE 2007 Paper -II

Ans. (b) : The drier in a refrigeration or air condition system has two essential function
(1) Absorbs systems contaminant such as water.
(2) Provide physical filtration.

344. In a refrigeration cycle, the moisture is to be removed before it enters the
(a) Cold side of the system
(b) Evaporator
(c) Compressor
(d) Condenser

GPSC ARTO 01.05.2016
MPPSC State Forest Service Exam, 2014

Ans. (c) : As we know, in a refrigeration the moisture is to be removed before it enters the compressor because it is difficult to compress, the refrigerant having moisture, & compressor get damaged.

345. In vapour compression refrigeration system, oil-separator is placed between
(a) Compressor and condenser
(b) Condenser and throttling valve
(c) Throttling valve and evaporator
(d) Evaporator and compressor

APSC AEE 2012
OPSC Civil Services Pre 2006

Ans. (a) : The function of an oil separator is to separate oil from the hot gas in the discharge line and return it to the compressor crankcase or to the oil reservoir in system with multiple compressors. Oil separator is installed immediate after the compressor.

346. Which of the following is correct for capillary tube used in vapor compression refrigeration system?
(a) It is very expensive
(b) It requires high maintenance
(c) The starting torque requirement of the motor of the compressor is low
(d) Its bore is large
(e) It is not used with hermetically sealed compressor

CGPSC AE 25.02.2018

Ans. (c) : Capillary tube - The capillary tube is a copper tube of very small internal diameter. It is of very long length and it is coiled to several turns so that it would occupy less space. The internal diameter of the capillary tube used for the refrigeration and air conditioning application varies from 0.5 to 23.28 mm. In any refrigerator the capillary is connected in between a condenser and evaporator to expand the refrigerant inside.

347. In the expansion valve of a refrigerator, the following property remains constant.
(a) Entropy (b) Enthalpy
(c) Internal energy (d) Product PV

RPSC ACF & FRO, 26.02.2021

Ans. (b) : In the expansion valve of a refrigerator enthalpy remains constant.

348. Which is/are the wrong statements for required refrigerant properties?
(1) High latent heat of vaporisation
(2) Higher critical temperature
(3) High boiling point
(4) High specific heat of liquid
(a) (1), (2) (b) (1), (3)
(c) (2), (4) (d) (3), (4)

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : Required refrigerant properties
(1) High latent heat of vaporization.
(2) High critical temperature
(3) Low boiling point.
(4) Specific heat of refrigerant in liquid phase must be low and in vapour phase must be high.

Search on Telegram @apna_pdf

349. What is the correct combination of refrigerants?

(a)	R-11	(I)	Centrifugal compressor & large capacity system
(b)	R-12	(II)	Reciprocating compressor & small capacity system
(c)	R-502	(III)	Frozen food
(d)	R-718	(IV)	Steam ejector

(a) (a-I), (b-II), (c-IV), (d-III)
(b) (a-II), (b-I), (c-IV), (d-III)
(c) (a-I), (b-II), (c-III), (d-IV)
(d) (a-II), (b-I), (c-III), (d-IV)

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a):

350. Low boiling point refrigerants are preferably suited for :
(a) large centrifugal compressors
(b) large axial flow rotary compressors
(c) reciprocating compressors
(d) All of the above

CGPSC AE 15.01.2021

Ans. (c) : Low boiling point refrigerants are preferably suited for reciprocating compressors.

351. Which property is suitable for refrigerants?
(a) Low specific volume
(b) Low critical temperature
(c) Low thermal conductivity
(d) Low latent heat

VIZAG Steel MT 24.01.2021

Ans. (a) : Property is suitable for refrigerants low boiling point, high critical temperature, high latent heat of vaporisation and low specific volume.

352. Relative ozone destruction efficiency of R-12 is
(a) 0.29 (b) 0.86
(c) 0.05 (d) 0.57

ESE 18.07.2021

Ans. (b) : The relative ozone destruction efficiency of R-12 ranges in 0.82 – 0.86.

353. The refrigerant Freon-12 belongs to the family of
(a) Aldehydes (b) ketones
(c) methanes (d) ethanes

HPPSC Poly. Lect. 05.07.2021

Ans. (c) : Freon 12(CF_2Cl_2) also known as dichlorodifluoromethane.

354. The Ozone Depletion Potential (ODP) among the refrigerants are measured relatively to the following refrigerant due to its maximum potential?
(a) R 717 (b) R 123
(c) R 11 (d) R 22

VIZAG Steel MT 24.01.2021, Shift-I

Ans. (c) : CFC11 (Trichlorofluoro methane) or R-11 has the maximum potential amongst chlrofluorocarbons because of the presence of three chlorine atoms in the molecule. So, the ozone depletion potential (ODP) among the refrigerants are measured relatively to the R-11 refrigerant due to the its maximum potential.

355. An air-air heat pump system adopted for year-round-conditioning can be achieved, if the following devices reverses its duties during summers and winters :
(a) Evaporator, Condenser
(b) Compressor, Expander
(c) Compressor, Condenser
(d) Evaporator, Expander

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) :

356. In turbo machine used to circulate refrigerant in large refrigeration plant is
(a) a centrifugal compressor
(b) a radial turbine
(c) an axial compressor
(d) an axial turbine

JPSC AE, 10.04.2021, Paper-I

Ans. (c) : In turbo machine, an axial compressor is used to circulate refrigerant in large refrigeration plant.

357. The purpose of lowering the pressure at refrigeration in an expansion valve is to
(a) Improve the boiling point
(b) Lower the freezing point
(c) to improve rate of condensation
(d) lower the rate of evaporation

TNCSC AE 2020

Ans. (c) : The purpose of lowering the pressure at refrigerant in an expansion valve is to improve rate of condensation.
Expansion valve reduce condensing pressure and temperature to evaporation temperature and pressure to get cooling.

358. For the same pressure the saturation temperature of ammonia is
(a) Higher than saturation temperature of water
(b) Lower than saturation temperature of water
(c) Same as the saturation temperature of water
(d) Depends on concentration of ammonia in water

UPPSC AE 13.12.2020, Paper-2

Ans. (b) : For same pressure, the saturation temperature of ammonia is lower than saturation temperature of water.

359. Choose undesirable properties of a secondary refrigerants.
(a) low freezing point
(b) high viscosity
(c) good stability
(d) low vapour pressure

UPPSC AE 13.12.2020, Paper-2

Ans. (b) : Desirable properties of a secondary refrigerant–
(i) low freezing point
(ii) good stability
(iii) low vapour pressure
High viscosity is the undesirable property of secondary refrigerant.

Search on Telegram @apna_pdf

360. The boiling point of Refrigerant R-32 is:

(a) –43 °C (b) –52 °C
(c) –10 °C (d) –76 °C

CIL MT 27.02.2020

Ans. (b) : The boiling point of refrigerant R – 32 is –52 °C

361. The compressor in the Carnot vapour cycle has to be large as it has to handle a

(a) dry saturated steam
(b) dry saturated liquid
(c) liquid + vapour system
(d) high temperature condenser exhaust

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (c) : The compressor in the carnot vapour cycle has to be large as it has to handle a liquid and vapour system.

362. In food refrigeration facilities, most widely used fluid is,

(a) Ammonia (b) Water
(c) R-134a (d) Ethane

Oil India Senior Officer 23.12.2020

Ans. (a) : In food refrigeration facilities, most widely used fluid is ammonia.

363. A single-stage, single acting reciprocating refrigerant compressor has the following data:
Clearance volume = 0.0005 m^3
Stroke volume = 0.01 m^3
Suction volume = 0.0084 m^3
The volumetric efficiency of compressor is given by

(a) 84% (b) 94%
(c) 78% (d) 90%

SJVN ET 2019

Ans. (a) : Volumetric efficiency of compressor

$$= \frac{\text{Amount of gas leaving the compressor}}{\text{Amount of gas entering the compressor}}$$

$$\eta_v = \frac{0.0084}{0.01} \times 100 = 84\%$$

364. Air is designated as

(a) R729 (b) R764
(c) R732 (d) R744

SJVN ET 2019

Ans. (a) : Air is an inorganic compound
So
R-(700 + Molecular weight of air)
R-[700 + 29]
R-729

365. Which of the following is not the arrangement of supply ducts used in air conditioning?

(a) Extended plenum duct system
(b) Axial perimeter duct system
(c) Loop perimeter duct system
(d) Radial perimeter duct system

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (b) : Types of Supply Duct System– These are basic type of supply and return duct system. Any one of the system types, or a combination of different types, can be utilized to fit the need of a particular structure. The general types of supply duct system include.
(i) Radial perimeter duct system
(ii) Extended plenum duct system
(iii) Reducting plenum duct system
(iv) Reducting trunk duct system
(v) Loop perimeter duct system,

366. Consider the following statements:
An expansion device in a refrigeration system

(1) reduces the pressure from the condenser to the evaporator
(2) regulates the flow of the refrigerant to the evaporator depending on the load
(3) is essentially a restriction offering resistance to flow

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2019

Ans. (d) : An expansion device in a refrigeration system expands the liquid refrigerant from the condenser pressure to the evaporator pressure.
The expansion device also controls the supply of the liquid to the evaporator at the rate at which it is evaporated. The expansion device is essentially a restriction.

367. The centrifugal compressors are generally used for refrigerants that require:

(a) Small displacements and low condensing pressures
(b) Large displacements and high condensing pressures
(c) Small displacements and high condensing pressures
(d) Large displacements and low condensing pressures

OPSC AEE 2019 PAPER - II

Ans : (d) : The centrifugal compressors are generally used for refrigerants that require large displacements and low condensing pressures.

368. Most air cooled condensers are designed to operate with a temperature difference of

(a) 5ºC (b) 8ºC
(c) 14ºC (d) 22ºC

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Most air cooled condensers are designed to operate with a temperature difference of 14ºC. In air cooled condensers the temperature difference between the ambient and the condensing temperature is referred to as the condenser split.

369. In case of leakage of ammonia refrigerant, a sulphur stick produces:

(a) blue smoke (b) yellow smoke
(c) white smoke (d) red smoke

AAI Jr. Executive 29.11.2018

Search on Telegram @apna_pdf

Ans. (c) : Sulphur stick are used industrial ammonia refrigeration system to detect minor ammonia leaks. A sulphur stick is made from a wick which contain particle of sulphur.
The sulphur stick is lit and smolders some thing like the taper that is used to light fire works. The colour of sulphur smoke is used to find the leak when there is no ammonia. The smoke is colourless but when ammonia is present the combined sulphur and ammonia vapour produce a white smoke.

370. If a gas is to be liquefied, its temperature must be .....
(a) increased to two times of critical temperature
(b) increased to five times of critical temperature
(c) raised to ten times of critical temperature
(d) decreased below the critical temperature

RPSC AE 2018

Ans. (d) : If a gas is to be liquefied, its temperature must be decreased below the critical temperature.

371. The freezing point of R-12 is
(a) –86.6ºC (b) –95.2ºC
(c) –107.7ºC (d) –135.8ºC

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : The freezing point of R–12 is –135.8ºC.

372. The refrigerant used in small-tonnage commercial machines (hermetically sealed units) is
(a) Ammonia (b) Carbon dioxide
(c) Sulphur dioxide (d) R-12

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The refrigerant used in small tonnage commercial machines is sulphur dioxide.
Being easily condensed and possessing a high heat of evaporation, sulfur dioxide is a candidate material for refrigerants. Prior to the development of chlorofluorocarbons sulfur dioxide was used as a refrigerant in home refrigerators.

373. In order to collect liquid refrigerant and to prevent it from going to a ..... a device known as accumulator is used at the suction of compressor
(a) compressor (b) condenser
(c) expansion valve (d) evaporator

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : In order to collect liquid refrigerant and to prevent it from going to a compressor, a device known as accumulator is used at the suction of compressor. The accumulator is installed in the suction line, close to the compressor. It usually is a vertical container with top connection. This protects the compressor against liquid slugging by providing additional superheat to the suction gas.

374. An ordinary passenger aircraft requires a cooling system of capacity
(a) 2 TR (b) 4 TR
(c) 8 TR (d) 10 TR

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : An ordinary passenger aircraft requires a cooling system capable of 8 TR capacity and a super constellation requires a cooling system of more than 8 TR capacity.

375. Which is the type of condenser used for ≥3 ≤50 Tons cooling capacity of a refrigeration unit?
(a) Water cooled (b) Air cooled
(c) Water and air cooled (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (a) : Ton's of Refrigeration Capacity :-
i) Water cooled condenser – ≥ 3 - ≤ 50 tons.
ii) Air cooled condenser – ≤ 3 tons.
iii) Water and air cooled condenser – > 50 tons.
iv) Shell & tube type condenser – 10 – 50 tons.

376. Which is the type of condenser used for > 50 Tons cooling capacity of a refrigeration unit?
(a) Water cooled (b) Air cooled
(c) Water and air cooled (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (c) : Water cooled type of condensers having refrigeration capacity is around > 50 tons.

377. The material of pipelines for a system using Freon as refrigerant should be
(a) Aluminium (b) Copper
(c) Steel (d) Brass

TSPSC AEE 2017

Ans. (b) : The material of pipelines for a system using Freon as a refrigerant should be copper, because copper conducts heat better than other materials.

378. The refrigerant R-764 stands for-
(a) Ammonia (b) Carbon dioxide
(c) Sulphur dioxide (d) Methyl chloride

GMB AAE 25.06.2017

Ans. (c) : R – 764
For inorganic substance
R – 700 + Molecular weight
Molecular weight of SO_2 = 64
R -764 = SO_2
$NH_3 \Rightarrow 17 \Rightarrow$ R717
$CO_2 \Rightarrow 44 \Rightarrow$ R744

379. Which of the following is not used as a refrigerant?
(a) Ammonia (b) Carbon Monoxide
(c) Carbon Dioxide (d) Sulphur Dioxide

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Carbon monoxide is not used as a refrigerant.

380. Consider the following statements in respect of (l) the temperature of the medium, (m) the refrigerant and (n) the condenser and absorption system – in a refrigeration unit:
1. Temperature of the medium being cooled must be below that of the evaporator.
2. Refrigerant leaves the condenser as liquid.
3. Any solar thermally operated absorption system is capable only of intermittent operation.

Which of the above statements are correct?
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2017

Search on Telegram @apna_pdf

Ans. (c) : In absorption system the temperature of medium being cooled is more than the evaporator temperature, so statement-1 is wrong.

381. CFC's were banned due to

(a) Global warning (b) Ozone depleting
(c) Both (1) and (2) (d) None of these

Nagaland PSC CTSE 2017 2nd Paper

Ans. (c) : CFC banned due to reason because they damage the earth's ozone layer, CFC are also greenhouse gas that affects the environment by contributing to global warming.

382. Which of the following is eco-friendly refrigerant?

(a) R-11 (b) R-718
(c) R-12 (d) R-22
(e) R-110

CGPSC ARTO & TSI 07.01.2017

Ans. b : Eco- friendly refrigerators those refrigerant which are not lead to deplete ozone layer.
Some Eco friendly Refrigerants.
1. R- 290 – Propane
2. R-600 A – Isobutane
3. R-134 A – Tetraflouroethane
4. R-718 – Water

383. In larger industrial vapour compression refrigeration systems, the refrigerant widely used is

(a) R-12 (b) Carbon dioxide
(c) Ammonia (d) Sulphur dioxide

APGENCO AE, 2017

Ans. (c) : In larger industrial vapour compression refrigeration systems, the refrigerant widely used is ammonia.

384. Thermostatic expansion valves are set mostly for a super heat of

(a) 5°C (b) 10°C
(c) 15°C (d) 20°C

Kerala PSC Poly. Lect., 2017

Ans. (a) : Mostly thermostatic expansion valves are set for a super heat of 5°C.

385. In a Refrigeration system with multiple evaporators at different temperature with compound compression and flash intercooler, the suction vapour to the high pressure stage is:

(a) Wet state (b) Dry saturated
(c) Super heated (d) Saturated liquid

Kerala PSC Poly. Lect., 2017

Ans. (b) : In a Refrigeration system with multiple evaporators at different temperature with compound compression and flash intercooler, the suction vapour to the high pressure stage is dry saturated.

386. Finned tube evaporates are used in a

(a) Fridge (b) Window air conditioner
(c) Water cooler (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (b) : Finned tube evaporators are used in a windows air conditioner.

387. Bare tube evaporator is used in a

(a) Cold storage plant (b) Ice plant
(c) Milk Plant (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (b) : Bare tube evaporator is used in a ice plant. In this type of evaporator, the entire surface of the coil is in contact with the refrigerant inside. This type of evaporator is also called prime surface evaporator. They are easier to clean, therefore its use in household purposes.

388. In a dry evaporator refrigerant at the outlet is

(a) in the wet state (b) saturated state
(c) super heated state (d) none

Nagaland PSC CTSE 2017 2nd Paper

Ans. (c) : In dry evaporator, refrigerant at the outlet is super heated state.

389. Forced air cooled condenser in refrigeration unit has a

(a) Counter flow (b) Parallel flow
(c) Cross flow (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (c) : Forced air cooled condenser in refrigeration unit has a cross flow.

390. Water cooled condenser in refrigeration unit

(a) Counter flow (b) Parallel flow
(c) Cross flow (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (a) : Water cooled condenser in refrigeration unit has a counter flow.

391. Flooded evaporator needs at the outlet a

(a) Flash chamber (b) Accumulator
(c) Inter cooler (d) None

Nagaland PSC CTSE 2017 2nd Paper

Ans. (b) : Flooded evaporator needs at outlet of accumulator.

392. A condenser manufacturer gives a 'heat rejection capacity factor' at 26°C wet bulb temperature of 1.22. What is the condenser duty if the cooling capacity is 350 kW?

(a) 387 kW (b) 296 kW
(c) 427 kW (d) 572 kW
(e) None of these

CGPSC AE 16.10.2016

Ans. (c) : As we know,
Condenser duty = Cooling capacity × Factor
= 350 × 1.22
= 427 kW

393. Freon group of refrigerants have a property of

(a) Non-Toxic and Non-Inflammable
(b) Inflammable
(c) Toxic
(d) Toxic and Non- Inflammable

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (a) : The Freon are colourless, odourless non-flammable, non-corrosive gases or liquid of low toxicity that are introduced as refrigerant.
Non toxic (due to presence of fluorine)
Non flammable (due to absence of hydrogen)

Search on Telegram @apna_pdf

394. Which of the following are blamed for ozone layer depletion?

(a) Chloro-fluoro-carbon refrigerants
(b) Hydrofluorocarbons
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (c) : The main cause of ozone layer depletion and the ozone hole is manufactured chemicals, especially manufactured halocarbon refrigerants, solvents propellants and foam blowing agents (Chlorofluorocarbons) (CFCs) (HCFCs) referred to as ozone depleting substance (ODS).

395. Which one of the following is a CFC refrigerant?

(a) R 744 (b) R 290
(c) R 502 (d) R 718
(e) None of the above

Kerala PSC AM 09.08.2021
CGPSC Poly. Lect. 22.05.2016

Ans. (c) : R502 – Azeotropes as refrigerants
R-502 → R-(500 + random number)
$CHClF_2 + CClF_2CF_3 \rightarrow CFC \rightarrow C_3HCl_2F_7$

396. Ozone depletion potential (ODP) is the measure of ozone depletion capability of a refrigerant compared to that of

(a) R11 (b) R718
(c) R717 (d) R22

RPSC LECTURER 16.01.2016

Ans. (a) : Ozone depletion potential (ODP) is the measure of ozone depletion capability of a refrigerant compared to that of R-11 [$CFCl_3$]
R-717 → NH_3
R-718 → H_2O
R-22 → CHF_2Cl

397. Which of the following is not the desirable property of refrigerant

(a) Low latent heat
(b) High vapour density
(c) Low freezing temperature
(d) Low condenser pressure

RPSC Lecturer 16.01.2016

Ans. (a) : Refrigerant should be high latent heat of vaporisation, high vapour density, low freezing temperature these are the desirable property of refrigerant.

398. The leakage in a refrigeration system using ammonia is detected by

(a) hilide torch (b) sulphur sticks
(c) soap solution (d) hot water

APPSC AEE MAINS 2016 PAPER-III
ESE 2000

Ans. (b) : The leakage in a refrigeration system using ammonia is detected by sulphur sticks.

399. The capillary tube is not used in large capacity refrigeration systems because

(a) Cost is too high
(b) Capacity control is not possible
(c) It is made of copper
(d) Required pressure drop cannot be achieved

APPSC AEE MAINS 2016 PAPER-III

Ans. (b) : The capillary tube is not used in large capacity refrigeration systems because capacity control is not possible.

400. R-12 is preferred over R-22 in deep freezer, because

(a) It has lower operating pressure
(b) It gives higher COP
(c) It is miscible with oil over a large range of temperature
(d) All of the above

UPPSC AE 12.04.2016 Paper-II

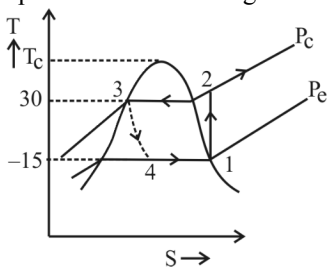
Ans : (c) R-12 is preferred over R-22 in deep freeze, because it is miscible with oil over a large range of temperature.
R-12:- Dichloro - difluore - methane (CCl_2F_2)
* Non-toxic, non corrosive and non-flammable
* Operates at low pressure
* Relatively low latent heat
* Equally amenable with all types of compressor and condensing tubes
* Good miscibility with oil
* Leakage easy detected with halide torch or by an electronic detector

401. Which one of the following is WRONG statement?

(a) A refrigerant should have higher critical temperature
(b) A refrigerant should have high boiling point
(c) A refrigerant should have high latent heat
(d) A refrigerant should have low specific heat

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (b) : Properties of refrigerant–
1. Critical temperature should be high



2. Latent heat should be high.
3. Refrigerant should have low specific heat.
4. Refrigerant should have low boiling point.

402. Dry evaporator is used in A.C. Units of capacity

(a) < 3 tons (b) < 10 tons
(c) > 10 tons (d) None

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Dry evaporator is used is A.C. Units of capacity is less than 3 tons.

Search on Telegram @apna_pdf

403. Heat lost in the condenser is

(a) < (N + W) (b) = (N + W)
(c) > (N + W) (d) None

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) :

$$Heat\ Loss\left(Q_L\right)=\left(N+W\right)$$

404. Heat lost in the condenser is due to

(a) Decrease in the degree of super heat
(b) Decrease in the degree of sub cooling
(c) Decrease in the degree of super heat + Latent heat + Increase in degree of sub cooling
(d) None of these

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Heat loss in condenser is due to decrease in degree of super heat + Latent heat + Increase of degree of sub-cooling.

405. The purpose of installing a flash chamber in the refrigeration circuit is to

(a) Improve overall heat transfer coefficient
(b) Reduce pressure losses through evaporator
(c) Reduce the size of evaporator by avoiding vapours going to evaporator
(d) All the above

APPSC AEE Screening Test 2016

Ans. (d) : At entry evaporator (liquid + vapour) particle is present. So with the use of flash chamber which is installed at the entry evaporator allow only liquid particle to enter into the evaporator which results in absorption of heat

- With the use of flash chamber their is no impact on (COP)
- It helps to reducing the size of evaporator.

406. In an air craft refrigeration system the pressure at the cooling turbine outlet is equal to

(a) Ambient pressure
(b) Cabin pressure
(c) Pressure at inlet to compressor
(d) None of the above

UPPSC AE 12.04.2016 Paper-II

Ans : (b) In an air craft refrigeration system the pressure at the cooling turbine outlet is equal to the cabin pressure.

407. The presence of moisture in refrigeration effect is felt at:

(a) Evaporator (b) Condenser pipes
(c) Expansion valve (d) Compressor unit

UPPSC AE 12.04.2016 Paper-II

Ans : (c) The presence of moisture in refrigeration effect is felt at Expansion valve.

408. The refrigeration effect in a dry evaporator compared to flooded evaporator in a similar plant is

(a) Same
(b) More
(c) Less
(d) More or less depending on ambient conditions

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : The advantage of flooded evaporator is that the whole surface of the evaporator coil is in contact with liquid so refrigeration effect per unit input is high.
It is expensive but COP of this refrigerator is high.
The refrigeration effect in a dry evaporator compared to flooded evaporator in a similar plant is less.

409. Match List-I with List-II and select the correct answer :

	List-I		List-II
A.	Dichlorodifluoro-methane	1.	R 718
B.	Water	2.	R 22
C.	Methyl chloride	3.	R 40
D.	Monochlorodifluoro-methane	4.	R 12

	A	B	C	D		A	B	C	D
(a)	4	1	2	3	(b)	1	4	3	2
(c)	1	4	2	3	(d)	4	1	3	2

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-1999

Ans. (d) :

Dichlorodifluoro-methane	–	R 12
Water	–	R 718
Methyl chloride	–	R 40
Monochlorodifluoro-methane	–	R 22

410. The refrigerant R - 744 is

(a) ammonia (b) Freon-12
(c) carbon dioxide (d) sulfur dioxide

(KPSC AE 2015)

Ans : (c) for Inorganic refrigerants
R- 700 + Atomic weight)
R - 700 + (CO_2 Atomic weight)
R - 744

411. Pipe material for the refrigerator with ammonia solution as working fluid should not be:

(a) Mild steel (b) Copper
(c) Aluminum (d) Brass

OPSC AEE 2015 PAPER - II

Ans : (b) Pipe material for the refrigerator with ammonia solution as working fluid should not be copper. An Ammonia refrigerating system the tubes of a shell and tube condenser are made of steel. Every vapour-compression refrigeration system or unit ever built will have at least one each of these four components:
* Compressor * Condenser
* Expansion * Evaporator

412. An evaporator pressure regulator performs the following function

(a) Monitors evaporator temperature
(b) Maintains compressor inlet pressure
(c) Maintains expansion valve
(d) Keeps pressure up for system needs

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : An evaporator pressure regulator Keeps pressure up for system needs

Search on Telegram @apna_pdf

413. Match List-I with List-II and select the correct answer :

List-I	List-II
A. Sulphur candle test	1. Propane
B. Halide torch test	2. Ammonia
C. Soap and water test	3. Halocarbon refrigerants
D. Ammonia swab test	4. Sulphurdioxide

	A	B	C	D		A	B	C	D
(a)	2	3	1	4	(b)	4	1	3	2
(c)	2	1	3	4	(d)	4	3	1	2

Nagaland PSC CTSE 2015 Paper-II, CSE Pre-2004

Ans. (a) :

Sulphur candle test	–	Ammonia
Halide torch test	–	Halocarbon refrigerants
Soap and water test	–	Propane
Ammonia swab test	–	Sulphurdioxide

414. In split system of air - conditioner, the condensing unit is located:

(a) Inside the area to be conditioned
(b) Outside the area to be conditioned
(c) Near the refrigerator
(d) None of the above

OPSC AEE 2015 PAPER - II

Ans : (b) In split system of air- conditioner, the condensing unit is located outside the area to be conditioned.

415. The ideal location for a filter-drier in a refrigeration cycle is the point where it will remove moisture before the moisture enters the

(a) Condenser
(b) Compressor
(c) Cold side of system
(d) Warm side of system

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : The ideal location for a filter-drier in a refrigeration cycle is the point where it will remove moisture before the moisture enters the cold side of the system.

416. Use of flash chamber in Vapour Compression Refrigeration (VCR) is best justified with :

(a) Increased refrigeration effect
(b) Reduced compression work
(c) Reduced size of evaporator
(d) Increased (COP)

KPSC ADF 2015

Ans. (c) : Use of flash chamber in vapour compression refrigeration (VCR) is best justified with reduced size of evaporator.

A flash chamber is a device which separates liquid from vapours. Only liquid is passed to evaporator and the vapours will be passed to the compressor directly. This flash chamber between the condenser and evaporator is known as flash inter cooling.

417. Consider the following for use of refrigeration system with liquid sub cooler

1. Prevent the entry of liquid into compressor
2. Prevent flashing of refrigerant liquid ahead of low stage expansion device
3. Promotes flashing of refrigerant liquid ahead of low stage expansion device
4. Reduce work of compression

Of the above, which is correct

(a) 1 (b) 2
(c) 3 (d) 4
(e) 1 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : Use of refrigeration system with liquid sub cooler prevent flashing of refrigerant liquid ahead of low stage expansion device.

418. Consider the following for flash tank:

1. Flash gas formed during expansion can be removed at an intermediate pressure
2. Quality of refrigerant at the evaporator inlet can be increased
3. Temperature of refrigerant vapour at the inlet to higher stage compressor can be reduced
4. Pressure drop in evaporator be reduced

Of the above, which is correct

(a) 1 and 2 (b) 2 and 3
(c) 1 and 3 (d) 1, 2 and 3
(e) 1, 3 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) : 1. **Function of flash tank**- Flash gas formed during expansion can be removed at an intermediate pressure.
2. Temperature of refrigerant vapour at the inlet to higher stage Compressor can be reduced.
3. Pressure drop in evaporator can be used.

419. Which of the following refrigerant has the lowest boiling point?

(a) R-134a (b) R-407c
(c) R-410a (d) R-417a

MPPSC State Forest Service Exam, 2014

Ans. (c) : R-410a is azeotropic mixture of R-32 & R-125, used as refrigerant in air conditioning having low boiling point as compared to all among.

420. Which of the following refrigerant has minimum ozone depletion potential?

(a) R-11 (b) R-12
(c) R-22 (d) R-134a

MPPSC State Forest Service Exam, 2014
ESE 1992

Ans. (d) : R-134a is known as tetrafluoro ethane from the family of HFC refrigerant which is a replacement to CFCs & HCFCs because it have very less or minimum ozone depletion, potential.

421. The Refrigerant R – 718 is

(a) Ammonia (b) Water
(c) Air (d) Carbon dioxide

TNPSC AE 2014

Search on Telegram @apna_pdf

Ans. (b) : R–718—R-718 is a organic compound.
R – [700 + moleculer weight]
R – [700 + moleculer weight of water (H_2O)]
R – [700 + 1 × 2 + 16]
R – 718 → water

422. Match List I (Containing designation of refrigerants) with List II (containing chemical formula and name of refrigerant) and select the correct answer:

List I		List II	
A	**R-22**	**1**	**CCl_2F_2**
B	**R-11**	**2**	**SO_2**
C	**R-12**	**3**	**CCl_3F**
D	**R-764**	**4**	**CH_2FCl**
		5	**$CHClF_2$**

(a) A-4, B-2, C-3, D-5 (b) A-1, B-3, C-2, D-4
(c) A-5, B-3, C-1, D-2 (d) A-1, B-4, C-5, D-3
(e) A-4, B-5, C-1, D-3

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) :
R – 22 $CHClF_2$
R – 11 CCl_3F
R – 12 CCl_2F_2
R – 764 SO_2

423. Consider the following for Ammonia as a refrigerant
1. It offers excellent performance
2. It is a natural refrigerant
3. It is inexpensive
4. It deplete ozone layer

Of the above, which is correct
(a) 1 and 2 (b) 1 and 3
(c) 1 and 4 (d) 1, 2 and 3
(e) 3 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) : Properties and Advantages of Ammonia Refrigerant—
1. **Small piston displacement**- Ammonia has the highest refrigerating effect per pound compared to all the refrigerants being used including the halocarbon. Even though the specific volume of ammonia is high, the compressor displacement required per ton of refrigeration is quite small, due to this small compressor is required per ton of the refrigeration capacity. This saves lots of Power in the long run.
2. Since specific volume of Ammonia is high it is used mostly with rotary and the centrifugal compressor.
3. **Environment friendly**- It is safe to the environment and does not cause and depletion of the ozone layer.
4. **Corrosive nature of Ammonia**-An hydro ammonia is non-corrosive in nature, however, in presence of moisture it tends to become corrosive to copper, brass and other non-ferrous materials.
5. **Miscibility with oil**-Ammonia refrigerant is non-miscible with oil.
6. **Ammonia is Cheap and available readily**-Ammonia is available almost every where and is the cheapest of all the commonly used refrigerants.

424. Which of the following …… has the highest freezing point?
(a) Sulphur dioxide (b) Ammonia
(c) Carbon dioxide (d) R.12

GPSC Lect. (Poly.) 07.12.2014

Ans. (c) : Sulphur dioxide – 75.2 C
Ammonia – 28 C
Carbon dioxide – 109.4C
R– 21.8 C

425. The critical temperature for Freon-12 is
(a) Around - 20º C (b) Above 100º C
(c) 0ºC (d) Around 50º

GPSC Lect. (Poly.) 07.12.2014

Ans. (b) : The critical temperature for Freon-12 is
R – 12 – 111.97ºC

426. Consider the following statements :
Dry compression in reciprocating compressor is preferred because it
1. **prevents valve damage**
2. **enables use of thermostatic expansion valve**
3. **minimize irreversibility in the compressor**
4. **prevents washing out of the lubricating oil from cylinder walls**

Which of these statements are correct?
(a) 1 and 2 (b) 2 and 3
(c) 1 and 4 (d) 3 and 4

Haryana PSC Civil Services Pre, 2014
CSE Pre-1999

Ans. (c)

427. Consider the following statements concerning fixed vane and rotary compressors as used in vapour compression refrigeration system.
1. These compressors are used in small capacity systems (less than 2kW)
2. They require suction value, but do not require discharge value
3. Refrigerant leakage is minimized by hydrodynamic lubrication
4. Compared to reciprocating compressors, the re-expansion losses are high in rotary vane compressor

Of the above, which is correct
(a) 1 and 2 (b) 1 and 3
(c) 1 and 4 (d) 2 and 3
(e) 2 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : Fixed vane and rotary compressor as used in vapour Compression refrigeration system because these compressors are used in small capacity system (less than 2 kW) and refrigerant leakage is minimized by hydrodynamic lubrication.

Search on Telegram @apna_pdf

428. Hermetic compressors are used mainly in smaller systems as they:
(a) Yield higher COP
(b) Do not require frequent servicing
(c) Offer the flexibility of using any refrigerant
(d) Can be used under different load conditions efficiently
(e) result in better refrigeration capacity

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : Hermetic compressors are used mainly in smaller system as they do not require frequent servicing.

429. Actual expansion process in a throttling device is:-
(a) Reversible adiabatic expansion
(b) Isenthalpic expansion
(c) Fanno - line expansion
(d) Isothermal expansion

UKPSC AE-2013, Paper-II

Ans. (c) : Actual expansion process in a throttling device is fanno - line expansion,

430. The system used for cooling of supersonic aircraft is:-
(a) Simple system
(b) Bootstrap system
(c) Reduced ambient system
(d) Regenerative system

UKPSC AE-2013, Paper-II

Ans. (c) : The system used for cooling of supersonic aircraft is reduced ambient system.

431. External equalizer in thermostatic expansion valve (TEV) is used so that the TEV senses the pressure of evaporator:-
(a) At the outlet
(b) At the inlet
(c) In the middle
(d) At outlet as well as inlet

UKPSC AE-2013, Paper-II

Ans. (a) : External equalizer in thermostatic expansion valve (TEV) is used so that the TEV senses the pressure of evaporator at the outlet.

432. Refrigeration in aeroplanes usually employs the following refrigerant :
(a) CO_2 (b) Freon-11
(c) Freon-22 (d) Air

J&K PSC Civil Services Pre, 2013

Ans. (d) : Refrigeration in aeroplanes usually employs the following refrigerant air.

433. Moisture should be removed from refrigerants to avoid
I. Compressor seal failure.
II. freezing at the expansion valve.
III. restriction to refrigerant flow.
IV. corrosion of steel parts.
Of these statements
(a) I, II, III and IV are correct
(b) I and II are correct
(c) II, III and IV are correct
(d) I, III and IV are correct

APPSC Poly. Lect. 2013

Ans. (a) : Moisture should be removed from refrigerants to avoid
(i) Compressor seal failure.
(ii) freezing at the expansion valve
(iii) restriction to refrigerant flow
(iv) Corrosion of steel parts

434. In the following refrigeration x represents any digit. Which of these is a hydrocarbon refrigerant?
(a) R-xx 1 (b) R-xx0
(c) R-7xx (d) R-x2

RPSC AEN Pre-2013

Ans. (b)
- Hydrocarbon refrigerant – (Saturated refrigerant)
  R – xx0
- Unsaturated (Hydrocarbon) refrigerant
  R – xxx0
- If the refrigerant is inorganic (Compound) refrigerant
  R – 700 + Mol. weight

435. The working fluid in refrigeration cycle is
(a) Refrigerator (b) Refrigerant
(c) Absorbent (d) Lubricant

TNPSC AE 2013

Ans. (b) : The working fluid in refrigeration cycle is known as refrigerant.

436. The boiling point of carbon dioxide is
(a) –20.5 ºC (b) – 50 ºC
(c) – 73.6 ºC (d) – 78.3 ºC

JPSC AE 2013 Paper-V

Ans. (c) : – 73.6 ºC

437. Normal boiling point of different refrigerants are given below. Which pairs are correct?
(1) NH3 – 40.8°C (2) R-12 – 29.8°C
(3) R-22 – 33.3°C (4) R-134a – 26.2°C
(a) (1) and (2) are correct
(b) (3) and (4) are correct
(c) (2) and (4) are correct
(d) (1) and (4) are correct

UKPSC AE-2013, Paper-II

Ans. (c) :

438. A regenerative liquid – vapour heat exchanger is used in a vapour compression system operating on ammonia refrigerant, the COP:-
(a) Will increase
(b) Will decrease
(c) Can increase or decrease
(d) Remains unaffected

UKPSC AE-2013, Paper-II

Ans. (b) :

439. The refrigerant C_2H_4 is designated as:-
(a) R 24 (b) R 15
(c) R 1150 (d) R 150

UKPSC AE-2013, Paper-II

Ans. (c) : $C_mH_nF_pCl_q$ m = 2, n = 4, p = 0, q = 0
n + p + q = 2m
R1(m – 1) (n + 1)p
R1150

Search on Telegram @apna_pdf

440. Which of the refrigerant is more toxic?
(a) Carbon dioxide (b) Ammonia
(c) Freon-12 (d) Freon-22
UKPSC AE-2013, Paper-II

Ans. (b) : Ammonia as a refrigerant is more toxic.

441. Which of the following refrigerant is more costly?
(a) Ammonia (b) Carbon dioxide
(c) Methyl chloride (d) Freon-12
UKPSC AE-2013, Paper-II

Ans. (d) :

442. Pick up the correct statement:-
(a) The refrigerant should have high thermal conductivity and low freezing temperature
(b) The refrigerant should have low heat transfer coefficient and high latent heat
(c) The refrigerant should have high specific volume and high latent heat
(d) The refrigerant should have high specific volume and low latent heat
UKPSC AE-2013, Paper-II

Ans. (a) :

443. The most commonly used refrigerant in vapour compression system is :
(a) Ammonia (b) R-12
(c) CO_2 (d) Ethylene
TNPSC AE (Industries) 09.06.2013

Ans. (b) :

444. Finned evaporators are used on air conditioning application to
(a) equalize air flow over the cooling coil surface
(b) prevent moisture carry over
(c) extend the effective area of the cooling surface
(d) increase the dehumidifying capacity
UKPSC AE 2012 Paper–II

Ans. (c) : Finned evaporators are used on air conditioning application to extend the effective area of the cooling surface.

445. What is the storage temperature for milk ?
(a) 4 °C (b) 7 °C
(c) 2 °C (d) 0.5 °C
UKPSC AE 2012 Paper–II

Ans. (d) : 0.5 °C

446. Due to suction vapour superheating in vapour compression cycle the COP increases in case of the following refrigerant :
(a) R 22 (b) NH_3
(c) R – 12 (d) None of the above
UKPSC AE 2012 Paper–II

Ans. (c) : For R 12 & R 134 COP↑
and for Freon, R22 and NH_3 COP↓

447. Which one of the following is not a desirable property of a good refrigerant ?
(a) low specific heat
(b) high specific volume of vapour
(c) large latent heat at evaporator pressure
(d) high critical temperature
UKPSC AE 2012 Paper–II

Ans. (b) : high specific volume of vapour

448. Which refrigerant would you choose for 800 TR air conditioning plant using centrifugal compressor ?
(a) NH_3 (b) CO_2
(c) CFC 11 (d) CFC 114
UKPSC AE 2012 Paper–II

Ans. (c) : CFC 11

449. The brine is an aqueous solution of ___ in water.
(a) Calcium chloride (b) Sodium chloride
(c) Calcium carbonate (d) Sodium carbonate
UKPSC AE 2012 Paper–II

Ans. (b) : Sodium chloride

450. Go through the following statements and choose the correct alternative :
1. Wet compression increases COP of ammonia vapour compression system.
2. Use of liquid-vapour heat exchanger in vapour compression system decreases COP in case of ammonia refrigerant.
3. For good performance, a refrigerant must have high critical pressure and low critical temperature.
4. Refrigerants that are not miscible with oils, presents many problems.
5. In flooded evaporators, the liquid refrigerant covers the entire heat transfer surface.

(a) Statements 1, 2 and 5 are true
(b) Statements 1, 2 and 3 are true
(c) Statements 3, 4 and 5 are true
(d) Statements 2, 4 and 5 are true
UKPSC AE 2012 Paper–II

Ans. (a) : Statements 1, 2 and 5 are true

451. The function of solenoid valve in a refrigeration system is to
(a) control the flow of refrigerant in suction line
(b) control the flow of refrigerant through expansion valve
(c) stop the flow of refrigerant when there is no load on the evaporator
(d) stop the flow of refrigerant in liquid line when compressor stops
UKPSC AE 2012 Paper–II

Ans. (d) : stop the flow of refrigerant in liquid line when compressor stops

452. An evaporator pressure regulator performs the following function
(a) Monitors evaporator temp
(b) Maintains compressor inlet pressure
(c) Keeps pressure up for system needs
(d) All of these
RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (d) : An evaporator pressure regulator, monitors evaporator temperature by changing throttling pressure, maintains compressor inlet pressure, due to change in throttling pressure & keeps pressure up for system needs and constant surface temperature at evaporator, by throttling in suction line.

Search on Telegram @apna_pdf

453. When a R–22 refrigeration system is charged with R–12, the system will :
(a) Not Function
(b) Operate at low temperature
(c) Have considerable fluctuations in the operating pressures
(d) Have its refrigeration capacity reduce to about one-third

OPSC Civil Services Pre. 2011

Ans. (d) : When a R–22 refrigeration system is charged with R–12, the system will have its refrigeration capacity reduce to about one-third.

454. The refrigeration system of a passenger aircraft works on reversed :
(a) Brayton cycle (b) Atkinson cycle
(c) Carnot cycle (d) Otto cycle

J&K PSC Civil Services Pre, 2010

Ans. (a) : The refrigeration system of a passenger aircraft works on reversed brayton cycle.

$$(COP) = \frac{1}{\left[\left(r_p\right)^{\frac{\gamma-1}{\gamma}} - 1\right]}$$

Where, r_p = pressure ratio

$$r_p = \frac{P_2}{P_1}$$

455. Assertion (A) : Sometimes particular combination of refrigerant and piping will result in a resonant frequency which may amplify the sound and vibration to an undesirable level.
Reason (R) : Muffler is used to solve the above problem.
Codes :
(a) Both A and R are individually true and R is the correct explanation of A
(b) Both A and R are individually true and R is not the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (b) : We know that sometimes particular combination of refrigerant & piping will result in a resonant frequency which may amplify the sound & vibration to an undesirable level for so for solving these problem we use muffler which decrease the resonating frequency.

456. In a domestic refrigerator, periodical defrosting is necessary to
(a) Protect the coil from damage
(b) Avoid wastage of power
(c) Reduce evaporator pressure
(d) Reduce condenser pressure

UPSC JWM Advt. No.-50/2010

Ans. (b) : As we know, in a domestic refrigerator, the periodical defrosting is necessary to reduce the wastage of power. In this, we remove the ice that is deposited on the evaporator tube. Since ice is bad conductor of heat.

457. Which is usually costliest item in a refrigeration system ?
(a) condenser (b) capillary tube
(c) compressor (d) evaporator

J&K PSC Civil Services Pre, 2010

Ans. (c) : Compressor is the costliest item in a refrigerating system.

458. At the back of domestic refrigerator, the bank of tubes are :
(a) Evaporator tubes
(b) Condenser tubes
(c) Refrigeration cooling tubes
(d) Capillary tubes

J&K PSC Civil Services Pre, 2010

Ans. (b) : The bank of tubes at the back of domestic refrigerator is condenser tubes

459. The number of hydrogen atoms in the refrigerant R-12 is :
(a) 4 (b) 2
(c) 1 (d) 0

DRDO Scientists 2009

Ans. (d) : Chemical formula of F-12 is CCl_2F_2
So, there is no hydrogen atom.

460. With an increase in suction pressure, the volumetric efficiency of a reciprocating refrigeration compressor
(a) increases
(b) decreases
(c) remains constant
(d) may increase or decrease depending upon the type of refrigerant

UKPSC AE 2007 Paper -II

Ans. (a) : $\eta = 1 + C - C\left(\frac{P_{condenser}}{P_{evaporator}}\right)^{1/n}$

$P_{evaporator}$ = Suction pressure of compressor
$P_{evaporator}\uparrow$, $\eta_v\uparrow$

461. Dry ice is produced by expanding
(a) Liquid ammonia
(b) Liquid Freon-22
(c) Liquid carbon dioxide
(d) Liquid Freon-12

UKPSC AE 2007 Paper -II

Ans. (c) : Liquid carbon dioxide

462. Which of the refrigerant is least used these days?
(a) Freon-12 (b) Sulphur dioxide
(c) Carbon dioxide (d) Ammonia

UKPSC AE 2007 Paper -II

Ans. (c) : Carbon dioxide

463. Among the refrigerants namely R - 11, R - 12, R - 22 and R - 717, the ratio of specific heats is highest for
(a) R - 12 (b) R - 22
(c) R -11 (d) R - 717

UKPSC AE 2007 Paper -II

Ans. (d) : R - 717

Search on Telegram @apna_pdf

464. The following refrigerant is not miscible with oil.
(a) R - 717 (b) R - 11
(c) R - 22 (d) R - 12
UKPSC AE 2007 Paper -II

Ans. (a) : R - 717

465. It is desirable for a good refrigerant to have
(a) High critical temperature
(b) Low critical temperature
(c) High freezing point
(d) High melting point
OPSC Civil Services Pre 2006

Ans. (a) : Properties of a good refrigerants
(i) Low boiling point.
(ii) High critical temperature.
(iii) High latent heat of vaporisation.
(iv) Low specific heat of liquid.
(v) Low specific volume of vapour.
(vi) Easy to liquefy at moderate pressure and temperature.

466. Which of the following is NOT an ozone friendly refrigerant?
(a) Freon-12 (b) Ammonia
(c) Air (d) Carbon dioxide
OPSC Civil Services Pre 2006

Ans. (a) : CFC-R12 (Freon-12) was widely used in refrigerators, inhalers and aerosol spray cans.
CFCs were not widely used in air-conditioning system, but are worth talking about here to understand their effect on the environment.
When CFCs, which are made chlorine, fluorine and carbon, break down over time due to exposure to UV radiation, they release chlorine atoms which react with the ozone molecule to destroy it.

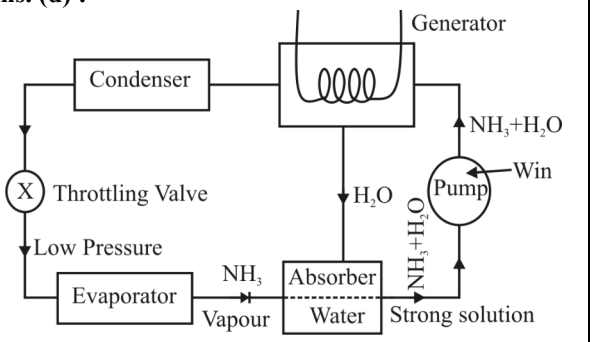
4. Vapour Absorption Refrigeration System

467. In an Electrolux system:
(a) ammonia is absorbent and water is refrigerant
(b) lithium bromide is refrigerant and water is absorbent
(c) water is refrigerant and lithium bromide is absorbent
(d) ammonia is refrigerant and water is absorbent
NLCIL GET 17.11.2020, Shift-II, Vizag Steel MT 2017
HPPSC W.S. Poly. 2016, KPSC AE 2015
ISRO Scientist/Engineer (RAC) 29.11.2015
APPSC IOF 2009, ESE 2005

Ans. (d) : The electrolux refrigeration system is also called three fluid absorption system. The three fluids used are ammonia, hydrogen and water. The main purpose of this system is to make the machine noiseless by eliminating moving parts (pump).
Water is used as absorbent because it has ability to absorbs ammonia.

468. In vapour absorption refrigeration, heat is rejected in:
(a) condenser only
(b) generator only
(c) absorber only
(d) condenser and absorber
(e) generator and absorber
CGPSC AE 25.02.2018
CGPSC ARTO & TSI 07.01.2017
BPSC AE Mains 2017 Paper-V
Nagaland PSC CTSE 2017, 2016 Paper-II
Haryana PSC Civil Services Pre, 2014

Ans. (d) :



→ In vapour absorption system compressor is replaced by absorber, pump and generator.
→ In VARS heat is rejected in condenser and absorber.

469. Waste heat can be effectively used in which one of the following refrigeration systems?
(a) vapour compression refrigeration cycle
(b) air refrigeration cycle
(c) vapour absorption refrigeration cycle
(d) vortex refrigeration cycle
VIZAG STEEL MT 2017
Nagaland PSC CTSE 2017, 2016 Paper-II
UJVNL AE 2016
CGPSC Poly. Lect. 22.05.2016
Haryana PSC Civil Services Pre, 2014
UPRUVNL AE 2014

Ans. (c) : VARS system is based on Low grade energy (heat) or solar based energy.
VARS = Vapour Absorption Refrigeration System.

470. The refrigerant used for absorption refrigerators working on heat from solar collectors is a mixture of water and which of the following substance?
(a) Carbon dioxide (b) Sulphur dioxide
(c) Lithium bromide (d) Freon 12
Nagaland PSC (CTSE) 2018, Paper-II
UJVNL AE 2016, UPRVUNL AE 2014
UKPSC AE 2007 Paper -II, ESE 1996

Ans : (c) Lithium Bromide use as absorber in absorption refrigerators system and H_2O is use as refrigerant.
An absorption refrigerator is a refrigerator that uses a heat source to provide the energy needed to drive the cooling process.

Search on Telegram @apna_pdf

471. Lithium bromide in vapour absorption refrigeration system is used as:

(a) refrigerant (b) cooling substance
(c) auxiliary refrigerant (d) absorbent

ISRO Scientist/ Engineer (RAC) 07.05.2017
UKPSC AE 2012 Paper-II
J&K PSC Civil Services Pre. 2010
J & K PSC Screening, 2006

Ans. (d) : LiBr (Lithium Bromide) in vapour Absorption System is used as absorbent and water (H_2O) is used as refrigerant.

472. In aqua-ammonia and lithium bromide water absorption refrigeration systems, the refrigerants are respectively:

(a) Ammonia and water
(b) Water and water
(c) Water and lithium bromide
(d) Ammonia and lithium bromide

OPSC AEE 2019 PAPER - II
Nagaland PSC (CTSE) 2018, Paper-II
APPSC AEE 2016
UKPSC AE 2013 Paper-II

Ans. : (a) : In aqua ammonia and lithium bromide water absorption refrigeration system the refrigerants are respectively Ammonia and water.

473. In a lithium bromide absorption refrigeration system

(a) lithium bromide is used as a refrigerant and water as an absorbent
(b) water is used as a refrigerant and lithium bromide as an absorbent
(c) ammonia is used as a refrigerant and lithium bromide as an absorbent
(d) none of the above

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 18.09.2017
GPSC ARTO 01.05.2016

Ans. (b) : Solar refrigeration systems are based on vapour absorption refrigeration system. Two most commonly refrigerant used in vapour absorption systems are the mixture of
(i) Ammonia and water
(ii) Water and Lithium

- In a Lithium bromide absorption refrigeration system water is used as a refrigerant and lithium bromide as on absorbent.

474. The most suitable pair of refrigerant and absorbent combination for solar refrigeration is

(a) Ammonia and water
(b) Ammonia and sodium thiocyanide
(c) Water and lithium bromide
(d) R22 and dimethyl formamide

Gujarat PSC AE 2019
GPSC EE PRE.28.01.2017, ESE 2012

Ans : (c) : Solar heat input is used in LiBr - H_2O (Lithium bromide and water) refrigeration system.

475. In a vapour absorption refrigerator, the temperature of evaporator and ambient air are 10 °C and 30 °C, respectively. For obtaining COP of 2 for this system, the temperature of the generator is to be nearly

(a) 90 °C (b) 85 °C
(c) 80 °C (d) 75 °C

UPPSC AE 13.12.2020, Paper-2
ESE 2018

Ans. (c) : Given,

$T_e = 10 + 273 = 283\ K$

$T_o = 30 + 273 = 303\ K$

$COP = 2$

$(COP)_{VARS} = \eta_E\ (COP)_R$

$$= \frac{T_G - T_o}{T_G} \times \frac{T_e}{T_o - T_e} = \frac{T_e}{T_G}\left(\frac{T_G - T_o}{T_o - T_e}\right)$$

$$2 = \frac{283(T_G - 303)}{T_G(303 - 283)}$$

$T_G = 352.87\ K$

$T_G = 79.87°C \simeq 80°C$

476. In the absorption refrigeration cycle, the compressor of vapour compression refrigeration cycle is replaced by

(a) Liquid pump
(b) Generator
(c) Absorber and generator
(d) Absorber, liquid pump and generator

UKPSC AE 2012, 2007 Paper–II

Ans. (d) : Absorber, liquid pump and generator

477. A vapour absorption refrigeration system

(a) gives noisy operation
(b) gives quiet operation
(c) requires little power consumption
(d) cools below 0ºC

Nagaland PSC (CTSE) 2018, Paper-II
UKPSC AE 2012 Paper–II

Ans. (b) : A vapour absorption refrigeration system gives quiet operation. The vapour compression refrigeration system requires the expenditure of high-grade energy in the form of shaft work to drive the compressor with the concommitant disadvantage of vibration and noise, the absorption refrigeration system requires only low grade energy in the form of heat to drive it and it is relatively silent in operation and subject little wear.

478. A vapour absorption refrigerator uses ..... as a refrigerant

(a) water (b) ammonia
(c) freon (d) aqua-ammonia

Nagaland PSC (CTSE) 2018, Paper-II
UKPSC AE 2007 Paper -II

Ans. (d) : A vapour absorption refrigerator uses aqua-ammonia as a refrigerant. In the vapour absorption system the refrigerant used is ammonia, water or lithium bromide. The refrigerant gets condensed in the condenser and it gets evaporated in the evaporator. The refrigerant produces cooling effect in the evaporator and releases the heat to the atmosphere via the condenser.

Search on Telegram @apna_pdf

Vapour absorption refrigeration system may have two types–
(1) NH_3-Water
(2) LiBr-Water
In first type NH_3 (Ammonia) is used as refrigerant & in second type water is used as refrigerant. Hence in VAS water and ammonia (aqua-ammonia) is used as refrigerant.

479. In Electrolux refrigerator
(a) ammonia is absorbed in hydrogen
(b) ammonia is absorbed in water
(c) ammonia is evaporates in hydrogen
(d) hydrogen evaporates in ammonia

Nagaland PSC (CTSE) 2018, Paper-II
ESE 2005

Ans. (c) : An electrolux refrigerator works on three fluid system. There is no circulation pump. The total pressure is the same throughout the system. The third fluid remains mainly in the evaporator. Which reduces the partial pressure of refrigerant to enable it to evaporate at low pressure and hence low temperature.
Liquid NH_3 evaporates in the evaporator in the presence of H_2. Hydrogen is chosen because it is non-corrosive and insoluble in water. Thus a complete leak proof silent system is achieved.

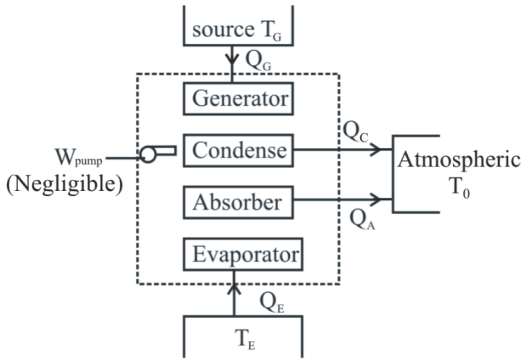
480. The C.O.P. of an absorption type refrigerator is given by (where T_1 = Temperature at which the working substance receives heat, T_2 = Temperature of cooling water, and T_3 = Evaporator temperature)

(a) $\dfrac{T_1(T_2-T_3)}{T_3(T_1-T_2)}$ (b) $\dfrac{T_3(T_1-T_2)}{T_1(T_2-T_3)}$

(c) $\dfrac{T_1(T_1-T_2)}{T_3(T_2-T_3)}$ (d) $\dfrac{T_3(T_2-T_3)}{T_1(T_1-T_2)}$

Sikkim PSC (Under Secretary), 2017
ESE 2012, 2003

Ans. (b) :



I[st] law of thermodynamic–

$Q_E + Q_G = Q_C + Q_A$ .....(i)

$\dfrac{Q_E}{T_E}+\dfrac{Q_G}{T_G}=\dfrac{Q_C}{T_C}+\dfrac{Q_A}{T_0}$ .....(ii) [Clausius inequality]

$\dfrac{Q_E}{T_E}+\dfrac{Q_G}{T_G}=\dfrac{Q_C+Q_A}{T_0}\Rightarrow\dfrac{Q_E+Q_G}{T_0}=\dfrac{Q_E}{T_0}+\dfrac{Q_G}{T_0}$

$\dfrac{Q_E}{T_E}-\dfrac{Q_E}{T_0}=\dfrac{Q_G}{T_0}-\dfrac{Q_G}{T_G}$

$Q_E\left[\dfrac{1}{T_E}-\dfrac{1}{T_0}\right]=Q_G\left[\dfrac{1}{T_0}-\dfrac{1}{T_G}\right]$

$Q_E\left[\dfrac{T_0-T_E}{T_E\cdot T_0}\right]=Q_G\left[\dfrac{T_G-T_0}{T_G\cdot T_0}\right]$

$(COP)=\dfrac{Q_E}{Q_G}=\dfrac{T_G-T_0}{T_G}\times\dfrac{T_E}{T_0-T_E}$

$\boxed{(COP)_{VARS}=\dfrac{Q_E}{Q_G}=\dfrac{T_E}{T_G}\left(\dfrac{T_G-T_0}{T_0-T_E}\right)}$

$(COP)_{VARS}=\dfrac{T_3(T_1-T_2)}{T_1(T_2-T_3)}$

481. In ammonia-water and lithium bromide-water absorption refrigeration systems the absorbents are, respectively.
(a) ammonia and water
(b) water and water
(c) ammonia and lithium bromide
(d) water and lithium bromide

RPSC ACF & FRO, 26.02.2021

Ans. (d) : Ammonia –water absorption system-
Refrigerant → Ammonia (NH_3)
Absorbent → Water (H_2O)
Lithium bromide water absorption system-
Refrigerant → Water
Absorbent → Lithium bromide.

482. In vapour absorption refrigeration system, the refrigeration temperature is 7 °C, generator temperature 127 °C temperature of heat sink 47 °C. The maximum possible COP of the system
(a) 0.714 (b) 0.86
(c) 1.4 (d) 0.11

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) : Given, $T_E = 7°C = 7°C + 273 = 280K$
$T_G = 127°C = 400K$
$T_O = 47°C = 320K$

$(COP)_{max}=\dfrac{T_G-T_O}{T_G}\times\dfrac{T_E}{T_O-T_E}$

$=\dfrac{400-320}{400}\times\dfrac{280}{320-280}$

$(COP)_{max}=1.4$

483. In an absorption type refrigeration system, heating in generator, refrigeration in evaporator and cooling by cooling water in condenser, take place at 95°C, –5°C and 30°C respectively. What is the maximum COP of the system?
(a) 1.17 (b) 1.35
(c) 1.52 (d) 1.78

ESE 18.07.2021

Search on Telegram @apna_pdf

Ans. (b)

Temperature of evaporator (T_E) = –5°C = 268 K

Temperature of generator (T_G) = 95°C = 368 K

Temperature of surrounding (T_o) = 30°C = 303 K

$$\text{Maximum COP} = \frac{T_E(T_G - T_O)}{T_G(T_O - T_E)}$$

$$= \frac{268\times(368-303)}{368\times(303-268)} = 1.352$$

484. The operating temperatures of a single stage Vapour Absorption Refrigeration System (VARS) are : Generator 90 °C, condenser and absorber 40°C, evaporator 0°C. If the pump work is negligible, find the ideal COP of this VARS

(a) 0.94 (b) 1.4

(c) 0.84 (d) 2.4

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) :

$$COP|_{VARS} = \frac{T_E}{T_g}\left(\frac{T_g - T_o}{T_o - T_E}\right)$$

$T_g = 90°C = 363$ K

$T_o = 40°C = 313$ K

$T_E = 0°C = 273$ K

$$COP|_{VARS} = \frac{363-313}{363}\times\frac{273}{313-273}$$

$$COP|_{VARS} = 0.94$$

485. A solar thermal operated vapour absorption system is capable of

(a) Continuous operation

(b) Both continuous operation and intermittent operation

(c) No operation

(d) Intermittent operation

JPSC AE PRE 2019

Ans. (d) : A solar thermal operated vapour absorption system is capable of intermittent operation. Solar refrigeration systems are based on vapour absorption refrigeration system.

486. In an Electrolux refrigerator, a thermo-siphon bubble pump is used to lift the

(a) weak aqua solution from the generator to the separator

(b) weak aqua solution from the separator to the absorber

(c) strong aqua solution from the generator to the separator

(d) strong aqua solution from the generator to the evaporator

ESE 2019

Ans. (a) : A thermo-siphon bubble pump is used to lift weak aqua solution from the generator to the separator and then to the absorber.

487. In vapor absorption refrigeration system, heat input, rejection and refrigeration occurs at 400 K, 300 K and 270 K respectively. Ideal COP of the system will be:

(a) 1.25 (b) 2.25

(c) 3.25 (d) 4.25

(e) 4.75

CGPSC AE 25.02.2018

Ans. (b) : For vapor absorption refrigeration system-

$T_G \rightarrow \eta_{H.E.}\left[1-\frac{T_o}{T_G}\right]$

T_o

$T_{ref} \rightarrow [COP]_{ref.} = \frac{T_{ref.}}{(T_o - T_{Ref.})}$

Then Ideal COP of VARS.

$$[COP]_{VARS} = \left[1-\frac{T_o}{T_G}\right]\times\left[\frac{T_{Ref}}{T_o - T_{Ref.}}\right]$$

$$= \frac{T_{Ref.}}{T_G}\left[\frac{T_G - T_o}{T_o - T_{Ref.}}\right]$$

Where, $T_{Ref.} = 270$ K

$T_o = 300$ K

$T_G = 400$ K

$$[COP]_{VARS} = \frac{270}{400}\left[\frac{400-300}{300-270}\right] = \frac{270}{400}\times\frac{100}{30}$$

$$\boxed{[COP]_{VARS} = 2.25}$$

488. A vapor absorption refrigeration system with COP of 0.85 and refrigeration capacity of 1 kW. The heat input at generator (Q_g) and summation of heat rejected at absorber & condenser (Q_a + C) is given as:

(a) $Q_g = 1.25$ kW; $Q_a + c = 1.25$ kW

(b) $Q_g = 1.25$ kW; $Q_a + c = 1$ kW

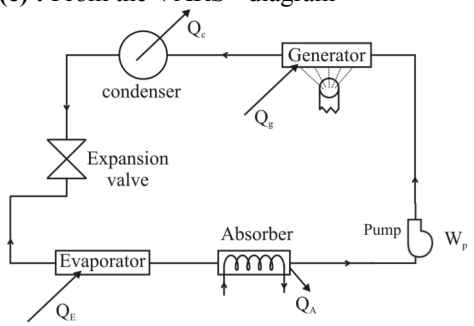
(c) $Q_g = 0.8$ kW; $Q_a + c = 1.8$ kW

(d) $Q_g = 0.8$ kW; $Q_a + c = 1$ kW

(e) $Q_g = 1.25$ kW; $Q_a + c = 2.25$ kW

CGPSC AE 25.02.2018

Ans. (e) : From the VARS - diagram



Data given-

R.E. = 1 kW

$[COP]_{VARS} = 0.8$

If, we assume W_P [pump work] equal to zero then

$$[COP]_{VARS} = \frac{R.C.}{Q_g + W_p} = \frac{R.C.}{Q_g} \qquad W_p = 0$$

Search on Telegram @apna_pdf

$$0.8 = \frac{1}{Q_g} \Rightarrow Q_g = 1.25\text{kW}$$

We know that,

$$Q_E + Q_g = Q_A + Q_C$$

$$Q_A + Q_C = 1.25 + 1 = 2.25\text{kW}$$

489. Consider the following statements regarding vapour absorption systems in the field of refrigeration:

1. In ammonia-water absorption system, ammonia is the refrigerant.
2. In water-lithium bromide system, water is the refrigerant.
3. Ammonia-water absorption reaction is endothermic.
4. The amount of ammonia absorbed by water is inversely proportional to the temperature of ammonia.

Which of the above statements are correct?

(a) 1, 2 and 3 (b) 1, 3 and 4
(c) 1, 2 and 4 (d) 2, 3 and 4

ESE 2018

Ans. (c) : Ammonia water absorption is exothermic hence it's wrong statement.

490. COP of simple vapour absorption cycle is around

(a) 0.6 (b) 4
(c) 2 (d) 0.1

Vadodara Muncipal Corp. DEE, 2018

Ans. (a) : COP of vapour absorption cycle is around 0.6.

491. Maximum possible COP of a solar absorption refrigeration system with generator temperature of 360 K, absorber temperature of 300 K. condenser temperature of 300 K and evaporator temperature of 270 K is :

(a) 9 (b) 6
(c) 3 (d) 1.5

GPSC ARTO Pre 30.12.2018

Ans. (d) : Given,

$$T_G = 360\text{K}, \quad T_E = 270\text{K}, \quad T_0 = 300\text{K}$$

COP of Vapour Absorption Refrigeration system,

$$\text{COP} = \frac{T_G - T_O}{T_G} \times \frac{T_E}{T_O - T_E}$$

$$\text{COP} = \frac{360 - 300}{360} \times \frac{270}{300 - 270}$$

$$\text{COP} = \frac{270 \times 60}{360 \times 30}$$

COP = 1.5

492. Aqua Ammonia is used as refrigerant in the following type of refrigerant system

(a) Absorption (b) Compression
(c) Direct (d) Indirect

TSPSC AEE 2017

Ans. (a) : Aqua Ammonia is used as refrigerant in the absorption type of refrigeration system.

493. Which of the following statement is/are correct?

(a) In a vapour absorption refrigerator, the compression of refrigerant is avoided.
(b) Sub-cooling can be achieved by circulating more quantity of cooing water through the condenser.
(c) In a vapour compression refrigerator, the vapour is drawn in the compressor cylinder during its suction stroke and is compressed adiabatically during the compression stroke.
(d) All of the above

Karnataka PSC AE, 10.09.2017

Ans. (d) : In VARS absorption of refrigerator, the compression of refrigerant is avoided.

- Sub-cooling can be achieved by circulating more quantity of cooling water through the condenser.
- Vapour is compressed adiabatically during the compression stroke.

494. Consider the following statements in respect of a vapour – absorption refrigeration cycle:

1. The absorption refrigeration cycle is generally used when waste heat is available from an existing source or when free energy like solar energy is to be used.
2. There are no moving parts in the absorption refrigeration plant except a small liquid pump.
3. The value of the coefficient of performance is nearly the same in both vapour – absorption and vapour – compression refrigeration plants.

Which of the above statements are correct?

(a) 1, 2 and 3 (b) 1 and 2 only
(c) 1 and 3 only (d) 2 and 3 only

ESE 2017

Ans. (b) :

- An absorption refrigerator is a refrigerator that uses a heat source (e.g. solar energy, a fossil-fueled flame, waste heat from factories) to provide the energy needed to drive the cooling process.
- The absorption cycle use a liquid pump, not a compressor to create the pressure rise between evaporator and condenser. Pumping a liquid is much easier and cheaper than compressing a gas, so the system takes less work input.
- The COP of absorption system is about 20 to 30% of the vapour compression system.

495. What is the critical temperature and critical pressure of ammonia respectively?

(a) 132.4°C and 111.3 atm
(b) –132.4°C and 11.13 atm
(c) 132.4°C and 11.3 atm
(d) none of these

KPCL AE 2016

Ans. (a) : For ammonia, the critical temperature and critical pressure is 132.4°C and 111.3 atm.

Search on Telegram @apna_pdf

496. During the liquefaction of gases, if the gas is at a sufficiently low temperature and high pressure, the throttling process would bring the gas into the saturated-mixture region, where the vapour and liquid could be separated using:

(a) Linde liquefier (b) Hamstead liquefier
(c) Thomson liquefier (d) Slinger liquefier

HPPSC Asstt. Prof. 29.10.2016

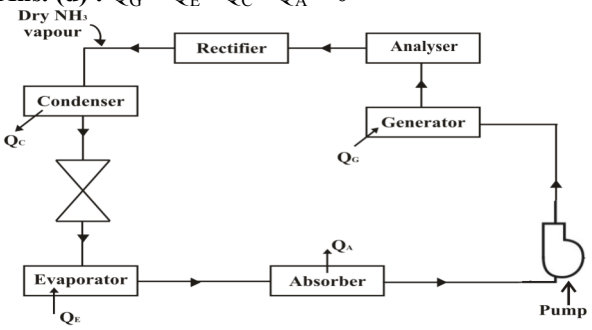
Ans. (a) : Linde liquefier.

497. Neglecting the pump work, Energy equation for vapour absorption refrigeration system may be written as (where Q = heat transfer rate into the system)

(a) $Q_{generator} + Q_{evaporator} + Q_{condenser} + Q_{absorber}$
(b) $Q_{generator} + Q_{evaporator} + Q_{condenser} - Q_{absorber}$
(c) $Q_{generator} + Q_{evaporator} - Q_{condenser} + Q_{absorber}$
(d) $Q_{generator} + Q_{evaporator} - Q_{condenser} - Q_{absorber}$

RPSC Lecturer 16.01.2016

Ans. (d) : $Q_G + Q_E - Q_C - Q_A = 0$

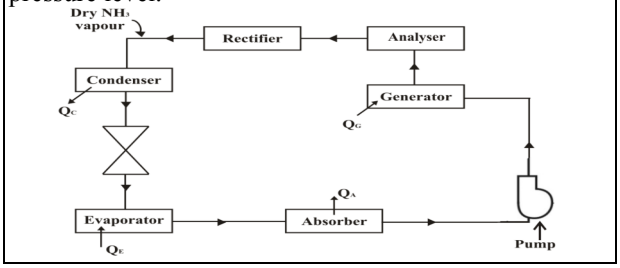


498. Which of the following components of vapour absorption refrigeration system has same pressure level (neglecting the pipe loss)

(a) Generator and absorber
(b) Evaporator and absorber
(c) Generator and evaporator
(d) Condenser and evaporator

RPSC Lecturer 16.01.2016

Ans. (b) : Evaporator and absorber components of vapour absorption refrigeration system has same pressure level.



499. Ammonia absorption refrigeration cycle requires

(a) Very little work input
(b) Same work input as for vapour compression cycle
(c) Zero work input
(d) Maximum work input

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (a) : Ammonia absorption refrigeration cycle requires very little work input.

500. An Electrolux refrigerator is called as

(a) Two-fluid absorption system
(b) No fluid absorption system
(c) Three-fluid absorption system
(d) Single-fluid absorption system

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : **Electrolux Refrigerator–**It is based on vapour absorption system. It is a three fluid VARS system. i.e. water (H_2O), ammonia (NH_3) and hydrogen (H_2).
Water (H_2O) acts as absorbent, ammonia acts as refrigerant and hydrogen is used to create low partial pressure for NH_3 refrigerant.
Note-Flow takes place under the action of gravity so no pump is used.

501. C.O.P. of a vapour absorption system can be increased by using

(a) Vapour compression
(b) Heat exchanger
(c) Both vapour compression and Heat exchanger
(d) None of these is correct

MPPSC AE 08.11.2015

Ans. (b) : C.O.P. of a vapour absorption system can be increased by using heat exchanger.

502. Consider the following for an ideal refrigerant-absorbent mixture:

1. There is neither expansion nor contraction upon mixing
2. The mixing process is exothermic
3. The mixing process is endothermic
4. Obeys Raoult's law in liquid phase and Dalton's law in vapour phase of the above,

Which is correct

(a) 1 (b) 2
(c) 3 (d) 1 and 3
(e) 1 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) : For an ideal refrigerant- absorbent mixture there is neither expansion nor contraction upon mixing and obeys Raoult's law in liquid phase and Dalton's law in vapour phase.

503. In an ammonia-water system, a rectification column is used mainly to:

(a) To improve the COP of the system
(b) To reduce the operating pressures
(c) To minimize the concentration of water in refrigeration circuit
(d) To maximize the concentration of water in refrigeration circuit
(e) To minimize the space of the system

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) : In an ammonia- water system, a rectification column is used mainly to minimize the concentration water in refrigeration circuit.

Search on Telegram @apna_pdf

504. An Electrolux refrigerator uses

(a) one pump (b) two pump
(c) no pump (d) three pump

Haryana PSC Civil Services Pre, 2014

Ans. (c) : Electrolux refrigerator system has three fluids (H_2, H_2O & NH_3), in which pump is not used.

505. Which of the following has the lowest COP?

(a) Vapour absorption cycle
(b) Vapour compression cycle dry compression
(c) Vapour compression cycle with superheated vapour at the end of compression
(d) Vapour compression cycle with sub cooling

TNPSC AE 2014

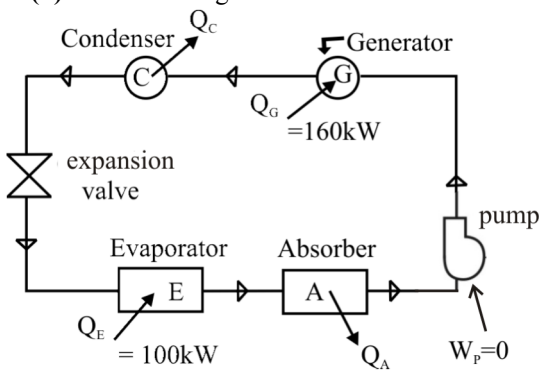
Ans. (a) : Vapour absorption cycle has the lowest COP.

506. The operating temperatures of a single stage vapour absorption refrigeration system are: generator: 90^0C; condenser and absorber: 40^0C; evaporator: 0^0C. The system has a refrigeration capacity of 100 kW and the heat input to the system is 160 kW. The solution pump work is negligible. Find the COP of the system and the total heat rejection rate from the system.

(a) 0.525, 160kW (b) 0.625, 260kW
(c) 1.6, 100kW (d) 1.6, 160kW
(e) 0.625, 160kW

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : VARS – diagram



From this fig –

$$[COP]_{VARS} = \frac{\text{Ref.Effect}}{Q_G + W_P} = \frac{100}{160 + 0} = 0.625$$

from energy Conservation

$$Q_C + Q_A = Q_G + Q_E$$
$$= 160 + 100$$
$$\boxed{Q_C + Q_A = 260\,kW}$$

507. Match List-I (Basic components of Aqua-ammonia refrigeration system) with List-II (Function of the components in the system) and select the correct answer using the codes given the lists:

List I		List II	
A	Generator	1	Dehydration
B	Analyser	2	Removal of vapour from strong aqua-ammonia solution
C	Rectifier	3	Producing dry ammonia vapour by removing traces of water particles completely
D	Receiver	4	Storage of high pressure liquid ammonia
		5	Formation of liquid ammonia from high pressure vapours

(a) A-3, B-1, C-2, D-5 (b) A-5, B-3, C-4, D-5
(c) A-1, B-3, C-2, D-5 (d) A-2, B-1, C-3, D-4
(e) A-2, B-4, C-1, D-3

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) :

Components	Function
1. **Generator**	Removal of vapour from strong aqua- ammonia solution
2. **Analyser**	Dehydration
3. **Rectifier**	Producing dry ammonia vapour by removing traces of water particles completely.
4. **Receiver**	Storage of high pressure liquid ammonia.

508. Consider the following for absorption refrigeration system as compared to compression system

1. Higher COPs
2. Lower refrigeration temperatures
3. Possibility of using low-grade energy sources
4. Possibility of using in vehicles

(a) 1 (b) 2
(c) 3 (d) 4
(e) 1 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) : Vapour Absorption Refrigeration system (VARS) belong to class of vapour cycles similar to vapour Compression refrigeration systems. Since these systems run on low-grade thermal energy, they are preferred when low grade energy such as waste heat or solar energy is available.

509. Consider the following for water-lithium bromide systems:

1. Crystallization of solution is likely to occur in absorber
2. Crystallization of solution is likely to occur in solution heat exchanger
3. Crystallization is likely to occur when generator temperature falls
4. Crystallization is likely to occur when condenser pressure falls

Of the above, which is correct

(a) 1 (b) 2
(c) 4 (d) 1 and 2
(e) 1 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) : In water – lithium bromide systems crystallization of solution is likely to occur in absorber and crystallization is likely to occur when condenser pressure falls.

Search on Telegram @apna_pdf

510. Absorption of energy in solar collectors can be increased to a maximum value by coating the absorber surface by:-

(a) Black paint (b) Lamp black
(c) Rough black coating (d) Selective coating

UKPSC AE-2013, Paper-II

Ans. (d) : Absorption of energy in solar collectors can be increased to a maximum value by coating the absorber surface by selective coating.

511. On increasing the temperature of absorber plate of solar collector the efficiency of collector:-

(a) Increases
(b) Decreases
(c) May increase or decrease depending upon atmospheric temperature
(d) Does not depend on absorber plate temperature

UKPSC AE-2013, Paper-II

Ans. (b) : On increasing the temperature of absorber plate of solar collector the efficiency of collector decreases.

512. Solar photovoltaic cell is made up of semiconductor materials. The efficiency of conversion of solar energy into electrical energy is of the order of:-

(a) 7% (b) 21%
(c) 70% (d) 90%

UKPSC AE-2013, Paper-II

Ans. (b) :

513. In vapour absorption system, the compressor is the vapour compressor cycle is replaced by :

(a) Condensor
(b) Absorber – Generator Assambly
(c) Superheater
(d) Evaporator

TNPSC AE (Industries) 09.06.2013

Ans. (b) :

514. What is the function of rectifier in a practical vapour absorption refrigeration system?

(a) To convert AC supply to DC supply.
(b) To condense the weak ammonia solution.
(c) To remove the water vapours from the ammonia coming out from the analyser.
(d) to control the pressure of vapours entering the condenser.

RPSC AEN Pre-2013

Ans. (c) Analyser– Dehydration
Rectifier– To remove water vapour from the ammonia coming out from analyser.
Generator– Removal of vapour from strong aqua ammonium solution.
In vapour absorption refrigeration system to remove the water vapour from the ammonia coming out from analyser. The compressor is replaced by absorber, pump and generator. Absorbent Refrigerant (ammonia – water),
Ammonia – refrigerant
Water – absorber

515. Ammonia is used in Aqua - ammonia system because it is

(a) Vigorously absorbed in water (b) Low cost
(c) Toxic (d) Low ODP

TNPSC AE 2013

Ans. (a) : Ammonia is used in Aqua - ammonia system because it is vigorously absorbed in water.
Ammonia - water vapor
Absorption Refrigeration system—In this system ammonia is used as the refrigerant and water is used as the absorbent. The ammonia - water absorption system is used in the domestic as well as the commercial application where the requirement of the temperature is above 320F.

516. In a vapour absorption refrigeration system, the refrigeration temperature is – 15 °C and the generator temperature is 110 °C. If sink temperature is 55 °C, the maximum COP of the system will be

(a) 1.00 (b) 3.69
(c) 0.34 (d) 0.90

UKPSC AE 2012 Paper–II

Ans. (*) : $T_G = 110°C = 110 + 273 = 383\ K$
$T_O = 55°C = 55 + 273 = 328\ K$
$T_R = -15°C = -15 + 273 = 258\ K$

$$[COP]_{max.} = \left[1 - \frac{T_o}{T_G}\right]\left[\frac{T_R}{T_o - T_R}\right]$$

$$= \left[1 - \frac{328}{383}\right]\left[\frac{258}{328 - 258}\right] = 0.52$$

517. In a lithium bromide absorption refrigeration system, the refrigerant is :

(a) Lithium bromide (b) Water
(c) Ammonia (d) None of these

OPSC Civil Services Pre. 2011

Ans. (b) : In a Lithium bromide absorption refrigeration system the refrigeration is water and lithium bromide is absorbent.

518. In an ammonia-hydrogen refrigeration system the hydrogen

(a) helps evaporation of NH_3
(b) acts as refrigerant
(c) helps NH_3 to flow through the circuit
(d) burns to supply heat

TNPSC AE, 2008

Ans. (a) : In an ammonia-hydrogen refrigeration system, the hydrogen helps evaporation of NH_3.

519. In aqua-ammonia absorption refrigeration system, the refrigerant is

(a) Water (b) aqua-ammonia
(c) Ammonia (d) air

OPSC Civil Services Pre 2006

Ans. (c) : In aqua- ammonia (NH_3-water) absorption system, Ammonia act as refrigerant and water as absorbent. Ammonia has highest affinity to absorb in water.

Search on Telegram @apna_pdf

5. Psychometric Chart and its Applications

520. The wet bulb depression is zero, when relative humidity is equal to

(a) Zero (b) 50%
(c) 75% (d) 100%

RPSC IOF, 2020, OPSC AEE 2019 Paper-II
ISRO Scientist / Engineer (RAC) 07.05.2017
TSPC AE 2017, GPSC ARTO 01.05.2016
UKPSC AE 2012 Paper-II
OPSC Civil Service Pre-2011
UKPSC AE 2007 Paper-II, ESE 2006

Ans. (d) : Wet bulb depression is the difference between the dry bulb temperature and wet bulb temperature. Hence, when DBT = WBT implies that relative humidity = 100%
Therefore when the wet bulb depression is zero the relative humidity is equal to 100%.

521. Dew point temperature is the temperature at which condensation begins when air is cooled at constant

(a) volume (b) entropy
(c) pressure (d) enthalpy

UJVNL AE 12.09.2021, Gujarat PSC AE 2019
RPSC AE 2018, TSPSC AEE 2017
Nagalanad PSC CTSE 2017, 2016 Paper-II
UPPSC AE 12.04.2016 Paper-II
Haryana PSC Civil Services Pre, 2014
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
PSPCL AE 2012, UKPSC AE 2012 Paper-II
GATE 2006

Ans. (c) Dew point temperature is the temperature at which condensation begins when air is cooled at constant pressure.

522. The sensible heat factor is the ratio of :

(a) Sensible heat and latent heat
(b) latent heat and sensible heat
(c) sensible heat and total heat
(d) latent heat and total heat

APPSC Poly Lect. 13.03.2020
Haryana PSC AE (PHED) 04.09.2020 Paper-I
VIZAG MT 14.12.2020
ISRO Scientist/Engineer (RAC), 10.03.2019
TANGEDCO AE 2015
UKPSC AE 2013 Paper-II
TNPSC AE, 2008

Ans. (c) : The sensible heat factor (SHF) is the ratio of the sensible heat and total heat.

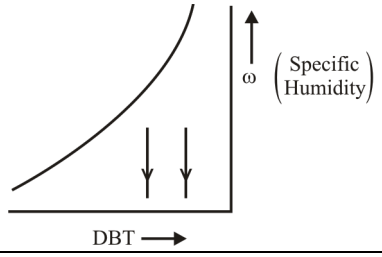
$$SHF = \frac{\text{sensible heat}}{\text{total heat}\left(\text{sensible heat + latent heat}\right)}$$

523. The vertical and uniformly spaced lines on a psychrometric chart indicate :

(a) wet-bulb temperature
(b) dew-point temperature
(c) specific humidity
(d) dry –bulb temperature

GPSC DEE, Class-2 (GWSSB) 04.07.2021
CGPSC AE 15.01.2021
Nagaland PSC (CTSE) 2018, Paper-II
CGPSC AE 16.10.2016
MPPSC State Forest Service Exam 2014

Ans. (d) : The vertical and uniformly spaced lines on a psychrometric chart indicate DBT
(Dry Bulb Temperature)

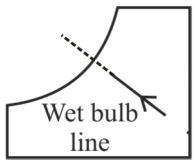


524. During adiabatic cooling of moist air

(a) DBT remains constant
(b) Specific humidity remains constant
(c) Relative humidity remains constant
(d) WBT remains constant
(e) None of the above

UPPSC AE 13.12.2020
GPSC Executive Engineer 23.12.2018
CGPSC Poly. Lect. 22.05.2016
UPRUVNL AE 2014, HPPSC AE 2014
APPSC AEE 2012

Ans. (d) : During adiabatic cooling enthalpy remains constant and in the psychrometric chart the WBT lines and the enthalpy lines have the same slope therefore the WBT will also remain constant during the adiabatic cooling process.



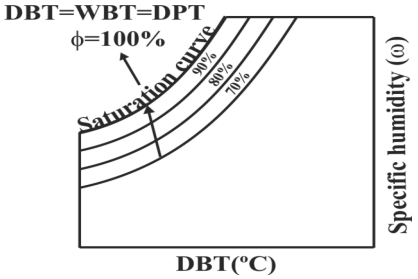
525. In Psychrometric chart, relative humidity lines are:

(a) curved
(b) horizontal
(c) straight inclined from left to right
(d) vertical

GPSC DEE, Class-2 (GWSSB) 04.07.2021
TSPSC Manager (Engg.) HMWSSB 12.11.2020
ISRO Scientist/Engineer (RAC) 22.04.2018
KPSC AE 2015
TRB Poly. Lect. 2012
UKPSC AE 2012, 2007 Paper–II

Search on Telegram @apna_pdf

Ans. (a) : In Psychrometric chart, relative humidity lines are curve.



526. During an adiabatic saturation process of an unsaturated air, the parameters which remains constant is

(a) Dry bulb temperature
(b) Dew point temperature
(c) Thermodynamic wet bulb temperature
(d) Relative humidity

PPSC Asstt. Municipal Engineer 15.06.2021
UPPSC AE 13.12.2020, Paper-2
RPSC IOF 2020, RPSC AE 2018
KPSC AE 2015

Ans. (c) : During an adiabatic saturation process of an unsaturated air, the thermodynamic wet bulb temperature remains constant.

- Dry bulb temperature, t↓
- Specific humidity ratio, ω↑
- Dew point temperature (DPT↑)
- Relative humidity, (ϕ)↑
- h (constant)
- Specific volume, v↓
- WBT (Constant)

527. The difference between dry bulb temperature and wet bulb temperature, is called :

(a) dry bulb depression
(b) wet bulb depression
(c) dew point depression
(d) degree of saturation

OPSC AE 2019 Paper-II
Punjab PSC SDE 12.02.2017
GPSC LECT 23.10.2016
TNPSC AE 2013, UKPSC AE 2007 Paper-II

Ans. (b) : Wet bulb depression = DBT – WBT

- WBT is an indirect measure of the dryness of the moist air.

528. The minimum temperature to which air can be cooled under ideal conditions in evaporative cooling is

(a) Dew point temperature of the inlet air
(b) Wet bulb temperature of the inlet air
(c) Dry bulb temperature of the inlet air
(d) All the above

OPSC AEE 2019 Paper-II
Nagaland PSC CTSE 2015 Paper-II
KPSC ADF 2015
OPSC Civil Services Pre 2006
ESE 1995

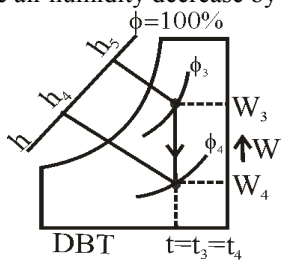
Ans. (b) : Evaporative cooling is used in air washer. In which air can cooled theoretically upto wet bulb temperature of entering air. Similarly in cooling tower water can be cooled upto wet bulb temperature of entering air.

529. During dehumidification process ..... remains constant

(a) Wet bulb temperature
(b) Relative humidity
(c) Dry bulb temperature
(d) Specific humidity

Nagaland PSC (CTSE) 2018, Paper-II
Vizag Steel (MT) 2017
TSPSC AEE 2017, KPSC AE 2015
Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : When the state of air is altered along DBT = Constant line such as 3-4 in Fig. moisture in the form of water vapour is transferred to change the specific humidity of the air humidity decrease by w_3 to w_4.



530. When the outside air is introduced for ventilation purpose there is :

(a) Sensible heat gain
(b) Latent heat gain
(c) Sensible and latent heat gain
(d) No heat gain

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II, CGPSC AE 16.10.2016
UKPSC AE 2007 Paper-II

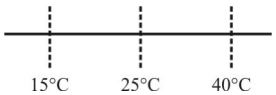
Ans. (c) : Sensible heat and latent heat both gain when outside air is introduced for ventilation purpose. Sensible heat gain due to temperature difference between fresh air and air in space. Latent heat gain due to humidity.

531. The atmospheric air at dry bulb temperature of 15 °C enters a heating coil maintained at 40°C. Air leaves the heating coil at 25 °C. The bypass factor of heating coil is

(a) 0.376 (b) 0.60
(c) 0.40 (d) 0.67

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II, HPPSC AE 2014
ISRO Scientist / Engineer (RAC) 22.4.2018

Ans. (b) :



$$\text{By pass factor (BPF)} = \frac{40°C - 25°C}{40°C - 15°C}$$

$$(BPF) = 0.60$$

Search on Telegram @apna_pdf

532. The expression $\frac{0.622p_v}{p_1 - p_v}$ is used to determine

(a) relative humidity (b) specific humidity
(c) degree of saturation (d) partial pressure

CGPSC AE 2014 Paper-II, APPSC Poly. Lect. 2013
CSE Pre-2001, ESE 1998

Ans. (b) : The expression $\frac{0.622p_v}{p_1 - p_v}$ is used to determine specific humidity (ω).

533. The most commonly used method for the design of duct size is the

(a) velocity reduction method
(b) equal friction method
(c) static regain method
(d) dual or double method

UJVNL AE 2016, UPRUVNL AE 2014
APPSC Poly. Lect. 2013, ESE 1996

Ans. (b) : Equal friction method- where a constant head loss is taken and duct sizes are taken considering this constant loss throughout the ducting. Most commonly used method because of easier calculation.

534. For air with a relative humidity of 80%

(a) The dry bulb temperature is less than wet bulb temperature
(b) The dew point temperature is less than wet bulb temperature
(c) The dew point temperature and wet bulb temperature are equal
(d) The dry bulb and dew point temperature are equal

ISRO Scientist/Engineer (RAC) 07.05.2017
UPPSC AE 12.04.2016 Paper-II
TSPSC Manager 2015, GATE 2003

Ans. (b) : RH (ϕ) = 80%
So, air is unsaturated
DBT > WBT > DPT

535. The pressure, dry bulb temperature and relative humidity of air in a room are 1 bar, 30°C and 70% respectively. If the saturated steam pressure at 30°C is 4.25 kPa, the specific humidity of the room air in kg water vapour/kg dry air is:

(a) 0.0083 (b) 0.0101
(c) 0.0191 (d) 0.0242

GPSC Asst. Director Of Transport 05.03.2017
VIZAG Steel MT 2017
UP Jal Nigam AE 2016, GATE 2013

Ans. (c) : Relative humidity (ϕ) = 0.7
Saturated steam pressure (P_{v_s}) = 4.25 kPa
Total pressure P_t = 1 bar = 100 kPa
∴ Specific humidity,

$$\omega = 0.622 \times \frac{P_v}{P_t - P_v} \quad ...(i)$$

Again from relative humidity,

$$\phi = \frac{P_v}{P_{v_S}}$$

$P_v = 0.74 \ P_{v_s} = 2.975$ kPa
From equation (i),

$$\omega = 0.622 \times \frac{2.975}{100 - 2.975} = 0.091$$

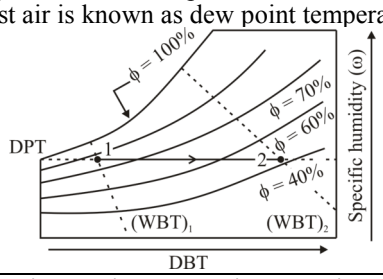
ω = 0.0191 kgw.v/kg.d.a.

536. Saturation temperature of the water vapour in the moist air is known as :

(a) Dry bulb temperature
(b) Dew point temperature
(c) Wet bulb temperature
(d) Critical temperature
(e) Adiabatic saturation temperature

CGPSC AE 25.02.2018
APPSC AEE Screening Test 2016
RPSC Insp. of Factories And Boiler 2016

Ans. (b) : Saturation temperature of the water vapour in the moist air is known as dew point temperature.

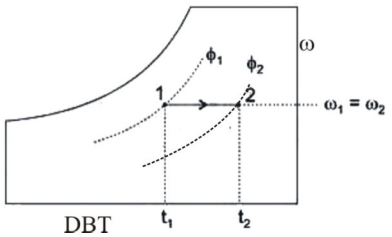


537. During a simple sensible heating process, the relative humidity _____ .

(a) Increases (b) Decreases
(c) Is zero (d) Remains constant

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Nagaland PSC (CTSE) 2018, Paper-II
CIL MT 26.03.2017, UPPSC AE 12.04.2016 Paper-II

Ans. (b) : Sensible heating- It is the process of increasing the Dry bulb temperature at constant specific humidity.



Effects of sensible heating-

i) Dry bulb temperature increases
ii) Sp. Humidity or humidity ratio remains constant
iii) Dew point temperature is constant.
iv) Relative humidity decreases
v) Enthalpy increases
vi) Specific volume increases.
vii) Wet bulb temperature increases.

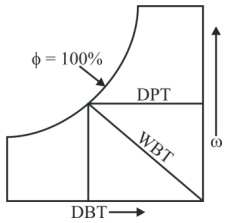
538. If we have 100% RH, then DPT, WBT and DBT can be related to each other as:

(a) DBT < DPT < WBT
(b) DBT = DPT = WBT
(c) DPT > WBT > DBT
(d) None of the above

OPSC AEE 2019 PAPER - II
Nagaland PSC CTSE 2017 Paper-II
OPSC AEE 2015 PAPER - II
MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Search on Telegram @apna_pdf

Ans : (b) When 100% Relative humidity then saturation condition



(i) At saturation conditions
DBT = WBT = DPT
(ii) At unsaturated conditions
DBT > WBT > DPT.
DBT = Dry bulb temperature
WBT = Wet bulb temperature
DPT = Dew point temperature.

539. In a saturated air–water mixture the :
(a) dry bulb temperature is higher than the wet bulb temperature
(b) dew point temperature is lower than the wet bulb temperature
(c) dry bulb temperature, wet bulb temperature and dew point temperature are the same
(d) dry bulb temperature is higher than the dew point temperature

TANGEDCO AE 2015, (HPPSC AE 2014)
OPSC Civil Service Pre-2011, ESE 1993

Ans. : (c) (i) At saturated condition
DBT = WBT = DPT
WBD = 0
(ii) At unsaturated condition
DBT > WBT > DPT
DBT = Dry bulb temperature
WBT = wet bulb temperature
DPT = Dew point temperature
WBD = wet bulb Depression
(Saturated ϕ = 100%)

540. Which of the following processes is generally used in winter air conditioning?
(a) dehumidification
(b) humidification
(c) cooling and dehumidification
(d) heating and humidification

TSPSC Manager Engg. HMWSSB 12.112020
VIZAG Steel MT 2017
Kerala PSC AE 06.08.2015, KPSC AE 2015

Ans. (d) : Heating and humidification process is used in winter air conditioning

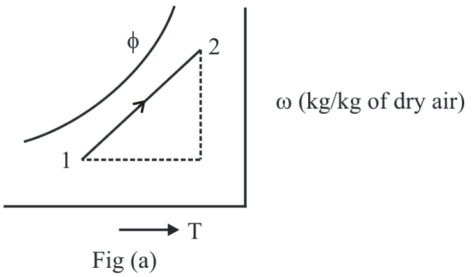


Fig (a)

Fig (a) shows the heating & humidification process.

541. The comfort conditions in air conditioning are at
(a) 0ºC DBT and 0% RH
(b) 20ºC DBT and 60% RH
(c) 30ºC DBT and 80% RH
(d) 40ºC DBT and 90% RH

MPPSC AE 08.11.2015, KPSC AE 2015
J&K PSC Civil Services Pre, 2013
ESE 2012

Ans. (b) : The comfort conditions in air conditioning are at 20ºC DBT and 60% RH.
DBT → Dry bulb temperature
RH → Relative humidity

542. The latent heat load in a auditorium is 25% of sensible heat load. The value of sensible heat factor is :
(a) 0.3 (b) 0.5
(c) 0.8 (d) 1.0

GPSC ARTO Pre 30.12.2018
BPSC AE MAINS 2017 Paper-V
ESE 2016, CGPSC Poly Lect 22.05.2016

Ans. (c) : Given, LH = 25% of SH

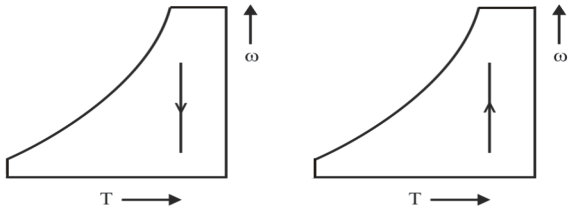
$$SHF = \frac{SH}{LH + SH} = \frac{SH}{0.25SH + SH}$$

$$SHF = \frac{1}{1.25} = 0.8$$

543. In psychrometric charts, what does a vertical downward line represent ?
(a) Sensible cooling process
(b) Adiabatic saturation process
(c) Humidification process
(d) Dehumidification process

GPSC ARTO Pre 30.12.2018
BPSC AE MAINS 2017 Paper-V
UKPSC AE 2012 Paper-II, ESE 2009

Ans. (d) : Dehumidification process



Vertical downward line represents dehumidification process and vertical upward line represents humidification process.

544. The relative humidity is defined as :
(a) the mass of water present in $1m^3$ of dry air
(b) the mass of water present in 1 kg of dry air.
(c) the ratio of the actual mass of water vapour in a unit mass of dry air to the mass of water vapour in the same mass of dry air when it is saturated at the same temperature and pressure.

Search on Telegram @apna_pdf

(d) the ratio of the actual mass of water vapour in a given volume of moist air to the mass of water vapour in the same volume of saturated air at the same temperature and pressure.

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Nagaland PSC (CTSE) 2018, Paper-II
Punjab PSC SDE 12.02.2017
APGENCO AE 2012

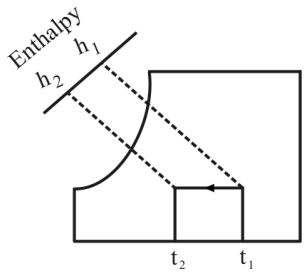
Ans. (d) : The relative humidity is defined as the ratio of the actual mass of water vapour in a given volume of moist air to the mass of water vapour in the same volume of saturated air at the same temperature and pressure.

545. During sensible cooling, wet bulb temperature-

(a) Decreases
(b) Increases
(c) Remains constant
(d) Can increase or decrease

GPSC DEE, Class-2 (GWSSB) 04.07.2021
GMB AAE 25.06.2017
J&K PSC Civil Services Pre. 2010
ESE 1998

Ans. (a)



Dew point temperature remains contant during sensible cooling and wet bulb temperature decreases.

546. Dew point is

(a) the temperature at which condensation of steam in saturated air will start
(b) the lowest temperature attainable for a mixture of air and steam
(c) dependent on pressure of air and volume of air
(d) highest temperature in an air conditioning cycle

GPSC Lect. 23.10.2016
TRB Asstt. Prof., 2012, TNPSC AE 2008
UKPSC AE 2007 Paper-II

Ans. (a) : Dew Point- The dew point is the temperature at which air is saturated with water vapour, which is the gaseous state of water.

When air has reached the dew point temperature at particular pressure, the water vapour in the air is in equilibrium with liquid water meaning water vapour is condensing at the same rate at which liquid water is evaporating.

547. The effective temperature is a measure of the combined effects of

(a) Dry bulb temperature and relative humidity
(b) Dry bulb temperature and air motion
(c) Wet bulb temperature and air motion
(d) Dry bulb temperature, relative humidity and air motion

GPSC ARTO 30.12.2018, TSPSC AEE 2017
CGPSC ARTO & TSI 07.01.2017
ESE 1998

Ans. (d) : A measure of Comfort that involves the combined effects of the dry bulb temperature, relative humidity and air movements.

548. In a psychrometric process, the sensible heat added is 30 kJ/sec and latent heat added is 20 kJ/sec. The sensible heat factor for the process is

(a) 0.3 (b) 0.6
(c) 0.67 (d) 1.5

RPSC IOF, 2020, JWM 2017
ISRO Scientist/Engg. (RAC) 07.05.2017

Ans. (b) : Sensible heat factor is the ratio of sensible heat to the total heat.

So, $$SHF = \frac{30}{30+20}$$

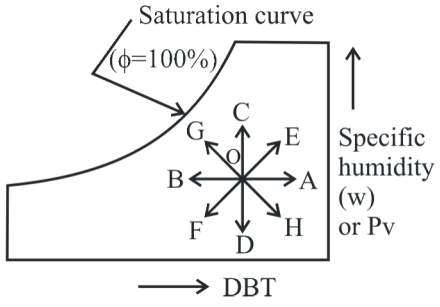
$$SHF = 0.6$$

549. Which of the following parameters-remains constant during sensible cooling or heating process?

(a) Dry-bulb temperature
(b) Wet-bulb temperature
(c) Humidity ratio
(d) Relative humidity

BPSC AE MAINS 2017 Paper-V
Assam PSC CCE Pre 2015
RPSC AEN Pre-2013

Ans. (c)



Process in diagram		Type of Air Conditioning
OA	–	Sensible Heating
OB	–	Sensible Cooling
OC	–	Humidification
OD	–	Dehumidification
OE	–	Heating & Humidification
OF	–	Cooling & Dehumidification

Search on Telegram @apna_pdf

OG – Cooling & Humidification
OH – Heating & Dehumidification

Specific Humidity or Humidity Ratio (ω)

$$\omega = \frac{\text{Mass Vapour}}{\text{Mass of dry air}} = \frac{m_v}{m_a}$$

$$\omega = 0.622\frac{P_v}{P_a} = 0.622\frac{P_v}{P_t - P_v}$$

$P_t = P_v + P_a$

P_v = Partial Pressure of Vapour

P_a = Partial Pressure of Air

P_t = Total Pressure (Atmospheric)

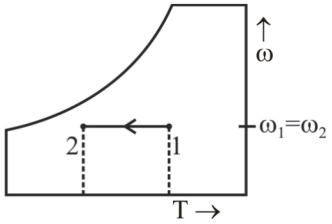
550. In sensible cooling process, specific humidity of the system

(a) Increases (b) Decreases

(c) Remains constant (d) None of these

MPPSC State Forest Service Exam, 2014
ESE 2012
UKPSC AE 2007 Paper-II

Ans. (c) :



1-2 → Sensible cooling $T_1 > T_2$

1-2 → Specific humidity is remain constant ($\omega_1 = \omega_2$)

551. The bypass factor of cooling coil

(a) Decrease with increase in velocity of air passing through it

(b) Increase with increase in velocity of air passing through it.

(c) Remains unchanged with increase in velocity of air passing through it

(d) May increase or decrease with increase in velocity of air passing through it depending upon the condition of air entering

ISRO Scientist/Engineer (RAC), 10.03.2019
MPPSC AE 2014, PSPCL AE 2012

Ans. (b) : Bypass factor of cooling coil increases with increase in velocity of air passing through it.

552. The ratio of partial pressure of water vapour (p_v) to the saturation pressure of water vapour (p_s) at same temperature is

(a) relative humidity

(b) degree of saturation

(c) specific humidity

(d) absolute humidity

UPPSC AE 13.12.2020, Paper-2
Oil India Senior Officer 23.12.2020
TNPSC 2019, 2013

Ans. (a) : Relative Humidity– The ratio of partial pressure of water vapour (P_v) to the saturation pressure of water vapour (P_{vs}) at same temperature

$$\boxed{\phi = \frac{P_v}{P_{vs}}}$$

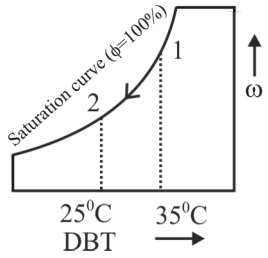
553. Moist air at 35^0C and 100% relative humidity is entering a psychrometric device and leaving at 25^0C and 100% relative humidity.
The name of the device is

(a) Humidifier (b) Dehumidifier

(c) Sensible heater (d) Sensible cooler

UPPSC AE 13.12.2020, Paper-2
GUJARAT PSC AE 2019
GATE 2014

Ans. (b) : From point (1) 35^0C to point (2) 25^0C at 100% relative humidity, dehumidification takes place. So, most appropriate option should be option (b)



554. On psychrometric chart wet bulb temperature lines are :

(a) horizontal

(b) vertical

(c) straight inclined sloping downward to the right

(d) curved

VIZAG MT 14.12.2020, ESE 2007
J & K PSC Screening, 2006

Ans. (c) : Wet Bulb Temperature– Straight Inclined and sloping downwards towards right

Dry Bulb Temperature – Vertical

Specific humidity – Horizontal

Relative humidity – Curved

555. The air conditioning process during summer is _____.

(a) cooling and humidification

(b) heating and dehumidification

(c) cooling and dehumidification

(d) heating and humidification

VIZAG Steel MT 24.01.2021
Kerala PSC Asstt. Prof. 27.09.2016
TNPSC AE (Industries) 09.06.2013

Ans. (c) : The air conditioning process during summer is cooling and dehumidification and in winter is heating and humidification.

Search on Telegram @apna_pdf

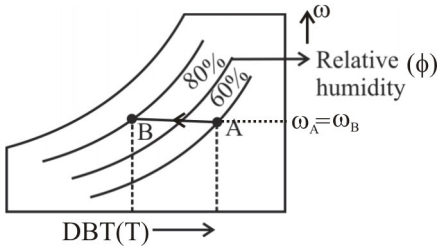
556. The relative humidity during sensible cooling process

(a) increases (b) decreases

(c) remains same (d) unpredictable

Kerala PSC IOF 19.04.2016
RPSC Lect. (Tech. Edu. Dept.) 2011
UKPSC AE 2007 Paper-II

Ans. (a) : From, Psychrometric chart,
The relative humidity during sensible cooling process increases.
A-B → sensible cooling.



557. The ratio of the actual mass of water vapour in a unit mass of dry air to the mass of water vapour in the same mass of dry air when it is saturated at the same temperature and pressure, is called:

(a) humidity ratio
(b) relative humidity
(c) absolute humidity
(d) degree of saturation

Nagaland PSC (CTSE) 2018, Paper-II
Punjab PSC SDE 12.02.2017
Kerala PSC IOF 19.04.2016
ESE 2004

Ans. (d) : Degree of Saturation – It is the mass of water vapour in a sample of air to the mass of water vapour in the same air when it is saturated at the same temperature

• The capacity of air to absorb moisture is called degree of saturation

$$\mu = \frac{w}{w_S}\bigg|_T = \frac{P_V}{P_S}\left[\frac{1-P_S/P}{1-P_V/P}\right]$$

w = Specific humidity at vapour pressure P_V ' w_S = Specific humidity at saturation pressure P_S.

Relative Humidity (R_H or ϕ)- It is the ratio of mass of water vapour in a given volume of air at any temperature and pressure to the maximum amount of mass of water vapour which is the same volume of air can hold at the same temperature conditions. The air contains maximum amount of water vapour at the saturations conditions.

$$R_H/\phi = \frac{\text{mass of water vapour in a fixed volume of moist air at temp. T}}{\text{mass of water vapour in a saturated sample of moist air at same temp. and vol.}}$$

$$= \frac{m_v}{m_s}\bigg|_T = \frac{P_v V/RT}{P_s V/RT} = \frac{P_v}{P_s} = \frac{V_s}{V_v}$$

$$\mu = \phi\left[\frac{1-P_s/P}{1-P_v/P}\right]$$

Humidity ratio (Specific Humidity)– It is the ratio of mass of water vapour to the mass of dry air contained in the sample air. It is denoted '*w*'. It is normally expressed in g/kg of dry air.

$$w = \frac{\text{mass of water vapour in air}}{\text{mass of dry air in air}}$$

Specific humidity / humidity ratio

$$w = \frac{m_w}{m_a} = \frac{V_a}{V_w} = 0.622\frac{P_v}{P-P_v}$$

P_v = Partial pressure of vapour
P = Total pressure of moist air.

Absolute humidity– It is the mass of water vapour present in one cubic metre of dry air. It is expressed in terms of gram per cubic metre of dry air (g/m^3 of dry air) many a time it is expressed in terms of gram per m^3 of dry air one kg of water vapour is equal to 15,430 grams.

$$P_V V = m_V R_V T$$

where, P_v = Vapour pressure in air saturation pressure at dew point.
V = Volume of air, which is also of water vapour.
T = Dry bulb temp.
R_V = Gas constant of water vapour (462 kJ/kg-K)
m_V = mass of water vapour in kg.

$$\text{Vapour Density} = \frac{m_V}{V} = \frac{P_v}{R_v T}$$

558. The equivalent diameter (D) of a circular duct corresponding to a rectangular duct having longer side 'a' and shorter side 'b' for the same velocity and pressure drop is given by

(a) $D = \frac{a+b}{ab}$ (b) $D = \frac{ab}{a+b}$

(c) $D = \frac{2ab}{a+b}$ (d) $D = \frac{a+b}{2ab}$

Nagaland PSC (CTSE) 2016, Paper-II
Rajasthan AE (Nagar Nigam) 2016 Shift-3
ESE 2004

Ans. (c) : Equivalent diameter (D) of a circular duct corresponding to a rectangular duct having longer side 'a' and shorter side 'b' for the same velocity and pressure drop is given by

$$D = \frac{4A}{P} = \frac{4ab}{2(a+b)} = \frac{2ab}{a+b}$$

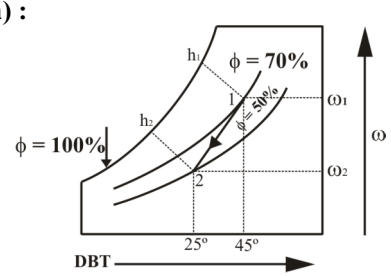
559. It is desired to condition the outside air form 70% RH and 45°C DBT to 50% RH and 25° DBT at room condition. The practical arrangement would be

Search on Telegram @apna_pdf

(a) Cooling and dehumidification
(b) Cooling and humidification
(c) Heating and dehumidification
(d) heating and humidification

TNPSC AE 2014, APPSC IOF 2009
CSE Pre-1994

Ans. (a) :

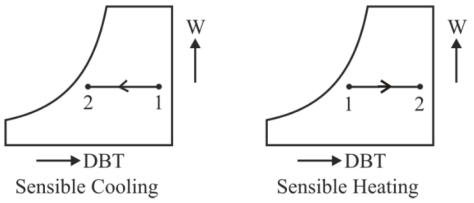


$\omega \downarrow \rightarrow$ Dehumidification
DBT $\downarrow \rightarrow$ Cooling
$h_1 > h_2 \rightarrow h \downarrow$
WBT $\downarrow$

560. In a psychrometric chart sensible heating or cooling is represented by
(a) Vertical line (b) Horizontal line
(c) Inclined line (d) Curved lines

VIZAG Steel MT 24.01.2021, Shift-I
GUJARAT PSC AE 2019
Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014

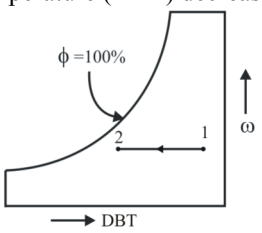
Ans. (b) In a psychrometric chart sensible heating or cooling is represented by horizontal line.



561. During the process of sensible cooling :
(a) The specific humidity increase and dry bulb temperature decreases
(b) The specific humidity remains constant and dry bulb temperature decreases
(c) The specific humidity decreases and dry bulb temperature increase
(d) The specific humidity remains constant and dry bulb temperature increases.

Oil India Limited Sr. Engineer (Drilling) 30.11.2019
PSPCL AE 2012, ESE 2012

Ans. (b) : According to psychrometric chart during sensible cooling 1-2 specific humidity remains constant and dry bulb temperature (DBT) decreases.



562. During chemical dehumidification process of air
(a) dry-bulb temperature and specific humidity decrease
(b) dry-bulb temperature increases and specific humidity decreases
(c) dry-bulb temperature decreases and specific humidity increases
(d) dry-bulb temperature and specific humidity increase

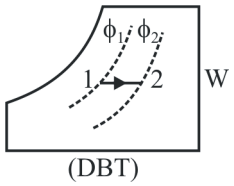
BPSC AE Mains 2017 Paper - V
UPPSC AE 12.04.2016 Paper-II, GATE 2004

Ans : (b) : Air dehumidified while enthalpy remains constant. Certain chemicals like silica gel and alumina absorb moisture from air and hence its 'ω' value decreases but at the same time latent heat of condensation liberates and added to air (self-heating) and hence its dry bulb temperature increases.

563. If a certain mass of moist air in an air tight vessel is heated to a higher temperature, then
(a) Specific humidity of the air increases
(b) Specific humidity of the air decreases
(c) Relative humidity of the air increases
(d) Relative humidity of the air decreases

RPSC AE 2018
UPPSC AE 12.04.2016 Paper-II
ISRO Scientist/Engineer 03.07.2016

Ans. (d) :



$\phi_2 < \phi_1$

■ Moist air is a composition of dry air and water vapour. Dry air is a pure substance but moist air is not a pure substance because the percentage of water vapour content varies from place to place. As we have seen that at some places their is a high humidity and at some places their is a low humidity.
"Specific humidity indicates the actual amount of water vapour present in the air where as, relative humidity indicates indirectly the moisture absorption capacity of the present air."
Note : Generally the state of moist air is superheated.

564. Water at 42°C is sprayed into a stream of air at atmospheric pressure, dry bulb temperature of 40°C and a wet bulb temperature of 20°C. The air leaving the spray humidifier is not saturated. Which of the following statements is true?
(a) Air gets cooled and humidified
(b) Air gets heated and humidified
(c) Air gets heated and dehumidified
(d) Air gets cooled and dehumidified

Gujarat PSC AE 2019
UPPSC AE 12.04.2016 Paper-II, GATE 2005

Search on Telegram @apna_pdf

Ans : (b) : Spray water temperature = 42°C
Air stream condition
DBT = 40°C
WBT = 42°C
Since, temperature of spraying water is greater than that of air stream temperature. Hence, air gets heated and humidified.

565. Humidity ratio can be given in terms of partial pressures of dry air (P_a) and water vapour (P_v) as

(a) $0.622\left(\frac{P_a}{P_v}\right)$ (b) $0.622\left(\frac{P_v}{P_a}\right)$

(c) $0.622\left(\frac{P_v}{P_v - P_a}\right)$ (d) None of the above

UPPSC AE 12.04.2016 Paper-II
Nagaland PSC (CTSE) 2016 Paper-II
ESE 2001

Ans : (b) Humidity ratio = $\frac{m_v}{m_a}$

$PV = mRT$

For vapour $P_vV = m_v R_vT$

$$m_v = \frac{P_v \cdot V_v}{R_v T_v}$$

For air $m_a = \frac{P_a \cdot V_a}{R_a T_a}$

$V_v = V_a$
$T_v = T_a$

We know that
$R_a = 0.287$ kJ/kgK
$R_v = 0.416$ kJ/kgK

$$\omega = \frac{m_v}{m_a} = \frac{P_v \cdot R_a}{R_v \cdot P_a}$$

Humidity ratio = $\frac{0.622 P_v}{(P_t - P_v)}$

$P_t = P_v + P_a$

m_a = mass of dry air
P_v = Partial pressure of vapour
P_a= Partial Pressure of air
P_t= Total pressure

566. In a spray washing system, if the temperature of water is higher than the dry bulb temperature of entering air, then the air is

(a) Heated and dehumidified
(b) Heated and humidified
(c) Cooled and humidified
(d) Cooled and dehumidified

Nagaland PSC (CTSE) 2018, Paper-II
Vizag Steel (MT) 2017, ESE 1993

Ans. (b) : In spray washing system, if the temperature of water is higher than the dry bulb temperature of entering air then the air is heated and humidified.

567. As relative humidity decreases, the dew point will be :

(a) lower than WBT (b) equal to WBT
(c) higher than WBT (d) unpredictable

RPSC ACF & FRO, 26.02.2021
(KPSC AE. 2015)
Kerala PSC AE 06.08.2015

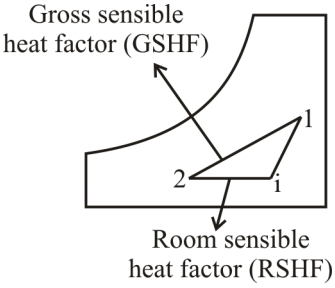
Ans. (a) : As relative humidity decreases, the dew point temperature will be lower than wet. bulb temperature.

568. The supply air state of cooling coil with a bypass factor (BPF) lies at

(a) Intersection of RSHF line with saturation curve
(b) Intersection of GSHF line with saturation curve
(c) Point dividing RSHF line in proportion of BPF and (1-BPF)
(d) Intersection of RSHF line and GSHF line

RPSC Lect (Tech. Edu Dept) 13.03.2021
OPSC AEE 2019 PAPER - II
Kerala PSC Poly. Lect., 2017

Ans. (d) : The supply air state of cooling coil with a bypass factor (BPF) lies of intersection of RSHF line and GSHF line.



569. The moisture content of air is indicated by

(a) dry bulb temperature
(b) wet bulb temperature
(c) dew point temperature
(d) both wet bulb and dew point temperature

TNPSC AE, 2008
J & K PSC Screening, 2006

Ans. (c) : The moisture content of air is indicated by Dew Point Temperature (DPT). The higher the dew point, the higher the moisture content of the air at a given temperature.

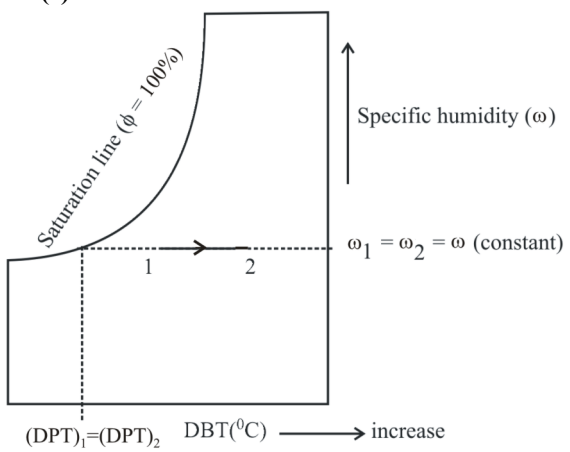
570. If the specific humidity of moist air remains same but its dry bulb temperature increases.

(a) its dew point temperature increases
(b) its dew point temperature decreases
(c) its dew point temperature remains same
(d) its dew point temperature may increase or decrease depending upon increase or decrease of relative humidity.

UPPSC AE 13.12.2020 Paper-II
TNPSC AE, 2008

Search on Telegram @apna_pdf

Ans. (c)



If the specific humidity (ω) of moist air remains same but its dry bulb temperature (DBT) increases, then its dew point temperature (DPT) remains same.

i.e., Process is sensible heating.

i.e., $\omega_1 = \omega_2 = \omega$ (same)

DBT increase

$(DPT)_1 = (DPT)_2 = DPT$ (same)

571. If the specific heats of dry air and water vapour are 1kJ/kg-K and 1.88 kJ/kg-K and the humidity ratio is 0.011, the specific heat of moist air will be:

(a) 1.0207 kJ/kg-K (b) 1.869 kJ/kg-K
(c) 1.891 kJ/kg-K (d) 0.9793 kJ/kg-K

TSPSC Managers, 2015
ESE 1994

Ans. (a) : C_p of Moist air = C_p of dry air + humidity ratio × C_p of water vapour.

$= 1.00 + 0.011 \times 1.88$
$= 1.00 + 0.02068$
$= 1.0207$ kJ/kg-K

572. If 1 kg of air having specific humidity as 0.03 kg/kg of dry air mixes with 2 kg of air having specific humidity as 0.015 kg/kg of dry air. The specific humidity of mixture in kg/kg of dry air will be approximately

(a) 0.025 (b) 0.015
(c) 0.02 (d) 0.03

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 Paper-II

Ans. (c) : Specific humidity for mixture

$$\omega_{mix} = \frac{m_1\omega_1 + m_2\omega_2}{m_1 + m_2}$$

$$= \frac{1\times 0.03 + 2\times 0.015}{1+2}$$

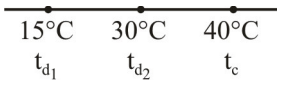
$$\omega_{mix} = 0.02$$

573. The atmospheric air at dry bulb temperature 15° C enters a heating coil maintained at 40° C. If the air leaves the heating coil at 30° C, the coil efficiency is _____.

(a) 0.6 (b) 0.4
(c) 0.2 (d) 0.75

VIZAG MT, 14.12.2020, ESE 2013

Ans. (a) :



Coil efficiency

$$\eta = \frac{30-15}{40-15} = \frac{15}{25}$$

$$\boxed{\eta = 0.6}$$

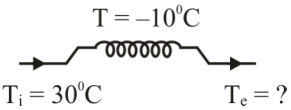
574. In an air condition unit air enters the cooling coil a temperature 30^0C. The coil surface temperature is -10^0C. If the cooling coil bypass factor is 0.45, then the temperature at the exit will be

(a) 6^0C (b) 8^0C
(c) 10^0C (d) 12^0C

UPPSC AE 13.12.2020, Paper-2
ESE 2018

Ans. (b) : Given,

$T_i = 30^0$C
$T_e = ?$
$t = -10^0$C
BPF = 0.45



$$BPF = \frac{T_e - t}{T_i - t}$$

$$0.45 = \frac{T_e + 10}{30 + 10} \Rightarrow T_e = 8^0\text{C}$$

575. If the volume of moist air with 50% RH is isothermally reduced to half its original volume, then relative humidity of moist air becomes

(a) 25% (b) 60%
(c) 70% (d) 100%

UPPSC AE 13.12.2020, Paper-2
ESE 2003

Ans. (d) : Given,

$\varphi_1 = 50\%$

If volume is reduced to half its original isothermally

$\left(\text{i.e.}\, V_2 = \frac{V_1}{2}\right)$

$$P_1V_1 = P_2V_2$$

$$P_1V_1 = P_2 \times \frac{V}{2}$$

$$P_2 = 2P_1$$

$$\varphi_2 = \frac{P_{v_2}}{P_{v_s}} = \frac{2P_{v_1}}{P_{v_s}} = 2\times 50 = 100\%$$

Search on Telegram @apna_pdf

576. The room sensible heat loss is 30,000 kJ/hr and the latent heat loss is 20,000 kJ/hr. Then the sensible heat factor is

(a) 0.667 (b) 0.60
(c) 0.30 (d) 3.00

UPPSC AE 13.12.2020, Paper-2, ESE 2013

Ans. (b) : Given,
Sensible heat loss, (SHL) = 30,000 kJ/hr
Latent heat loss, (LHL) = 20,000 kJ/hr

$$SHF = \frac{SHL}{SHL + LHL}$$

$$SHF = \frac{30,000}{30,000 + 20,000} = 0.6$$

577. For an air conditioned space, RTH = 100 kW, RSHF = 0.75, volume flow rate of air is 100 m^3/minute and room specific humidity is 0.01 kg/kg of dry air. The specific humidity of supply air in kg/kg of dry air is

(a) 0.0100 (b) 0.0075
(c) 0.0050 (d) 0.0025

UPPSC AE 13.12.2020, Paper-2, ESE 2005

Ans. (c) Given,
RTH = 100 kW, RSHF = 0.75
C_{mm} = Volume flow rate of air = 100 m^3/min
ω_2 = 0.01 kg/kg of dry air
Supply Air, $\Delta\omega = \omega_1 - \omega_2$

$$RSHF = \frac{RSH}{RTH}$$

RSH = 0.75 × 100 = 75 kW
RLH = RTH – RSH
= 100 – 75 = 25 kW
We know that,
RLH = 50 $C_{mm}\Delta\omega$ kW
25 = 50 × 100 × $\Delta\omega$
$\Delta\omega$ = 0.005 kg/kg of dry air

578. The sensible heat factor for auditorium or cinema hall is generally kept as

(a) 0.6 (b) 0.7
(c) 0.8 (d) 0.9

Assam PSC AE (PHED), 18.10.2020
OPSC AEE 2019 Paper-II

Ans. (b) : The sensible heat factor for auditorium or cinema hall is generally kept as 0.70.

579. The atmospheric air at 35ºC and 60% RH can be brought to 20ºC and 60% RH by

(a) cooling and humidification process
(b) cooling and dehumidification process
(c) sensible cooling process
(d) adiabatic saturation process

Assam PSC AE (PHED), 18.10.2020, ESE 2006

Ans. (b) : The atmospheric air at 35ºC and 60% RH can be brought to 20ºC and 60% RH by cooling and dehumidification process.

580. Humidity ratio is defined as the ratio of

(a) Mass of water vapour to the mass of air water vapour mixture
(b) Mass of water vapour to the mass of dry air in a given mixture of air-water vapour mixture
(c) Mass of dry air to the mass of air water vapour mixture
(d) Mass of dry air to mass of water vapour in an air-water vapour mixture

APGCL AM, 2021, OPSC AEE 2019 Paper-II

Ans. (b) Humidity Ratio– It is the ratio of mass of vapour to the mass of dry air in a given mixture of air water vapour . It is represented by (ω)

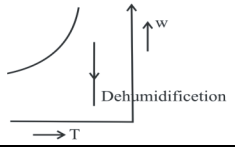
$$\omega = \frac{m_v}{m_a} \text{kgvapour/kg dry air}$$

581. The process of removing moisture from air at constant dry bulb temperature is known as

(a) Sensible heating (b) Sensible cooling
(c) Humidification (d) dehumidification

APGCL AM, 2021, HPPSC W.S Poly. 2016

Ans. (d) :
⇒ Process of removing moisture from air at constant dry bulb temperature is known as dehumidification.
⇒ Pure Humidification & dehumidification processes are not possible practically.



582. Dew point temperature of air at one atmospheric pressure (1.013 bar) is 18°C. The air dry bulb temperature is 30°C. The saturation pressure of water at 18°C and 30°C are 0.02062 bar and 0.04241 bar respectively. The specific heat of air and water vapour respectively are 1.005 and 1.88 kJ/kgK and latent heat of vaporization of water at 0°C is 2500 kJ/kg. The specific humidity (kJ/kg of dry air) and enthalpy (kJ/kg of dry air) of the moist air respectively are :

(a) 0.01051, 52.64 (b) 0.01291, 63.15
(c) 0.01481, 78.66 (d) 0.01532, 81.40

APPSC IOF, 2009, GATE 2004

Ans. (b) : P = 1.013 bar, $(P_s)_{DPT} = (P_v)_{DBT}$ = 0.02062 bar

$$\text{Specific humidity } (\omega) = 0.622 \times \frac{P_v}{P_t - P_v}$$

$$\omega = \frac{0.622 \times 0.02062}{1.013 - 0.02062} = 0.01291 \text{kg/kg of dry air}$$

h = 1.005 DBT + w(2500 + 1.88 DBT)
h = 1.005 × 30 + 0.01291 × (2500 + 1.88 × 30)
h = 3015 + 33.029
h = 63.179 kJ/kg d.a.

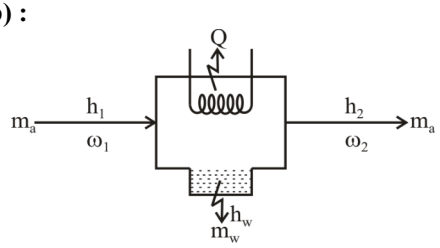
Search on Telegram @apna_pdf

583. Atmospheric air at a flow rate of 3 kg/s (on dry basis) enters a cooling and dehumidifying coil with an enthalpy of 85 kJ/kg of dry air and humidity ratio of 19 gram/kg of dry air. The air leaves the coil with an enthalpy of 43 kJ/kg of dry air and a humidity ratio of 8 gram/kg of dry air. If the condensate water leaves the coil with an enthalpy of 67 kJ/kg, the required cooling capacity of the coil in kW is :

(a) 75 (b) 123.8
(c) 128.2 (d) 159

APPSC IOF, 2009, GATE 2007

Ans. (b) :



Mass flow rate of water, $m_w = m_a(\omega_1 - \omega_2)$
$= 3 \times (0.019 - 0.008)$
$= 0.033$ kg/s

Energy balance equation,
$m_a h_1 = m_a h_2 + m_w h_w + Q$
$3 \times 85 = 3 \times 43 + 0.033 \times 67 + Q$
$Q = 123.8$ kW

584. Dew point temperature lines on the psychrometric chart are :

(a) Horizontal
(b) Vertical
(c) Curved
(d) Straight inclined slopping downward to the right.

ISRO Scientist/Engineer (RAC), 10.03.2019
Kerala PSC IOF 19.04.2016

Ans. (a) : Horizontal– Dew point temperature lines on psychrometric charts are horizontal lines.

585. Taking B as bypass factor in sensible cooling or heating of air, the coil efficiency is equal to

(a) B-1 (b) 1-B
(c) B+1 (d) 1/B

MPPSC State Forest Service Exam, 2014
HPPSC AE 2014

Ans. (b) : If B as by pass factor in sensible cooling or heating of air, the coil efficiency is equal to,

$\Rightarrow \quad \eta_{coil} = (1 - B) \times 100\%$

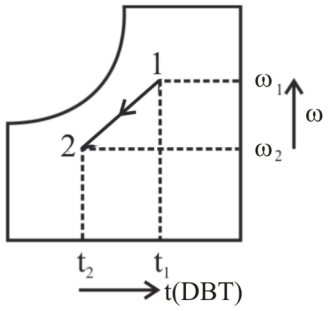
586. A stream of moist air at dry-bulb temperature of 40°C and dew-point temperature of 25°C passes through a water shower whose temperature is maintained at 20°C. The stream of air will undergo a process of

(a) Sensible cooling
(b) Evaporative cooling
(c) Cooling and humidification
(d) Cooling and dehumidification

RPSC IOF 2020, GPSC EE Pre, 28.01.2017

Ans. (d) : Cooling and Dehumidification of moist air-

- Air is to be cooled and during cooling water vapour is to be separated from the air.
- Since moisture separation will occur only when moist air is cooled to a temperature below its DPT. Therefore, the effective surface temperature of the cooling coil kept below the initial DPT of the air and the surface temperature is called apparatus dew point temperature (t_{ADP}).



587. Two air streams with mass flow rates of 36 kg/min and 14 kg/min with respective enthalpies of 36 kJ/kg and 50 kJ/kg are mixed. The enthalpy of mixture is nearly

(a) 64 kJ/kg (b) 55 kJ/kg
(c) 46 kJ/kg (d) 40 kJ/kg

GPSC ARTO Pre 30.12.2018, ESE 2017

Ans. (d) : Given, $m_1 = 36$ kg/min $h_1 = 36$ kJ/kg
$m_2 = 14$ kg/min $h_2 = 50$ kJ/kg

$$m_1h_1 + m_2h_2 = (mh)_{mix}$$
$$36 \times 36 + 14 \times 50 = 50\, h_{mix}$$
$$h_{mix} = 39.92 \simeq 40\, kJ/kg$$

588. The optimum effective temperature for human comfort is

(a) Higher in winter than the summer
(b) Lower in winter than the summer
(c) Same in winter and summer
(d) Not dependent on season

Nagaland PSC (CTSE) 2018, Paper-II
ESE 2005

Ans. (b) : Optimum effective temperature is dependent on seasonal changes. So, For human comfort the optimum effective temperature is lower Human generally fell comfortable between temperatures of 22°C to 27°C and a relative humidity of 40% to 60%.

589. Sensible heat factor is given by

(a) S.H/(S.H + L.H) (b) (S.H+L.H)/S.H
(c) (L.H–S.H)/S.H (d) S.H/(L.H–S.H)

Nagaland PSC (CTSE) 2018, Paper-II
ESE 1999

Ans. (a) : Sensible heat ratio is defined as the sensible heat or cooling load divided by the total heat or cooling load.

$$SHF = \frac{SH}{S.H. + L.H.}$$

Search on Telegram @apna_pdf

590. During sensible cooling

(a) Relative humidity remains constant
(b) Wet bulb temperature increases
(c) Specific humidity increases
(d) Partial pressure of vapor remains constant

Nagaland PSC (CTSE) 2018, Paper-II
HPPSC Asstt. Prof. 18.09.2017

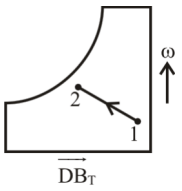
Ans. (d) : During sensible cooling process the dry bulb temperature and wet bulb temperature of the air reduces, while the latent heat of the air and the dew point temperature of the air remains constant. In general the sensible cooling process is carried out by passing the air over the coil.

591. When the air is passed through an insulated chamber having sprays of water maintained at a temperature higher than the dew point temperature of entering air but lower than the dry bulb temperature, then the air is said to be

(a) cooled and dehumidified
(b) cooled and humidified
(c) heated and humidified
(d) heated and dehumidified

ISRO Scientist/Engineer (RAC) 12.01.2020
ESE 1994

Ans. (b) : Because, insulated chamber is having sprays of water, the process will humidification and the dry bulb temperature of spray water is less than the air. Then the process will also be cooling process.
So air is said to be cooled and humidified.



592. Specific humidity is defined as

(a) Mass of water vapor contained in air-vapor mixture per kg of dry air
(b) Mass of water vapor contained per kg of air-vapor mixture
(c) Mass of dry air contained per kg of air-vapor mixture
(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : Specific humidity is defined as mass of water vapor contained in air-vapor mixture per kg of dry air.

593. For a typical sample of ambient air (at 35°C, 75% relative humidity and standard atmospheric pressure), the amount of moisture in kg per kg of dry air will be approximately.

(a) 0.002 (b) 0.027
(c) 0.25 (d) 0.75

VIZAG STEEL MT 10.06.2012
GATE 2005

Ans. (b) : Given data-Dry bulb temperature $T_{db} = 35°C$
Relative humidity $\phi = 75\% = 0.75$
at 35°C, $P_s = 0.05628$ bar (from psychrometric chart)

$$\phi = \frac{P_v}{P_s} \Rightarrow 0.75 = \frac{P_v}{0.05628}$$

$P_V = 0.75 \times 0.05628$
$P_V = 0.04221$ bar

$$W = \frac{0.622\,P_V}{P - P_V} = \frac{0.622 \times 0.04221}{1.01325 - 0.04221}$$

$$\boxed{W = 0.0270 \text{ kg / kg of dry air}}$$

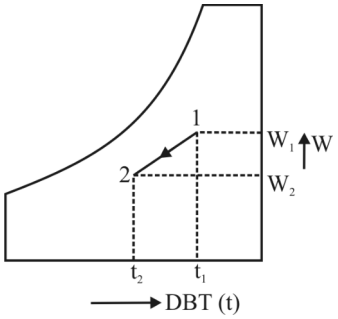
594. Air at dry bulb temperature of 35ºC and dew point temperature of 25ºC passes through an air washer whose temperature is maintained at 20ºC. What is the nature of the process?

(a) Cooling humidification
(b) Sensible cooling
(c) Heating and dehumidification
(d) Heating and humidification
(e) Cooling and dehumidification

CGPSC ARTO & TSI 07.01.2017
ESE 2005

Ans. (e) : Cooling and Dehumidification of moist air :-

- Air is to be cooled and during cooling water vapour is to be separated From air.



- Since moisture separation will occur only when moist air is cooled to a temperature below its DPT.

595. Humidity ratio W is expressed as
(P_v = Partial pressure of vapour
Pa = partial pressure or air
Pb = barometric pressure of air)

(a) $W = 0.622\ P_v / P_b$
(b) $W = 0.622\ P_v / P_a$
(c) $W = 0.622 \dfrac{P_v}{P_b + P_v}$
(d) $W = 0.622 \dfrac{P_v}{(P_b - P_v)}$

GPSC ARTO 01.05.2016
OPSC AEE 2015 PAPER - II

Ans. (d) : Humidity ratio/specific Humidity (W) =

$$\frac{M_{vapour}}{M_{dry\ air}} = \frac{M_V}{M_a}$$

Search on Telegram @apna_pdf

P_V = Pressure of water vapour
P_a = Pressure of dry air
P = Total atmosphere pressure
$P = P_V + P_a$

$$W = \frac{M_V}{M_a} = \left(\frac{P_v.V/R_{vT}}{P_a V/R_{aT}}\right) \quad \{\because PV = MRT\}$$

$$= \frac{P_V}{P_a}\frac{R_a}{R_V} = \frac{18}{29}.\frac{P_V}{P_a} \quad \{\because P_a = P - P_v\}$$

$$\boxed{W = 0.622.\frac{P_V}{P - P_V}}$$

596. If the specific humidity of the moist air remains same but its dry bulb temperature increases
(a) its dew point temperature increases
(b) its dew point temperature decreases
(c) its dew point temperature remains constant
(d) none of the above

ESE 2011, UKPSC AE 2007 Paper -II

Ans. (c) : Its dew point temperature remains constant

597. The enthalpy of moist air with normal notation as is given by
(a) $h = (1.005 + 1.88\omega)\, t + 2500\omega$
(b) $h = 1.88\omega t + 2500\omega$
(c) $h = 1.005\omega t$
(d) $h = (1.88 + 1.005\omega)\, t + 2500\omega$

ESE 2019, RPSC Lect. 16.01.2016

Ans. (a) : Enthalpy of moist air
$h = h_a + \omega h_v = 1.005\, t + \omega\,[2500 + 1.88t]$
$= [1.005 + 1.88\omega]t + 2500\,\omega$

598. If moist air is passed over chemicals like silica gel, the process which takes place is
(a) humidification
(b) dehumidification
(c) cooling and dehumidification
(d) heating and dehumidification

UKPSC AE 2012 Paper–II
ESE 2010

Ans. (d) : heating and dehumidification

599. The amount of moisture in air can be measured by
(a) Sling psychrometer (b) Mass spectrometer
(c) Photometer (d) Thermistor

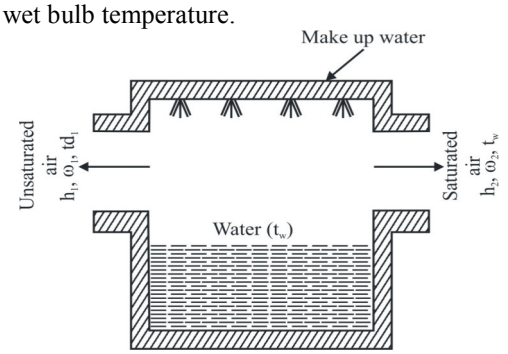
GPSC Executive Engineer 23.12.2018
KPSC AE 2015

Ans : (a) The amount of moisture in air can be measured by sling psychrometer.

600. In cooling tower, "approach" is the temperature difference between the:
(a) Hot inlet water and cold outlet water.
(b) Hot inlet water and wet bulb temperature
(c) Cold outlet water and wet bulb temperature
(d) Dry bulb and wet bulb temperature

OPSC AEE 2015 PAPER - II
APPSC AEE 2012

Ans : (c) In cooling tower "approach" is the temperature difference between the cold outlet water and wet bulb temperature.



The Thermodynamic wet bulb temperature or adiabatic saturation temperature is the temperature at which the air can be brought to saturation state, adiabatically, by the evaporator of water into the flowing air.

601. For completely dry air total heat is
(a) Total latent heat
(b) Sum of latent heat and sensible heat
(c) Total sensible heat
(d) Difference of sensible heat and latent heat

RPSC Vice Principal ITI 2018, NPCIL ET, 2015

Ans. (c) : For completely dry air, since latent part will not present hence total heat will be equal to total sensible heat.

602. When air is adiabatically saturated, the temperature attained is
(a) dew point temperature
(b) dry bulb temperature
(c) wet bulb temperature
(d) triple point temperature

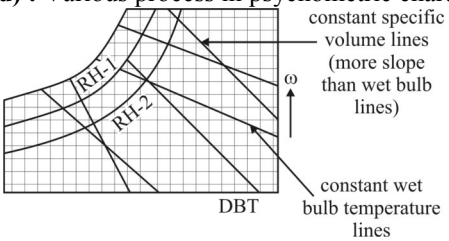
Gujarat PSC AE 2019, ESE 2011

Ans : (c) : When air is adiabatically saturated, the temperature attained is wet bulb temperature.

603. The statements concern psychrometric chart
1. Constant relative humidity lines are uphill straight lines to the right.
2. Constant wet bulb temperature lines are downhill straight lines to the right.
3. Constant specific volume lines are downhill straight lines to the right.
4. Constant enthalpy lines are coincident with constant wet bulb temperature lines.
Which of the statements are correct?
(a) 2 and 3 (b) 1 and 2
(c) 1 and 3 (d) 2 and 4

Gujarat PSC AE 2019, GATE 2006

Ans : (d) : Various process in psychometric charts



Search on Telegram @apna_pdf

(i) Constant RH lines are curved and uphill to right.
(ii) Constant WBT line and specific volume lines both are straight lines but different slopes.
(iii) Constant enthalpy and constant WBT line are coincident.

604. Evaporative regulation of body temperature fails when the body temperature is :
(a) more than wet bulb temperature but less then dry bulb temperature
(b) more than dew point temperature but less than wet bulb temperature
(c) more than dew point temperature but less than dry bulb temperature
(d) less than dew point temperature.

GPSC ARTO Pre 30.12.2018
CSE Pre-1999

Ans. (d) : Evaporative regulation of body temperature fails when the body temperature is less than dew point temperature.

605. On Psychrometric chart, the constant wet bulb temperature lines coincides with (which one of the following is correct)
(a) Constant relative humidity liners
(b) Constant enthalpy lines
(c) Constant dew point temperature line
(d) Constant volume lines

Nagaland PSC (CTSE) 2017, 2016 Paper-II
ESE 2008

Ans. (b) : On Psychrometric chart, the constant wet bulb temperature lines coincides with constant enthalpy lines.

606. For cooling and dehumidifying of unsaturated moist air, it must be passed over a coil at a temperature
(a) Of adiabatic saturation of incoming stream
(b) Which is lower than the dew point of incoming steam
(c) Which lies between dry bulb and wet bulb temperature
(d) Constant which lies between wet bulb and dew point temperature of incoming stream

ISRO Scientist Engineer 22.04.2018
Nagaland PSC (CTSE) 2017, 2016, 2015 Paper-II

Ans.(b) : For cooling and dehumidifying of unsaturated moist air, it must be passed over a coil at a temperature which is lower than the dew point of incoming steam.

607. Effective temperature depends on dry bulb temperature and
(a) Wet bulb temperature only
(b) Relative humidity and specific volume
(c) Specific humidity and enthalpy
(d) Wet bulb temperature and air motion

Nagaland PSC (CTSE) 2016, Paper-II, ESE 2006

Ans. (d) : Effective temperature depends on dry bulb temperature and Wet bulb temperature and air motion

608. Equal friction method of designing ducts is preferred
(a) When system is balanced
(b) When system is not balanced
(c) Only for return ducts
(d) For any system

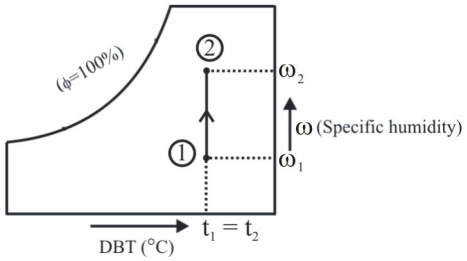
Nagaland PSC (CTSE) 2016, Paper-II
ESE 2008

Ans. (a) : Equal friction method of designing ducts is preferred it is quite easy to use, total pressure drop is low and flow is balanced.

609. A humidification process means :
(a) An increase in specific humidity
(b) A decrease in relative humidity
(c) A decrease in temperature
(d) An increase in temperature

RPSC IOF & Boiler 20.09.2017
UPSC JWM Advt. No.-52/2010

Ans. (a) : Explanation : Humidification means adding the water vapour or moisture to the humid air. During the humidification process, specific humidity should be increases



(humidification process express in Psychometric chart)

610. A cooling coil with a bypass factor of 0.1 and apparatus dew point (adp) of 12°C comes in contact with air having a dry-bulb temperature of 38°C and dew point of 9°C. Over the cooling coil, the air would undergo
(a) sensible cooling
(b) cooling and humidification
(c) cooling and dehumidification
(d) adiabatic saturation

Nagaland PSC CTSE 2015 Paper-II, CSE Pre-2001

Ans. (a) : Given,
BPF = 0.1
ADP = 12 °C
DBT = 38 °C
DPT = 9°C

$$\text{BPF for cooling coil} = \frac{t_{d_2} - t_{d_3}}{t_{d_1} - t_{d_3}}$$

$$0.1 = \frac{t_{d_2} - 12}{38 - 12}$$

$$t_{d_2} = 2.6 + 12$$

$$t_{d_2} = 14.6\ °C > DPT$$

Sensible cooling.

Search on Telegram @apna_pdf

611. Moist air exists at a pressure of 1.01 bar. The partial pressure and saturation pressure of water vapour are 0.01 bar and 0.02 bar, respectively. What are the relative humidity and humidity ratio of the moist air, respectively?

(a) 50% and 0.00622 (b) 100% and 0.0126
(c) 50% and 0.0126 (d) 100% and 0.00622

Nagaland PSC CTSE 2015 Paper-II
ESE 2004

Ans. (a) : Given,

$P_{atm} = 1.01$ bar

$P_v = 0.01$ bar

$P_{sat} = 0.02$ bar

$$RH = \frac{P_v}{P_{sat}} = \frac{0.01}{0.02}$$

$$= 50\%$$

$$\text{Humidity ratio } (\omega) = \frac{0.622 P_v}{P_{atm} - P_v}$$

$$= \frac{0.622 \times 0.01}{1.01 - 0.01}$$

$$= 0.00622$$

612. When a GSHF line is extended, it may strike the saturation curve at a point, which is called

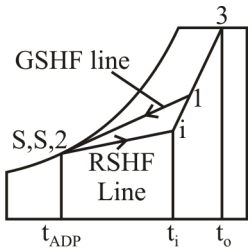
1. Effective surface temperature.
2. Air saturation temperature.
3. Water boiling temperature.
4. Apparatus dew point.

Which of the above is correct?

(a) 1 and 2 (b) 1 and 4
(c) 2 and 3 (d) 3 and 4

Nagaland PSC CTSE 2015 Paper-II
CSE Pre-2007

Ans. (b) :



GSHF → Grand sensible heat factor
RSHF → Room sensible heat factor
ADP → Apparatus dew point

613. Consider the following statements

1. The human body can lose heat even if temperature is less than the atmospheric temperature.
2. Relative humidity can be increased by cooling dehumidification.
3. Warm air increases the rate of radiation of heat from the human body.
4. Increase in air movement increases the evaporation from the human body.

Which of the above are correct

(a) 1 and 4 (b) 2 and 4
(c) 1 and 3 (d) 2 and 3

Nagaland PSC CTSE 2015 Paper-II
ESE 1994

Ans. (a) : ■ The human body can lose heat even if temperature is less than the atmospheric temperature.
■ Increase in air movement increases the evaporation from the human body.
■ It has to do with the temperature sensing mechanism of human body.

614. Which of the following statements is correct

(a) Dew point temperature can be measured with the help of thermometer
(b) Dew point temperature is the saturation temperature corresponding to the partial pressure of water vapors in moist air
(c) Dew point temperature is the same as the thermodynamic wet bulb temperature
(d) For saturated air, dew point temperature is less than the wet bulb temperature

RPSC VPITI 14.02.2016
TSGENCO AE 14.11.2015

Ans. (b) : Dew point temperature is the saturation temperature corresponding to the partial pressure of water vapour in moist air. It is the saturation temperature corresponding to the initiation of the condensation or water particle just start to condense.

615. For low bypass factor a cooling coil, the fin spacing and the number of tube rows will be respectively

(a) High and high (b) High and low
(c) Low and high (d) Low and low
(e) None of the above

BPSC AE Mains 2017 Paper-V
CGPSC Poly. Lect. 22.05.2016

Ans. (c) : The bypass factor is a function of the airflow, number of rows, surface temperature, number of fins per inch, height of fins and many other construction attributes of coils.
The bypass factor of a cooling coil decreases with decrease in fin spacing and increase in number of rows.

616. What are the general comfort conditions in an air-conditioning system?

(a) 20 DBT, 80% RH (b) 24 DBT, 60% RH
(c) 25 DBT, 40% RH (d) 25 DBT, 100% RH
(e) None of the above

CGPSC Poly. Lect. 22.05.2016
ESE 2006

Ans. (b) : The comfort conditions in air conditioning are at 24 DBT and 60% RH.

617. As an index of comfort, the temperature of saturated air at which a person would experience the same feeling of comfort as experienced in the actual unsaturated environment is called

Search on Telegram @apna_pdf

(a) Comfort temperature
(b) Effective temperature
(c) Wet bulb temperature
(d) Soothing temperature

UPPSC AE 12.04.2016 Paper-II
ESE 2010

Ans : (b) Effective temperature is the temperature of saturated air at which a person would experience same feeling of comfort as in unsaturated environment.

618. The phenomenon that enables cooling towers to cool water to a temperature below the dry bulb temperature of air is termed as
(a) Chemical dehumidification
(b) Adiabatic evaporative cooling
(c) Cooling and dehumidification
(d) Sensible cooling

RPSC Lect (Tech. Edu. Dept.) 13.03.2021
ESE 2020

Ans. (b) : Water cools due to evaporation and air gets heated and humidified and the phenomenon is called adiabatic evaporative water cooling.

619. In air-conditioning systems, air may be cooled and dehumidified by
1. Spraying chilled water to air in the form of fine mist
2. Circulating chilled water or brine in a tube placed across the air flow.
3. Placing the evaporator coil across the air flow.
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

RPSC Lect (Tech. Edu. Dept.) 13.03.2021
ESE 2020

Ans. (d) : 1, 2 and 3

620. A measure of feeling warmth or coolness by the human body in response to the air temperature, moisture content and air motion is called
(a) Dry bulb temperature
(b) Effective temperature
(c) Wet bulb temperature
(d) Dew point temperature

ESE 2020, CGPSC AE 16.10.2016

Ans. (b) : A measure of feeling warmth or coolness by the human body in response to the air temperature, moisture content and air motion is called effective temperature.

621. Sensible Heat Factor (SHF) is defined as:
(a) $SHF = \frac{LH}{SH + LH}$ (b) $SHF = \frac{LH}{SH - LH}$
(c) $SHF = \frac{SH}{SH + LH}$ (d) $SHF = \frac{SH}{SH - LH}$

Where $SH \rightarrow$ Sensible Heat
$LH \rightarrow$ Latent Heat

TRB Polytechnic Lecturer 2017
ESE 1999

Ans. (c) : $SHF = \frac{\text{Sensible heat}}{\text{Total heat}}$

$= \frac{SH}{LH + SH}$

622. In a desert cooler, the main process is
(a) sensible cooling
(b) dehumidification
(c) adiabatic saturation
(d) cooling and dehumidification

Nagaland PSC CTSE 2017 2nd Paper
HARYANA PSC Civil Services Pre. 2014

Ans. (c): In dessert cooler, cooling and humidification process used (which responsible in increasing humidity) while, coolers used in normal regions which apply cooling + dehumidification (decrease humidity)

623. In a sample of moist air at standard atmospheric pressure of 101.5 kPa and 28^0C, the partial pressure of water vapour is 1.445 kPa. If the saturation pressure of water vapour is 3.55 kPa at 28^0C, then what are the humidity ratio and relative humidity of moist air sample?
(a) 0.00836 and 1.32% (b) 0.00836 and 40%
(c) 0.00898 and 41% (d) 0.01344 and 1.32%
(e) 0.01344 and 40%

CGPSC AE 26.04.2015 SHIFT-II
ESE 2009

Ans. (c) : Data given as,
P = 101.325 kPa at 28^0C
P_v = 1.445 kPa
$P_{v\,sat.}$ = 3.55 kPa at 28^0C
We know that

Humidity ratio (ω) = $\frac{0.622P_v}{(P - P_v)} = \frac{0.622 \times 1.445}{(101.325 - 1.445)}$

$\omega = 0.00898$

Relative humidity (ϕ)

$\phi = \frac{P_v}{P_{vsat.}} = \frac{1.445}{3.55} \times 100$

$\phi = 40.7 \approx 41\%$

624. Index of human comfort is given by:
(a) Relative humidity
(b) Dry bulb temperature
(c) Air velocity
(d) Effective temperature
(e) Dew point temperature

CGPSC AE 25.02.2018

Ans. (d) : Index of human comfort is given by effective temperature.

625. Which of the following is true for sensible heating process?
(a) DBT increases, WBT increases, RH increases, Dew point temperature remains same
(b) DBT increases, WBT decreases, RH increases, Dew point temperature increases
(c) DBT increases, WBT increases, RH decreases, Dew point temperature remain same

Search on Telegram @apna_pdf

(d) DBT increases, WBT decreases, RH decreases, Dew point temperature increases
(e) DBT decreases, WBT increases, RH increases, Dew point temperature remains same

CGPSC AE 25.02.2018

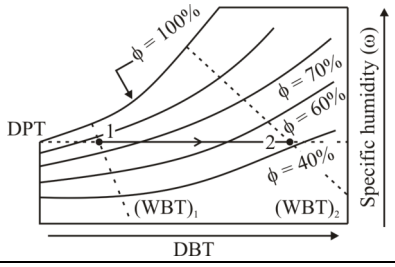
Ans. (c) : For sensible heating process-

DBT ↑ , WBT ↑

DPT → Constant

ω → constant

ϕ ↓, h ↑, v ↑



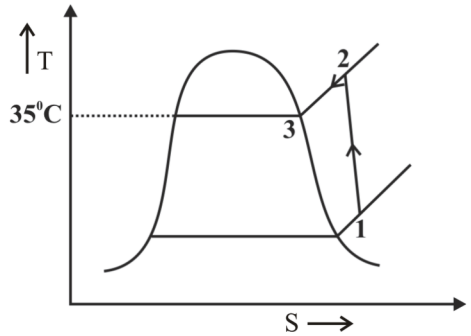
626. Moist air at a pressure of 100 kPa is compressed to 500 kPa and then cooled to 35°C in an aftercooler. The air at the entry to the aftercooler is unsaturated and becomes just saturated at the exit of the aftercooler. The saturation pressure of water at 35°C is 5.628 kPa. The partial pressure of water vapour (in kPa) in the moist air entering the compressor is closest to

(a) 0.57 (b) 1.13
(c) 2.26 (d) 4.52

VIZAG STEEL MT 10.06.2012
GATE 2008

Ans. (b) : Assuming that compression is isentropic in air compressors, the process can be described on the T–S diagram.

The process in the intercooler is constant pressure.



$P_2 = P_3$

But, $P_2 = 5P_1$

$$P_1 = \frac{P_2}{5} = \frac{P_3}{5}$$

$$P_1 = \frac{5.628}{5}$$

$$\boxed{P_1 = 1.13 \text{ kPa}}$$

627. The by- pass factor for a cooling coil

(a) decreases with increase in velocity of air passing through it.
(b) increases with increase in velocity of air passing through it.
(c) remains unchanged with increase in velocity of air passing through it.
(d) May increase of decrease with increase in velocity of air passing through it depending upon the condition of air entering.

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (b) : The by- pass factor is defined as amount of uncontained air which pass the coil increase in velocity of air by pass factor will increase.

628. During sensible heating of moist air, enthalpy

(a) increases. (b) decreases.
(c) remains constant. (d) None of the above

PPSC Asstt. Municipal Engineer 15.06.2021

Ans. (a) : During sensible heating of moist air, enthalpy increases.

629. In a psychrometric process, the sensible heat added is 40 kJ/sec and the latent heat added is 20 kJ/sec. The sensible heat factor for the process will be :

(a) 0.3 (b) 0.6
(c) 0.67 (d) 1.5

RPSC ACF & FRO, 26.02.2021

Ans. (c) : Sensible heat factor (SHF)

$$= \frac{\text{Sensible heat}}{\text{sensible heat} + \text{latent heat}}$$

$$= \frac{40}{40 + 20}$$

$$= 0.666$$

$$\boxed{\text{SHF} = 0.67}$$

630. Which one of the following conditions is not satisfied for saturated air?

(a) 100 percent relative humidity
(b) Specific humidity is constant
(c) Zero wet bulb depression
(d) DBT is equal to DPT

VIZAG Steel MT 24.01.2021

Ans. (b) : The maximum limit of water vapour that a given quantity of air hold at a particular pressure or temperature is termed as saturated vapour. In such a case, relative humidity will be 100%.

- For saturated vapour all the temperatures are equal.

$$\boxed{\text{DBT} = \text{WBT} = \text{DPT}}$$

- In case of saturated air the value of WBD

WBD = DBT – WBT

$$\boxed{\text{WBD} = 0}$$

Search on Telegram @apna_pdf

631. Which is the correct combinations for psychometric processes?

(a)	Activated alumina	(I)	Heating & humidification	
(b)	Water injection	(II)	Heating & dehumidification	
(c)	Steam injection	(III)	Cooling & dehumidification	
(d)	Hygroscopic	(IV)	Cooling & humidification	

(a) (a-I), (b-II), (c-III), (d-IV)
(b) (a-III), (b-IV), (c-I), (d-II)
(c) (a-IV), (b-III), (c-II), (d-I)
(d) (a-II), (b-IV), (c-I), (d-III)

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) :

632. Consider the following statements for sensible heat factor:

1. **Sensible heat factor will be negative if sensible heat and latent heat are both negative.**
2. **Sensible heat factor will be negative if sensible heat is negative and latent heat is positive.**
3. **Sensible heat factor will be negative if sensible heat is positive and latent heat is negative.**
4. **Sensible heat factor will be negative if sensible heat and latent heat are both positive.**

Which of the above statements are correct?

(a) 2 and 3 only (b) 1 and 2 only
(c) 1 and 3 only (d) 2 and 4 only

ESE 18.07.2021

Ans. (a) : Sensible heat factor (SHF)

$$= \frac{\text{Sensible heat (SH)}}{\text{Sensible Heat (SH)} + \text{Latent Heat (LH)}}$$

(1) when SH is -ve & LH is -ve SHF $\rightarrow$ +ve
(4) when SH $\rightarrow$ +ve & LH is +ve SHF $\rightarrow$ +ve
Hence, statement 1 & 4 are incorrect and statement 2 & 3 are correct.

633. If the air initially at dry bulb temperature 35°C and wet bulb temperature 26.1° as it enters an air washer which has a humidifying efficiency of 85%, then what is the final dry bulb temperature of air washed with recalculated spray water?

(a) 26.81°C (b) 27.43°C
(c) 32.83°C (d) 30.49°C

ESE 18.07.2021

Ans. (b) :

$$\text{Humidifying efficiency} = \frac{DBT - T_{out}}{DBT - WBT}$$

$$0.85 = \frac{35^0 - T_{out}}{(35^0 - 26.1^0)}$$

$$\Rightarrow T_{out} = 35° - 0.85\,(35° - 26.1°)$$
$$= 27.435°C$$

634. When air passes over a dry surface which is at a temperature greater than its (air) dry bulb temperature, it undergoes _____

(a) sensible heating (b) sensible cooling
(c) condensation (d) none of the above

HPPSC Workshop Suptd. 08.07.02021

Ans. (a) : When air passes over a dry surface which is at a temperature greater than its (air) dry bulb temperature, it undergoes sensible heating.

635. For saturated air

(a) Wet bulb depression is zero
(b) Wet bulb depression is positive
(c) Wet bulb depression is positive
(d) Wet bulb depression can be either positive or negative

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : For saturated air, the wet bulb depression is zero.

636. The temperature of air recorded by a thermometer, when it is not affected by the moisture present in it is called

(a) Wet bulb temperature
(b) Dry bulb temperature
(c) Dew Point Temperature
(d) None of these

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) :

637. Room sensible heat factor is defined as : (RSH=Room sensible heat, RL.H=Room Latent Heat)

(a) RSH/(RSH + RLH)
(b) RLH/(RSH + RLH)
(c) RSH/RLH
(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) : Room sensible heat factor

$$RSHF = \frac{RSH}{RSH + RLH}$$

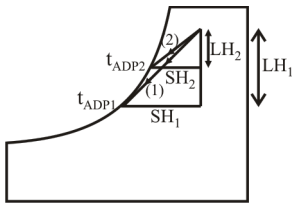
638. The Apparatus Dew Point (ADP) for the cooling coil of an air conditioning system with high latent load compared to a system with high sensible load will be

(a) More
(b) Less
(c) Remains same
(d) Depends on air flow through the coil

ISRO Scientist/Engineer (RAC) 12.01.2020

Search on Telegram @apna_pdf

Ans. (b) :



Process (1) → ADP with high latent load.
Process (2) → ADP with high sensible load.
ADP of process (1) is lower than ADP of process (2).

639. Psychrometer is useful to measure.
(a) Dry bulb temperature
(b) Dry and wet bulb temperature
(c) Wet bulb temperature
(d) Dew point temperature

Oil India Senior Officer 23.12.2020

Ans. (b) : Dry and wet bulb temperature

640. The primary factors responsible for human comfort are
(a) dry bulb temperature, relative humidity and air motion
(b) dry bulb temperature, dew point temperature and air motion
(c) dry bulb temperature, relative humidity and latitude of the place
(d) dry bulb temperature, relative humidity, air motion and elevation of the place

UPPSC AE 13.12.2020, Paper-2

Ans. (a) : The primary factor responsible for human comfort are–
(i) Dry Bulb Temperature (DBT)
(ii) Relative Humidity (ϕ)
(iii) Air motion

641. Partial pressure of water vapour at dew point temperature of moist air is 1.5×10^{-3} MPa. The barometric pressure is 0.1 MPa. The specific humidity of air is
(a) 15.225 gm/kg da (b) 9.47 gm/kg da
(c) 15.00 gm/kg da (d) 9.33 gm/kg da

UPPSC AE 13.12.2020, Paper-2

Ans. (b) : Given,

$P_v = 1.5 \times 10^{-3}$ MPa

$P_{atm} = 0.1$ MPa

Specific humidity, $\omega = \dfrac{0.622\, P_v}{P_t - P_v}$

$$\omega = \frac{0.622 \times 1.5 \times 10^{-3}}{\left(0.1 - 1.5 \times 10^{-3}\right)}$$

$$\boxed{\omega = 9.47 \text{gm/kg dry air}}$$

642. If air at dry bulb temperature of 35^0C and dew point temperature of 20^0C passes through air washer in which water is sprayed at 25^0C, then the process would be
(a) sensible cooling
(b) cooling and dehumidification
(c) cooling and humidification
(d) cooling at constant dew point temperature

UPPSC AE 13.12.2020, Paper-2

Ans. (c) : As water sprayed is at 25^0C < (DBT = 35^0C) and dew point temperature is 20^0C
So, cooling and humidification process takes place.

643. For summer air-conditioning, the relative humidity should not be less than
(a) 40% (b) 60%
(c) 75% (d) 90%

Assam PSC AE (PHED), 18.10.2020

Ans. (b) : Relative humidity should not be less than 60% according to the comfort conditions for summer air conditioning.
⇒ For winter air conditioning, the relative humidity should not be more than 40%.

644. Dew point temperature of a moist air mixture is achieved by
(a) Providing cold water of varying temperature in contact with it
(b) Cooling moist air without varying its humidity
(c) Adiabatic saturation of air
(d) Cooling as well as saturation of air

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : For an air mixture with constant mixture content when the temperature decrease to (T_d) the moist air is saturated (ϕ = 100%) and water will leave the air and condense into "dew" if the temperature continues to fall. Therefore dew point is the critical point of water condensation.

645. A sling psychometer measures
(a) Specific humidity
(b) Relative humidity
(c) Wet bulb temperature
(d) Dew point

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : Sling psychometer is used to measure relative humidity of moist air which is represented in percentage (ϕ in %).

646. In a system with outdoor air for ventilation, apparatus dew point (ADP) of the evaporator coil is _____ the room ADP
(a) equal to
(b) higher than
(c) lower than
(d) invariant of (subject to more that)

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : In outdoor air ventilation, cooling and dehumidification is done which can achieve only if ADP of the evaporator is less than the room ADP.

Search on Telegram @apna_pdf

647. In a system without any outdoor air for ventilation, the cooling load of the building is _____ the coil load

(a) lower than
(b) equal to
(c) higher than
(d) invariant of (subject to more data)

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (b) : For without outdoor air for ventilation, the load on cooling coils is only sensible cooling and no latent cooling, so the cooling load of the building is equal to the coil load.

648. Air-conditioning systems with reheat are used when the_____ loads are high

(a) Latent (b) Sensible
(c) Total (d) Bypass air

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Reheating is done when incoming air is too much cold. In this, air is initially heated and then adiabatically humidified and final position is achieved after reheating.

649. If the atmospheric conditions are 20°C, 1.013 bar and specific humidity of 0.0095 kg/kg of dry air, the partial pressure of vapour will be nearly

(a) 0.076 bar (b) 0.056 bar
(c) 0.036 bar (d) 0.016 bar

ESE 2020

Ans. (d) : Given, DBT = 20°C = 293 K

$P_t = 1.013$ bar

$$\omega = 0.622 \times \frac{P_v}{P_t - P_v}$$

$$0.0095 = 0.622 \times \frac{P_v}{1.013 - P_v}$$

$$0.0152 = \frac{P_v}{1.013 - P_v}$$

$$0.0153 - 0.0152P_v = P_v$$

$$0.0153 = 1.0152P_v$$

$P_v = 0.016$ bar

650. A duct of rectangular cross-section 600 mm × 400 mm carries 90 m^3/min of air having density of 1.2 kg/m^3. When the quantity of air in both cases is same, the equivalent diameter of a circular duct will be nearly

(a) 0.86 m (b) 0.76 m
(c) 0.64 m (d) 0.54 m

ESE 2020

Ans. (d) :

$$D = \frac{1.3(ab)^{0.625}}{(a+b)^{0.25}}$$

$$= \frac{1.3(0.6 \times 0.4)^{0.625}}{(0.6+0.4)^{0.25}} = 0.53 \text{ m}$$

651. A room having dimensions of 5 m × 5 m × 3 m contains air at 25°C and 100 kPa at a relative humidity of 75%. The corresponding value of P_S is 3.169 kPa. The partial pressure of dry air will be nearly

(a) 106 kPa (b) 98 kPa
(c) 86 kPa (d) 78 kPa

ESE 2020

Ans. (b) :

$$\phi = \frac{P_v}{P_s}$$

$$0.75 = \frac{P_v}{3.169}$$

$P_v = 2.376$ kPa

$P_t = P_a + P_v$

$100 = P_a + 2.376$

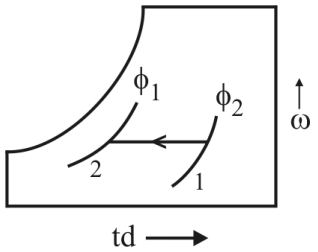
$P_a = 97.624 \approx 98$ kPa

652. As warm air cools, it's relative humidity

(a) Increases
(b) Decrease
(c) Remains same
(d) Depends on wet bulb temperature

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) :



$\phi_2 < \phi_1 \rightarrow$ Relative humidity increases

653. Atmospheric air flowing at rate of 4 kg/s enters the cooling and dehumidifying coil with enthalpy value of 90 kJ/kg of dry air and has humidity rate of 20 gram/kg dry air. When it leaves the coil it has humidity ratio 10 gram/kg of dry air and enthalpy of 50 kJ/kg or dry air. Condensate water leaving coil has enthalpy of 70 kJ/kg. The cooling capacity of coil in kW should be:

(a) 110.1 (b) 132.4
(c) 162.8 (d) 115.4

HPPSC ADF 05.03.2019

Ans. (*) : $m_a = 4$ kg/s

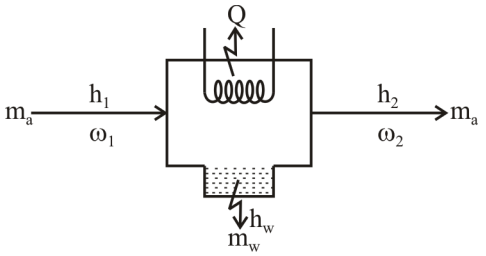
$\omega_1 = 20$ gram/kg of dry air

$h_1 = 90$ kJ/kg of dry air

$\omega_2 = 10$ gram/kg of dry air

$h_2 = 50$ kJ/kg of dry air

$h_w = 70$ kJ/kg



$m_w = (\omega_1 + \omega_2)m_a = (20 - 10) \times 4 = 40$ gram/s

Search on Telegram @apna_pdf

Energy balance,

$m_a h_1 = m_a h_2 + Q + m_w h_w$

$4 \times 90 = 4 \times 50 + Q + 0.04 \times 70$

$\boxed{Q = 157.2\,kW}$

654. A room contains 40 kg of dry air and 0.5 kg of water vapour. The total pressure and temperature of air in the room are 100 kPa and 27° C, respectively. Given that the saturation pressure for water at 27°C is 3.2 kPa, the relative humidity of the room is:

(a) 64.32% (b) 52.34%

(c) 61.56% (d) 67.37%

HPPSC ADF 05.03.2019

Ans. (c) : Relative humidity $\phi = \frac{P_v}{P_{vs}}$

$P_{vs} = 3.2$ Kpa Pv=?

Specific humidity $\omega = \frac{0.622 P_v}{P - P_v}$

$$\frac{0.5}{40} = \frac{0.622 \times P_v}{100 - P_v}$$

$50 - 0.5\,P_v = 24.88\,P_v$

$P_v = 1.97$ KPa

$$\phi = \frac{1.97}{3.2} = 0.615$$

$\boxed{\phi = 61.5\%}$

655. Match the list- I and list- II.

List-I	List-II
P : Cooling and dehumidification	1: DB increases and DP decreases
Q : Chemical dehumidification	2: DP increases and DB is constant
	3: DB and WB both decreases
	4: DB decreases and DP increases

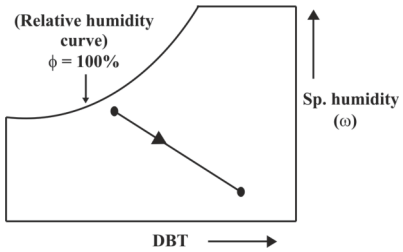
Here, DB = Dry bulb temperature : DP = Dew point temperature : WB = Wet bulb temperature

(a) P- 3, Q- 1 (b) P- 1, Q- 3

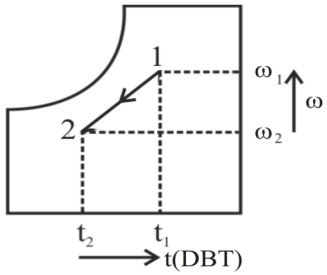
(c) P- 4, Q- 2 (d) P- 2, Q- 4

HPPSC ADF 05.03.2019

Ans. (a) :



Chemical dehumidification



Cooling and dehumidification

In cooling and dehumidification DB and WB both decreases.

In chemical dehumidification DB increases and DP decreases.

656. The humidity ratio of atmospheric air at 28°C [$P_{sat@28^oC,\ water} = 28.34$mm Hg] dry bulb temperature and 760 mm Hg pressure is 0.018 kg/kg of dry air. What will be the relative humidity of air?

(a) 96.13% (b) 75.42%

(c) 55.25% (d) 88.35%

SJVN ET 2019

Ans. (b) : Given, $P_t = 760$ mm Hg

$\omega = 0.018$ kg/kg of dry air

$P_s = 28.34$ mm Hg

$$\omega = \frac{0.622 P_v}{P_t - P_v}$$

$$0.018 = \frac{0.622\,P_v}{P_t - P_v}$$

$\Rightarrow (760 - P_v)0.018 = 0.6122\,P_v$

$\Rightarrow 760 \times 0.018 - 0.018 P_v = 0.622\,P_v$

$P_v = 21.375$ mm Hg

$$RH(\phi) = \frac{P_v}{P_s} = \frac{21.375}{28.34} = 75.42\%$$

657. Amount of moisture that air can hold increases by:

(a) Decreasing both Saturation Pressure and Temperature

(b) Decreasing Saturation Pressure and Increasing Temperature

(c) Increasing Saturation Pressure and Decreasing Temperature

(d) Increasing both Saturation Pressure and Temperature

OPSC AEE 2019 PAPER - II

Ans : (d) : Increasing both saturation pressure and temperature

658. In air conditioning design hunt load for an average adult male during idle condition can be considered as:

(a) 75 W (b) 115 W

(c) 175 W (d) 215 W

OPSC AEE 2019 PAPER - II

Search on Telegram @apna_pdf

Ans : (d) : In air conditioning design hunt load for an average adult male during idle condition can be considered as 215 W

659. For comfort condition the effective temperature for child as compared to adult is:
(a) Same (b) Higher
(c) Lower (d) Insufficient data

OPSC AEE 2019 PAPER - II

Ans : (b) : The children require higher effective temperature compared with adults.

660. During an air-conditioning of a plant, the room sensible heat load is 40 kW and room latent heat load is 10 kW, ventilation air is 25% of supply air. At full load, the room sensible heat factor will be
(a) 0.9 (b) 0.8
(c) 0.7 (d) 0.6

ESE 2019

Ans. (b) : $RSHF = \frac{RSH}{RSH + RLH} = \frac{RSH}{RTH}$

Where RSHF = Room sensible heat factor
RSH = Room sensible heat
RLH = Room latent heat
RTH = Room total heat

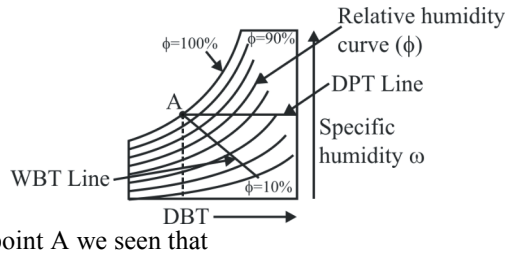
Given,
RSH = 40 kW
RTH = RSH + RLH = 50 kW

$RSHF = \frac{40}{50} = 0.8$

661. If the relative humidity of atmospheric air is 100%, then the wet-bulb temperature will be
(a) more than dry-bulb temperature
(b) equal to dew-point temperature
(c) equal to dry-bulb temperature
(d) less than dry-bulb temperature

ESE 2019

Ans. (b,c) : If relative humidity of atmospheric air is 100% then air is saturated and for saturated air DBT = WBT = DPT



At point A we seen that
DBT = WBT = DPT

662. Statement I: Referring to vapour compression refrigeration system, the coefficient of performance (COP) of a domestic refrigerator is less than that of a comfort air-conditioning plant.
Statement II: In domestic refrigerator, the work required for pumping the same amount of heat is more than that in an air-conditioning plant because of greater difference between condenser and evaporator temperatures.

ESE 2018

Ans. (a) : Evaporator temperature of refrigeration system is less than that of air conditioning system.
Hence work input in refrigerator is more than that of air conditioning system.
Therefore, COP of air conditioner is more than that of refrigerator. Compressor and evaporator temperature difference for domestic refrigerator is more than air-conditioning.

663. In a steam condenser, the partial pressure of steam and air are 0.06 bar and 0.007 bar, respectively. The condenser pressure is :
(a) 0.067 bar (b) 0.06 bar
(c) 0.053 bar (d) 0.007 bar

GPSC ARTO Pre 30.12.2018

Ans. (a) : Given,
Partial pressure of steam, $p_s = 0.06$ bar
Partial pressure of air, $p_a = 0.007$ bar
Condense pressure, $P_c = p_s + p_a$
$= 0.06 + 0.007$
$P_c = 0.067$ bar

664. A conference hall of the size 7m × 4m × 4m is filled with an air-water vapour mixture of 38 °C, atmospheric pressure of 1bar and RH 70%. The mass of air will be (assume Ps at 38°C = 0.06624 bar):
(a) 149.2 kg (b) 83.2 kg
(c) 119.7 kg (d) 169.7 kg

AAI Jr. Executive 29.11.2018

Ans. (c) : Sol. $0.7 = \frac{P_v}{P_{vs}} \Rightarrow P_v = 0.7 \times 0.06624 \times 10^5$

$P_V = 4636.8$
$PV = mRT$
$V = 7 \times 4 \times 4 = 112$
R = 0.286 kJ/kgK

$m_v = \frac{4636.8 \times 112}{0.286 \times 311}$

$m_v = 3.614 kg$

Specific humidity $(\omega) = \frac{m_v}{m_a} = \frac{0.622 \times P_v}{P_t - P_v}$

$P_t = 1 bar = 10^5 N/m^2$

$\frac{3.614}{m_a} = \frac{0.622 \times 4636.8}{95363.2}$

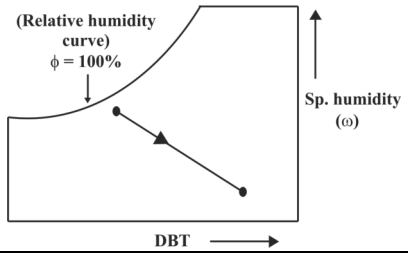
$m_a = 119.51 kg$

665. In a chemical dehumidification process, the dry bulb temperature of air
(a) Decreases
(b) Remains constant
(c) Increases
(d) Depends on wet bulb temperature

ISRO Scientist/Engineer (RAC) 22.04.2018

Search on Telegram @apna_pdf

Ans. (c) : In a chemical dehumidification process, the dry bulb temperature of air increases.



666. During sensible heating of moist air, enthalpy-

(a) increases (b) decreases
(c) remains constant (d) none of the above

RPSC AE 2018

Ans. (a) : During sensible heating, the enthalpy of the moist air will increase.

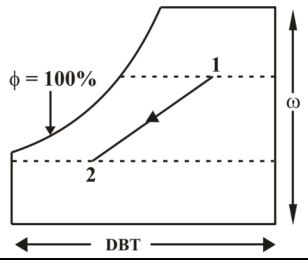
667. The relative humidity, during cooling and dehumidification of moist air-

(a) increases
(b) decreases
(c) can increase or decrease
(d) remains constant

RPSC AE 2018

Ans. (c) : The relative humidity, during cooling and dehumidification of moist air can increase or decrease

$\omega \downarrow, DBT \downarrow, WBT \downarrow$



668. In an unsaturated air the state of vapour is-

(a) Wet (b) Superheated
(c) Saturated (d) Unsaturated

RPSC AE 2018

Ans. (b) : In an unsaturated air the state of vapour is superheated.

669. Statement I: In air-conditioning, the atmospheric air (mixture of dry air and water vapour) can be considered as mixture of two ideal gases.

Statement II: In the temperature range used in air conditioning, the partial pressure of the water vapour is very low and it follows the ideal gas relation with negligible error.

ESE 2018

Ans. (a) : The air to be processed in air conditioning system is a mixture of dry air and water vapour.

When air and water vapour exist alone at moderate or low pressure, always the case for our conditions, they closely approximate ideal gases. In that case the relationship between pressure, temperature and mass can be expressed as,

$PV = mRT$

At low pressure, if their and water vapour are mixed together the interaction between the molecules of the two gases is modest so that the mixture can be considered an ideal gas.

670. Consider the following statements:

1. The relative humidity of air does not change with temperature as long as specific humidity remains constant.
2. Dew-point temperature is the temperature at which air is cooled at constant volume
3. Saturated air passing over a water surface does not cause change of air temperature
4. For saturated air, dry bulb, wet-bulb and dew point temperatures are identical

Which of the above statements are correct?

(a) 1 and 2 (b) 2 and 3
(c) 1 and 4 (d) 3 and 4

ESE 2018

Ans. (d) : (i) Relative humidity changes with DBT hence statement (1) is wrong.

(ii) Dew point temperature is the temperature at which when condensation happens at constant pressure. Hence statement (2) is also wrong therefore option (d) is correct.

671. The difference between dry bulb temperature and dew point temperature, is called

(a) Dry bulb depression
(b) Wet bulb depression
(c) Dew point depression
(d) Degree of saturation

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The difference between dry bulb temperature and dew point temperature is called Dew Point depression. For a constant temperature, the smaller the difference the more moisture is there and the higher the relative humidity.

672. The wet bulb depression is zero when relative humidity is

(a) 0 (b) 0.5
(c) 0.75 (d) 1.0

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Wet bulb depression is the difference between the dry bulb and wet bulb temperature. Hence, when DBT = WBT implies that relative humidity is 100% therefore when the wet bulb depression is zero the relative humidity is equal to one.

673. The alignment circle is marked on the psychometric chart at

(a) 20ºC DBT and 50% RH
(b) 26ºC DBT and 50% RH
(c) 20ºC DBT and 60% RH
(d) 26ºC DBT and 60% RH

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (b) : Alignment circle is a reference point on the psychometric chart it generally lies within 24ºC to 26ºC DBT and 50% Relative humidity.

Search on Telegram @apna_pdf

674. In a psycrometric chart, specific humidity lines are:

(a) vertical and uniformly space
(b) horizontal and uniformly space
(c) horizontal and non-uniformly space
(d) curved lines

HPPSC Asstt. Prof. 18.09.2017

Ans. (b) :

675. The degree of warmth or cold felt by a human body depends mainly on :

(a) DBT (b) Relative humidity
(c) Air velocity (d) All of the above

Kerala PSC Poly. Lect., 2017

Ans. (d) : The degree of warmth or cold felt by a human body depends mainly on 'DBT', 'Relative humidity' and 'Air-velocity'.

Effective Temperature–It is the temperature of saturated air at which a person or human being would feel same level of comfort as in actual environment. It includes comfort temperature velocity, humidity and air motion.

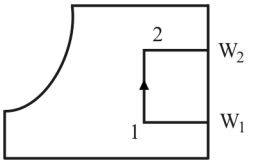
It is found that at an effective temperature of 20°C, 99% of people are comfortable in winter and in summer this temperature is found to be 21.6°C. The comfortable relative humidity conditions are 50% to 60%.

676. The humidification process on the psychrometric chart is shown by-

(a) Horizontal line (b) Veritical line
(c) Inclined line (d) Curved line

GMB AAE 25.06.2017

Ans. (b) : The humidification process on the psychometric chart shown by the vertical line



677. A low wet bulb temperature indicates

(a) very cool air
(b) very low humidity
(c) very low atmospheric temperature
(d) Both (a) and (b)

WBPSC AE, 2017

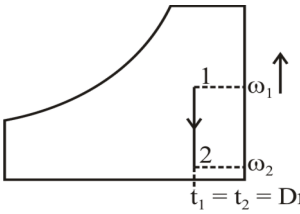
Ans. (d) : A low wet bulb temperature indicates very cool air and very low humidity.

678. A dehumidifier is required in

(a) A winter air-conditioning system
(b) A summer air-conditioning system
(c) Filters for removing dust particles
(d) A duct where air is circulated into required space

Karnataka PSC AE, 10.09.2017

Ans. (b) : The purpose of dehumidifier is to reduce humidity in the environment and used mainly in A.C. in summers.

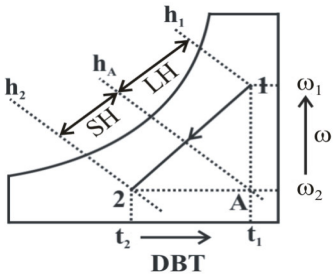


679. The sensible heat factor during cooling and dehumidification process is given by (where h_1 = Enthalpy of air entering the cooling coil, h_2 = Enthalpy of air leaving the cooling coil, and h_A = Enthalpy of air at the end of dehumidification process)

(a) $\frac{h_A - h_2}{h_1 - h_2}$ (b) $\frac{h_2 - h_A}{h_1 - h_2}$
(c) $\frac{h_1 - h_2}{h_A - h_2}$ (d) $\frac{h_A - h_1}{h_2 - h_1}$

Karnataka PSC AE, 10.09.2017

Ans. (a) :



$$SHF = \frac{\text{Sensible heat}}{\text{Total heat}} = \frac{SH}{SH + LH}$$

$$= \frac{h_A - h_2}{h_1 - h_2}$$

680. Which of the following is NOT a method for the design of Air-conditioning system?

(a) Velocity reduction method
(b) Equal friction method
(c) Equal pressure method
(d) Static regain method

Punjab PSC (Lect.) 06.08.2017

Ans. (c) : Method for the design of Air-conditioning system is

(i) Velocity Reduction Method
(ii) Equal Friction Method
(iii) Static Regain Method

681. The Dew point temperature of humid air is

(a) Always higher than the wet bulb temperature
(b) Same as the wet bulb temperature
(c) The temperature of air obtained on cooling it till saturation at constant pressure
(d) The temperature of air obtained on cooling it till saturation at constant volume

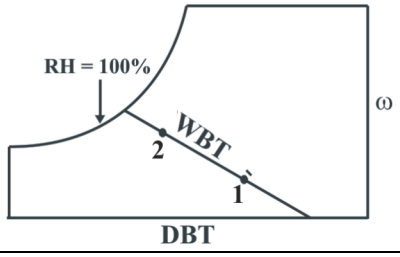
GPSC Asstt. Director of Transport 05.03.2017

Search on Telegram @apna_pdf

Ans. (c) : From psychrometric chart Dew Point Temperature (DPT) lines on psychometric charts are horizontal line upto the saturation curve.
So, for humid Air, the dew point temperature obtained on cooling it till saturation at constant pressure.

682. During evaporative cooling process, wet bulb temperature
(a) Increases (b) decreases
(c) remains constant (d) unpredictable
ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (C) : During evaporative cooling process, wet bulb temperature remains constant.

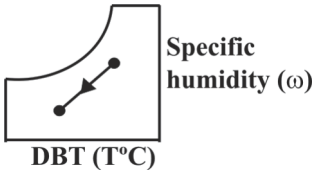


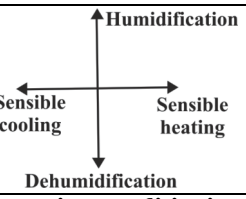
683. The bypass factor of cooling coil decreases with
(a) Decrease in fin spacing and increase in number of rows
(b) Increase in fin spacing and increase in number of rows
(c) Increase in fin spacing and decrease in number of rows
(d) Decrease in fin spacing and decrease in number of rows
ISRO Scientist/Engineer (RAC) 07.05.2017

Ans. (a) : The bypass factor of cooling coil decrease with decrease in fin spacing and increase in number of rows.

684. The air inside a space capsule is maintained at the required condition by passing it through a set of heat exchangers. The heat exchangers are designed such that the humid air passing through them is cooled and partial condensation of the water vapour occurs. On a psychometric chart, this process appears as a line which is
(a) Horizontal to the left
(b) Vertical downwards
(c) Diagonal downwards to the left
(d) Diagonal upwards to the right
ISRO Scientist/Engineer 07.05.2017

Ans. (c) : On a psychrometric chart, this process appears as a line which is diagonal to the left and this process is called cooling and dehumidification.





685. For winter air conditioning, the relative humidity should not be more than :
(a) 60% (b) 75%
(c) 40% (d) 90%
TRB Polytechnic Lecturer 2017

Ans. (c) : For winter air conditioning, the relative humidity should not be more than 40%.

686. The object for air conditioning a car is to control these in the
(a) Temperature and Pressure
(b) Pressure and Humidity
(c) Humidity and Temperature
(d) Humidity and Pressure
TNPSC AE 2017

Ans. (c) : The object for air conditioning a car is to control these in the Humidity and Temperature.

687. Air at 30°C and 1 bar has a specific humidity of 0.016 kg/kg of dry air. By considering the saturation pressure of water vapour at 30°C as 4.246kPa, the relative humidity of the air will be
(a) 66.1% (b) 60.2%
(c) 58.8% (d) 56.8%
ESE 2017

Ans. (c) : Given,
$T_{sat} = 30°C$, $P = 1$ bar
$P_{sat} = 4.246$ kPa
Specific humidity (ω) = 0.016 kg/kg of dry air
We know that

$$\omega = 0.622\left(\frac{P_V}{P - P_V}\right)$$

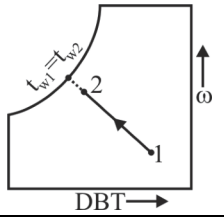
$$0.016 = 0.622\left(\frac{P_V}{1 - P_V}\right)$$

$$P_V = 0.025 \text{ bar} = 2.5 \text{ kPa}$$

$$\text{Relative humidity } (\phi) = \frac{P_V}{P_{sat}} = \frac{2.5}{4.246} = 0.5887 = 58.87\%$$

688. Consider the following statements in respect of an evaporative cooling process:
1. The wet-bulb temperature remains constant.
2. The dew-point temperature remains constant.
3. The enthalpy remains constant.
Which of the above statements are correct?
(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only
ESE 2017

Ans. (d) :



Search on Telegram @apna_pdf

The evaporative cooling process wet bulb temperature and enthalpy remains constant for process 1 – 2
Cooling and humidification

$T_{w1} = T_{w2}$

$h_1 = h_2$

Note- In this process (1–2)
- Relative humidity (RH) increases
- Specific humidity (ω) increases
- DBT decreases.

689. The atmospheric air at dry bulb temperature of 15ºC enters a heating coil maintained at 40ºC. The air leaves the heating coil at 22.5ºC. What is the by-pass-factor of the heating coil?

(a) 0.35 (b) 0.4
(c) 0.6 (d) 0.7
(e) 0.75

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : By pass Factor $= \frac{t_2 - t_3}{t_1 - t_3}$

Where,
t_1= Dry bulb temperature of air entering the heating Coil.
t_2= Dry bulb temperature of air leaving the heating coil
t_3= Dry bulb temperature of the heating coil.
t_1= 15ºC, t_2= 22.5ºC, t_3= 40ºC

By Pass factor $= \frac{22.5 - 40}{15 - 40}$
$= 0.7$

690. The by pass factor (B.P.E) is expressed as:

(a) $\frac{dt_1 - t_{coil}}{dt_2 - t_{coil}}$ (b) $\frac{dt_1 - t_{coil}}{dt_2 + t_{coil}}$
(c) $\frac{dt_1 + t_{coil}}{dt_2 + t_{coil}}$ (d) None of these

PTCUL AE 25.06.2017

Ans. (a) :

691. For air conditioning the operation theatre in a hospital, the percentage of outside air in the air supplied is:

(a) Zero (b) 20
(c) 50 (d) 100

HPPSC Asstt. Prof. 18.09.2017

Ans. (d) : For air conditioning the operation theatre in a hospital, the percentage of outside air in the air supplied is 100.

692. A human body feels comfortable when the heat produced by the metabolism of human body is equal to :

(a) Heat dissipated to surroundings
(b) Heat stored in the human body
(c) Sum of Heat dissipated to surroundings and Heat stored in the human body
(d) Difference of Heat dissipated to surrounding and Heat stored in the human body

MPPSC AE 2016

Ans. : (c) A human body feels comfortable when the heat produced by the metabolism of human body is equal to sum of heat dissipated to surrounding and heat in the human body.

693. Where, H_1 = Total heat of air entering the heating coil
H_2 = Total heat of air leaving the heating coil
H_3 = Total heat of air at the end of the humidification
What is the sensible heat factor during the heating and humidification process equal to:

(a) $(H_3 - H_1)/(H_3 + H_1)$ (b) $(H_2 - H_1)/(H_3 - H_1)$
(c) $(H_3 + H_1)/(H_3 + H_2)$ (d) $(H_1 + H_2)/(H_1 + H_3)$

RPSC VPITI 14.02.2016

Ans. (b) : Sensible heat factor is the ratio of sensible heat to total heat.
Sensible heat = $H_2 - H_1$
Total heat = $H_3 - H_1$
Sensible heat factor during heating and humidification

$= \frac{H_2 - H_1}{H_3 - H_1}$

694. For the unsaturated air, wet bulb temperature is

(a) More than dry bulb temperature
(b) Twice the dew point temperature
(c) Less than dry bulb temperature
(d) Less than dew point

Rajasthan Nagar Nigam AE 2016, Shift-II

Ans. (c) : For unsaturated air wet bulb temperature is less than dry bulb temperature because of evaporative cooling.
In case of unsaturated air, DBT > WBT > DPT
In case of saturated air DBT = WBT = DPT

WBD = 0

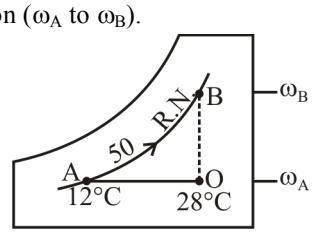
WBD = Wet Bulb depression

695. Atmospheric air from 12 °C and 50% relative humidity can be brought to 28 °C and 50% relative humidity by:

(a) Heating and humidification process
(b) Heating and dehumidification process
(c) Sensible heating process
(d) Adiabatic saturation process
(e) Chemical heating

CGPSC Asstt. Workshop Supt., 17.07.2016

Ans. (a) : Path A to B is a process of heating as well as humidification (ω_A to ω_B).



Search on Telegram @apna_pdf

696. When atmospheric air is heated at constant pressure, then which one is not correct

(a) Humidity ratio does not change
(b) Relative humidity increases
(c) Dew point temperature does not change
(d) Dry bulb temperature remain constant

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b,d) : When atmospheric air is heated at constant pressure, then relative humidity decreases & dry bulb temperature also increases.

697. To determine the relative humidity of an air-water vapour mixture, a psychrometer uses..... thermometer(s).

(a) one (b) two
(c) three (d) zero

HPPSC AE (PWD) 10.09.2016

Ans. (b) : To determine the relative humidity of an air water vapour mixture a psychrometer uses two thermometers.

698. Which of the following parameter increases during heating and humidification process?

(a) Humidity ratio
(b) Dry bulb temperature
(c) Saturation temperature
(d) All of the above
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (d) : During heating and humidification process,
- Humidity ratio
- Dry bulb temperature
- Saturation temperature

699. A cooling coil with a bypass factor of 0.15 and apparatus dew point (adp) of 10^0C comes in contact with air having a dry-bulb temperature of 35^0C and dew point of 15^0C. Over the cooling coil the air would undergo

(a) Sensible cooling
(b) Cooling and dehumidification
(c) Cooling and humidification
(d) Adiabatic saturation

UPRVUNL AE 21.08.2016

Ans. : (b) Given, BPF = 0.15, ADP = 10°C, DBT = 35°C, DPT = 15°C

$$\text{BPF} = \frac{t_{d_2} - t_{d_3}}{t_{d_1} - t_{d_3}}$$

$$0.15 = \frac{t_{d_2} - 10}{35 - 10} \Rightarrow t_{d_2} = 13.75$$

$$t_{d_2} < \text{DPT}$$

Hence, cooling and dehumidification takes place.

700. If wet bulb depression is equal to the sum of range and approach of a cooling tower then the water

(a) Outlet temperature is equal to dry bulb temperature of ambient air
(b) Inlet temperature is equal to the wet bulb temperature of ambient air
(c) Outlet temperature is equal to the wet bulb temperature of ambient air
(d) Inlet temperature is equal to dry bulb temperature of ambient air

UPRVUNL AE 21.08.2016

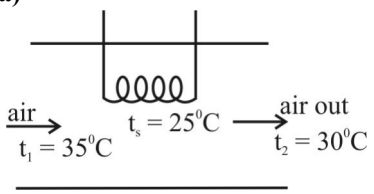
Ans. : (d) If wet bulb depression is equal to the sum of range and approach of a cooling tower, then the water inlet temperature is equal to dry bulb temperature of ambient air.

701. When 35^0C and 30^0C are the dry bulb temperatures of air entering and leaving a cooling coil, then the cooling coil temperature is 25^0C. What is the bypass factor for the case of sensible cooling?

(a) 0.50 (b) 0.20
(c) 0.25 (d) 0.33

UPRVUNL AE 21.08.2016

Ans. : (a)



$$\text{By pass factor (BPF)} = \frac{t_2 - t_s}{t_1 - t_s}$$

$$= \frac{30 - 25}{35 - 25} = 0.5$$

By pass factor = 0.5

702. Ratio of latent heat transfer to total heat transfer is given by

(a) Sensible heat factor (SHF)
(b) 1 - SHF
(c) $(SHF)^2$
(d) $1 - (SHF)^2$

RPSC LECTURER 16.01.2016

Ans. (b) : We know that
Sensible heat factor (SHF)

$$= \frac{\text{Sensible heat}}{\text{Sensible heat + Latent heat}} = \frac{\text{SH}}{\text{SH+LH}}$$

$$(1 - SHF) = 1 - \frac{SH}{SH + LH}$$

$$(1 - SHF) = \frac{SH + LH - SH}{SH + LH}$$

$$\frac{LH}{\text{Total heat}} = (1 - SHF)$$

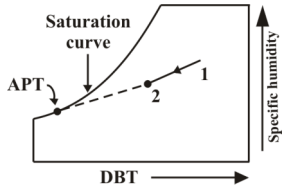
Search on Telegram @apna_pdf

703. On pyschormetric chart, when condition line is extended to meet the saturation curve at a point, the temperature of this point is known as

(a) Dry bulb temperature
(b) Wet bulb temperature
(c) Apparatus dew point
(d) Atmospheric temperature

RPSC Lecturer 16.01.2016

Ans. (c) : On pyschormetric chart, when condition line is extended to meet the saturation curve at a point, the temperature of this point is known as Apparatus dew point temperature.



704. If sensible and latent heating transfer in an air conditioning process is 2.5 kW and 1.5 kW respectively. Then sensible heat factor (SHF) will be

(a) 1 (b) Zero
(c) 0.5 (d) 0.625

UPRVUNL AE 2016

Ans. (d) : We know that

$$\text{Sensible heat factor} = \frac{\text{Sensible heat}}{\text{Total heat}}$$

$$= \frac{\text{Sensible heat}}{\text{Sensible heat + Latent heat}}$$

$$= \frac{2.5}{2.5+1.5} = \frac{2.5}{4} = 0.625$$

705. Sensible heat factor (SHF) line is inclined at an angle of 45° with temperature axis on psychrometric chart. It's SHF will be:

(a) 0.59 (b) 0.49
(c) 0.29 (d) 0.39

UPRVUNL AE 2016

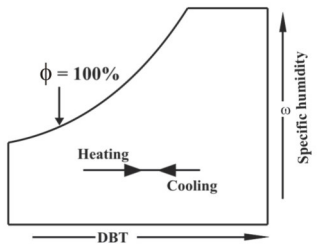
Ans. (b) : Sensible heat factor (SHF) line is inclined at an angle of 45° with temperature axis on psychrometric chart. It's SHF will be 0.50.

706. Sensible heating/cooling process on psychometric chart is:

(a) Along constant relative humidity line
(b) Along constant specific humidity line
(c) Along constant specific volume line
(d) Along constant enthalpy line

UPRVUNL AE 2016

Ans. (b) :



Sensible heating/cooling process on psychometric chart is along constant specific humidity line.

707. The constant partial pressure lines on the psychrometric chart are

(a) horizontal lines (b) vertical lines
(c) inclined lines (d) curved lines

APPSC AEE 2016

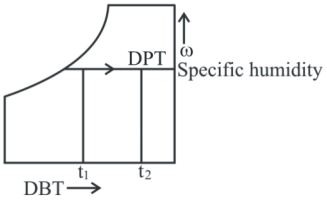
Ans. (a) : The constant partial pressure lines on the psychrometric chart are horizontal lines.

708. If the specific humidity of moist air remains the same but its DBT increases, its DPT

(a) Remains the same
(b) Increases
(c) Decreases
(d) May increase or decrease depending on its relative humidity

UPPSC AE 12.04.2016 Paper-II

Ans : (a) For the psychometric chart, we have seen that dew point temperature remains same.



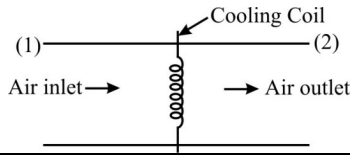
Dew point temperature line is horizontal and parallel to specific humidity line

709. If the air is passed over the cooling coils then this process is termed as

(a) Sensible heating
(b) Cooling with humidification
(c) Cooling with dehumidification
(d) None of the above

UPPSC AE 12.04.2016 Paper-II

Ans : (c) If the air is passed over the cooling coils then this process is termed as cooling with dehumidification.



Dehumidification is process of remaining mixture from the air at constant dry bulb temperature. there for, dehumidification, of air will take place if the coil surface temperature is below the dew point temperature of entering air.

710. What is air conditioning means?

(a) Maintaining comfort temperature and humidity
(b) maintaining odorless and clean air at comfortable velocity
(c) Both, option A and B
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Search on Telegram @apna_pdf

Ans. (c) : Air conditioning is the control of temperature, humidity purity and motion of air in an enclosed space.

711. In a moist air mixture, the dew point temperature is ..... the wet bulb temperature.

(a) more than (b) less than
(c) always equal to (d) not comparable to

HPPSC Asstt. Prof. 29.10.2016

Ans. (b) : For unsaturated moist air mixture-

$$DBT > WBT > DPT$$

For saturated moist air mixture-

$$DBT = WBT = DPT$$

712. Sensible heat is the heat required to ..... .

(a) change vapour into liquid
(b) change liquid into vapour
(c) increase the temperature of a liquid or vapour
(d) None of three mentioned here

GWSSB DEE 07.07.2016

Ans. (c) : Sensible heat is the heat required to increase the temperature of a liquid or vapour.

713. In a split type air conditioner, the unit kept outside the room is

(a) compressor, condenser and fan
(b) evaporator, fan
(c) condenser and fan
(d) compressor and fan

GPSC AE 26.07.2015

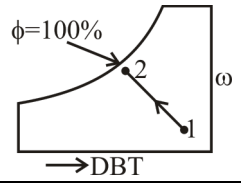
Ans. (a) : In a split type air conditioner, the unit kept outside the room is compressor, condenser and fan.

714. Adiabatic saturation process for moist air involves:

(a) Cooling and humidification
(b) Cooling and dehumidification
(c) Change in WBT
(d) Constant relative humidity

TSPSC Managers, 2015

Ans. (a) : Cooling and humidification process is one of the most commonly used air conditioning application for the cooling purpose. In this process the moisture is added to the air by passing it over the stream or spray of water at which temperature lower than the dry bulb temperature of the air.



715. On a particular time of a day, if the dry bulb temperature is equal to the wet bulb temperature, then it can safely concluded that-

(a) Specific humidity of air was 0.010 kg per kg of dry air
(b) Dew point was less than 20°C
(c) Relative humidity of air was 100 %
(d) Atmospheric air was free from moisture

NPCIL ET, 2015

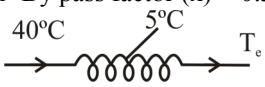
Ans. (c) : On a particular day (time), if the dry bulb temperature is equal to the wet bulb temperature, then safely concluded that relative humidity of air was 100%
At DBT = WBT = Relative humidity 100%

716. The bypass factor of a cooling coil is 0.3, when its coil surface temperature is 5°C and air enters at 40°C. The exit air temperature is:

(a) 10°C (b) 12.5°C
(c) 15.5°C (d) 20°C

NPCIL ET, 2015

Ans. (c) : Given- By pass factor (x) = 0.3



$$\text{By pass factor (x)} = \frac{T_e - 5}{40 - 5}$$

$$0.3 = \frac{T_e - 5}{35}$$

$$T_e - 5 = 10.4$$

$$T_e = 10.5 + 5$$

$$T_e = 15.5^{\circ}C$$

717. Free air is the air at :

(a) 20°C and 1 kg /cm^2 and relative humidity of 36%
(b) 25°C 1 kg/cm^2 and relative humidity of 50%
(c) 0°C and standard atmospheric conditions
(d) atmospheric conditions at any specific location.

GWSSB AAE, 27.12.2015

Ans. (d) : free air refer to air at atmospheric condition at any specific location.

718. The weight of the water vapour in kg contained in 1 m^3 of air-vapour mixture at its total pressure is known as

(a) Degree of saturation (b) Percent humidity
(c) Relative humidity (d) Vapour density

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : The weight of the water vapour in kg contained in 1m^3 of air-vapour mixture at its total pressure is known as vapour density.

719. Consider the following statements pertaining to Room Sensible Heat Ratio (RSHR) line:

1. It is the line draw on psychrometric chart through the room conditions.
2. Its slope is the ratio of sensible cooling load to room latent heat load.
3. The supply air condition must lie on this line for satisfactory performance.

Search on Telegram @apna_pdf

Which of the statements given above are correct?

(a) 1, 2 and 3 (b) 1 and 2
(c) 1 and 3 (d) 2 and 3

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : ■ It is the line drawn on psychometric chart through the room condition.
■ The supply air condition must lie on this line for satisfactory performance.

720. Which of the parameter remains constant during evaporative cooling process through an air washer with the same water recirculated again and again

(a) Wet bulb temperature
(b) Dry bulb temperature
(c) Dew point
(d) Absolute humidity

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) : Evaporative Cooling–This system is based on the principle that when moist but unsaturated air comes in contact with a wetted surface whose temperature is higher than the dew point temperature of air. These systems are attractive for hot and dry climates.

721. A cooling tower is to be installed in a place where dry bulb temperature and wet bulb temperature are almost constant throughout? Such a proposition is

(a) Excellent
(b) Not desirable
(c) Can be considered
(d) Other data are required to determine the same

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : Wet bulb temperature is an important factor in performance of evaporative water cooling equipment. It is a controlling factor from the aspect of minimum cold water temperature to which water can be cooled by the evaporative method. Thus wet bulb temperature of the air entering the cooling tower determines operating temperature levels throughout the plant. Theoretically a cooling tower will cool water to the entering wet bulb temperature, when operating without a heat load.

722. Delignification (eating up of wood) in cooling tower is controlled by

(a) Controlling blow down to keep the concentration of soluble and scale forming solids below a limit
(b) Softening the makeup water with lime several phosphates
(c) Adjusting pH between 7 to 7.5
(d) Adding chlorine, copper sulphate, potassium permanganate etc. to the circulating water

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : Delignification (eating up of wood) in cooling tower is controlled by adjusting pH between 7 to 7.5.

723. If air is heated without changing its moisture content, the dew point will-

(a) increases (b) remain same
(c) decrease (d) unpredictable

ISRO Scientist/Engineer (RAC) 29.11.2015

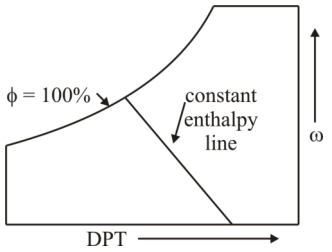
Ans : (b) If air is heated without changing its moisture content means specific humidity remains constant and therefore its dew point temperature will be remain same after heating at constant moisture content.

724. On a Psychrometric chart, adiabatic process follows

(a) constant DBT lines
(b) Constant relative humidity lines
(c) Constant DPT lines
(d) Constant enthalpy lines

TSPSC AEE 2015

Ans. (d) :



In psychrometric charge adiabatic process follows constant enthalpy lines.

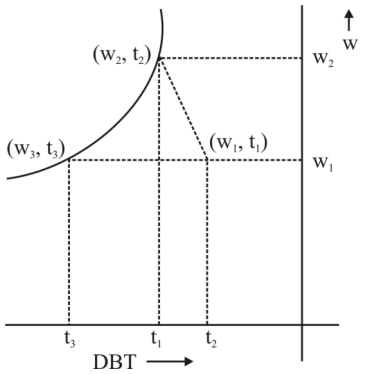
725. An air water vapour mixture has a DBT of 60° c and a DPT of 40°c. The WBT (tw) for the above mixture would be

(a) Less than 40°C
(b) 40°C
(c) 60°C
(d) $40^{o}C < T_w < 60^{o}C$

TSPSC AEE 2015

Ans. (d) : We know that
DBT > WBT > DPT
So, $40^{o}C < T_W < 60^{o}C$
For saturated vapour-
DBT = WBT = DPT

726. Psychrometric chart



Search on Telegram @apna_pdf

(a) $t_1 \rightarrow DBT, t_2 \rightarrow DBT, t_3 \rightarrow WBT$

(b) $t_1 \rightarrow DBT, t_2 \rightarrow WBT, t_3 \rightarrow DBT$

(c) $t_1 \rightarrow WBT, t_2 \rightarrow DBT, t_3 \rightarrow DPT$

(d) $t_1 \rightarrow DBT, t_2 \rightarrow WBT, t_3 \rightarrow DPT$

TSPSC AEE 2015

Ans. (d) : $t_1 \rightarrow DBT, t_2 \rightarrow WBT, t_3 \rightarrow DPT$

727. Heating of air without changing its moisture content takes place on a psychometric chart along :

(a) A horizontal line of constant dew point

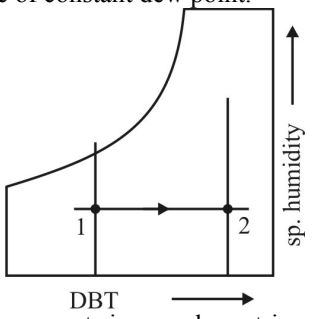
(b) Rising line

(c) Falling line

(d) Curved line

OPSC AEE 2015 PAPER - II

Ans : (a) Heating of air without changing its moisture content takes place on a psychometric chart along a horizontal line of constant dew point.



line – 1-2 represent in psychometric chart heating without changing moisture content.

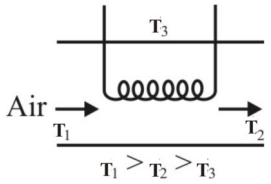
728. If T_1 and T_2 are dry bulb temperature of air entering and leaving the coil and T_3 is ADP temperature (temperature of cooling coil), then T_1 bypass factor for sensible cooling of air is:

(a) $\frac{T_3 - T_1}{T_2 - T_1}$ (b) $\frac{T_1 - T_2}{T_2 - T_3}$

(c) $\frac{T_2 - T_3}{T_1 - T_3}$ (d) $\frac{T_2 - T_3}{T_1 - T_2}$

OPSC AEE 2015 PAPER - II

Ans : (c)



$$\text{By pass factor}(BPF) = \frac{T_2 - T_3}{T_1 - T_3}$$

729. During mixing of steams in case of air conditioning, the process is associated with:

(a) Throttling (b) Adiabatic

(c) Isobaric (d) Isochoric

OPSC AEE 2015 PAPER - II

Ans : (b) During mixing of steams in case of air conditioning, the process is associated with adiabatic.

730. The desuperheating coil in a condenser performs the function of:

(a) improving the heat of superheat of the refrigerant before it goes into condenser

(b) Removing heat from condenser

(c) Improving condenser performance

(d) To humidity the refrigerant before it goes into condenser

OPSC AEE 2015 PAPER - II

Ans : (c) The desuperheating coil in a condenser performance the function of improving condenser performance.

731. Consider the following statements.

(1) As the by-pass factor (BPF) of the cooling coil increases, temperature difference between air at the outlet of the coil and coil ADP decreases

(2) The BPF of the coil increases as the velocity of air through the coil increases

(3) The BPF of the coil increases as the fin pitch increases

(4) The BPF of the coil decreases as the number of rows in the flow direction increase

Of the above, which is correct?

(a) 1, 2 and 3 (b) 1 and 3

(c) 2 and 4 (d) 2, 3 and 4

(e) 1, 2, 3 and 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) : By-pass Factor (BPF) is part of the total air through the coil which fails to come into contact with the surface of the cooling coil.

1. The BPF of the coil increase as the velocity of air through the coil increase.
2. The BPF of the coil increase as the fin pitch increase.
3. The BPF of the coil decrease as the number of rows in the flow direction increase.

732. Consider the following statements.

1. The air conditioning load on a building increases, if 0.4% design value is used for outside conditions instead of 1.0% value for summer
2. The air conditioning load on a building decreases, if 0.4% design value is used for outside conditions instead of 1.0% value for summer
3. For winter air conditioning, a conservative approach is to select 99.6% value for the outside design conditions instead of 99% value
4. For winter air conditioning, a conservative approach is to select 99% value for the outside design conditions instead of 99.6% value

Of the above, which is correct

(a) 1 and 2 (b) 2 and 3

(c) 2 and 4 (d) 1 and 3

(e) 1, 3 and 4

CGPSC AE 26.04.2015 SHIFT-II

Search on Telegram @apna_pdf

Ans. (d) : 1. The air conditioning load on a building increases, if 0.4% design value is used for outside conditions instead of 1.0% value for summer
2. For winter air conditioning, a conservative approach is to select 99.6% value for the outside design conditions instead of 99% value

733. Consider the following statements

1. Thermodynamic WBT is a property of moist air, while WBT as measured by wet bulb thermometer is not a property
2. Both the thermodynamic WBT and WBT as measured by wet bulb thermometer are properties of moist air
3. Under no circumstances, dry bulb and wet bulb temperatures are equal
4. Wet bulb temperature is always lower than dry bulb temperature, but higher than dew point temperature

Of the above, which is correct?

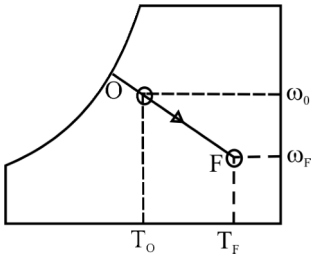
(a) 1 (b) 2
(c) 3 (d) 4

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) : Wet bulb temperature is always lower than dry bulb temperature, but higher than dew point temperature

$t_b > t_w > t_d$

734. The process shown in the psychometric process is



(a) Sensible heating
(b) Sensible cooling
(c) Cooling and humidification
(d) heating with humidification
(e) Chemical dehumidification

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) : The process shown in the psychometric process is chemical dehumidification.

$T_d \uparrow$, T_w = Const, $\omega\downarrow$, $\phi\downarrow$
h = Constant

735. Water in an insulated evaporative cooler evaporates at the rate of 0.005 kg/s. Air flow rate is 1.2 kg/s. What is the air temperature decrease if the specific heat of humid air is 1kJ/kg K and latent heat of water is 2700 kJ/kg?

(a) 2.7^0C (b) 5.25^0C
(c) 11.25^0C (d) 13.25^0C
(e) 14.75^0C

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) : Data given,

$\dot{m}_w = 0.005\,kg/s$

$\dot{m}_A = 1.2\,kg/s$

$(LH)_w$ = 2700 kJ/kg
C_p = 1 kJ/kg K
ΔT = ?
We know that,
Heat gained by water will be equal to heat lost by air

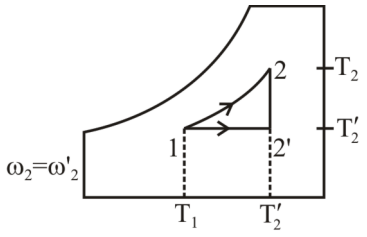
$$\dot{m}_w \times (LH)_w = \dot{m}_A\, C_p \Delta T$$
$$0.005 \times 2700 = 1.2 \times 1 \times \Delta T$$
$$\boxed{\Delta T = 11.25^0 C}$$

736. In spray humidification process, total heat

(a) Remains same (b) Decreases
(c) Increases (d) Unpredictable

MPPSC State Forest Service Exam, 2014

Ans. (a) :



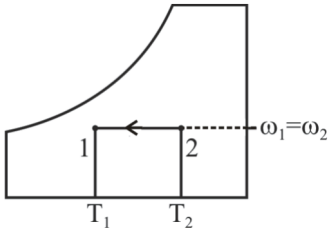
1-2' is heating, $T_{2'} > T_1$
2'-2 is humidification
So, in spray humidification process total heat remains same.

737. Cooling of air without any change in its specific humidity, is called

(a) Sensible heating (b) Humidification
(c) Dehumidification (d) Sensible cooling

MPPSC State Forest Service Exam, 2014

Ans. (d) : From psychrometric chart,



$\Delta\omega = 0$ or constant ω
1 to 2 is a sensible cooling process in which the specific humidity remains constant.

738. During air conditioning of a space the sensible heat added is 100 Kcal /sec and the latent heat added is 50 cal/sec, then the sensible heat factor is :

(a) 0.25 (b) 0.33
(c) 0.50 (d) 0.67

MPSC Poly. Lect. 2014

Search on Telegram @apna_pdf

Ans. (d) : Given,
Sensible Heat (SH) = 100 Kcal/sec.
Latent Heat (LH) = 50 Kcal/sec.
Sensible Heat Factor (SHF)

$$= \frac{SH}{SH + LH} = \frac{100}{100 + 50} = 0.6667$$

739. Grand total heat is :
(a) RLH+TSH (b) TLH+RLH
(c) TSH-TLH (d) TSH+TLH

TNPSC AE (Industries) 09.06.2013

Ans. (d) : Grand total heat = TSH+TLH

740. Dew point temperature is constant as long as there is :
(a) no change in moisture content of the air
(b) no change in volume of air
(c) no change in dry bulb and wet bulb temperature
(d) no change in relative and specific humidity of air

J&K PSC Civil Services Pre, 2013

Ans. (a) : Dew point temperature is constant as long as there is no change in moisture content of the air.

741. Air is normally dehumidified by :
(a) injecting water (b) passing steam
(c) heating (d) cooling

J&K PSC Civil Services Pre, 2013

Ans. (d) : Air is normally dehumidified by cooling.
When temperature of air becomes less than Dew point temperature then air will be dehumidified.

742. Consider the following psychometric terms:
A. Degree of saturation B. Specific humidity
C. Humidity ratio D. Relative humidity
Which of the above terms have the same meaning?
(a) (A) and (B) (b) (B) and (C)
(c) (A), (B) and (C) (d) (C) and (D)

RPSC AEN Pre-2013

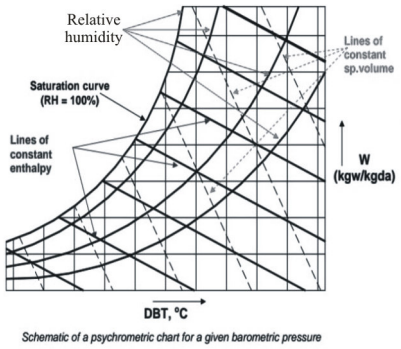
Ans. (b) : Specific humidity or humidity ratio-
It is defined as the ratio of mass of water vapour per kg of dry air in the given volume and given temperature.
Specific humidity / humidity ratio (ω).

$$(\omega) = \frac{m_v}{m_a} = \frac{0.622 P_v}{P - P_v}$$

743. Which of the following psychrometric properties is not shown as straight inclined lines on the psychometric chart?
(a) Wet bulb temperature
(b) Enthalpy
(c) Specific volume
(d) Relative humidity

RPSC AEN Pre-2013

Ans. (d) :



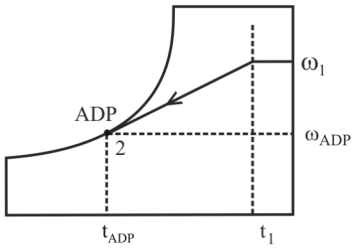
Schematic of a psychrometric chart for a given barometric pressure

(h) Enthalpy = Inclined uniformly spaced
WBT = Inclined but non uniformly space
(Sp. volume) (v) = Highest degree of inclination
(h) Enthalpy, WBT = same degree of inclination.

744. What is the full form of the term ADP employed in air conditioning?
(a) Apparatus dew point
(b) Adiabatic dew point
(c) Ambient design point
(d) Air conditioning design point.

RPSC AEN Pre-2013

Ans. (a) : ADP employed for air conditioning-
ADP = Apparatus dew point.

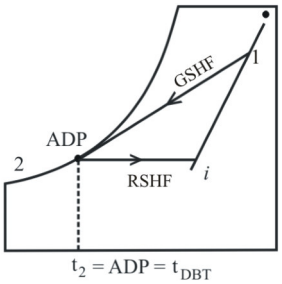


Apparatus dew point is obtained when cooling & dehumidification line cut the saturation curve.

745. What is the line on the psychometric chart joining the state of mixture of fresh air and re-circulated air entering the cooling coil to the state of ADP of cooling coil called ?
(a) Mean SHF line
(b) Room SHF line
(c) Effective SHF line
(d) Grand SHF line

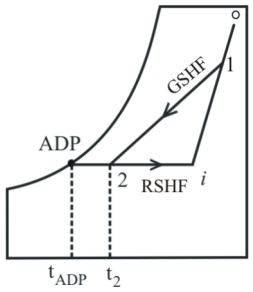
RPSC AEN Pre-2013

Ans. (d) : Grand SHF line –



Search on Telegram @apna_pdf

RSHF – For non- zero bypass factor.



746. In winter air conditioning, the inside design conditions are given by the following:-
(a) 25°C DBT, 50% RH
(b) 25°C DBT, 60% RH
(c) 21°C DBT, 50% RH
(d) 21°C DBT, 60% RH

UKPSC AE-2013, Paper-II

Ans. (d) :

747. Effective temperature in respect of air conditioning is the temperature of:-
(a) Unsaturated air
(b) Saturated air
(c) Dry air
(d) Either (b) or (c) above

UKPSC AE-2013, Paper-II

Ans. (b) : Effective temperature in respect of air conditioning is the temperature of saturated air.

748. During adiabatic saturation process of air in air washer, the water is sprinkled at a surface temperature equal to —— of incoming air:-
(a) DBT (b) WBT
(c) DPT (d) None of the above

UKPSC AE-2013, Paper-II

Ans. (b) :

749. When steam is injected into the incoming air, the following changes occur in the condition of air:-
(a) Temperature increases significantly but specific humidity increases negligibly.
(b) Temperature increases negligibly but specific humidity increases appreciably.
(c) Both temperature and sp. humidity increase appreciably.
(d) Both temperature and sp. humidity increase negligibly.

UKPSC AE-2013, Paper-II

Ans. (b) : When steam is injected into the incoming air then temperature increase negligibly but specific humidity increases appreciably of the air.

750. In the concept of effective temperature, the relative humidity of air is considered to be:-
(a) 0% (b) 50%
(c) 75% (d) 100%

UKPSC AE-2013, Paper-II

Ans. (b) :

751. For atmospheric air, following conditions are given:-
DBT = 35°C, DPT = 23°C and barometer reads 750 mm Hg. Saturation pressure at 23°C and 35°C is 21.06 mm Hg and 42.4 mm Hg respectively. The relative humidity and partial pressure of water vapour will be:-
(a) 49.7% and 21.06 mm Hg respectively
(b) 35.5% and 42.4 mm Hg respectively
(c) 35.5% and 15.06 mm Hg respectively
(d) Impossible to calculate

UKPSC AE-2013, Paper-II

Ans. (a) : Partial Pressure corresponds to DPT
P_v= 21.06 mm Hg
P_s= 42.4 mm Hg

$$\phi = \frac{P_v}{P_S} = \frac{21.06}{42.4} = 0.4967$$

$$\boxed{\phi \simeq 49.67\%}$$

752. A sample of moist air is at a dry bulb temperature of 21°C and dew point temperature of 15°C. Specific humidity of air is 0.011 kg w.v./kg d.a. What will be the enthalpy of moist air?
(a) 59.4 kJ/kg d.a. (b) 323.4 kJ/kg d.a.
(c) 52.5 kJ/kg d.a. (d) 49.0 kJ/kg d.a.

UKPSC AE-2013, Paper-II

Ans. (d) : Given as, t_{dbt} = 21°C, t_{dpt} = 15°C
ω = 0.011 kg w.v./kg d.a.
We know that enthalpy of moist air

$$h = 1.005\,t_{dbt} + \omega\left[2500 + 1.88\,t_{dbt}\right]$$

$$h = 1.005 \times 21 + 0.011 \times [2500 + 1.88 \times 21]$$

h = 49 kJ/kg d.a.

753. The necessary data required for the design of the air conditioning apparatus is/are:-
(a) Grand total heat
(b) Dehumidified air quantity
(c) Apparatus dew point
(d) All of the above

UKPSC AE-2013, Paper-II

Ans. (d) :

754. The ratio of the actual partial pressure of the water vapour of the air-vapour mixture, to the pressure of the saturated water vapour at the same dry bulb temperature of the air is known as
(a) relative humidity
(b) absolute humidity
(c) specific humidity
(d) degree of saturation

TNPSC ACF 2012

Ans. (a) : Relate humidity $= \frac{P_V}{P_{VS}}$

P_V = actual pressure of the water vapour
P_{VS} = the pressure of the saturated water vapour.

Search on Telegram @apna_pdf

755. The dry bulb, wet bulb and dew point temperature will all the same when the air is

(a) completely dry
(b) fully saturated
(c) partially wet
(d) at atmopsheric pressure

TRB Poly. Lect., 2012

Ans. (b) : The dry bulb, wet bulb & dew point temperature will be all are same, when the air is completely saturated.

756. When air is at saturated state, which pair, out of the given alternatives is not correctly matched ?

List-I		List-II
(a) Relative humidity	-	100%
(b) DBT	-	WBT
(c) Degree of saturation	-	1
(d) Specific humidity	-	0.01 kg w.v/kg d.a

UKPSC AE 2012 Paper–II

Ans. (d) : Specific humidity - 0.01 kg w.v/kg d.a

757. In case of air conditioning of auditoriums, the cooling load which is predominant is

(a) lighting load
(b) occupancy load
(c) load due to fans
(d) load due to electronic equipments

UKPSC AE 2012 Paper–II

Ans. (b) : occupancy load

758. The design condition of temperature for winter air conditioning is

(a) 25 ± 1 °C (b) 27 °C
(c) 21 °C (d) none of the above

UKPSC AE 2012 Paper–II

Ans. (c) : 21 °C

759. In summer air conditioning system fresh air is introduced into the recirculated air to

(a) reduce load on equipment
(b) exercise easy control over equipment
(c) improve air quality by diluting odour and contaminants
(d) reduce quantity of supply air

UKPSC AE 2012 Paper–II

Ans. (c) : improve air quality by diluting odour and contaminants

760. Temperature recorded by a thermometer which is not affected by moisture is

(a) dry bulb temperature
(b) wet bulb temperature
(c) dew point temperature
(d) adiabatic saturation temperature

UKPSC AE 2012 Paper–II

Ans. (a) : The dry bulb temperature refers basically to the ambient air temperature. It is called "Dry Bulb" because the air temperature is indicated by a thermometer not affected by the moisture of the air.

761. In cooling and dehumidifying apparatus, the effect of the by pass factor is to

(a) lower the ADP of the cooling coil
(b) decrease the COP of the system
(c) both (a) & (b) above
(d) increase the ADP of the cooling coil and to improve the COP of the system

UKPSC AE 2012 Paper–II

Ans. (c) : both (a) & (b) above

762. Ambient air dry bulb temperature is 45°C and wet bulb temperature is 27°C. Select the lowest possible condensing temperature from the following for an evaporative cooled condenser.

(a) 25°C (b) 30°C
(c) 42°C (d) 48°C

VIZAG STEEL MT 10.06.2012

Ans. (d) : Condensing temperature should be greater than ambient dry bulb temperature.

In the option only (D) is satisfied, which have temperature $T_c > 45°$

So, $\boxed{t_{condensing} = 48^0 C}$

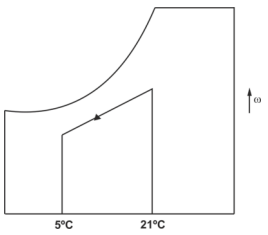
763. 1kg of moist air of RH 70% at 21°C is cooled at constant pressure of 1 bar to 5°C. The vapour pressure at 21°C and 5°C are 0.025 bar and 0.0087 bar. The percentage of water vapour that condenses into water, at 5°C is

(a) 66% (b) 85%
(c) 51% (d) 17%

ISRO Scientist/Engineer 2011

Ans. (a) : Moist air, mass (m) = 1 kg

RH=70%



Specific humidity is given by

$$\omega = \frac{0.622 P_v}{P_t - P_v}$$

Percentage of water vapour condenses into water.

$$\frac{\omega_1 - \omega_2}{\omega_1} \times 100$$

$$= \frac{\frac{0.025}{1-0.025} - \frac{0.087}{1-0.087}}{\frac{0.025}{1-0.025}} \times 100$$

= 66%

Search on Telegram @apna_pdf

764. The conditioned air supplied to the room must have the capacity to take up

(a) Room sensible heat load only
(b) Room latent heat only
(c) Both room sensible heat and latent heat loads
(d) None of the above

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (c) : Conditioned air supplied to the room must have the capacity to take up, both room sensible heat & latent heat loads, due to the presence of water vapour in the air.

765. Consider the following statements for moist air, when it has attained the dew point temperature.

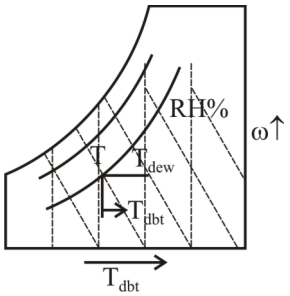
1. Dry-and wet-bulb temperatures are indentical.
2. Relative humidity is 100%.
3. Air is fully saturated with water vapour.
4. Humidity ratio is 100%.

Which of the above statements is/are correct ?

(a) 1 only (b) 2 and 3 only
(c) 1, 2 and 3 (d) 3 and 4

UPSC JWM Advt. No.-50/2010

Ans. (c) :



- When a moist air attains the Dew Point Temperature (DPT), the DBT is equal to Wet Bulb Temperature (WBT) & equal to dew point temperature.
- RH (Relative Humidity) is 100%.
- And is fully saturated.

766. Consider the following properties :

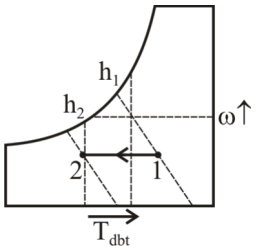
1. Wet-bulb temperature
2. Specific enthalpy of air-vapour mixture

Which of these properties decrease(s) during sensible cooling of air-water vapour mixture?

(a) Neither 1 nor 2 (b) Both 1 and 2
(c) 1 only (d) 2 only

UPSC JWM Advt. No.-50/2010

Ans. (b) :



From phychrometric chart, we know that, these properties decrease during sensible cooling of air water vapour is wet bulb temperature & specific enthalpy of air vapour mixture.

767. Assertion (A) : Comfort is a function of temperature, humidity and velocity in the conditioned space.

Reason (R) : By controlling temperature, humidity and velocity in the conditioned space, one can select a combination which consumes less energy without compromising the comfort.

Codes :

(a) Both A and R are individually true and R is the correct explanation of A
(b) Both A and R are individually true and R is not the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

UPSC JWM Advt. No.-50/2010

Ans. (a) : As we know, human comfort is a function of temperature, humidity and velocity of the air this is decided by the factor called is effective temperature. By controlling these, in a combination, which consume less energy without compromising the comfort. Both sentences related to each other.

768. In an extra humid atmosphere which one of the following motor would you select?

(a) Open type
(b) Semi-protected
(c) Drip proof
(d) Totally enclosed fan cooled

ISRO Scientist/Engineer 2010

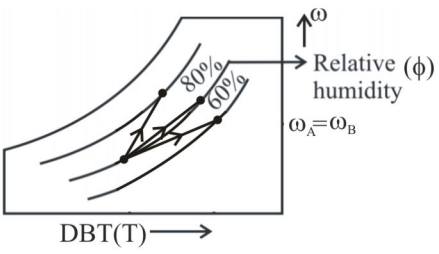
Ans. (d) : Totally enclosed fan cooled. This type of motor will not permit extra moisture from the humid atmosphere to come inside the motor and hence protects it from corrosion and other factors which help in reducing its life.

769. The relative humidity during heating and humidification :

(a) Increases
(b) Decreases
(c) May increase or decrease
(d) Remains constant

J&K PSC Civil Services Pre, 2010

Ans. (c) :



The specific humidity during heating and humidification process may increase or decrease.

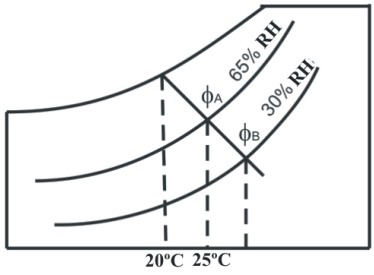
Search on Telegram @apna_pdf

770. Two systems have the same wet bulb temperature at 20°C. System 'A' has Dry bulb temperature of 25°C since it has a relative humidity of 65%. System 'B' has a relative humidity of 30%. What will be its dry bulb temperature

(a) 33°C
(b) 25°C
(c) 27°C
(d) 22°C

ISRO Scientist/Engineer 2009

Ans. (a) : Two system A and B
for system 'A' WBT = 20°C
DBT = 25°C
Relative humidity
$\phi_A = 65\%$
for system 'B'
WBT = 20°C
DBT = ?
Relative humidity
$\phi_B = 30\%$



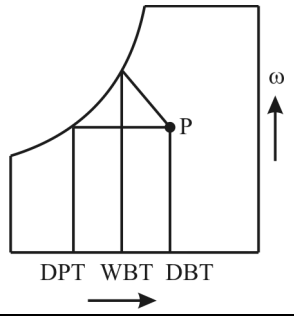
So here we need to take a guess between (a) & (c), as we are going from 65% RH to 30% RH the DBT for system B should be higher i.e. not 27°C, as it is very close. Hence the correct option is (a).

771. Which of the following options is true for the dry bulb temperature (T_{DBT}), the wet bulb temperature (T_{DPT}) for a mixture of air and water vapour ?

(a) $T_{DPT} < T_{DBT} < T_{WBT}$
(b) $T_{DPT} < T_{WBT} < T_{DBT}$
(c) $T_{WBT} < T_{DPT} < T_{DBT}$
(d) $T_{WBT} < T_{DBT} < T_{DPT}$

DRDO Scientists 2009

Ans. (b) : $T_{DPT} < T_{WBT} < T_{DBT}$



772. In a counter-flow cooling tower, warm water enters at temperature of T_w. The dry bulb and the wet bulb temperatures of air entering the tower are T_{DBT} and T_{WTB}, respectively. The minimum temperature of water at the exit of the cooling tower is :

(a) T_{WBT} (b) T_{DBT}
(c) $T_W - T_{DBT}$ (d) $T_W - T_{WBT}$

DRDO Scientists 2009

Ans. (c) :

773. For a given dry bulb temperature as the relative humidity increases, the wet bulb depression will be

(a) more
(b) less
(c) same
(d) more / less depending on other factors

TNPSC AE, 2008

Ans. (b) : Wet bulb Depression = Dry bulb temperature – Wet bulb temperature
For a given dry bulb temperature ($DBT_1 = DBT_2$), as the relative humidity ($\phi_2 > \phi_1$) increases, the wet bulb depression (WBD) will be decreases or less.

774. If pure humidification is desired, the spray water through which air passes, to be maintained as

(a) WBT (b) DBT
(c) DPT (d) None of these

TNPSC AE, 2008

Ans. (b) : If pure humidification is desired, the spray water through which air passes, has to be maintained as DBT. i.e, constant Dry Bulb Temperature (DBT) line.

775. In adiabatic saturation

(a) the process consists of increasing the humidity ratio without change in its heat content
(b) the process includes change in DBT keeping the humidity ratio of air as constant
(c) the process consists of heating the air without changing the humidity ratio
(d) the process can be accomplished either by the addition of steam or heated water in air

TNPSC AE, 2008

Ans. (a) : Adiabatic saturation is the process consists of increasing the humidity ratio (ω) without change in its heat content.

776. Determining moisture in steam by measuring the temperature in throttling calorimeter is an example of

(a) direct measurement
(b) indirect measurement
(c) measurement by comparison
(d) measurement by calibration

TNPSC AE, 2008

Search on Telegram @apna_pdf

Ans. (b) : The percentage by weight of steam in a mixture of steam and water is called the quality of the steam. The apparatus used to determine the moisture content of steam is called a calorimeter through since it may not measure the heat in the steam, the name is not descriptive of the function of the apparatus.

777. Clothes dry relatively easily in an environment where the

(a) relative humidity is high
(b) specific humidity is high
(c) relative humidity is low
(d) relative humidity fluctuates

DRDO Scientists 2008

Ans. (c) :

778. If P_v is partial pressure of water vapour in air and P_s is the saturation pressure of water vapour at the same temperature, the relative humidity is equal to

(a) $1-\frac{P_v}{P_s}$ (b) $1-\frac{P_s}{P_v}$ (c) $P_s - P_v$ (d) P_v / P_s

UKPSC AE 2007 Paper -II

Ans. (d) : P_v / P_s

779. Foggy condition in atmosphere results when

(a) Hot and humid air mixes with cold dry air
(b) Cold and dry air mixes with hot and dry air
(c) Hot and humid air mixes with hot and dry air
(d) None of the above

UKPSC AE 2007 Paper -II

Ans. (a) : Hot and humid air mixes with cold dry air

780. The wet bulb temperature is a measure of which humidity?

(a) Relative (b) Absolute
(c) Specific (d) None of above

UKPSC AE 2007 Paper -II

Ans. (b) : Absolute

781. The dry bulb temperature during heating and dehumidification

(a) decreases
(b) increases
(c) remains constant
(d) unpredictable

UKPSC AE 2007 Paper -II

Ans. (b) : During the heating and dehumidification process dry bulb temperature of the air increases while its dew point and wet bulb temperature reduces.

782. The specific humidity is the mass of water vapour present in (per)

(a) kg of dry air
(b) m^3 of dry air
(c) m^3 of wet air
(d) kg of wet air

UKPSC AE 2007 Paper -II

Ans. (a) : Kg of dry air

783. Air conditioning is concerned with maintaining the following:

(a) Temperature (b) Humidity
(c) Cleanliness (d) All the above

UKPSC AE 2007 Paper -II

Ans. (d) : All the above.

784. Air in domestic Window Air Conditioner is dehumidified by :

(a) heating (b) cooling
(c) Injecting water (d) Injecting steam

J & K PSC Screening, 2006

Ans. (b) : Air in domestic window air conditioner is dehumidified by cooling.
When temperature of air becomes less than Dew Point Temperature then air will be dehumidified.

785. Heating and dehumidification can be achieved simultaneously if air is passed through :

(a) sprays of water maintained at a temperature higher then the dew point temperature of the entering air
(b) a solid absorbent surface
(c) a liquid absorbent spray
(d) any one of the (b) and (c)

J & K PSC Screening, 2006

Ans. (d) : Heating and dehumidification can be achieved simultaneously by passing air through.
(1) A solid absorbent surface
(2) A liquid absorbent surface
This process can be achieved by using hygroscopic material This material can be solid or liquid.

786. For summer air conditioning in coastal regions, the psychrometric process employed is

(a) cooling with humidification
(b) cooling with dehumidification
(c) sensible cooling
(d) sensible heating

OPSC Civil Services Pre 2006

Ans. (b) : In coastal areas relative humidity and moisture contents in the air is high so in summer air conditioning cooling and dehumidification process is employed.

787. In psychrometry, during a sensible cooling process, the dew point temperature

(a) Decreases
(b) Increases
(c) May increase or decrease
(d) Remains constant

OPSC Civil Services Pre 2006

Ans. (d) : During sensible cooling or heating, dew point temperature and specific humidity (moisture content) remain same. In sensible cooling relative humidity, wet bulb temperature and enthalpy decreases and relative humidity increases.

Internal Combustion Engine

1. Air Standard Cycles

1. For same compression ratio thermal efficiency of:

(a) Otto cycle is less than Dual cycle
(b) Otto cycle is same as that for Diesel cycle
(c) Otto cycle is less than that of Diesel cycle
(d) Otto cycle is more than that of Diesel cycle

TSPSC Manager (Engg.) HMWSSB 12.11.2020
Gujarat PSC AE 2019, RPSC AE 2018
Nagaland PSC CTSE 2017 Paper-2
TNPSC AE 2017
CGPSC Poly. Lect. 22.05.2016
RPSC Lecturer 16.01.2016
Rajasthan Nagar Nigam AE 2016, Shift-I
Kerala PSC AE 06.08.2015
OPSC AEE 2015 PAPER - II
MPPSC State Forest Service Exam, 2014
TNPSC AE 2013, WBPSC AE 2008
ISRO Scientist/Engineer 2012
UKPSC AE 2007 Paper -II
OPSC Civil Services Pre 2006

Ans. (d) : For same compression ratio, the efficiency of otto cycle is more efficient than diesel cycle. Due the large amount of heat transfer.

$\eta_{otto} > \eta_{diesel}$ (same compression ratio)

(i) For same compression ratio and heat addition

$\eta_{otto} > \eta_{dual} > \eta_{diesel}$

(ii) for same maximum temperature and heat rejection

$\eta_{diesel} > \eta_{dual} > \eta_{otto}$

2. For the same maximum pressure and the heat input, the efficiencies of the power cycles are

(a) $\eta_{diesel} > \eta_{dual} > \eta_{otto}$
(b) $\eta_{dual} > \eta_{diesel} > n_{otto}$
(c) $\eta_{otto} > \eta_{diesel} > \eta_{dual}$
(d) $\eta_{otto} > \eta_{dual} > \eta_{diesel}$

Assam PSC AE (PHED), 18.10.2020
TNPSC AE 2019
BPSC AE Mains 2017 Paper - V
WBPSC AE, 2017, UPPSC AE. 2016
RPSC AE 2016, (HPPSC AE 2014)
RPSC ACF-2011

Ans. (a) : For the same maximum pressure and heat input

$\eta_{diesel} > \eta_{dual} > \eta_{Otto}$

For same compression ratio and heat output

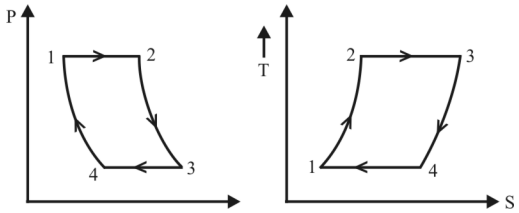
$\eta_{Otto} > \eta_{dual} > \eta_{diesel}$

3. A cycle consisting of two reversible isothermal processes and two reversible isobaric processes is known as :

(a) Atkinson cycle (b) Stirling cycle
(c) Brayton cycle (d) Ericsson cycle

ISRO Scientist/Engineer (RAC), 10.03.2019
Vadodara Muncipal Corp. DEE, 2018
Kerala PSC Asstt. Prof. 27.09.2016
APGENCO AE 2012, ESE 2009
WBPSC AE, 2007, GATE 1996

Ans. (d) : Ericsson cycle consist of two reversible isothermal and two reversible isobaric.



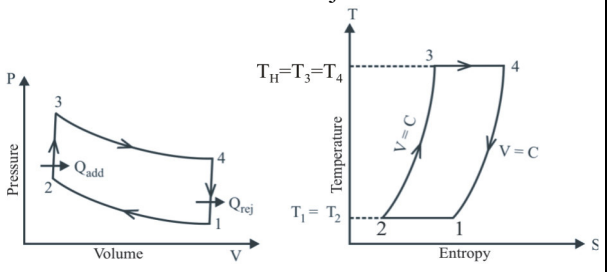
1–2 → Constant Pressure Heat addition
2–3 → Isothermal Expansion
3–4 → Constant Pressure Heat rejection
4–1 → Isothermal compression.

4. Stirling cycle consists of :

(a) Two constant volume and two adiabatic processes
(b) Two constant volume and two isothermal processes
(c) Two constant pressure and two isothermal processes
(d) One constant volume, one constant pressure and two adiabatic processes

VIZAG Steel MT, 14.12.2020
Nagaland PSC (CTSE) 2018, Paper-II
Punjab PSC SDE 12.02.2017
GMB AAE 25.06.2017, GPSC Lect. 23.10.2016
TSPSC Managers, 2015

Ans. (b) : Stirling cycle– It consists of four processes.
1–2→ Isothermal compression.
2–3→ Constant volume heat addition
3–4→ Isothermal expansion.
4–1→ Constant volume heat rejection.



At the same temperature limits carnot cycle efficiency is equal to stirling cycle efficiency.

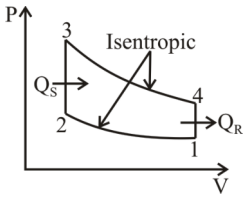
Search on Telegram @apna_pdf

5. The constant volume cycle is also called

(a) Carnot cycle (b) Joule cycle
(c) Diesel cycle (d) Otto cycle

CGPSC AE 15.01.2021
Haryana PSC AE (PHED) 04.09.2020, Paper-I
APPSC AEE Screening Test 2016
MPPSC AE 08.11.2015, TSPSC AEE 2015
UKPSC AE-2013, Paper-II

Ans. (d) :



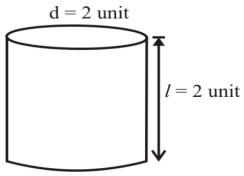
It has two constant volume process one for heat addition and other for heat rejection and two reversible adiabatic process.

6. An IC engine has a bore and stroke each equal to 2 units. The total area to calculate heat loss from the engine can be taken as

(a) 4π (b) 5π
(c) 6π (d) 8π

GPSC EE Pre, 28.01.2017, (HPPSC AE 2014)
ESE 2012, APGENCO AE 2012
GATE 1998

Ans. (c) :



Stroke length (l) = 2 unit
Base diameter (d) = 2 unit
r = 1 unit
Total area heat loss from engine
$= 2\pi r\,[r + l]$
$= 2\pi \times 1\,[1 + 2]$
$= 2\pi \times [3]$
$= 6\pi$

7. The crank radius of a single cylinder IC engine is 60 mm and the diameter of the cylinder is 80 mm. The swept volume of the cylinder in cm^3 is :

(a) 48 (b) 96
(c) 301 (d) 603

GPSC Asstt. Director of Transport 05.03.2017
UP Jal Nigam AE 2016
VIZAG STEEL MT 10.06.2012
VIZAG STEEL MT 18.08.2013
GATE 2011

Ans. (d) : Given,

Diameter of cylinder (D)	= 80 mm	= 8 cm
Radius of crank (r)	= 60 mm	= 6 cm
Length of stroke (L)	= 2 r	= 12 cm

Sewpt volume of the cylinder,

$$V_S = \frac{\pi}{4}D^2L = \frac{\pi}{4}\times(8)^2\times 12$$

$$V_S = 603.18\ cm^3$$

8. If the compression ratio of an engine working on otto cycle is increased 5 to 7 then the percentage increase in efficiency will be–

(a) 2% (b) 4%
(c) 8% (d) 14%

RPSC ACF & FRO, 26.02.2021
TNPSC AE 2017, HPPSC AE 2014
RPSC IOF & Boiler 20.09.2017

Ans : (d)

C-I, $\eta_1 = 1 - \frac{1}{r^{\gamma-1}} = 1 - \frac{1}{5^{1.4-1}} = 47.4\%$

C-II, $\eta_2 = 1 - \frac{1}{7^{1.4-1}} = 54.08\%$

$$\%\text{increase} = \frac{\eta_2 - \eta_1}{\eta_1} = \frac{\eta_2}{\eta_1} - 1$$

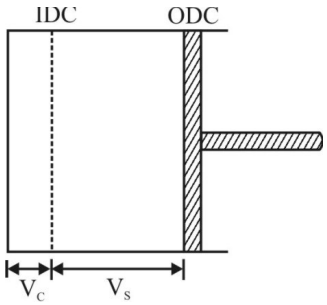
$$= \frac{54.08}{47.4} - 1 = 14.09 \approx 14\%$$

9. A 100 cc engine has the following parameter as 100 cc

(a) cylinder volume (b) clearance volume
(c) swept volume (d) full tank capacity

Rajasthan Nagar Nigam AE 2016, Shift-I
(KPSC AE 2015), GWSSB AAE, 27.12.2015
TNPSC AE 2014

Ans. : (c)



$$V_s = \frac{\pi}{4}D^2 \times L$$

$$V_s = \text{Swept volume}\left(cm^3\right)$$

D = bore dia (cm)
L = Stroke length (cm)

10. The Otto cycle is more efficient than Diesel cycle for the condition.

(a) Same maximum pressure and heat input
(b) Same maximum pressure and maximum temperature
(c) Same heat input and compression ratio
(d) Same heat output and maximum pressure

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
GPSC ARTO Pre 30.12.2018
HPPSC Asstt. Prof. 29.10.2016
GPSC Lect. (Auto) 16.10.2016
MPPSC AE 08.11.2015

Ans. (c) : For same compression ratio and Heat addition.

$$\eta_{otto} > \eta_{dual} > \eta_{diesel}$$

For same compression ratio and Heat rejection.

$$\eta_{otto} > \eta_{dual} > \eta_{diesel}$$

Search on Telegram @apna_pdf

For same maximum temp. and heat rejection.

$$\eta_{diesel} > \eta_{dual} > \eta_{otto}$$

For same maximum temp. and heat addition.

$$\eta_{diesel} > \eta_{dual} > \eta_{otto}$$

11. The air standard efficiency of a standard otto cycle for compression ratio of 5.5 is

(a) 25% (b) 50%

(c) 70% (d) 90%

ISRO Scientist/Engineer (RAC) 07.05.2017
RPSC AE 2016
MPPSC State Forest Service Exam, 2014

Ans. (b) : We know that

$$\eta_{otto} = 1 - \frac{1}{r^{(\gamma-1)}}$$

$$= 1 - \frac{1}{(5.5)^{1.4-1}}$$

$$\eta_{otto} \approx 0.5 = 50\%$$

12. In an air standard Otto cycle, r is the volume compression ratio and γ is an adiabatic index (c_p/c_v), the air standard efficiency is given by :

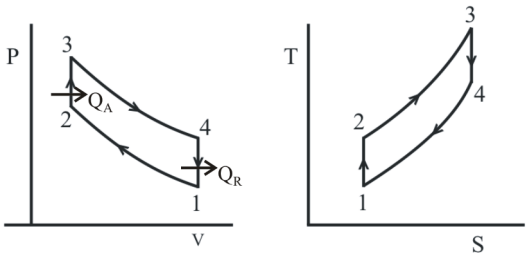
(a) $\eta = 1 - 1/(r^{\gamma} - 1)$ (b) $\eta = 1 - 1/r^{\gamma}$

(c) $\eta = 1 - 1/r^{(\gamma-1)}$ (d) $\eta = 1 - 1/r^{2\gamma-1}$

GPSC ARTO Pre 30.12.2018
TNPSC AE 2014, WBPSC AE 2003

Ans. (c) : Air standard efficiency of I.C. engine.

$$\eta_{sta} = \left[1 - \frac{1}{r^{\gamma-1}}\right]$$



1 - 2 → Compression process

2 - 3 → heat addition (combustion)

3 - 4 → expansion process

4 - 1 → exhaust process

13. In an air standard Diesel cycle at fixed compression ratio and fixed value of adiabatic index (γ)

(a) Thermal efficiency increases with increases in heat addition cut-off ratio

(b) Thermal efficiency decreases with increase in heat addition cut-off ratio

(c) Thermal efficiency remains same with increase in heat addition cut-off ratio

(d) None of the above

Nagaland PSC CTSE 2017 Paper-2
TNPSC AE 2017
UPPSC AE 12.04.2016 Paper-II

Ans.: (b) In an air standard diesel cycle at fixed compression ratio and fixed value of adiabatic index then thermal efficiency decreases with increase in heat addition cut–off ratio.

• $\eta\uparrow$ with decrease cut-off ratio (ρ)

14. In an air-standard Otto cycle, the compression ratio is 10. The condition at the beginning of the compression process is 100 kPa and 27°C. Heat added at constant volume is 1500 kJ/kg, while 700 kJ/kg of heat is rejected during the other constant volume process in the cycle. (Specific gas constant for air = 0.287 kJ/kg K)

The mean effective pressure (in kPa) of the cycle is

(a) 103 (b) 310

(c) 515 (d) 1032

VIZAG STEEL MT 10.06.2012
VIZAG STEEL MT 18.08.2013
GATE 2009

Ans. (d) : $V_1 = \frac{RT_1}{P_1} = \frac{0.287 \times 300}{100} = 0.861 \text{ m}^2/\text{kg}$

$$\frac{V_1}{V_2} = r = 10$$

$$V_2 = \frac{V_1}{r} = \frac{0.861}{10} = 0.0861 \text{ m}^3/\text{kg}$$

Mean effective pressure

$$P_m = \frac{W_{net}}{V_1 - V_2}$$

$$= \frac{Q_S - Q_R}{0.816 - 0.0861}$$

$$= \frac{1500 - 700}{0.7749}$$

$$= \frac{800}{0.7749}$$

$$P_m \cong 1032 \text{ kPa}$$

15. The efficiency of Diesel cycle approaches to Otto cycle efficiency when

(a) Cut-off is increased

(b) Cut-off is decreased

(c) Cut-off is zero

(d) Cut-off is constant

RPSC IOF, 2020
Nagaland PSC (CTSE) 2018, Paper-II
Nagaland PSC CTSE 2015 Paper-II

Ans. (c) :

$$\eta_{diesel} = 1 - \frac{1}{r^{\gamma-1}} \frac{(\rho^{\gamma} - 1)}{\gamma(\rho - 1)}$$

The diesel cycle efficiency depends upon the cut-off ratio. So when the cut-off ratio is equal to one then it approaches to Otto cycle efficiency as then

Search on Telegram @apna_pdf

Cut-off ratio = $\frac{V_3}{V_2} = 1$.

So, $V_3 = V_2$

Which ultimately ensure that the heat addition is done at constant volume and approaches to the Otto cycle at the same compression ratio.

16. The order of values of thermal efficiency of Otto, Diesel and Dual cycle, when they have equal compression ratio and heat rejection, is given by:

(a) $\eta_{Otto} > \eta_{Diesel} > \eta_{Dual}$
(b) $\eta_{Diesel} > \eta_{Dual} > \eta_{Otto}$
(c) $\eta_{Dual} > \eta_{Diesel} > \eta_{Ottal}$
(d) $\eta_{Otto} > \eta_{Dual} > \eta_{Diesel}$

Nagaland PSC (CTSE) 2018, Paper-II
MPPSC AE 2016
UKPSC AE-2013, 2012 Paper-II

Ans : (d)
i. Equal compression ratio and heat rejection order of values of thermal efficiency:-

$\eta_{Otto} > \eta_{Dual} > \eta_{Diesel}$

ii. For same maximum temperature and heat addition

$\eta_{Diesel} > \eta_{dual} > \eta_{Otto}$

iii. Same maximum pressure and heat input

$\eta_{diesel} > \eta_{dual} > \eta_{Otto}$

17. The accumulation of carbon in a cylinder results in increase of

(a) clearance volume
(b) ignition delay
(c) effective compression ratio
(d) volumetric efficiency

TNPSC AE (Industries) 09.06.2013
UKPSC AE-2013, Paper-II
APPSC AEE 2012

Ans. (c) : The accumulation of carbon in a cylinder results in-

- Increase of effective compression ratio
- Decreases fuel efficiency
- Decreased compression
- Increased exhaust pollutants
- Decreased oil life
- Decreased ring life
- Decreased spark plug life

18. The thermal efficiency of a 2 stroke cycle engine as compared to a 4 stroke cycle engine is

(a) More (b) Less
(c) Equal (d) Much less

JPSC AE, 10.04.2021, Paper-I
Nagaland PSC CTSE 2017 Paper-2
TNPSC ACF 2012

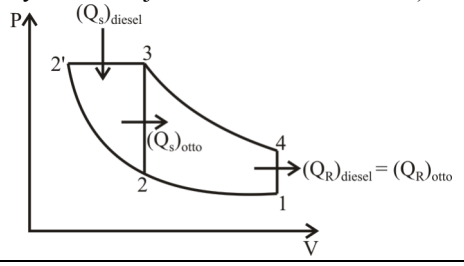
Ans. (b) : The thermal efficiency of a 2 stroke cycle engine as compared to 4 stroke cycle is always less. Thermal efficiency of four stroke is higher part load efficiency is better than two stroke cycle engine.

19. For the same maximum pressure and temperature of Otto, Diesel and dual combustion air standard cycles :

(a) The compression ratio will be same
(b) Heat supplied to the cycles will be same
(c) Air standard efficiency will have same value
(d) Heat rejected by the engine will be same

Kerala PSC Poly. Lect., 2017
JPSC AE 2013 Paper-V

Ans. (d) : For the same maximum pressure and temperature of Otto, Diesel and dual combustion air standard cycles heat rejected by the engine will be same (i.e. all cycle heat rejected at constant volume).



20. An engine is having clearance volume as 20 cm^3 and total volume 320 cm^3, mechanical efficiency 90% and volumetric efficiency as 80%. The volume of charge that can be available in the engine after suction.

(a) 320 cc (b) 300 cc
(c) 270 cc (d) 240 cc

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Ans. (d) : Given,

$V_C = 20cm^3$

$V_T = V_S + V_C = 320cm^3$

Where, V_C = Clearance volume

V_S = Swept volume

V_T = Total volume

$\eta_{mech} = 0.90$

$\eta_{vol.} = 0.80$

$V_S + V_C = 320$

$V_S = 320 - V_C$

$= 320 - 20$

$V_S = 300\ cm^3$

$$\eta_V = \frac{\text{Actual suction volume}}{\text{Theoretical swept volume}}$$

Actual suction volume $= \eta_V \times V_S$

$= 0.80 \times 300$

$= 240$ cc

21. An engine operating on Otto cycle has clearance volume as 10% of the swept volume. If $\gamma = 1.4$ the air standard cycle efficiency is

(a) 38.3% (b) 39.8%
(c) 60.2% (d) 61.7%

UPPSC AE 13.12.2020, Paper-2
GATE 2003

Ans. (d) : Given

$\gamma = 1.4$, $V_c = 10\%\ V_s$

$V_c = 0.1\ V_s$

$\frac{V_c}{V_s} = 0.1 = c$ (clearance ratio)

Compression ratio $(r) = 1 + \frac{1}{c}$

Search on Telegram @apna_pdf

$$r = 1 + \frac{1}{0.1}$$

$$\boxed{r = 11}$$

$$\eta_{otto} = 1 - \left(\frac{1}{r}\right)^{\gamma-1} = 1 - \left(\frac{1}{11}\right)^{1.4-1}$$

$$= 61.67\%$$

22. The efficiency of Diesel cycle with decrease in cut off

(a) Increases
(b) Decreases
(c) Remain unaffected
(d) First increases and then decreases

WBPSC AE, 2017
MPPSC State Forest Service Exam, 2014

Ans. (a) : $\boxed{\eta_{diesel} = 1 - \frac{(\rho^{\gamma} - 1)}{\gamma \cdot r^{(\gamma-1)} \cdot (\rho - 1)}}$

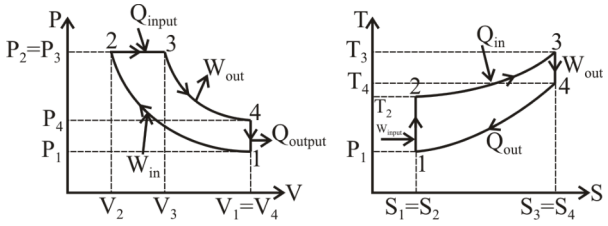
So, if cutoff ratio(ρ)↓, η_{diesel}(↑)

23. A cycle consisting of one constant pressure, one constant volume and two isentropic processes is known as

(a) Carnot cycle (b) Stirling cycle
(c) Otto cycle (d) Diesel cycle

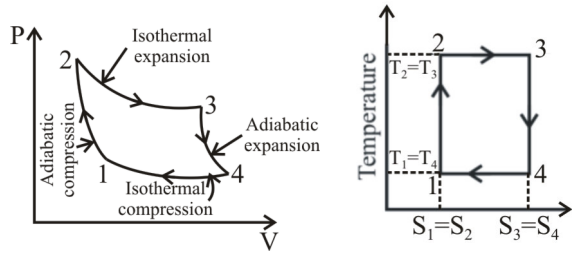
ISRO Scientist/Engineer (RAC), 10.03.2019
Sikkim PSC (Under Secretary), 2017

Ans. (d) : Diesel cycle- Diesel cycle consist of two reversible adiabatic or isentropic and one constant pressure, and one constant volume.

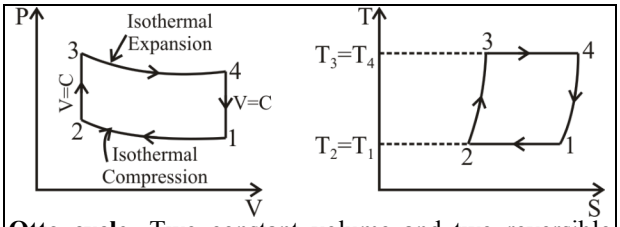


1-2 : Isentropic compression
2-3 : Constant pressure heat addition
3-4 : Isentropic expansion
4-1 : Constant volume heat rejection

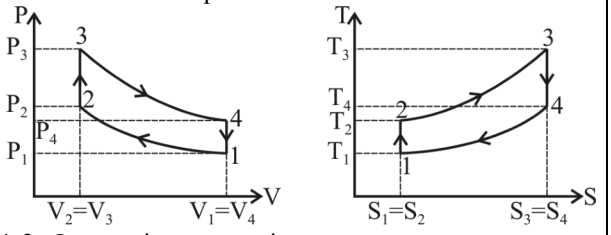
Carnot cycle- Two adiabatic process and two isothermal process.



Stirling cycle- Two isothermal process and two constant volume process.



Otto cycle- Two constant volume and two reversible adiabatic or isentropic.



1-2 : Isentropic compression
2-3 : Constant volume heat addition
3-4 : Isentropic expansion
4-1 : Constant volume heat rejection

24. For the same values of peak pressure, peak temperature and heat rejection, the correct order of efficiencies for Otto, Dual and Diesel cycles.

(a) Otto > Dual > Diesel
(b) Dual > Diesel > Otto
(c) Diesel > Dual > Otto
(d) Diesel > Otto > Dual

ISRO Scientist/Engineer (RAC), 10.03.2019
GATE 2015

Ans. (c) : For same peak pressure, peak temperature and heat rejected

$$\eta_{Diesel} > \eta_{Dual} > \eta_{Otto}$$

for same compression ratio

$$\eta_{Otto} > \eta_{Dual} > \eta_{Diesel}$$

25. Which of the following cycle has maximum efficiency

(a) Rankine (b) Brayton
(c) Carnot (d) Joule

Rajasthan Nagar Nigam AE 2016, Shift-I
MPPSC AE 08.11.2015

Ans. (c) : Carnot cycle has maximum efficiency. This cycle is practically not possible so it is called hypothetical cycle.

26. In air-standard Otto cycle the terminal pressure at the end of compression, heat release and expansion are respectively P_2, P_3 and P_4. If the corresponding values are P'_2, P'_3 and P'_4 taking into account the effect of variable specific heat and dissociation of the working fluid, then

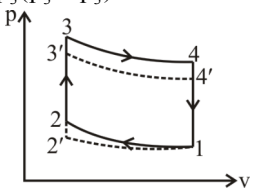
(a) $P_2 < P'_2$ and $P_3 < P'_3$
(b) $P_3 < P'_3$ and $P_4 < P'_4$
(c) $P_2 > P'_2$, $P_3 > P'_3$ and $P_4 < P'_4$
(d) $P_2 > P'_2$ and $P_3 > P'_3$

GPSC Asstt. Director of Transport 05.03.2017
GATE 1989

Search on Telegram @apna_pdf

Ans. (d) : All gases except monoatomic gases shows an increase in specific heat at higher temperature. At the sometime the difference ($c_p - c_v = R$) remains constant. But their ratio (c_p/c_v) decreases with increase in temperature.

The Otto cycle with the constant specific heat is represented by solid lines and the dotted lines represents the Otto cycle with the variable specific heats. So at the end of the compression, p_2 will be greater than $p_2'(p_2 > p_2')$ and at the end of the heat addition, p_2 will be greater than $p_3'(p_3 > p_3')$.



27. Air standard analysis of high speed diesel engines can be done using-

(a) Otto cycle
(b) Diesel cycle
(c) Dual combustion cycle
(d) None of the above

CIL MT 27.02.2020
GPSC Lect. (Auto) 16.10.2016

Ans. (c) : Air standard analysis of high speed diesel engines can be done by using dual combustion cycle.

28. Efficiency of Diesel cycle depends on

(a) Compression ratio
(b) Compression ratio and cutoff ratio
(c) Cut off ratio
(d) Cut off and pressure ratio

GMB AAE 25.06.2017, TNPSC AE 2013

Ans. (b) : Efficiency of diesel cycle depends on compression ratio and cut off ratio

$$\eta_{diesel} = 1 - \frac{1}{r^{(\gamma-1)}} \frac{\left(\rho^{\gamma} - 1\right)}{\gamma(\rho - 1)}$$

$$\eta_{diesel} = f(r, \rho)$$

Where r = Compression ratio
ρ = Cutoff ratio

29. Thermal efficiency of Otto cycle _____that of Brayton cycle for the given same compression process

(a) Same as (b) less than
(c) greater than (d) not comparable to

APPSC AEE MAINS 2016 PAPER-III
UPPSC AE 12.04.2016 Paper-II

Ans. (a) : For same compression ratio (r), thermal efficiency of Otto cycle same as Brayton cycle.

$$\eta_{Otto} = 1 - \frac{1}{r^{(\gamma-1)}}$$

$$\eta_{Brayton} = 1 - \frac{1}{(r_p)^{(\gamma-1)/\gamma}}$$

Where r = Compression ratio
r_P = Pressure ratio

We know that

$$r_p = r^{\gamma}$$

$$\left[\frac{P_2}{P_1}\right] = \left[\frac{V_1}{V_2}\right]^{\gamma}$$

$$\eta_{Brayton} = 1 - \frac{1}{(r)^{\gamma\times(\gamma-1)/\gamma}}$$

$$= 1 - \frac{1}{r^{\gamma-1}}$$

Then,

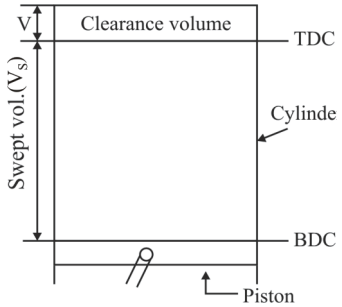
$$\eta_{Brayton} = \eta_{Otto}$$ (For same compression ratio)

30. The stroke of an engine is the

(a) volume of the cylinder
(b) length of the connecting rod
(c) internal diameter of the cylinder
(d) distance between TDC and BDC

Kerala PSC Poly. Lect. (Auto) 05.05.2016
TSPSC AEE 2015

Ans. : (d) The stroke of an engine is the distance between TDC and BDC



Distance between TDC to BDC is called stroke length

$$V_s = \frac{\pi}{4} D^2 \times L_s$$

V_s = Swept volume
L_s = stroke length
D = Bore diameter

31. The bore and stroke of the cylinder of a six cylinder engine working on an Otto cycle are 17 cm and 30 cm respectively, total clearance volume is 9225 cm^3, and then what is the compression ratio?

(a) 7.8 (b) 6.2
(c) 15.8 (d) 5.4

RPSC Lect. (Tech. Edu. Dept.) 2011
ESE 2009

Ans. (d) : (C.R.) Compression Ratio

$$= \frac{\text{Volume of the cylinder (total)}}{\text{Clearance volume}}$$

Clearance volume (V_C) = 9225 cm^3
Volume of the Cylinder (Total) $V_T = V_S + V_C$

V_S = Swept volume = $\frac{\pi}{4} D^2 \times L \times n$

D = Diameter of bore, L = Length of the bore
n = No. of cylinder.

$$C.R. = \frac{V_T}{V_C} = \frac{V_s + V_c}{V_c} = \frac{9225 + \frac{\pi}{4}(17)^2 \times 30 \times 6}{9225}$$

C.R. = 5.4

Search on Telegram @apna_pdf

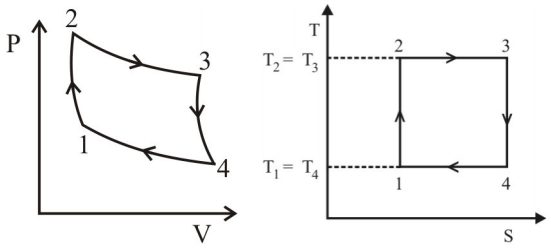
32. If both Stirling and Carnot cycles operate within the same temperature limilt, then the efficiency of Stirling cycle as compared to Carnot cycle is

(a) more (b) less
(c) equal (d) anything, more or less

WBPSC AE, 2017
APPSC AEE MAINS 2016 PAPER-III

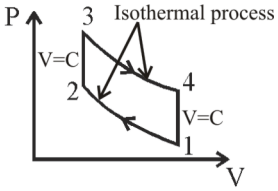
Ans. (c) : • A Carnot cycle consists of four process :- Two isothermal process and two isentropic process

$$\eta_{Carnot} = \frac{T_3 - T_1}{T_3}$$



• Stirling cycle is the modified form of Carnot cycle. Stirling cycle consists of the reversible isothermal and two reversible constant volume (isochoric) process.

$$\eta_{Stirling} = \frac{T_3 - T_1}{T_3}$$



Which is same, as Carnot efficiency.

33. An ideal air standard Otto cycle has a compression ratio of 8.5. If the ratio of the specific heats (γ) is 1.4, then what is the thermal efficiency (in percentage) of the Otto cycle?

(a) 57.5 (b) 45.7
(c) 52.5 (d) 95

VIZAG STEEL MT 10.06.2012
GATE 2002

Ans. (a) : Given r = 8.5, $\gamma = 1.4$

$$\eta_{Otto} = \left(1 - \frac{1}{r^{\gamma-1}}\right) \times 100$$

$$= \left(1 - \frac{1}{8.5^{1.4-1}}\right) \times 100$$

$$\boxed{\eta_{Otto} = 57.5\%}$$

34. Thermal efficiency of a diesel cycle having fixed compression ratio, with increase in cut-off ratio will :

(a) Increase
(b) Decrease
(c) Independent
(d) May increase or decrease depending on the other factors

Kerala PSC AE (Irrigation) 05.04.2017
KPSC ADF 2015

Ans. (b) : In case of a diesel cycle having fixed compression ratio, with increase in cut-off ratio (r_c) thermal efficiency decreases.

$$\text{Efficiency } (\eta) = 1 - \frac{1}{(r)^{\gamma-1}}\left(\frac{r_c^{\gamma} - 1}{\gamma(r_c - 1)}\right)$$

where, r_c = cut off ratio

$$\boxed{r_c \uparrow \eta \downarrow}$$

35. In a two-stroke cycle engine the operations namely suction compression, expansion, exhaust are completed in the number of revolutions of crankshaft equal to

(a) Four (b) Three
(c) Two (d) One

GPSC DEE, Class-2 (GWSSB) 04.07.2021
Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : In a two-stroke cycle engine the operations namely suction compression, expansion, exhaust are completed in the number of revolutions of crankshaft equal to one revolution.

36. A gas engine has a swept volume of 300 cm^3 and its volumetric efficiency is 0.88 and mechanical efficiency is 0.90. The volume of mixture taken in per stroke is

(a) 248 cm^3 (b) 252 cm^3
(c) 264 cm^3 (d) 286 cm^3

ISRO Scientist/Engineer (RAC) 22.04.2018
ESE 1995

Ans. (c) : We know that volumetric efficiency is given by

$$\eta_{vol} = \frac{\text{Actual Volume of mixture taken per stroke (V)}}{\text{Swept Volume } (V_S)}$$

$$0.88 = \frac{V}{V_S} = \frac{V}{300}$$

$$\boxed{V = 264\,cm^3}$$

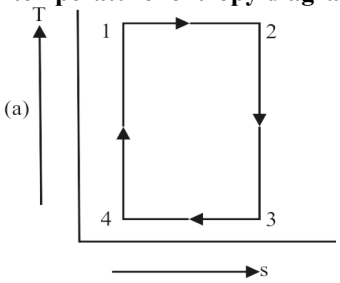
37. In case of diesel cycle, increasing the cutoff ratio will increase

(a) Efficiency
(b) Mean effective pressure
(c) The maximum pressure
(d) The engine weight

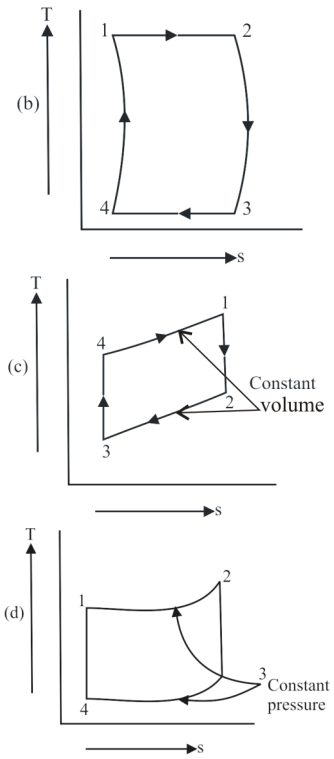
TSPSC Managers, 2015, TSPSC AEE 2015

Ans. (b) : Mean effective pressure will increase in case of diesel cycle if increasing the cut off ratio.

38. Which of the following represents Otto cycle on temperature- entropy diagram?



Search on Telegram @apna_pdf



Ans. (c) :

39. The air standard otto cycle comprises

(a) Two constant pressure processes and two constant volume processes.

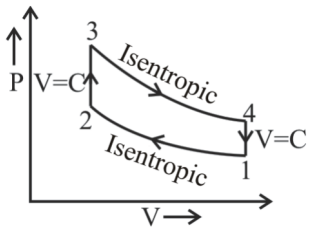
(b) Two constant pressure processes and two constant entropy processes.

(c) Two constant volume processes and two constant entropy processes

(d) None of the above.

Nagaland PSC CTSE 2017 Paper-2
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : Otto Cycle –



1-2– Isentropic compression

2-3– Constant volume Heat addition.

3-4 – Isentropic expansion

4-1 –Constant volume Heat rejection.

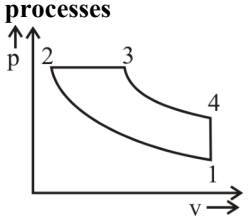
$$\eta_{otto} = 1 - \frac{1}{r^{\gamma-1}}$$

Compression ratio (r) = $\frac{V_1}{V_2} = \frac{V_s + V_c}{V_c}$

Where, V_s = Swept volume

V_c = Clearance volume

40. An air standard Diesel cycle consists of the following processes



1-2: Air is compressed isentropically

2-3: Heat is added at constant pressure

3-4: Air expands isentropically to the original volume

4-1: Heat is rejected at constant volume

If γ and T denotes the specific heat ratio and temperature respectively the efficiency of the cycle is

(a) $1-\frac{T_4-T_1}{\gamma(T_3-T_2)}$ (b) $1-\frac{T_4-T_1}{T_3-T_2}$

(c) $1-\frac{\gamma(T_4-T_1)}{T_3-T_2}$ (d) $1-\frac{T_4-T_1}{(\gamma-1)(T_3-T_2)}$

Assam Engg. College AP/Lect. 18.01.2021
GATE 2015

Ans. (a) : $\eta = 1 - \frac{Q_{rejection}}{Q_{supplied}}$

$= 1 - \frac{mc_v(T_4-T_1)}{mc_P(T_3-T_2)}$

$= 1 - \frac{T_4-T_1}{\frac{c_p}{c_v}(T_3-T_2)} \quad \left[\because \gamma = \frac{C_p}{C_v}\right]$

$\eta = 1 - \frac{T_4-T_1}{\gamma(T_3-T_2)}$

41. Match List-I (details of the processes of the cycle) with List-II (name of the cycle) and select the correct answer using the codes given below the List:

List I		List II	
A	**Two isothermals and two constant volumes**	**1**	**Carnot**
B	**Two isentropic and two constant volumes**	**2**	**Joule**
C	**Two isentropic and two constant pressures**	**3**	**Otto**
D	**Two isothermals and isentropic**	**4**	**Diesel**
		5	**Striling**

(a) A-5, B-3, C-1, D-2 (b) A-5, B-3, C-2, D-1

(c) A-3, B-4, C-2, D-1 (d) A-5, B-4, C-2, D-1

Nagaland PSC CTSE 2015 Paper-II
CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) :

Cycle	**Processes**
Stirling cycle	Two isothermal and two constant volumes.
Otto cycle	Two isentropic and two Constant Volume

Search on Telegram @apna_pdf

Diesel cycle	Two isentropic and one Constant Pressure and one constant volume
Carnot cycle	Two isothermals and two isentropic
Joule cycle	Two constant Pressure and two isentropic

42. Which factor leads to lower thermal efficiency on an actual Otto cycle in comparison of ideal Otto cycle?

(a) Increase in specific heat ratio of working fluid with rise in temperature.
(b) Decrease in specific heat ratio of working fluid with rise in temperature.
(c) Decrease in specific heat of working fluid with rise in temperature.
(d) No change in specific heat with change in temperature.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

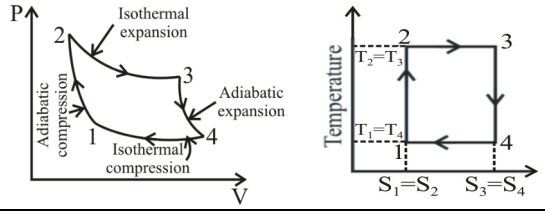
Ans. (b): Actual Otto cycle is less efficient than ideal Otto cycle because in actual cycle specific heat ratio decreases as temperature increases while in ideal cycle remains constant.

43. The air standard cycles which consist of two isothermal process and two isentropic process:

(a) Carnot cycle (b) Diesel cycle
(c) Otto cycle (d) Ericsson cycle

VIZAG Steel MT 24.01.2021 Shift-II

Ans. (a) : The air standard cycle of carnot, consists of two isothermal process and two isentropic process.



44. The stroke volume is 500 cc. The clearance is 50 cc. The compression ratio is

(a) 10 (b) 11
(c) 9 (d) 15

JPSC AE, 10.04.2021, Paper-I

Ans. (b) : Given, $V_S = 500$ cc
$V_C = 50$ cc

$$\text{Compression ratio, } r = \frac{V_S + V_C}{V_C} = \frac{V_1}{V_2}$$

$$r_C = \frac{550}{50}$$

$$\boxed{r_C = 11}$$

45. Lenoir cycle is used for

(a) Gas turbines (b) Pulse jet engines
(c) S.I engines (d) C.I engines

ESE 18.07.2021

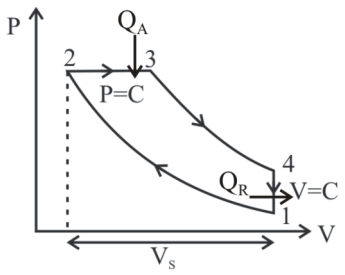
Ans. (b) : Gas turbine → Brayton cycle
S.I. engine → Otto cycle
C.I engine → Diesel cycle
Pulse jet engine → Lenoir cycle.

46. A diesel engines has a compression ratio of 20 and cut-off takes place at 5% of the stroke. What is the cut-off ratio

(a) 1.21 (b) 1.47
(c) 1.73 (d) 1.95

ESE 18.07.2021

Ans. (d) :



$$\frac{V_1}{V_2} = 20 = r \qquad (r = \text{compression ratio})$$

$$V_3 - V_2 = \frac{5}{100}(V_1 - V_2)$$

$$\frac{V_3}{V_2} - 1 = \frac{5}{100}\left(\frac{V_1}{V_2} - 1\right)$$

$$\text{or } \frac{V_3}{V_2} = \frac{1}{20}(20-1) + 1 = \frac{19}{20} + 1$$

$$= 1.95$$

47. The cubic capacity of a four-stroke oversquare spark-ignition engine is 275 cc. The clearance volume is 25 cc. What is the compression ratio of the engine?

(a) 8 (b) 10
(c) 12 (d) 14

ESE 18.07.2021

Ans. (c) : Given, swept volume, $V_s = 275$ cc
Clearance volume, $V_c = 25$ cc

$$\text{Clearance ratio (C)} = \frac{V_c}{V_s}$$

$$= \frac{25}{275} = \frac{1}{11}$$

$$\text{Compression ratio (r)} = 1 + \frac{1}{C}$$

$$= 1 + 11$$

$$r = 12$$

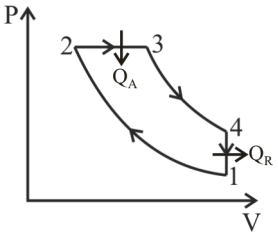
48. An ideal air-standard diesel engine has a compression ratio of 14:1. The state of air at the beginning of the compression stroke is 400 kPa and 400 K. The highest temperature during the cycle is 1500 K. Assume air to be an ideal gas with constant specific heats. The gas constant of air is R = 0.287 kJ/kg-K and specific heat at constant volume, c_v = 0.717 kJ/kg-K. Air temperature at the end of the compression stroke is:

(a) 1050K (b) 1500K
(c) 1149.51K (d) 560K

AAI Jr. Executive 26.03.2021

Search on Telegram @apna_pdf

Ans. (c)



Given, $r_c = 14$
$P_1 = 400$ kPa
$T_1 = 400$ k
$T_3 = 1500$ k

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} = (r_c)^{\gamma-1}$$

$$\frac{T_2}{400} = (14)^{1.4-1} \quad [\gamma = 1.4]$$

$T_2 = 400 \times (14)^{0.4}$
$T_2 = 1149.51$ K
Air temperature at end of compression stroke.

49. The following conclusion on efficiency (η) of gas power cycles working between same temperature limits can be drawn
(a) $\eta_{carnot} < \eta_{stirling} < \eta_{ericsson}$
(b) $\eta_{carnot} > \eta_{stirling} > \eta_{ericsson}$
(c) $\eta_{ericsson} < \eta_{stirling} < \eta_{carnot}$
(d) $\eta_{carnot} = \eta_{stirling} = \eta_{ericsson}$

GPSC DEE, Class-2 (GWSSB) 04.07.2021

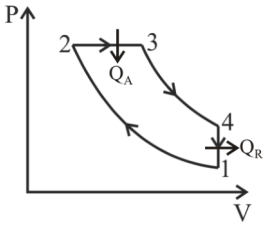
Ans. (d) : gas power cycles working between same temperature

$$\eta_{carnot} = \eta_{stirling} = \eta_{ericsson}$$

50. A compression ignition engine working on an air standard Diesel cycle has the following particulars
Cylinder bore = 15 cm
Stroke = 25 cm
Clearance volume=400 cm³
The fuel injection takes place at a constant pressure of 5% of the stroke. The cut off ratio will be about
(a) 0.82 (b) 1.55
(c) 2.1 (d) 12.0

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (b) :



$$V_s = \frac{\pi}{4} d^2 \ell$$

$$= \frac{\pi}{4} \times (15)^2 \times 25 \text{cm}^3$$

$= 4417.86$ cm³
$V_c = 400$ cm³

$$r = 1 + \frac{V_s}{V_c}$$

$$= 1 + \frac{4417.86}{400}$$

$r = 12.04$
ρ = Cut off at 5% of stroke
$\therefore \quad V_3 - V_2 = 0.05 \times V_s$
$\therefore \quad V_3 = V_c + 0.05\ V_s$
$= 620.90$ cm³

$$\rho = \frac{V_3}{V_2} = \frac{620.90}{400}$$

$\rho = 1.55$

51. In a dual cycle of limited pressure air standard cycle at fixed compression ratio, the heat added at constant volume is x and at constant pressure is y. Also x + y = constant. Choose the correct statement.
(a) If y is increased, thermal efficiency is increased
(b) If x = y, the thermal efficiency is maximum
(c) If x is increased, the thermal efficiency is increased
(d) All the above statements are true

CGPSC AE 15.01.2021

Ans. (c) :

52. The thermal efficiency of the dual combustion cycle depends on _____.
(a) Compression ratio, cutoff ratio and pressure ratio together
(b) Only Compression ratio and cutoff ratio
(c) Only pressure ratio and cutoff ratio
(d) Only Compression ratio

VIZAG Steel MT 24.01.2021 Shift-II

Ans. (a) : The thermal efficiency of dual combustion cycle depends on compression ratio, cutoff ratio and pressure ratio together.

$$\eta_{dual} = 1 - \frac{1}{r^{\gamma-1}} \left[\frac{r_p (r_c^{\gamma} - 1)}{(r_p - 1) + \gamma r_p (r_c - 1)} \right]$$

r = Compression ratio
r_c = Cutoff ratio
r_p = Pressure ratio or explosion ratio

53. The cylinder of an IC engine has 40 cm bore and 50 cm stroke. The clearance is 2832 cm³. The swept volume of the engine is
(a) 600000 cm³ (b) 30000 cm³
(c) 6000 cm³ (d) 60000 cm³

Assam PSC AE (PHED), 18.10.2020

Ans. (d) : Swept volume = Total volume – Clearance volume

Total Volume = $\pi r^2 h$
$= \pi \times 20 \times 20 \times 50$
$= 62831.85$ cm³
Swept volume = 62831.85 – 2832
= 59999.85
Swept volume ≈ 60000 cm³

Search on Telegram @apna_pdf

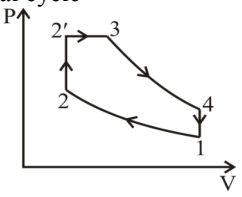
54. Which of the following is true for dual cycle? [x = compression ratio, y=expansion ratio, z = cut-off ratio]

(a) $x = yz$ (b) $x = y + z$

(c) $x = y/z$ (d) $x = y - z$

APPSC Poly Lect. 13.03.2020

Ans. (a) : For dual cycle –



Compression ratio (x) $= \frac{V_1}{V_2}$

Expansion ratio(y)= $\frac{V_4}{V_3}$

Cutt off ratio (z) $= \frac{V_3}{V_{2'}} = \frac{V_3}{V_2}$

Expansion Ratio (y) $= \frac{V_4}{V_3} = \frac{V_1}{V_3} = \frac{V_1}{V_2} \times \frac{V_2}{V_3}$

$$y = x \times \frac{1}{z} = \frac{\text{Compression Ratio}}{\text{Cut off Ratio}}$$

$\therefore$ Compression ratio (x)

= Expansion ratio (y) × Cut-off ratio(z)

$\Rightarrow \boxed{x = yz}$

55. Compression ratio of an internal combustion engine is defined as _____ . [V_S = Swept volume, V_C = Clearance volume]

(a) $\frac{V_c + V_s}{V_s}$ (b) $\frac{V_c}{V_s + V_c}$

(c) $\frac{V_c + V_s}{V_c}$ (d) $\frac{V_s}{V_c}$

APPSC Poly Lect. 13.03.2020

Ans. (c) : Compression ratio (r) $= \frac{V_c + V_s}{V_c}$

Where ;

V_c = clearance volume

V_s = swept volume

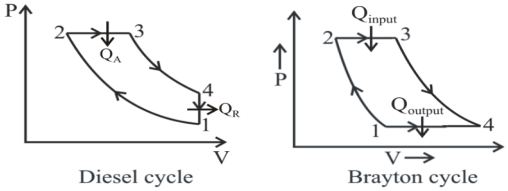
56. The difference between Diesel cycle and Brayton cycle is in the following process :

(a) Heat addition (b) Expansion

(c) Heat rejection (d) Compression

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : In Brayton cycle heat is rejected at constant pressure. In diesel heat is rejected of constant volume.



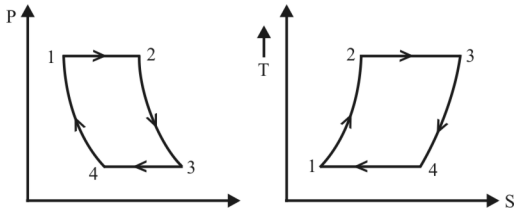
57. Which does not constitute the theoretical cycle for the working of a practical I.C. engine?

(a) Otto Cycle (b) Diesel Cycle

(c) Dual Cycle (d) Ericsson Cycle

TSPSC Manager (Engg.) HMWSSB 12.11.2020

Ans. (d) : Ericsson Cycle– It has two constant pressure processes and two reversible isotherms.



- Basic Ericsson cycle is externally irreversible.
- By incorporating a perfect heat exchanger, it is made reversible and efficiency equal to carnot cycle.

58. Which of the following uses a regenerator?

(a) Brayton cycle (b) Ericsson cycle

(c) Stirling cycle (d) Both (b) and (c)

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : Stirling and Ericsson cycle sometime called the regenerative cycle, a heat exchanger which utilizes waste heat.

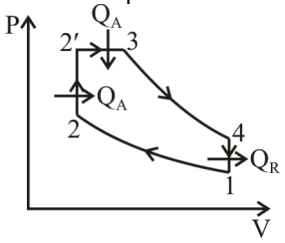
59. An ideal cycle based on the concept of combination of two heat transfer processes, one at constant volume and the other at constant pressure, is called

(a) Otto cycle (b) Dual cycle

(c) Diesel cycle (d) Carnot cycle

ESE 2020

Ans. (b) : In a dual cycle a part of the heat is first supplied to the system at constant volume and then the remaining part at constant pressure.



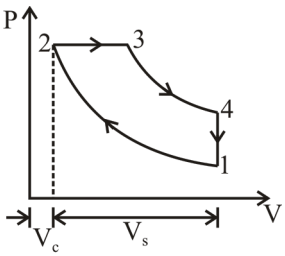
60. A diesel engine has a compression ratio of 16 and cut-off takes place at 6% of the stroke. What will be the cut-off ratio?

(a) 1.6 (b) 1.9

(c) 2.1 (d) 2.4

APPSC Poly Lect. 13.03.2020

Ans. (b) :



Diesel cycle

$(V_3 - V_2) = x\%$ of $(V_1 - V_2)$

Search on Telegram @apna_pdf

$$\left(\frac{V_3}{V_2}-1\right)=0.06\times\left(\frac{V_1}{V_2}-1\right)$$

$(\rho - 1) = 0.06 \times (r - 1)$ $(\rho = V_3/V_2,\ r = V_1/V_2)$

$\rho - 1 = 0.06 \times (16 - 1)$ (Given, r = 16)

$\rho - 1 = 0.06 \times 15$

$\rho = 1 + 0.9$

$\boxed{\rho = 1.9}$

61. A mass of 1 kg of air at 27ºC and 0.98 atm is taken through a diesel cycle. If the compression ratio of the engine is 16, calculate the temperature of the air after compression? (for calculation, take the ratio of specific heats of air as 1.5)

(a) 1200 deg C (b) 1473 deg C

(c) 927 deg C (d) 768 deg C

ISRO Scientist/Engineer 12.01.2020

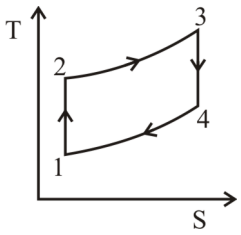
Ans. (c) : m = 1kg of air

$T_1 = 27ºC = 300$ K

$P = 0.98$ atm $= 0.98 \times 101.325$ kPa

$r_c = 16$ $T_2 = ?$

$n = 1.5$



Compression is isentropic process,

$$\frac{T_2}{T_1}=\left(\frac{V_1}{V_2}\right)^{(n-1)}=(r_c)^{n-1}$$

$$\frac{T_2}{T_1}=16^{0.5}=4$$

$T_2 = 4 \times 300 = 1200$ K

$T_2 = 1200 - 273 = 927ºC$

62. In an engine working on an ideal Otto cycle, the temperature at the beginning and at the end of compression are 300 K and 600 K respectively. What will be the air standard efficiency of the engine? [Consider $\gamma = 1.4$]

(a) 50% (b) 45%

(c) 55% (d) 40%

SJVN ET 2019

Ans. (a) : Given,

$T_1 = 300$ K

$T_2 = 600$ K

$$\frac{T_1}{T_2}=\left(\frac{V_2}{V_1}\right)^{\gamma-1}$$

$$\frac{600}{300}=\left(\frac{V_1}{V_2}\right)^{1.4-1}$$

$$\frac{V_1}{V_2}=(2)^{\frac{1}{0.4}}$$

$$\frac{V_1}{V_2}=r_c=5.656$$

$$\eta_{otto}=1-\frac{1}{(r_c)^{r-1}}$$

$$=1-\frac{1}{(5.65)^{1.4-1}}$$

$= 49.99\%$

$= 50\%$

63. In an Otto cycle the compression ratio is 9 : 1 and the pressure and temperature at the beginning of the compression process are 100 KPa and 10^0 C respectively. The heat addition by combustion gives highest temperature as 2500 K. The highest cycle pressure is

(a) 7.95 MPa (b) 2.17Mpa

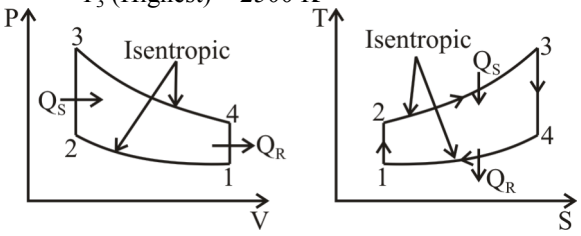
(c) 1.39 MPa (d) 8.50 MPa

BHEL ET 2019

Ans. (a) : Given, Compression ratio (r) $=\frac{9}{1}=9$

$P_1 = 100$ kPa, $T_1 = 10°C = 10 + 273 = 283$ K

T_3 (Highest) $= 2500$ K



For isentropic process, $PV^{\gamma} = \text{Constant}$

or $T_1V_1^{\gamma-1} = T_2V_2^{\gamma-1}$

$$\left(\frac{T_2}{T_1}\right)=\left(\frac{V_1}{V_2}\right)^{\gamma-1}=r^{\gamma-1}=9^{1.4-1}=9^{0.4}$$

$\therefore$ $T_1 \times 9^{0.4} = 283 \times 9^{0.4} = 681.527$ K

Also, $\frac{P_2}{P_1}=\left(\frac{V_1}{V_2}\right)^{\gamma}=9^{1.4}$

$\therefore$ $P_2 = P_1 \times 9^{1.4} = 100 \times 9^{1.4}$

$P_2 = 2167.4$ kPa

Now we know that,

From process, 2-3 i.e. V = Constant

$P \propto T$

i.e. $\frac{P_2}{P_3}=\frac{T_2}{T_3}$

$$\frac{2167.4}{P_3}=\frac{681.527}{2500}$$

$\boxed{P_3 = 7.95\,MPa}$

64. In an Otto cycle the compression ratio is 9 : 1 and the pressure and temperature at the beginning of the compression process are 100 kPa and 10^o C. The heat addition by combustion gives the highest temperature as 2500 K. Thermal efficiency of the cycle is :

(a) 68.47% (b) 48.57%

(c) 38.4% (d) 58.47%

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (d) : Given - Compression ratio $(r) = \frac{v_1}{v_2} = \frac{9}{1}$

air (γ) = 1.4

So, Otto cycle thermal efficiency

$$\eta_{th} = 1 - \frac{1}{(r)^{\gamma-1}}$$

$$= 1 - \frac{1}{(9)^{1.4-1}} = 1 - \frac{1}{9^{0.4}}$$

$$\eta_{th} = 0.5847 = 58.47\%$$

65. A 4-stroke reciprocating engine has cylinder diameter of 4 cm, stroke length of 7 cm and clearance volume 2 cm^3. The engine capacity in cc is:

(a) 110 (b) 252

(c) 400 (d) 352

BHEL ET 2019

Ans. (d) : Given - Diameter (d) = 4 cm

Stroke length (L) = 7 cm

Clearance volume (V_C) = 2 cm^3

Engine capacity in cc = Swept volume × No. of cylinder

$$= \frac{\pi}{4} \times d^2 \times L \times 4 = \frac{\pi}{4} \times 4 \times 4 \times 7 \times 4$$

$$= 351.85$$

$$\approx 352 \text{ cc}$$

66. In an Otto cycle the compression ratio is 9 : 1 and the pressure and temperature at the beginning of the compression process are 100 kPa and 10^o C. The heat addition by combustion gives the highest temperature as 2500 K. Specific heat added by combustion is :

(a) 0.762 MJ/kg (b) 1.303 MJ/kg

(c) 0.286 MJ/kg (d) 1.048 MJ/kg

BHEL ET 2019

Ans. (b) : Given -

In Otto cycle -

Compression ratio $(r) = \frac{9}{1}$

$$\frac{v_1}{v_2} = \frac{9}{1}$$

P_1 = 100 kPa, $T_1 = 10^0$ C = 273 + 10 = 283 K

T_3 = 2500 K

C_P= 1.005 kJ/kgK , C_V = 0.718 kJ/kgK. γ = 1.4

$$T_1 V_1^{\gamma-1} = T_2 V_2^{\gamma-1}$$

$$\frac{T_1}{T_2} = \left(\frac{V_2}{V_1}\right)^{\gamma-1}$$

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} = (9)^{1.4-1} = 9^{0.4}$$

$$\frac{T_2}{T_1} = 2.4082$$

$T_2 = 2.40822 \times 283$

$T_2 = 681.5275$ K

Specific heat addition by combustion -

$Q_{ha} = mC_v \times (T_3 - T_2)$

$= 1 \times 0.718 [2500 - 681.5275]$

$= 0.718 \times 1818.4724 = 1.305$ MJ/kg.

67. A diesel engine has a compression ratio of 14 and cutoff takes place at 6% of the stroke. The air standard efficiency will be

(a) 74.5% (b) 60.5%

(c) 52.5% (d) 44.5%

ESE 2019

Ans. (b) : Given,

r = 14

$(V_3 - V_2) = 0.06 (V_1 - V_2)$

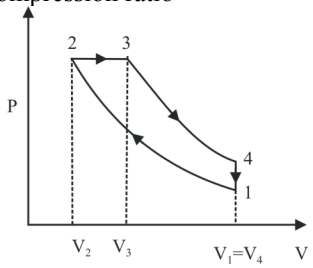
$$\left(\frac{V_3}{V_2} - 1\right) = 0.06\left(\frac{V_1}{V_2} - 1\right)$$

$(\rho - 1) = 0.06 (r - 1)$

$(\rho - 1) = 0.06 (14 - 1)$

$\rho = 1.78$

r = compression ratio



ρ = cut off ratio

$$\eta_{diesel} = 1 - \frac{1}{r^{\gamma-1}}\left[\frac{\rho^{\gamma} - 1}{\gamma(\rho - 1)}\right]$$

$$= 1 - \frac{1}{14^{(1.4-1)}}\left[\frac{1.78^{1.4} - 1}{1.4(1.78 - 1)}\right]$$

= 60.4%

68. An IC engine works with a compression ratio of 16. If cut off happens at 8% of the stroke, then the cut-off ratio of this engine is :

(a) 1.2 (b) 2.2

(c) 4.2 (d) 3.2

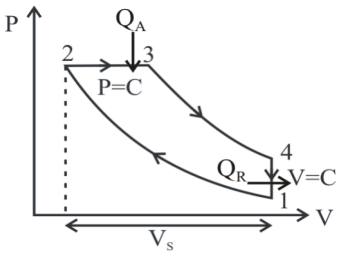
BHEL ET 2019

Ans. (b) : Given -

Compression ratio (r) = 16

cut-off ratio (ρ) = 8% of stroke

$$(V_3 - V_2) = \frac{8}{100} \times V_S$$



$V_3 - V_2 = 0.08 V_s$

$V_3 = 0.08 V_s + V_2$ ...(1)

compression ratio $r = 16 = \frac{V_c + V_s}{V_c}$

$16 V_c = V_c + V_s$

$15 V_c = V_s$

$$V_c = \frac{V_s}{15}$$

Search on Telegram @apna_pdf

$[\because V_c = V_2]$

$$V_2 = \frac{V_S}{15}$$

From equation (1)

$$V_3 = 0.08V_S + \frac{V_S}{15}$$

$$= \frac{1.2V_S + V_S}{15} = \frac{2.2V_S}{15}$$

$$\text{Cut-off ratio } (\rho) = \frac{V_3}{V_2} = \frac{\frac{2.2V_S}{15}}{\frac{V_S}{15}}$$

$$= \frac{2.2V_S}{15} \times \frac{15}{V_S}$$

$$\boxed{\text{cut} - \text{off ratio}(\rho) = 2.2}$$

69. Air enters diesel engine with a density of 1 kg/m^3. The compression ratio is 21. At steady state, the air intake is 21 × 10^{-3} kg/s and the network output is 20 kW. The Mean effective pressure (kPa) is :

(a) 500 (b) 1000
(c) 1500 (d) 2000

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (b) : Given, Compression ratio (r) = 21, ρ = 1kg/m^3,

m = 21 × 10^{-3}kg/sec.

$$r = \frac{V_s + V_c}{V_c} = 21$$

$$V_s = 20V_c \quad \ldots(i)$$

$$\text{Volume intake} = \frac{m}{\rho} = \frac{21\times10^{-3}}{1} = 21\times10^{-3}$$

$$V_s + V_c = 21\times10^{-3}$$

$$V_s + \frac{V_s}{20} = 21\times10^{-3}$$

$$V_s\left[1 + \frac{1}{20}\right] = 21\times10^{-3}$$

$$\boxed{V_s = 0.02}$$

Mean effective Pressure

$$P_{mean} = \frac{\text{work done}}{\text{swept volume}(V_s)}$$

$$= \frac{20\times10^3}{0.02}$$

$$= 1000000$$

$$\boxed{P_{mean} = 1000 \text{ kPa}}$$

70. The compression ratio of diesel engine as compared to expansion ratio is:

(a) Low
(b) Same
(c) High
(d) Depend on engine size

OPSC AEE 2019 PAPER - II

Ans. (c) : The compression ratio of diesel engine as compared to expansion ratio is high.

71. An IC engine having 6 cylinders, works on Otto cycle. It has a bore of 20 cm and a stroke 40 cm. If the clearance volume is 9000 cm^3, the compression ratio is :

(a) 10.03 (b) 8.53
(c) 9.38 (d) 7.33

BHEL ET 2019

Ans. (c) : Given - No. of cylinder = 6
Bore diameter (d) = 20 cm
Stroke (L) = 40 cm
Clearance volume (v_c) = 9000 cm^3

$$\text{Swept volume } (v_s) = \frac{\pi}{4}\times\left(20^2\right)\times40\times\text{No. of cylinder}$$

$$= \frac{\pi}{4}\times20\times20\times40\times6$$

$$v_s = 75398.2236 \text{ cm}^3$$

$$\text{Compression ratio (r)} = \frac{\text{Volume before compression}}{\text{Volume after compression}}$$

$$\text{Compression ratio (r)} = \frac{v_s + v_c}{v_c}$$

$$= \frac{75398.2236 + 9000}{9000}$$

$$= \frac{84398.223}{9000}$$

$$= 9.3775$$

$$\boxed{r = 9.38}$$

72. The crank radius of a single cylinder IC engine is (60/π) mm and diameter of the cylinder is 40 mm. The swept volume of the cylinder in cm^3 is:

(a) 48 (b) 58
(c) 68 (d) 78

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (a) : Given, Crank radius (r) $= \frac{60}{\pi} mm$

Bore dia (D) = 40 mm

$$\text{Swept volume } (V_s) = \frac{\pi}{4}D^2L$$

$$= \frac{\pi}{4}D^2\times(2r)$$

$$= \frac{\pi}{4}\times40^2\times2\times\frac{60}{\pi}$$

$$= 48000 \text{ mm}^3$$

$$\boxed{V_s = 48 \text{ cm}^3}$$

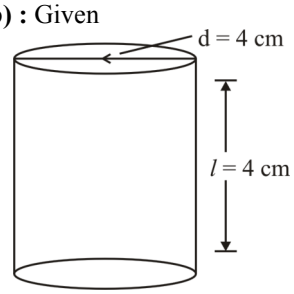
73. An IC engine has a bore and stroke length of 4 cm each. Total surface area through which heat transfer takes place in cm^2 is

(a) 18π (b) 24π
(c) 28π (d) 8π

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (b) : Given



Stroke length (ℓ) = 4 cm
bore diameter (d) = 4 cm
Heat transfer take place
at total surface area of cylinder

$= 2\pi r[r+\ell]$

$= 2\times\pi\times 2[2+4]$

$= 2\times\pi\times 2\times 6 \;\; = 24\pi \;\; cm^2$

74. The engine of a Lexus car has three cylinders with total displacement of 770 cc. If the compression ratio is 8.7, then each cylinder has a clearance volume of:

(a) 36.3 cc (b) 33.33 cc
(c) 44.4 cc (d) 3.33 cc

AAI Jr. Executive 29.11.2018

Ans. (b) : Compression Ratio = 8.7

$$CR = \frac{V_c + V_s}{V_c}$$

$$8.7 = \frac{V_c + V_s}{V_c}$$

$$8.7V_c = V_c + V_s$$

$$7.7V_c = 770$$

$$V_c = 100$$

$$\text{Each cylinder} = \frac{100}{3}$$

$$V_c = 33.33 \text{ cc}$$

75. Which one of the following cycles has the highest thermal efficiency for given maximum and minimum cycle temperature?

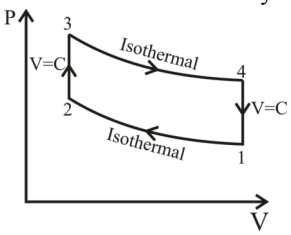
(a) Brayton cycle (b) Otto cycle
(c) Diesel cycle (d) Stirling cycle

GPSC ARTO Pre 30.12.2018

Ans. (d) : Stirling cycle has the highest thermal efficiency for given maximum and minimum cycle temperature.

Stirling cycle that features isothermal heat addition and heat rejection processes,

It is an alternate version of the carnot cycle.



76. Compression ratio of I.C. engine is .....

(a) the ratio of the volume of its combustion chamber from its largest capacity to its smallest capacity
(b) the ratio of clearance volumes available in the combustion cylinder
(c) the ratio of pressure after compression to pressure before compression
(d) the ratio of pressure before compression to pressure after compression

RPSC AE 2018

Ans. (a) : Compression ratio (r)—It is defined as the ratio of the volume of its combustion chamber from its largest capacity to its smallest capacity.

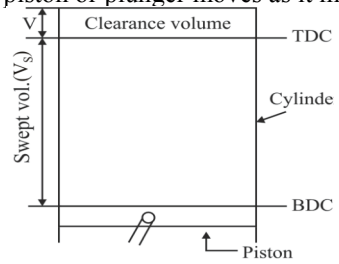
r = 7 - 12 (For SI Engine)
r = 12 - 17 (For Dual cycle Engine)
r = 16 - 21 (For CI Engine)

77. If V = volume at TDC and r = compression ratio. Then swept volume will be given by:

(a) $\frac{rV}{(r-1)}$ (b) $\frac{(r-1)v}{r}$
(c) Vr (d) (r – 1)V
(e) V ($r^2 - 1$)

CGPSC AE 25.02.2018

Ans. (d) : Swept Volume (V_S)– The volume through which a piston or plunger moves as it makes a stroke.



We know that compression ratio (r)

$$= \frac{V + V_S}{V}$$

$$r = 1 + \frac{V_S}{V}$$

$$\boxed{V_S = (r-1).V}$$

78. For the same maximum pressure and temperature

(a) Otto cycle is more efficient than Diesel cycle
(b) Diesel cycle is more efficient than Otto cycle
(c) Dual cycle is more efficient than Otto and Diesel cycle
(d) Dual cycle is less efficient than Otto and Diesel cycle

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (b) : For the same maximum pressure and temperature Diesel cycle is more efficient than otto cycle.

$\eta_{diesel} > \eta_{dual} > \eta_{otto}$

79. The two stroke cycle engine has

(a) one suction valve and one exhaust valve operated by one cam
(b) one suction valve and one exhaust valve operated by two cams

Search on Telegram @apna_pdf

(c) only ports covered and uncovered by piston to effect charging and exhausting
(d) none of the above

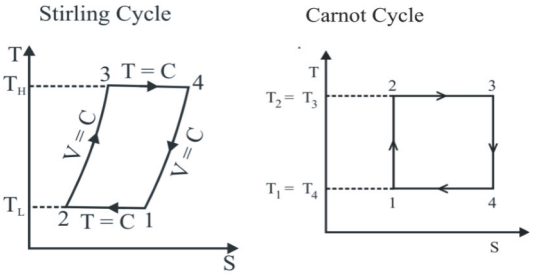
Nagaland PSC CTSE 2017 Paper-2

Ans. (c) : Two-stroke cycle has only ports covered and fin covered by piston to effect charging and exhausting.

80. Which of the following ideal cycles has the same efficiency as Stirling cycle?
(a) Diesel cycle (b) Otto cycle
(c) Joule cycle (d) Carnot cycle
(e) Dual cycle

CGPSC ARTO & TSI 07.01.2017

Ans. (d) :



$$\eta = 1 - \frac{T_L}{T_H}$$

81. Otto cycle efficiency is higher than diesel cycle efficiency for the same compression ratio and heat input because in Otto cycle.
(a) Combustion is at constant volume
(b) Expansion and compression are isentropic
(c) Maximum temperature is higher
(d) Heat rejection is lower

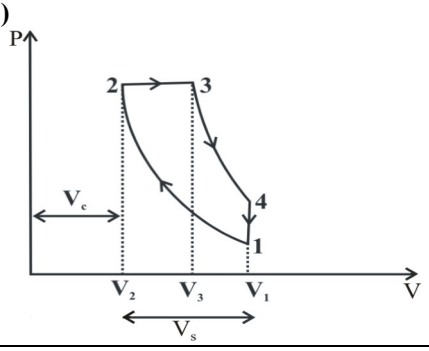
TSPSC AEE 2017

Ans. (d) : Although for a given compression ratio the Otto cycle has higher efficiency, because diesel engine, can be operated to higher compression ratio.
But for the same compression ratio and heat input the otto cycle efficiency is higher than diesel cycle due to heat rejection is lower so its increases Otto cycle efficiency.

82. In a diesel engine, the compression ratio is 13 : 1 and the fuel is cut-off at 8% of the stroke. γ for air = 1.4 and assuming the clearance volume = 1 m^3, the cut-off ratio is
(a) 1.51 (b) 1.96
(c) 0.196 (d) 0.51

Karnataka PSC AE, 10.09.2017

Ans. (b)



Compression ratio (r) = 13

$$r = \frac{V_1}{V_2} = 13$$

$$\text{Cutt-off}\,(\rho) = \frac{V_3}{V_2}$$

Given, $V_3 - V_2 = 0.08(V_1 - V_2)$

$V_3 = 0.08V_1 + 0.92V_2$

$V_3 = 0.08 \times 13V_2 + 0.92V_2$

$$\rho = \frac{V_3}{V_2} = 1.96$$

83. Increasing the compression ratio of Otto engine from 5 to 6 will change the air-standard efficiency by
(a) 20% (b) 8%
(c) 25% (d) –20%

GPSC Asstt. Director of Transport 05.03.2017

Ans. (b) : Given, $C.R_1 = r_1 = 5$ Let $\gamma = 1.4$

$C.R_2 = r_2 = 6$

Case-I $\eta_{otto} = 1 - \frac{1}{r^{\gamma-1}}$

$$\eta_I = 1 - \frac{1}{5^{1.4-1}} = 47.5\%$$

Case-II $\eta_{II} = 1 - \frac{1}{6^{1.4-1}} = 51.2\%$

$\eta_{II} - \eta_I = 51.2 - 47.5$

$= 3.7\%$

$$\% \text{ change in efficiency} = \frac{51.2 - 47.5}{47.5}$$

$= 7.8\% \approx 8\%$

84. An Engine operating on Otto cycle is having a thermal efficiency of 0.3 and relative efficiency of 0.5. The air-standard efficiency of the cycle is
(a) 0.15 (b) 0.2
(c) 0.6 (d) 0.8

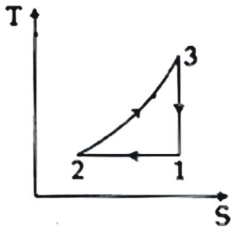
GPSC Asstt. Director of Transport 05.03.2017

Ans. (c)

$$\text{Relative efficiency} = \frac{\text{Indicated thermal efficiency}}{\text{Air standard efficiency}}$$

$$0.5 = \frac{0.3}{\eta_{air}} \Rightarrow \eta_{air} = 0.6$$

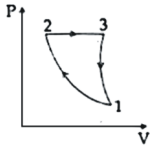
85. An ideal air standard cycle is shown in figure.



Search on Telegram @apna_pdf

(a) 
(b) 
(c) 
(d) 
TRB Polytechnic Lecturer 2017

Ans. (a)



86. The work output of theoretical Otto cycle
- (a) Increases with increase in compression ratio
- (b) Increases with increase in pressure ratio
- (c) Increases with increase in adiabatic index
- (d) Follows all the above

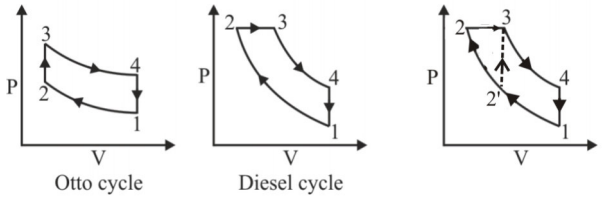
Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : Work output of theoretical otto cycle increase with increasing compression ratio, as well increases with increase in pressure ratio and increases with increase in adiabatic index.

87. If the maximum pressure in both air standard Otto and Diesel cycles is the same, then the relations for compression ratio r and the efficiency η between the two cycles are
- (a) $r_{Diesel} > r_{Otto}$ and $\eta_{Diesel} > \eta_{Otto}$
- (b) $r_{Otto} > r_{Diesel}$ and $\eta_{Diesel} > \eta_{Otto}$
- (c) $r_{Diesel} > r_{Otto}$ and $\eta_{Otto} > \eta_{Diesel}$
- (d) $r_{Otto} > r_{Diesel}$ and $\eta_{Otto} > \eta_{Diesel}$

ESE 2017

Ans. (a) :



Process 1 – 2 – 3 – 4 – 1 Diesel cycle
Process 1 – 2' – 3 – 4 – 1 Otto cycle
Compression ratio, $r_{diesel} > r_{otto}$
In this case by considering same maximum pressure and heat input or same maximum pressure and work output compression ratio and efficiency of diesel cycle is more than otto cycle.

88. The air standard efficiency of Ericsson cycle for same temperature limits is equal to the efficiency of:
- (a) Otto cycle
- (b) Rankine cycle
- (c) Carnot cycle
- (d) Dual cycle

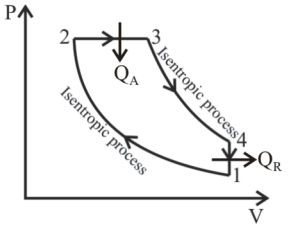
PTCUL AE 25.06.2017

Ans. (c) :

89. Cut-off ratio which is used to describe the diesel engine performance is defined as:
- (a) Volume at the start of heat addition/volume at the end of heat addition
- (b) Pressure at the start of heat addition/Pressure at the end of heat addition
- (c) Volume at the end of heat addition/volume at the start of heat addition
- (d) Pressure at the end of heat addition/pressure at the start of heat addition

HPPSC AE (PWD) 10.09.2016

Ans. (c) : The cut-off ratio is the ratio of the volume after combustion to the volume before combustion.
Air standard diesel cycle



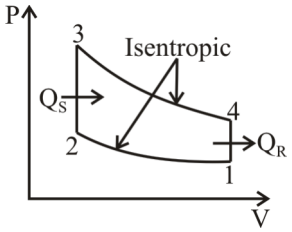
Compression ratio (r) $= \frac{V_1}{V_2}$

cut off ratio $(r_c) = \frac{V_3}{V_2}$

90. In an otto cycle, twice as much energy is generated per cycle as is rejected through the exhaust. What is the compression ratio? (for air , k = 1.4
- (a) 5.66
- (b) 7.66
- (c) 11.2
- (d) None of these

RPSC ADE 2016

Ans. (a) :



Efficiency of Otto cycle $= 1 - \frac{1}{(r)^{\gamma-1}}$

Efficiency $= \frac{\text{work output}}{\text{Heat supplied}} = \frac{\text{Heat generated - Heat rejected}}{\text{Heat supplied}} = \frac{2-1}{2}$

$\frac{1}{2} = 1 - \frac{1}{(r)^{1.4-1}}$ or r = compression ratio = 5.66

91. An otto cycle with a specific compression ratio is executed using air, argon, ethane and biogas. For which case will the thermal efficiency be highest?
- (a) Air
- (b) Argon
- (c) Ethane
- (d) Biogas

GPSC Lect. (Auto) 16.10.2016

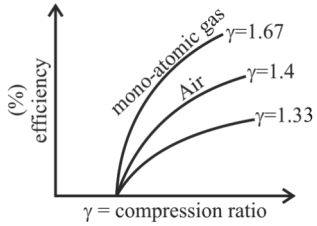
Search on Telegram @apna_pdf

Ans. (b) : $\eta_{otto} = 1 - \left(\frac{1}{r}\right)^{\gamma-1}$

For Argon $\gamma = 1.66$

Air $\gamma = 1.4$

As γ increases, efficiency also increases.

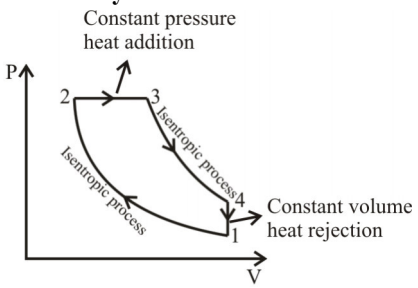


92. Air standard diesel cycle consist of :

(a) Constant volume heat addition
(b) Isothermal heat addition
(c) Adiabatic heat addition
(d) Constant pressure heat addition

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Diesel Cycle –



1-2 Isentropic compression.
2-3 Constant pressure heat addition.
3-4 Isentropic expansion.
4-1 Constant volume heat rejection.

$$\eta_{diesel} = 1 - \frac{(\rho^{\gamma} - 1)}{\gamma \cdot r^{(\gamma-1)} \cdot (\rho - 1)}$$

r = compression ratio = V_1/V_2

ρ = cut-off ratio $= \frac{V_3}{V_2}$

93. What is the Otto Cycle efficiency if the compression ratio is 8 and the ratio of the molar specific heats is 1.8?

(a) 19% (b) 81%
(c) 18% (d) None of these

KPCL AE 2016

Ans. (b) : Given, Compression ratio (r) = 8

$\gamma = 1.8$

$$\eta_{otto} = 1 - \frac{1}{r^{\gamma-1}}$$

$$= 1 - \frac{1}{(8)^{1.8-1}}$$

$$\eta_{otto} = 81.05\%$$

94. The dual combustion cycle is also known as the_____

(a) Trinkler cycle
(b) Seiliger cycle
(c) Limited pressure or mixed cycle
(d) All the above

KPCL AE 2016

Ans. (d) : Dual combustion cycle (also known as the mixed cycle, Trinkler cycle, Seiliger cycle or sabathe cycle) is a thermal cycle which is combination of the Otto cycle and the diesel cycle.

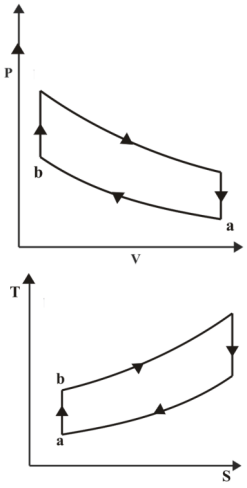
95. Thermal efficiency of Otto cycle can be represented by $\eta_{otto} = 1 - \frac{T_a}{T_b}$. Which of the following element is correct for state point a and b?

(a) Constant volume heat addition process will start from 'b'
(b) Constant volume heat rejection process will end at point 'b'
(c) Isentropic compression process will end at point 'a'
(d) Isentropic compression process will start from point 'b'

UPRVUNL AE 2016

Ans. (a) : The thermal efficiency of Otto cycle.

$$\eta_{Otto} = 1 - \frac{T_a}{T_b}$$



$$\eta_{otto} = 1 - \frac{1}{\left(\frac{T_b}{T_a}\right)}$$

$$\eta_{otto} = 1 - \frac{1}{(r_c)^{\gamma-1}}$$

It means that constant volume heat addition process will start from 'b' and adiabatic compression will start from point 'a' to point 'b'.

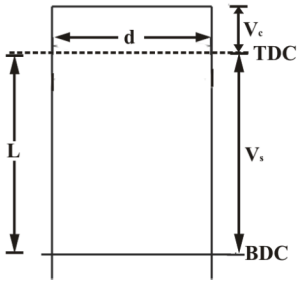
96. Swept volume of engine may be written as:

(a) $V_{BDC} - V_{TDC}$
(b) Volume of cylinder at BDC (V_{BDC})
(c) $V_{BDC} + V_{TDC}$
(d) Volume of cylinder at TDC (V_{TDC})

UPRVUNL AE 2016

Search on Telegram @apna_pdf

Ans. (a) : Swept volume of engine may be written as $V_{BDC} - V_{TDC}$



V_c = Clearance volume
V_s = Swept volume
d - Bore of cylinder
L - Stroke length

97. Thermal efficiency of diesel cycle is

(a) Reduced at high compression ratio for same cut off ratio and heat capacity ratio
(b) Independent of variation of cut off ratio and heat capacity ratio
(c) Reduced at higher cut off ratio for same compression ratio and heat capacity ratio
(d) Reduced at high heat capacity ratio for same compression ratio and cut off ratio

RPSC LECTURER 16.01.2016

Ans. (c) $\eta_{Diesel} = 1 - \frac{1}{r^{(\gamma-1)}} \times \frac{(\rho^{\gamma}-1)}{\gamma(\rho-1)}$

Thermal efficiency of diesel cycle is reduced at higher cut off ratio for same compression ratio and heat capacity ratio.

98. If stroke volume of engine = 300 cc. Clearance volume of engine = 20 cc. The compression ratio of engine will be

(a) 16 (b) 14
(c) 15 (d) 17

UPRVUNL AE 2016

Ans. (a) : Data given,
$V_s = 300$ cc
$V_c = 20$ cc
Then compression ratio (r_c)

$$r_c = \frac{V_s + V_c}{V_c}$$

$$r_c = 1 + \frac{V_s}{V_c} = 1 + \frac{300}{20}$$

$\boxed{r_c = 16}$

99. Air is compressed in a car engine from 22°C and 95 kPa in a reversible and adiabatic manner. If the compression ratio V_1/V_2 of this engine is 8, determine the final temperature of the air

(a) 632.7 K (b) 562.7 K
(c) 662.7 K (d) 762.7 K
(e) None of these

CGPSC AE 16.10.2016

Ans. (c) : $T_1 = 295$ K, $T_2 = ?$

$$\frac{V_1}{V_2} = 8$$

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1}$$

$$T_2 = (8)^{1.4-1} \times 295$$

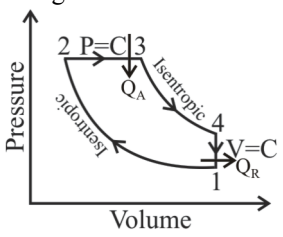
$T_2 = 662.7$ K

100. Diesel engine works on :

(a) Constant volume heat addition and constant volume heat rejection.
(b) Constant pressure heat addition and constant volume heat rejection
(c) Constant pressure heat addition and constant pressure heat rejection.
(d) None of the above

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : Diesel engines works on-



Process 2-3- const pressure heat addition.
Process 4-1- const volume heat rejection.

Efficiency of diesel engine, $\eta_{diesel} = 1 - \frac{1}{r^{\gamma-1}}\left[\frac{\rho^{\gamma}-1}{\gamma(\rho-1)}\right]$

Where, r = Compression ratio
ρ = Cut-off ratio

101. If compression ratio is increased :

(a) Thermal efficiency will be increased
(b) Polytropic efficiency will be increased
(c) Petrol efficiency will be decreased
(d) Air standard efficiency will be increased

HPPSC Lect. (Auto) 23.04.2016

Ans. (d) : Air standard efficiency

$$\boxed{\eta = 1 - \left(\frac{1}{r}\right)^{\gamma-1}}$$

with increase in compression ratio ($r\uparrow$), air standard efficiency ($\eta\uparrow$) will increased.
r = compression ratio
γ = specific heat ratio = C_p/C_v

102. A cross sectional area of a single cylinder engine by its stroke length is known as :

(a) Clearance volume
(b) Combustion volume
(c) Swept volume
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (c) : Swept Volume– Swept volume can be defined as the volume swept by the engine piston during one stroke. Swept volume is also the product of piston area and stroke

$$V_s = \frac{\pi}{4} D^2 \times L$$

Search on Telegram @apna_pdf

Where, D – Bore dia
L – Length of stroke

Clearance volume- Clearance volume can be defined as the volume that remains in the cylinder when the engine piston is at the top dead centre position.

103. If clearance volume of IC engines is increased, the compression ratio will

(a) Increase (b) Decrease
(c) Remain same (d) Be doubled

Assam PSC CCE Pre 2015

Ans. (b) :

Compression ratio, $r_c \downarrow = \frac{V_c \uparrow + V_s}{V_c \uparrow} = 1 + \frac{V_s}{V_c}$

If clearance volume of I.C. engines is increased, the compression ratio will decreases.

104. An Otto cycle on internal energy (U) and entropy (S) diagram is shown in

(a) 
(b)

(c)

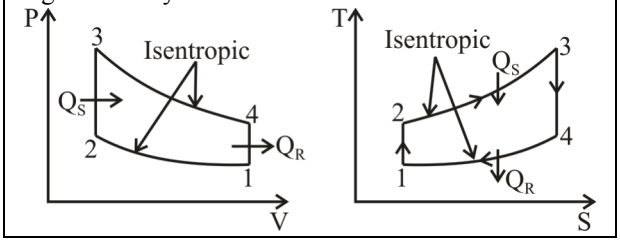
(d) 
Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : In air standard otto cycle air is used as working fluid which is considered as ideal gas.

We know,

For ideal gas (U) = f(T) only (Joule's law)

U-S diagram of otto cycle should be similar to T-S diagram otto cycle.



105. The temperature of interior surface of cylinder wall in normal operation is not allowed to exceed

(a) 80°C (b) 120°C
(c) 180°C (d) 240°C

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : The temperature of interior surface of cylinder wall in normal operation is not allowed to exceed 180°C.

106. A diesel and Otto cycle have the same compression ratio. The cutoff ratio of the cycle is 'S'. The air standard efficiency of the cycle will be equal when

(a) $S^r - r(S - 1) - 1 = 0$
(b) $S^r - r(S - 1) + 1 = 0$
(c) $S^r - r(S + 1) + 1 = 0$
(d) $S^r - r(S - 1) + r = 0$

TSPSC AEE 2015

Ans. (a) : If

$$\eta_{diesel} = \eta_{otto}$$

$$1 - \frac{1}{x^{(r-1)}} \frac{\left(S^r - 1\right)}{r\left(S-1\right)} = 1 - \frac{1}{x^{(r-1)}}$$

$$S^r - 1 = r\left(S-1\right)$$

$$\boxed{S^r - r\left(S-1\right) - 1 = 0}$$

107. The thermal efficiency of a diesel cycle can be increased by

(a) increasing both compression ratio and cutoff ratio
(b) decreasing both compression ratio and cutoff ratio
(c) decreasing compression ratio and increasing cutoff ratio
(d) increasing compression ratio and decreasing cutoff ratio

TSPSC AEE 2015

Ans. (d) : The thermal efficiency of a diesel cycle can be increase by increasing compression ratio and decreasing cutoff ratio (ρ):

$$\eta_{diesel} = 1 - \frac{1}{r^{(\gamma-1)}} \frac{\left(\rho^\gamma - 1\right)}{\gamma\left(\rho - 1\right)}$$

- $\uparrow\eta$ with $\uparrow$ r(compression ratio)
- $\uparrow\eta$ with $\downarrow$ ρ(cut-off)

108. Which gas power cycle consists of 4 processes during which work alone is transferred during two processes and heat alone is transferred during the other two processes?

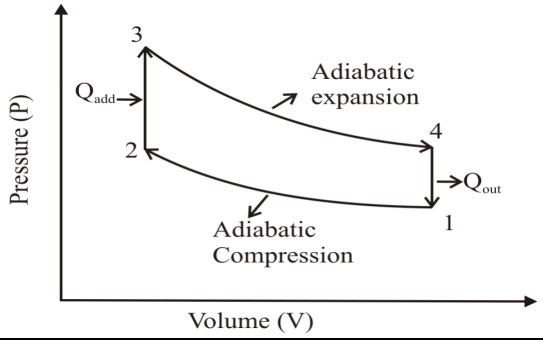
(a) Atkinson cycle (b) Carrot cycle
(c) Diesel cycle (d) Otto cycle

TSPSC Managers, 2015

Ans. (d) : Otto cycle-

- two constant volume process.
- two reversible adiabatic process.

Efficiency of otto cycle $\eta_o = 1 - \frac{1}{r^{\gamma-1}}$



109. The bore and stroke of the cylinder of a 6 cylinder engine working on an otto cycle are 20 cm and 30 cm respectively The total clearance volume is 3000π cm^3. What is the compression ratio?

(a) 5 (b) 6
(c) 7 (d) 8

TSPSC Managers, 2015

Search on Telegram @apna_pdf

Ans. (c) : Given- Bore diameter (d) = 20 cm
Stroke length (l) = 30 cm
No. of cylinder (n) = 6
total clearance volume (V_c) = 3000 π cm^3

$\therefore$ Swept volume = $n \times \frac{\pi}{4} \times d^2 \times l$

$= 6 \times \frac{\pi}{4} \times (20)^2 \times (30)$

$V_s = 18000\pi \text{ cm}^3$

We know that,

Compression ratio (r) $= \frac{V_s + V_c}{V_c}$

$(r) = \frac{18000\pi + 3000\pi}{3000\pi}$

$r = \frac{21000\pi}{3000\pi} = 7$

110. The thermal efficiency of Otto cycle increases with increase in
(a) Compression ratio
(b) Pressure ratio
(c) Adiabatic index
(d) All options are correct

MPPSC State Forest Service Exam, 2014

Ans. (d) : As we know, the thermal efficiency of otto cycle increase with increase in compression ratio, pressure ratio, adiabatic index.

$\Rightarrow \quad \eta_{otto} = 1 - \frac{1}{r^{\gamma-1}}$

- $\uparrow \eta_{otto}$ with $\uparrow$ r(compression ratio)
- $\uparrow \eta_{otto}$ with $\uparrow \gamma$
- $\uparrow \eta_{otto}$ with pressure ratio increases

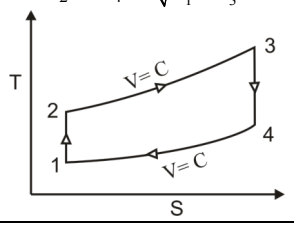
111. For maximum specific output an air standard Otto cycle.
(a) the working fluid should be air
(b) the speed be high
(c) suction temperature should be high
(d) temperature of the working fluid at the end of compression be the geometric mean of minimum and maximum temperature of cycle
(e) temperature of the working fluid at the end of compression be the arithmetic mean of minimum and maximum temperature of cycle.

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) For maximum specific output of an air standard Otto cycle temperature of the working fluid at the end of compression be the geometric mean of minimum and maximum temperature of cycle

For otto cycle $\rightarrow T_1 \times T_3 = T_2 \times T_4$

For max. work $\rightarrow T_2 = T_4 = \sqrt{T_1 \times T_3}$



112. Air standard efficiency of an I.C. Engine depends on
(a) Compression ratio (b) Speed of operation
(c) Fuel used (d) Torque

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) : Air standard efficiency of an I.C. Engine depends on $\boxed{\eta = 1 - \left(\frac{1}{r}\right)^{\gamma-1}}$ hence depends upon compression ratio (r) and specific heat ratio (γ).

113. The swept volume and clearance volume of an Otto cycle are 0.0184 m^3 and 0.00262 m^3 respectively. The value of compression ratio is:
(a) 7 (b) 8
(c) 9 (d) 5.99

TNPSC AE (Industries) 09.06.2013

Ans. (b) : Compression ratio $= \frac{V_c + V_s}{V_c}$

$= \frac{0.00262 + 0.0184}{0.00262}$

$= \frac{0.02102}{0.00262}$

$= 8.022$

114. If air is compressed adiabatically from atmospheric condition in a cylinder having compression ratio of 6, then pressure at the end of compression shall be :
(a) 6 atm
(b) Less than 6 atm
(c) More than 6 atm
(d) Less or more than 6 at depending on temperature at the end of compression

J&K PSC Civil Services Pre, 2013

Ans. (c) : $PV^{\gamma} = \text{constant}$

$P_1V_1^{\gamma} = P_2V_2^{\gamma}$

$\left(\frac{V_1}{V_2}\right)^{\gamma} = \left(\frac{P_2}{P_1}\right)$

Compression ratio (r) $= \frac{V_1}{V_2}$

$[\because \gamma = 1.4 \text{ for air}]$

$(6)^{1.4} = \left(\frac{P_2}{P_1}\right)$

$\frac{P_2}{P_1} = 12.28 \Rightarrow P_2 = 13P_1$

115. In an Otto cycle, the temperature at the beginning and end of the isentropic compression are 316 K and 596 K respectively. The compression ratio will be
(a) 4.588 (b) 4.858
(c) 4.885 (d) 4.558

JPSC AE 2013 Paper-V

Search on Telegram @apna_pdf

Ans. (c) : Given,

$T_1 = 316$ K

$T_2 = 596$ K

Compression ratio $= \frac{V_1}{V_2}$

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1}$$

$$\left(\frac{596}{316}\right) = \left(\frac{V_1}{V_2}\right)^{0.4}$$

$$\frac{V_1}{V_2} = \left(\frac{596}{316}\right)^{\frac{1}{0.4}}$$

$$\boxed{\frac{V_1}{V_2} = 4.885}$$

116. Increase in compression ratio in CI engines

(a) decreases turbulence
(b) increases mechanical efficiency
(c) decreases mechanical efficiency
(d) decreases thermal efficiency

TNPSC AE 2013

Ans. (c) : Decrease mechanical efficiency when increase in compression ratio of CI engines.

117. Air standard efficiency of an Otto cycle having compression ratio 4 and adiabatic exponent for air $\gamma = 1.5$ will be:-

(a) 50% (b) 75%
(c) 25% (d) 5.0%

UKPSC AE-2013, Paper-II

Ans. (a) : We know that efficiency of an otto cycle

$$\eta_{otto} = 1 - \frac{1}{[C.R.]^{\gamma-1}} = 1 - \frac{1}{[4]^{1.5-1}} = 0.50$$

$\eta_{otto} = 50\%$

118. The thermal efficiency of an ideal Otto cycle:-

(a) Increases with compression ratio
(b) Increases with specific heat ratio
(c) Increases with compression ratio and specific heat ratio
(d) Increases with compression ratio but decreases with specific heat ratio

UKPSC AE-2013, Paper-II

Ans. (c) : The thermal efficiency of an ideal Otto cycle increases with compression ratio and specific heat ratio.

119. For the same heat input and compression ratio the most efficient cycle is

(a) Otto cycle (b) Diesel cycle
(c) Dual cycle (d) None of these

TRB Poly. Lect., 2012

Ans. (a) : For same heat input & compression ratio, efficiency of Otto cycle is higher than that of diesel cycle. Dual cycle efficiency always lies between the Otto cycle and diesel cycle.

$$\boxed{\eta_{otto} > \eta_{dual} > \eta_{diesel}}$$

120. If T_{max} and T_{min} be the maximum and minimum temperature in an Otto cycle, then for the ideal conditions, the temperature after compression should be

(a) $\frac{T_{max} + T_{min}}{2}$
(b) $\sqrt{\frac{T_{max}}{T_{min}}}$
(c) $\sqrt{T_{max} \times T_{min}}$
(d) $T_{min} + \frac{T_{max} - T_{min}}{2}$

BPSC AE 2012 Paper - V

Ans : (c) : If the T_{max} and T_{min} be the maximum and minimum temperature in an Otto cycle. For the ideal conditions the temperature after compression should be

$= \sqrt{T_{max} \times T_{min}}$

121. In an Otto cycle, the heat addition and heat rejection take place at

(a) constant volume and at constant pressure respectively
(b) constant volume and at constant volume respectively
(c) constant pressure and at constant volume respectively
(d) constant pressure and at constant pressure respectively

UKPSC AE 2012 Paper–II

Ans. (b) : constant volume and at constant volume respectively

122. The air standard efficiency of an Otto cycle for a compression ratio of 5 and index $\gamma = 1.4$ is

(a) 60% (b) 50%
(c) 47.47% (d) 40%

UKPSC AE 2012 Paper–II

Ans. (c) : Given, r = 5

Air standard efficiency of an Otto cycle

$$\eta_{otto} = 1 - \frac{1}{r^{\gamma-1}}$$

$$= 1 - \frac{1}{(5)^{1.4-1}}$$

$= 47.47\%$

123. Consider the following statements :

1. An I.C. engine transforms chemical energy into mechanical energy.
2. A compressed spring possess potential energy.
3. A football rolling on the ground performs plane motion.
4. Strain gauges are used to measure torque.

Following are the correct statements :

(a) 1 and 2 only (b) 2 and 3 only
(c) 3 and 4 only (d) 1, 2 and 4 only

UKPSC AE 2012 Paper-I

Ans. (d)

124. The ratio of actual cycle efficiency to that of the ideal cycle efficiency is called

(a) effectiveness (b) work ratio
(c) efficiency ratio (d) net efficiency

TNPSC ACF 2012

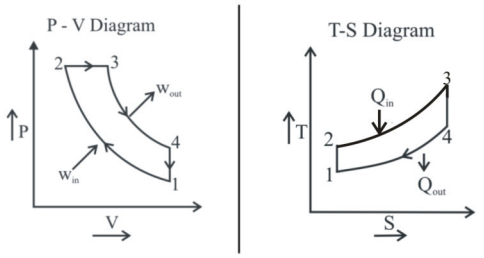
Ans. (c) : Efficiency ratio $= \frac{\text{Actual cycle efficiency}}{\text{Ideal cycle efficiency}}$

Search on Telegram @apna_pdf

125. The air standard cycle with the following processes in sequences :
(1) Reversible adiabatic compression
(2) Reversible constant pressure heat addition
(3) Reversible adiabatic expansion
(4) Reversible constant volume heat rejection is:
(a) Otto Cycle (b) Diesel Cycle
(c) Dual Cycle (d) Brayton Cycle

OPSC Civil Services Pre. 2011

Ans. (b) : (1) Reversible adiabatic compression
(2) Reversible constant pressure heat addition
(3) Reversible adiabatic expansion
(4) Reversible constant volume heat rejection



126. For specific limits for the maximum and minimum temperature, the ideal cycle with the lowest thermal efficiency is :
(a) Carnot (b) Otto
(c) Diesel (d) Dual

J&K PSC Civil Services Pre, 2010

Ans. (b) : Otto cycle has the lowest thermal efficiency for fixed maximum and minimum temperature.

$$\eta_{otto} = 1 - \frac{1}{\left(r^{\gamma-1}\right)}$$

$$\eta_{otto} = 1 - \left(\frac{1}{r}\right)^{\gamma-1}$$

$$\left[\because \left(\frac{1}{r}\right)^{\gamma-1} = \frac{T_1}{T_2} = \frac{\text{minimum temperature}}{\text{maximum temperature}}\right]$$

127. An oil engine working on ideal diesel cycle has 20 cm bore and 30 cm stroke and the clearance volume is 420 cm^3. The fuel supply is 50% of the stroke. If the fuel supply is delayed from 5% to 8%. Find the percentage change in thermal efficiency :
(a) 64.7% (b) 7.75%
(c) 52.4% (d) 58.0%

APPSC IOF, 2009

Ans. (b) : Given, d = 20 cm = 0.2 m, L = 30 cm = 0.3 m

$$v_2 = 420\ cm^3 = 4.2 \times 10^{-4}\ m^3$$

$$r = \frac{v_1}{v_2} = \frac{v_c + v_s}{v_c}$$

v_s = area × length

$$v_s = \frac{\pi}{4} d^2 \times L$$

$$v_s = \frac{\pi}{4}(0.2)^2 \times 0.3$$

$$v_s = 9.4 \times 10^{-3}\ m^3$$

$$r = \frac{4.2\times10^{-4} + 9.42\times10^{-3}}{4.2\times10^{-4}} = 23.42$$

Cuttoff ratio, $\rho = \frac{v_3}{v_2}$ for 5%

$$= \frac{\left(v_c + 5\% v_s\right)}{v_c}$$

$$\rho_{5\%} = 2.12$$

For 8%

$$\rho_{8\%} = 1 + \frac{(0.08 \times 9.42 \times 10^{-3})}{4.2 \times 10^{-4}} = 2.79$$

$$\eta_{\text{diesel } 5\%} = -\frac{1}{r^{(\gamma-1)}} \times \frac{(\rho^{\gamma} - 1)}{\gamma(\rho - 1)} = 66.34\%$$

Similarly $\eta_{\text{diesel } 8\%} = 58.58\% \rightarrow \Delta\eta = 7.75\%$

128. In an air-standard Diesel cycle, the compression ratio is 16, the cylinder bore is 200 mm and the stroke is 300 mm. Compression begins at 1 bar and 27°C. The cut-off takes place at 8 per cent of the stroke. The work done per cycle is :
(a) 51.56 kJ (b) 8.21 kJ
(c) 7.73 kJ (d) 30.16 kJ

APPSC IOF, 2009

Ans. (a) : d = 200 mm = 0.2 m, L = 300 mm = 0.3 m

$$r = \frac{v_1}{v_2} = \frac{v_c + v_s}{v_c} = 16$$

$$\rho = \frac{v_3}{v_2} \quad \text{for 8\%}$$

$$= \frac{v_c + 8\% v_s}{v_c} \qquad \therefore v_s = 9.4 \times 10^{-3}\ m^3$$

$$\rho = \frac{0.66 v_s + 0.08 v_s}{0.66 v_s} = 1.12 \qquad v_c = \frac{9.4}{15} \times 10^{-3}$$

$$v_c = \frac{v_s}{15}$$

$$\eta_{diesel} = 1 - \frac{1}{\gamma r^{(\gamma-1)}} \times \frac{(\rho^{\gamma} - 1)}{\rho - 1}$$

$$= 1 \frac{1}{1.4 \times 16^{1.4-1}} \times \frac{1.12^{1.4} - 1}{(1.12 - 1)}$$

$$= 1 - 1.43 \times \frac{1}{4.24} = 66.2\%$$

$$\eta = \frac{W}{Q}$$

$$\Rightarrow \quad W = \frac{p_1 v_1 r^{\gamma-1}\left[\gamma(\rho-1) - r^{1-\gamma}(\rho^{\gamma-1})\right]}{\gamma - 1}$$

$$= 51.56\ kJ$$

129. An oil engine working on Diesel cycle has compression ratio of 13.5. It uses A : F = 28 : 1. The CV of fuel used = 42 MJ/kg. The temperature at the end of compression is 800°C. Take $C_p = (1 + 18.8 \times 10^{-5}T)$ kJ/kg K, where T is in K. The percentage of stroke at which cut-off occurs is :

Search on Telegram @apna_pdf

(a) 8% (b) 16.7%
(c) 2.8% (d) 8.25%

APPSC IOF, 2009

Ans. (d) : $C_p = (1 + 18.8 \times 10^{-5}T)$ kJ/kg-K

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{r-1} \Rightarrow T_2 = 800°C = 1073\,K$$

$$T_1 = \frac{1073}{(13.5)^{1.4-1}} = 379.15\,K$$

$dQ = mC_p\,dT,$

$Q = \int_2^3 C_p dT$ for 1 kg of mixture

$$Q = \frac{C.V}{A+F} = \frac{42000}{28+1} = 1448.29\,kJ/kg$$

$$1448.29 = \int_2^3 (1+18.8\times10^{-5}T)\,dT$$

T_3 = We get

$$V_3 = V_2 \times \frac{T_3}{T_2}$$

Now, $(V_1 - V_2) = V_2\left(\frac{V_1}{V_2} - 1\right) = 12.502$

$$\rho\% = \frac{V_3 - V_2}{V_1 - V_2} = 8.25\%$$

130. For the same maximum pressure and same output :

(a) Otto cycle is less efficient than diesel cycle
(b) Dual cycle is more efficient than diesel cycle
(c) Otto cycle is more efficient than diesel cycle
(d) Dual cycle is less efficient than Otto cycle

APPSC IOF, 2009

Ans. (a) : $\Rightarrow$ For the same maximum pressure and heat input

$\eta_{diesel} > \eta_{dual} > \eta_{otto}$

$\Rightarrow$ For the same maximum pressure and heat output

$\eta_{diesel} > \eta_{dual} > \eta_{otto}$

$\Rightarrow$ For same maximum temperature and heat rejection

$\eta_{diesel} > \eta_{dual} > \eta_{otto}$

$\Rightarrow$ For same compression ratio and heat addition

$\eta_{otto} > \eta_{dual} > \eta_{diesel}$

$\Rightarrow$ For same compression ratio and heat rejection.

$\eta_{otto} > \eta_{dual} > \eta_{diesel}$

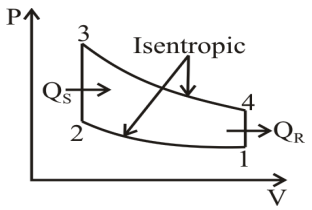
Diesel engine has higher thermal efficiency than otto cycle because of higher compression ratio.

131. Which process is not associated with diesel cycle?

(a) Constant pressure (b) Constant volume
(c) Adiabatic (d) Isothermal

UKPSC AE 2007 Paper -II

Ans. (d) :



Process (1-2) = Reversible adiabatic compression
Process (2-3) = Constant pressure heat addition
Process (3-4) = Reversible adiabatic expansion
Process (4-1) = Constant volume heat rejection

132. Diesel cycle efficiency is maximum when cut off is

(a) minimum (b) maximum
(c) zero (d) none of the above

UKPSC AE 2007 Paper -II

Ans. (a) : Diesel cycle efficiency is maximum when cut off is minimum.

2. SI and CI Engines

133. At the time of starting, idling and low-speed operation, the carburetor supplies a mixture which can be termed as

(a) Lean
(b) Slightly leaner than stoichiometric
(c) Stoichiometric
(d) Rich

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
Haryana PSC AE (PHED) 04.09.2020, Paper-I
Gujarat PSC AE 2019
OPSC AEE 2019 PAPER - II
ISRO Scientist/Engineer (RAC), 10.03.2019
GPSC ARTO Pre 30.12.2018
CGPSC AE 2014- II
RPSC AE 2016, (KPSC AE 2015)

Ans. (d) : In a SI engine carburetor, the idling line is used for providing rich mixture at low load. The no load running mode of the engine is called idling.

- At normal load (cruising) lean mixture required.
- For max. power rich mixture required.

The problem of dilution of charge by residual gases becomes more pronounced at low loads and idling hence richer mixture (Air-fuel ratio around 12.5:1) is required

134. In spark ignition engines knocking can be reduced by:

(a) Increasing the compression ration
(b) Increasing the cooling water temperature
(c) Retarding the spark advance
(d) Increasing the inlet air temperature

MPPSC AE 2016, RPSC AE 2016
KPSC ADF 2015, KPSC AE. 2015
Kerala PSC AE 06.08.2015
RPSC ACF-2011, TNPSC AE, 2008

Ans : (c) In spark ignition engines knocking can be reduced by Retarding the spark advance.

Factor tending to reduce knocking in SI engine

* Self ignition temperature of fuel	-	High
* Compression ratio	-	Low
* Inlet temperature and pressure	-	Low
* Super charging	-	No
* Spark advance	-	No
* Flame travel distance	-	Small
* Engine size	-	Small
* Engine Speed	-	High
* Octane rating	-	High

Search on Telegram @apna_pdf

135. Compression ratio in SI engine varies from

(a) 6 to 10 (b) 10 to 14
(c) 14 to 22 (d) 22 to 32

JPSC AE, 10.04.2021, Paper-I
HPPSC AE 2018
UKPSC AE 2007 Paper -II
Kerala PSC Poly. Lect., 2017
WBPSC AE 2008

Ans. (a) : Compression ratio for SI Engine (r) is 6 to 10
C.R. for CI engine is 16 to 21
C.R. for Dual cycle engine is 12 to 17

136. If petrol is used in a diesel engine, then :

(a) Low power will be produced
(b) Efficiency will be low
(c) Higher knocking will occur
(d) Black smoke will be produced

RPSC ACF & FRO, 26.02.2021
RPSC IOF, 2020
Nagaland PSC (CTSE) 2018, Paper-II
HPPSC Asstt. Prof. 2014
TNPSC ACF 2012

Ans. (c) : If petrol is used in diesel engine then higher knocking will occur because in diesel engine compression ratio is high.

137. The compression ratio for diesel engines is close to

(a) 3 to 6 (b) 5 to 8
(c) 15 to 20 (d) 20 to 30

ISRO Scientist/Engineer 22.04.2018
RPSC AE 2016, KPSC ADF 2015
UKPSC AE 2012 Paper–II , RPSC ACF-2011

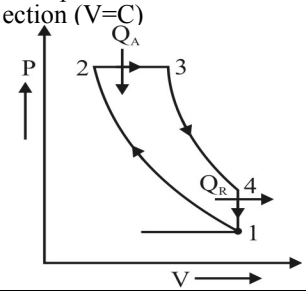
Ans. (c) : For diesel engine, $r_c = 15 – 22$
For Otto engine, $r_c = 7 – 12$
For Dual cycle engine, $r_c = 13 – 17$

138. In a four stroke cycle diesel engine during suction stroke

(a) Only air is sucked in
(b) Only fuel is sucked in
(c) Mixture of fuel and air is sucked in
(d) First air is sucked in, later fuel is sucked in

RPSC ACF & FRO, 26.02.2021
Nagaland PSC CTSE 2017 Paper-2
Rajasthan Nagar Nigam AE 2016, Shift-II
GPSC Lect. 23.10.2016, TSPSC AEE 2015

Ans. : (a) In a four stroke cycle diesel engine during suction stroke only air is sucked.
Diesel cycle:-
1-2 :- Isentropic compression
2-3:- heat addition (p = C)
3-4:- Isentropic Expansion
4-5:- Heat rejection (V=C)



139. With increase in the intake air temperature of I.C. engine, its efficiency will –

(a) Remain same (b) Decreases
(c) Unpredictable (d) Increases

Jharkhand Urja Vikas Nigam Ltd. AE 2017
Rajasthan Nagar Nigam AE 2016, Shift-I
(HPPSC AE 2014), ESE 2018, GATE 1998

Ans. (b) : With increase intake air temperature, density of air decreases and hence volumetric efficiency and power output decreases.

140. Knocking tendency in an SI engine reduces with increasing

(a) Supercharging (b) Wall temperature
(c) Compression ratio (d) Engine speed

UPPSC AE 13.12.2020, Paper-2
Karnataka PSC Lect., 27.05.2017
HPPSC Lect. (Auto) 23.04.2016
(KPSC AE 2015), WBPSC AE 2008

Ans. : (d) Knocking tendency in an SI engine reduces with increasing engine speed.

Factor tending to reduce knocking in SI engine		
* Self ignition temperature of fuel	-	High
* Compression ratio	-	Low
* Inlet temperature and pressure	-	Low
* Super charging	-	No
* Spark advance	-	No
* Flame travel distance	-	Small
* Engine size	-	Small
* Engine Speed	-	High
* Octane rating	-	High

141. Scavenging is usually done to increase

(a) Thermal efficiency (b) Speed
(c) Power output (d) Fuel consumption

RPSC ACF & FRO, 26.02.2021
Nagaland PSC CTSE 2017 Paper-2
Rajasthan AE (Nagar Nigam) 2016 Shift-3
WBPSC AE 2008

Ans. (c) : Scavenging is a process of pushing exhaust gas out of the cylinder and drawing in fresh draught of air or air fuel mixture for the next. Scavenging is usually done to increase power output.

142. For same power output and same compression ratio four stroke S.I. engine as compared to two stroke engine has :

(a) Higher fuel consumption
(b) Lower thermal efficiency
(c) Higher thermal efficiency
(d) Higher exhaust temperature

TNPSC AE 2017, GPSC ARTO 01.05.2016
RPSC AE 2016, RPSC ACF-2011

Ans : (c) For same power output and same compression ratio four stroke SI engine as compared to two stroke engine has high thermal efficiency.

(i) A two stroke cycle engine gives twice the number of power stroke than the four stroke cycle engine at the same engine speed. Theoretically, a two-stroke cycle engine should develop twice the power as that of a four-stroke cycle.

Search on Telegram @apna_pdf

143. The knocking tendency in CI engine increases with

(a) Decrease of compression ratio
(b) Increase in coolant water temperature
(c) Increase of compression ratio
(d) Increase of temperature of inlet air

BPSC AE Mains 2017 Paper - V
Punjab PSC SDE 12.02.2017
TNPSC AE 2014
UKPSC AE 2012 Paper–II

Ans. (a) : Following parameters will minimize knocking in CI engines :

S.No.	Parameters	Knocking
(i) Compression ratio	High	↓
(ii) Self-ignition temperature	Low	↓
(iii) Delay Period	Less	↓
(iv) Inlet temp and pressure	High	↓
(v) Combustion chamber temperature	High	↓
(vi) RPM	Low	↓
(vii) Engine size	Small	↓
(viii) Cetane Rating	High	↓
(ix) Supercharging	Yes	↓

144. By advancing the spark timing in an S.I. engine, the possibility of knock will

(a) increase (b) decrease
(c) not change (d) be eliminated

APPSC AEE MAINS 2016 PAPER-III
APPSC AEE 2012, WBPSC AE 2008
UKPSC AE 2013, 2007 Paper -II

Ans. (a) : Advancing the timing means the plug fires earlier in the compression stroke (further from TDC). Advance is required because the air/fuel mixture does not burn instantly. It takes time for the flame to ignite the all the mixture. However, if the timing is advanced too far, it will cause an engine knock.

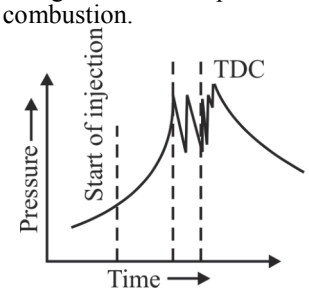
145. The knock in Diesel engine occurs due to

(a) Instantaneous and rapid burning of the first part of the charge
(b) Instantaneous auto ignition of last part of charge
(c) Delayed burning of the first part of the charge
(d) Reduction of delay period

CIL MT 27.02.2020
GWSSB DEE 07.07.2016
GPSC Asstt. Prof. 28.08.2016
MPPSC AE 08.11.2015

Ans. (a) : If the ignition delay quite long, so much fuel can accumulate that the rate of pressure rise is almost instantaneous. Such situation produce the extreme pressure differential and violent gas vibration known as knocking.

The knock in diesel engine occurs due to instantaneous and rapid burning of the first part of the charge i.e uncontrolled combustion.



146. During idling of a petrol engine requires :

(a) Chemically correct mixture
(b) Variable mixture
(c) Lean mixture
(d) Rich mixture

PPSC Asstt. Municipal Engineer 15.06.2021
RPSC IOF, 2020
Kerala PSC AE 06.08.2015, RPSC ACF-2011

Ans. (d) : Petrol Engine- During idling of a petrol engine requires rich mixture, to compensate for the charge dilution due to exhaust gases from the combustion chamber. exhaust gas dilution prevents efficient combustion by reducing the contact between the fuel and air particles.

147. In spark ignition engine the possibility of knocking can be reduced by :

(a) Increasing compression ratio
(b) Decreasing compression ratio
(c) Increasing the coolant temperature
(d) Advancing the spark timing

RPSC ACF-2011
J & K PSC Screening, 2006, ESE 2002

Ans. (b) : In spark ignition engine the possibility of knocking can be reduced by-

- Self ignition temperature of fuel – **Low**
- Compression ratio – **Low**
- Spark advancement – **NO**
- Engine speed – **High**
- Inlet pressure and temp – **Low**

148. Flame speed in SI engine increases:

(a) with increase in compression ratio
(b) with decrease in intake temperature and pressure of the mixture
(c) with decrease in engine speed
(d) with decrease in turbulence in mixture
(e) at very lean mixture

RPSC IOF, 2020, CGPSC AE 25.02.2018
OPSC AEE 2015 PAPER - II

Ans. (a) : Factor influencing the flame speed.

1. Turbulence– Turbulence ↑→ speed ↑→ heat flow to cylinder wall ↑→ flame speed ↑

2. Compression ratio-

(C.R.) ↑→ P ↑ ,T ↑→ flame speed ↑

3. Engine output- Engine output ↑→ turbulence ↑→ flame speed ↑

4. Engine speed- ↑→ V_{flame} ↑

Search on Telegram @apna_pdf

149. Carburetor is used for

(a) SI engines (b) Gas engines
(c) C.I. engines (d) None of the above

JPSC AE, 10.04.2021, Paper-I
Oil India Limited Sr. Engineer (Drilling) 30.11.2019
WBPSC AE 2008

Ans. (a) : Carburetor is used in SI engines.
The function of carburetor is to supply air and petrol mixture.

150. Voltage developed to strike spark is in the spark plug is in the range :

(a) 6 to 12 volts (b) 100 to 200 volts
(c) 1000 to 2000 volts (d) 20000-25000 volts

RPSC AE 2018, 2016
APPSC Poly. Lect. 2013, RPSC ACF-2011

Ans. (d) : Spark plugs usually require voltage of 12000-25000 volts.

151. What is the theoretical cycle on which the SI engines work ?

(a) Otto cycle (b) Diesel cycle
(c) Ericson cycle (d) Carnot cycle

GMB AAE 25.06.2017
RPSC AE (GWD) 06.05.2016
GWSSB AAE, 27.12.2015

Ans. (a) : Theoretical cycle on which the S.I. (spark Ignition) engine work is Otto cycle.

152. Combustion in compression ignition engine is :

(a) Homogeneous (b) Heterogeneous
(c) Laminar (d) Turbulent

Gujarat PSC AE 2019, MPSC Dy. Engineer 2014
UKPSC AE 2007 Paper -II

Ans. (b) : Combustion in CI engine is heterogeneous because of low physical delay period causes not proper mixing of air and fuel and results in uncontrolled heterogeneous combustion.

153. In carburetors the meter rod and economizer is used to supply air fuel mixture during:

(a) Cold starting (b) Acceleration
(c) Idling (d) Power enrichment

OPSC AEE 2019 PAPER - II
RPSC AE 2016, UJVNL AE 2016

Ans : (d) : Economiser is basically a valve that remains closed at normal cruise operation and gets opened to supply rich mixture at full throttle operation. It regulates the additional fuel supply during full throttle operation. So it can be called a power enrichment system.

154. The actual volume of fresh charge admitted in 4-stroke petrol engine is:

(a) Equal to stroke volume
(b) Equal to stroke volume and clearance volume
(c) Less than stroke volume
(d) More than stoke volume

CIL MT 27.02.2020
GPSC Asstt. Prof. 28.08.2016
Nagaland PSC CTSE 2015 Paper-II

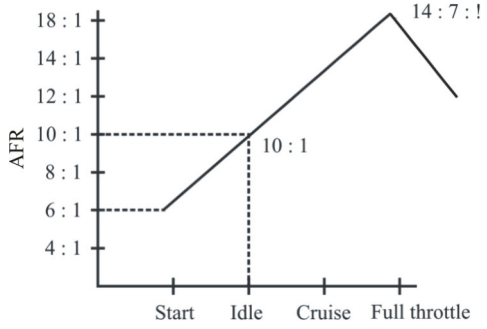
Ans. (c) : The actual volume of fresh charge admitted in 4- stroke petrol engine is less than stroke volume due to presence of clearance volume, and presence of some burned gas due to valve timing.

155. The air-fuel ratio for idling speed of an automobile petrol engine is closer to :

(a) 10 : 1 (b) 15 : 1
(c) 17 : 1 (d) 21 : 1

GPSC ARTO Pre 30.12.2018
SJVN ET 2013, APGENCO AE 2012

Ans. (a) : The Air Fuel Ratio (AFR) for idling speed of an automobile petrol engine is closer to 10 : 1



156. Detonation in spark ignition engine is due to early auto-ignition of the charge near

(a) The spark plug
(b) The suction valve
(c) The exhaust valve
(d) The combustion chamber cylinder walls
(e) None of these

CGPSC AE 15.01.2021, CGPSC AE 16.10.2016
UKPSC AE 2007 Paper -II

Ans. (d) : Due to early auto-ignition of the charge near the combustion chamber cylinder walls. Auto ignition may overheat the spark plug and exhaust valve and it remains so hot that its temperature is sufficient to ignite the charge in next cycle during the compression stroke before spark occurs and this causes the pre-ignition of the charges. Detonation is produced (knocking).

157. Which part is not common between the petrol and Diesel engine?

(a) Air cleaner (b) Exhaust silencer
(c) Battery (d) Fuel injector

Vadodara Muncipal Corp. DEE, 2018
MPPSC AE 08.11.2015
J & K PSC Screening, 2006

Ans. (d) : Fuel injector is not common part between the petrol and diesel engine. Because fuel injector used to injecting the fuel in the diesel engine. But in the petrol engine carburetor used to atomized the fuel.

158. In case of petrol engines, at starting

(a) Rich fuel-air ratio is needed
(b) Weak fuel-air ratio is needed
(c) Chemically correct fuel-air ratio is needed
(d) Any fuel-air ratio will do

RPSC AE 2016, TNPSC AE 2014, RPSC ACF-2011

Ans. : (a) Petrol engine at starting rich fuel air ratio is needed.

Operation	**A/F ratio**
Idling	12 - 12.5
Cruising	16 - 16.5
Max power	12 - 13
Starting	3 - 5

Search on Telegram @apna_pdf

159. A diesel engine in a power plant is more efficient than a spark engine because :

(a) air standard efficiency for a diesel cycle is higher than an Otto cycle at a fixed compression ratio

(b) diesel gives more heat per kg of fuel than gasoline

(c) higher temperature in diesel engine compared to a Spark engine

(d) compression ratio of a CI engine is higher than that of an SI engine

APPSC Poly Lect. Automobile Engg., 2020
UPPSC AE 13.12.2020, Paper-2
GPSC ARTO Pre 30.12.2018

Ans. (d) : A diesel engine is usually more efficient than a spark ignition engine because a diesel being a heavier hydrocarbon release more heat per kg than gasoline. The compression ratio of a diesel engine is higher than that of an spark ignition engine.

160. In a diesel engine, the fuel is ignited by

(a) Heater

(b) Spark plug

(c) Injected fuel

(d) Heat resulting from compressing air that is supplied for combustion.

GMB AAE 25.06.2017
Rajasthan Nagar Nigam AE 2016, Shift-II
GWSSB AAE, 27.12.2015

Ans. (d) : In a diesel engine, the mixture (fuel vapour + air), which is mostly air, is compressed by piston, due to this high pressure by piston, heat is produced and temperature reaches to fuel's ignition temperature and combustion starts. Hence in a diesel engine the fuel is ignited by heat resulting from compressing the air that is supplied for combustion.

161. In S.I. engine, to develop high voltage for spark plug

(a) Battery is installed

(b) Distributer is installed

(c) Carburetor is installed

(d) Ignition coil is installed

GPSC DEE, Class-2 (GWSSB) 04.07.2021
OPSC AEE 2019 PAPER - II
WBPSC AE 2008

Ans. (d) : In S.I. engine, to develop high voltage for spark plug Ignition coil is installed.

162. A Spark plug gap should be :

(a) 0.2 to 0.8mm (b) 0.3 to 0.7mm

(c) 0.4 to 0.9mm (d) 0.6 to 1.0mm

Kerala PSC Poly. Lect., 2017
UKPSC AE 2007 Paper -II

Ans. (b) : Spark plugs gap in automobiles generally have a gap between 0.3 and 0.7 mm.

Note-As per given option, suitable answer is option (b). But Kerala PSC cancelled this equation in official answer key.

163. In petrol engines, the knocking tendency will increase when

(a) Speed is increased

(b) Speed is decreased

(c) Fuel air ratio is made rich

(d) Fuel air ratio is made lean

(e) None of these

CGPSC AE 16.10.2016
RPSC AE (GWD) 06.05.2016

Ans. (b&c) : The tendency of knocking in petrol engines will depend on following factors –

(i) Compression ratio (r_p)↑ → Knocking↑

(ii) Speed↑ → Knocking↓

(ii) Load↑ → Knocking↑

(iv) Spark advancement↑ → Knocking↑

(v) FAR is made rich↑ → Knocking↑

In this question, both (b) & (c) options are correct.

Note-This question has been deleted by CGPSC.

164. An air-fuel ratio 8 will have

(a) Chemically correct air

(b) Excess fuel

(c) Excess air

(d) Any of the above

RPSC AE 2016, RPSC ACF-2011

Ans : (b)

(i) A mixture which contains less air than the stoichiometric requirement is called a rich mixture (Excess fuel)
Example: A/F ratio of 12:1, 8:1, 10:1 etc)

(ii) A mixture which contains more air than the stoichiometric requirement is called a lean mixture (Excess air)
Example: A/F ratio of 17:1, 20:1 etc)

165. In naturally aspirated engine, pressure inside cylinder at the end of suction stroke is

(a) less than atmospheric

(b) same as atmospheric

(c) more than atmospheric

(d) depends on atmospheric conditions

RPSC AE 2016, RPSC ACF-2011

Ans : (a) In naturally aspirated engine, pressure inside cylinder at the end of suction stroke is less than atmospheric.

166. In a 4–cylinder, 4–stroke Diesel engine operating at 1200 r.p.m., the duration of fuel injection is 20^o. The time in seconds during which fuel is injected would be

(a) $\frac{1}{360}$ sec (b) $\frac{1}{180}$ sec

(c) $\frac{1}{720}$ sec (d) $\frac{1}{1440}$ sec

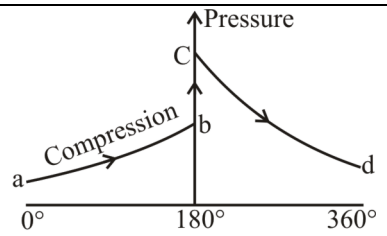
Nagaland PSC CTSE 2015 Paper-II
TNPSC AE 2014

Ans. (a) : First Method–

Given, N = 1200 rpm

Time taken by one revolution $= \frac{60}{1200} = \frac{1}{20}$ sec

Search on Telegram @apna_pdf



Crank angle (deg)

In four stroke engine fuel injection that is part of power stroke that lasts a stroke that is half a revolution of 180°.

Duration of power stroke $= \frac{1}{2} \times \frac{1}{20}$

Fuel injection of $20° = \frac{20}{180} \times \frac{1}{40} = \frac{1}{360}$ sec

Second Method– Angle turned by crank during fuel injection

$$\theta = 20^0 = 20° \times \frac{\pi}{180°} \text{ rad.}$$

N = 1200 rpm

We know that

$$\frac{\theta}{t} = \omega$$

$$t = \frac{\theta}{\omega} = \frac{\left[20° \times \frac{\pi}{180°}\right]}{\left[\frac{2\pi \times 1200}{60}\right]} = \frac{1}{360} \text{ sec}$$

Where t is time in seconds during fuel is injected.

167. Consider the following statements: Knock in the S.I. engine can be reduced by

(1)Supercharging
(2)Retarding the spark
(3)Using a fuel of long straight chain structure
(4)Increasing the engine speed
Other these correct statements are

(a)1 and 2 (b) 2 and 3
(c)1, 3 and 4 (d) 2 and 4

ESE 2017
UPPSC AE 12.04.2016 Paper-II

Ans.: (d)
Factor Tending to reduce knocking in SI engine

* Self ignition temperature of fuel	- High
* Compression ratio	- Low
* Inlet temperature and pressure	- Low
* Super charging	- No
* Spark advance	- No
* Flame travel distance	- Small
* Engine size	- Small
* Turbulence	- High
* Engine speed	- High
* Octane rating	- High

168. A diesel engine has

(a) one valve (b) two valves
(c) three valves (d) four valves

Nagaland PSC (CTSE) 2018, Paper-II
KPCL AE 2016

Ans. (c) : A diesel engine has three valves inlet valve, exhaust valve and fuel injector valve.
There are different valves used in a diesel engines Inlet valve-inlet valve generally allow the intake air to enter into combustion chamber.
Exhaust valve – likewise they allow the exhaust gas to allow burnt out gas from chamber to exhaust manifold.

169. The air-fuel ratio of the petrol engine is controlled by

(a) Fuel pump (b) Governor
(c) Injector (d) Carburetor

Gujarat PSC AE 2019
J&K PSC Civil Services Pre, 2013

Ans : (d) : The air-fuel ratio of the petrol engine is controlled by carburetor.

170. The function of a distributor in a coil ignition system of I.C. engines is

(a) to distribute spark
(b) to distribute power
(c) to distribute current
(d) to time the spark

Nagaland PSC (CTSE) 2018, Paper-II
TNPSC AE, 2008

Ans. (d) : The function of a distributor in a coil ignition system of I.C. engines is to time the spark.
A distributor is an enclosed rotating shaft used in spark-ignition internal combustion engines that have mechanically timed ignition. The distributor's main functions is to route secondary or high voltage, current from the ignition coil to the spark plugs in the correct firing order and For the correct amount of time.

171. In a petrol engine, the tendency for detonation increases with

(a) Retarded spark timing
(b) Running the engine at high speed
(c) Supercharging
(d) Increasing the cooling rate

Nagaland PSC CTSE 2017 Paper-2
GPSC EE Pre, 28.01.2017

Ans. (c) : In a petrol engine, the tendency for detonation increases with supercharging. Supercharging is operation of forcing additional air under pressure in the engine cylinder is known as supercharging.

172. Which of the following is not a function of nozzle in fuel injection

(a) Atomization
(b) Distribution of fuel to the required area
(c) Impingement on the walls
(d) No dribbling

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (c) : The function of nozzle in fuel injection system are to filter the fuel, to time the fuel injection, to break up the fuel into small particles. Non-impingement on the walls function of nozzle.

173. For S.I. engine carburetor the float is usually made of

(a) Brass sheet (b) Nylon
(c) Cast iron (d) Either (a) or (b)

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (d) : S.I. engine carburetor the float usually made of brass sheet, nylon.

Search on Telegram @apna_pdf

174. The intensity of detonation will depend mainly upon the amount of

(a) Energy contained in the end mixture
(b) Rate of chemical reaction
(c) Both energy contained in the end mixture and rate of chemical reaction
(d) None of the above

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (c) : The intensity of detonation will depend mainly upon the amount of energy contained in the end-mixture and the rate of chemical reaction which release it in the form of heat and a high intensity pressure-wave.

175. The exhaust valve usually opens ..... in a four stroke S.I. engine

(a) At TDC
(b) At BDC
(c) At 35º to 60º after BDC
(d) At 35º to 60º before BDC

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (d) : The exhaust valve in a four-stroke cycle petrol engine open at 50º before BDC (Bottom Dead Centre) and closes at 15º after TDC (Top Dead Centre)

176. Stoichiometric air-fuel ratio of petrol is roughly

(a) 50:1 (b) 25:1
(c) 15:1 (d) 1:1

GPSC Lect. 23.10.2016
GPSC Asstt. Prof. 28.08.2016

Ans. (c) : The stoichiometric mixture for a gasoline engine is the ideal ratio of air to fuel that burns all fuel with no excess air. Ratio is 14.7:1 (A/F).

177. Lean mixture in an automobile is required during :

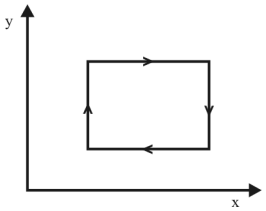
(a) Idling (b) Starting
(c) Accelerating (d) Cruising

HPPSC W.S. Poly. 2016, (KPSC AE 2015)

Ans : (d) Lean mixture in an automobile is required during cruising

Operation	**A/F ratio**
Idling	12-12.5
Cruising/normal	16- 16.5
Maximum power	12-13
Starting	3-5

178.

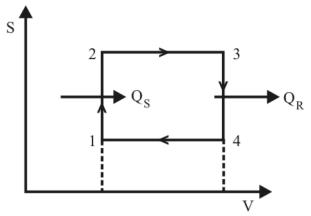


An air standard Otto cycle has the following shape on a thermodynamic plane. The X and Y coordinates respectively are:

(a) V and P (b) V and S
(c) V and T (d) S and P

PPSC Asstt. Municipal Engineer 15.06.2021
TSPSC Managers, 2015

Ans. (b)



(V-S diagram in otto cycle)

179. Duration between the time of injection and time of ignition in a diesel engine is called:

(a) Lead period
(b) Delay period
(c) Combustion period
(d) Period of compression

Sikkim PSC (Under Secretary), 2017
OPSC AEE 2015 PAPER - II

Ans : (b) Duration between the time of injection and time of ignition in a diesel engine is called delay period. Delay period in compression ignition engines depends upon

(i) Temperature and pressure in the cylinder at the time of injection.
(ii) Nature of the fuel mixture strength
(iii) Relative velocity between the fuel injection and air turbulence pressure of residual gases.

180. For same power and same speed, the flywheel of a four-stroke engine as compared to two-stroke I.C. engine will be :

(a) Smaller
(b) Bigger
(c) Same size
(d) Dependent on other engine parameters

OPSC AEE 2019 PAPER - II
(HPPSC AE 2014)

Ans : (b)

Four-stroke Engine	**Two-stroke Engine**
(i) Turning moment is not so uniform and hence a heavier flywheel is needed	(i) Turning moment is more uniform and hence a lighter flywheel can be used.
(ii) Higher volumetric efficiency due to more time for ixture intake	(ii) Lower volumetric efficiency. due to lesser time for mixture intake
(iii) Part load efficiency is better	(iii) Part load efficiency is poor.
(iv) Four- stroke engine have valves and valve mechanism	(iv) Two- Stroke engines have no valve but only ports.
(v) One power stroke in two revolutions lesser cooling and lubrication requirement lower rate of wear and tear.	(v) One power stroke in one revolution of crank shaft. Greater cooling and lubrication requirement. Higher rate of wear and tear.

181. The injection pressure in diesel engine is of the order of:-

(a) 30 – 40 bar (b) 100 – 150 bar
(c) 200 – 300 bar (d) 400 – 600 bar

UKPSC AE-2013, 2007 Paper-II

Search on Telegram @apna_pdf

Ans. (b) : The injection pressure in diesel engine is of the order of 100 – 150 bar.

182. Solid injection in C.I. engine refers to injection of

(a) Liquid fuel only (b) Liquid fuel and air
(c) Solid fuel (d) Solid fuel and air

MPSC Dy. Engg. (GWD) 19.05.2013
UKPSC AE 2007 Paper-II

Ans. (a) : Solid Injection System–It is the injection of atomized fuel oil into the combustion chamber of a diesel engine under the pressure of the liquid fuel itself. In this system, the liquid fuel is injected directly into the combustion chamber without the aid of compressed air.

183. Highest useful compression ratio is the compression ratio at which

(a) engine can be safely operated
(b) engine gives maximum thermal efficiency
(c) engine operates smoothly
(d) detonation first becomes audible

RPSC AE 2016, RPSC ACF-2011

Ans : (d) Highest useful compression ratio is the compression ratio at which detonation first becomes audible.

184. Which of the following are the assumptions involved in the auto-ignition theory put forth for the onset of knock in SI engines?

I. Flame velocity is normal before the onset of auto-ignition.
II. A number of end-gas elements auto ignite simultaneously.
III. Preflame reactions are responsible for preparing the end gas to ignite.

Of these statements, which are correct?

(a) I and II (b) I and III
(c) II and III (d) I, II and III

APPSC Poly. Lect. 2013, ESE 1998

Ans. (d) : Assumption which are involved in Auto-ignition theory put forth for the on set of knock is S.I. engines.

(1) Flame velocity in normal before the onset of auto Ignition.
(2) A number of end-gas elements auto ignite simultaneously.
(3) Pre-flame reactions are responsible for preparing the end-gas to ignite.

185. In petrol engines, the knocking tendency will increase when :

(a) Speed is decreased
(b) Fuel air ratio is made rich
(c) Fuel –air ratio is made lean
(d) Speed is increased

CGPSC AE 15.01.2021
J&K PSC Civil Services Pre, 2010

Ans. (a) : In SI engines, the knocking tendency will increase when speed is decreased.
As speed decreased turbulence decreases and temperature of cylinder increases, knocking tendency increase.

186. When a petrol engine is supplied with diesel fuel :

(a) The engine will not run
(b) The engine will consume more fuel
(c) The engine will operative with reduced output
(d) The exhaust will have dense black smoke

OPSC AEE 2015 PAPER - II
J & K PSC Screening, 2006

Ans. (a) : When a petrol engine is supplied with diesel fuel then combustion not takes place which results in high knocking and engine will not run.

187. Fuel is injected in the CI engine at the end of :

(a) suction stroke (b) compression stroke
(c) expansion stroke (d) exhaust stroke

APPSC Poly Lect. Automobile Engg., 2020
OPSC AEE 2015 PAPER - II

Ans. (b) : Fuel is injected in the CI engine at the end of the compression stroke. Fuel is injected directly into the combustion chamber by the injector.

188. Consider the following:

1. Increased cetane number
2. Increased compression ratio
3. Increased injection advance
4. Increased air turbulence

Which of the factors will reduce the physical delay in diesel engine?

(a) 1, 2 and 3 only (b) 2 and 4 only
(c) 2, 3 and 4 only (d) 1, 2, 3 and 4

RPSC Lect. (Tech. Edu. Dept.) 2011, ESE 2010

Ans. (b) : Physical delay means physical preparation of mixture e.g. mixing, heating, fuel vapourizing, atomising and how much fast this occure. From given factors, compression ratio and turbulence (or swirl) and the only factors which enhances this physical preparation fast i.e. reduced physical delay.
Cetane number is fuel characteristic which influences chemical delay.
Increased injection advance means longer physical delay because it starts from start of injection and increased knock.

189. The essential function of the carburetor in a S.I. engine is to :

(a) Mix the fuel into air stream and amount dictated by the load and speed
(b) Vapourise fuel
(c) Distribute fuel uniformly into all cylinders
(d) Both (B) and (C)

HPPSC Asstt. Prof. 20.11.2017
APGENCO AE 2012

Ans. (a) : The main functions of a carburetor are–

(i) The main function of carburetor is to mix air and gasoline and provides a high combustion mixture.
(ii) It controls the engine speed.
(iii) It also regulates the air-fuel ratio
(iv) Increase or decrease the amount of mixture according to the engine speed and load changing.
(v) To supply the correct amount of air-fuel mixture at the correct strength under all conditions of load and speed of the engine.

Search on Telegram @apna_pdf

190. Match List-I with List-II and select the correct answer :

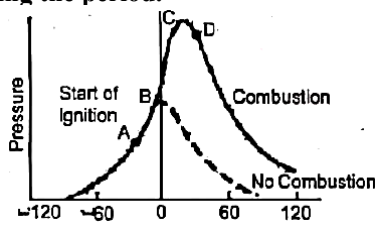
List-I	List-II
A. Idling	1. 12.5
B. Cold starting	2. 9.0
C. Cruising	3. 16.0
D. Maximum power	4. 22.0
	5. 3.0

	A	B	C	D
(a)	2	4	5	1
(b)	1	3	4	2
(c)	5	2	1	3
(d)	2	5	3	1

Nagaland PSC CTSE 2015 Paper-II
ESE 1995

Ans. (d) : Idling — 9.0
Cold starting — 3.0
Cruising — 16.0
Maximum power — 12.5

191. Hypothetical pressure diagram for a compression ignition engine is shown in the given figure. The diesel knock is generated during the period.



(a) AB (b) BC
(c) CD (d) after D

Nagaland PSC CTSE 2015 Paper-II
ESE 1998

Ans. (b) : Combustion is responsible for detonation in CI engine.

192. Ignition lag is
(a) Time before actual fuel injection and the pump plunger starts to pump fuel
(b) Time corresponding to actual ignition
(c) Time corresponding to actual injection and TDC
(d) Time taken by fuel after injection (before TDC) to reach up to auto ignition temperature

APPSC AEE MAINS 2016 PAPER-III
Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : Ignition lag is time taken by fuel after injection (before TDC) to reach up to auto ignition temperature.

193. For a given weight and displacement, a well-designed two –stroke engine can provide significantly ____ power than its four-stroke counterpart.
(a) Less (b) Equal
(c) More (d) Unpredictable

RPSC ACF & FRO, 26.02.2021

Ans. (c) : For a given weight and displacement, a well designed two stroke engine can provide significant more power than it's four stroke counterpart.

194. In two wheelers, which scavenging method is used?
(a) Uniform scavenging
(b) Reverse flow scavenging
(c) Loop scavenging
(d) Cross scavenging

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : Scavenging is the process of replacing the exhaust gas in a cylinder of an internal combustion engine with the fresh air/fuel mixture (or fresh air in the case of direct injection engine) for the next cycle. If scavenging is incomplete the remaining exhaust gases can cause improper combustion for the next cycle leading to reduce power output. Scavenging is equally important for both two stroke and four stroke engines. Most modern four stroke engine use cross flow cylinder heads and valve timing overlap to scavenge the cylinders. Modern two-stroke engine use either schnuerl scavenging (also known as loop scavenging)

195. Decrease of air-fuel ratio in spark ignition engines results in
(a) Increase of NO_x
(b) A decrease of CO and unburnt hydrocarbon
(c) An increase of CO and unburnt hydrocarbon
(d) None of the above

UPPSC AE 13.12.2020, Paper-2

Ans. (c) : Decrease of air fuel ratio in spark ignition engine results in an increase of CO and unburnt hydrocarbon.

196. Achieving high compression ratio is feasible in compression ignited engines due to
(a) Non-premixed combustion
(b) Premixed combustion
(c) Detonation
(d) Deflagration

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) : C.I. engines can run at higher compression ratio since they are based on the auto ignition principle and are not limited by the premixed fuel air combustion knock as in S.I. engines.

197. Equivalence ratio is the ratio of
(a) Actual to stoichiometric air-fuel ratio
(b) Actual mass of fuel to actual mass of air
(c) Actual to stoichiometric fuel-air ratio
(d) Actual mass of air to actual mass of fuel

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : Equivalence ratio is defined as the ratio of the actual fuel/air ratio to stoichiometric fuel/ air ratio.
For equivalence ratio is less than one, mixture is lean with excess air.

198. The effect of dissociation in combustion process is for:
(a) Separating the product of combustion
(b) Reducing the flame temperature
(c) Reducing the use of excess air
(d) Reducing CO_2 percentage in the gas

OPSC AEE 2019 PAPER - II

Search on Telegram @apna_pdf

Ans. (b) : Dissociation reaction is endothermic CO_2 absorbs heat and becomes ($CO + O_2$). H_2O absorbs heat and becomes ($H_2 + O_2$). These reactions reduce peak temperatures produced.

199. Which option is not correct for I head combustion chamber for SI engine?
(a) Higher volumetric efficiency
(b) Lower pumping losses
(c) Higher surface to volume ratio
(d) Less knocking

OPSC AEE 2019 PAPER - II

Ans : (c)
- Lower pumping losses and higher volumetric efficiency from better breathing of the engine from larger valves or valve lifts and more direct passageways.
- Less distance for the flame to travel and therefore greater freedom from knock, or in other words, lower octane requirements.
- Lower surface-volume ratio and, therefore, less heat loss and less air pollution.
- Easier to cast and hence lower casting cost.

200. Assertion (A): After burning increases the thrust of a jet engine.
Reason (R) : The air fuel ratio of jet engine is high.
(a) Both A and R are individually true and R is the correct explanation of A.
(b) Both A and R are individually true and R is not the correct explanation of A.
(c) A is true but R is false
(d) A is false but R is true

Gujarat PSC AE 2019

Ans : (b) : After burning in jet engine is equivalent to reheat in gas turbine. Since air fuel ratio of jet engine is high i.e., very lean mixture having excess air or oxygen, some extra fuel can be burnt in exhaust gases. So in after burning, secondary fuels is injected in exhaust from turbine, which increases jet velocity from nozzle and so the thrust.

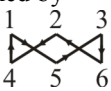
201. In a 6 cylinder petrol engine, the standard firing order is :
(a) 1-6-2-5-4-3 (b) 1-2-3-4-5-6
(c) 1-5-3-6-2-4 (d) 1-3-6-5-4-2

Oil India Limited Sr. Engineer (Drilling) 30.11.2019

Ans. (c) : Firing order is the sequence of power delivery of each cylinder in multi cylinder IC engine.

Firing order of V-shape 6-cylinder engine → 1-5-3-6-2-4 (crank-pins having piston mounted are arranged in every 60° of the crank shaft).

Also standard firing order for six cylinder engine can be determined by –



= 1-5-3-6-2-4

For four cylinder engine

= 1-3-4-2

202. Consider the following statements:
Combustion chamber is
(1) the volume between TDC and BDC during the combustion process.
(2) the space enclosed between the upper part of the cylinder and the top of the piston during the combustion process
(3) the space enclosed between TDC and the top of the piston during the combustion process
Which of the above statements is/are correct?
(a) 1 only (b) 2 only
(c) 3 only (d) 1, 2 and 3

ESE 2019

Ans. (b) : A combustion chamber is that part of an internal combustion engine or a reaction engine in which the fuel/air mixture is burned.
It is the space enclosed between the upper part of the cylinder and the top of the piston during the combustion process.

203. Which design of the combustion chamber has less problem in cold starting?
(a) M Combustion Chamber
(b) Open Combustion Chamber
(c) Air-Cell Combustion Chamber
(d) Any design of Combustion Chamber

OPSC AEE 2019 PAPER - II

Ans : (a) : M - Combustion chamber has less problem in cold starting.

204. Which type of nozzle is preferred to avoid weak injection and dribbling of fuel in combustion chamber?
(a) Single hole (b) Multi hole
(c) Pintle (d) Pintaux

OPSC AEE 2019 PAPER - II

Ans : (c) : Pintle type of nozzle is preferred to avoid weak injection and dribbling of fuel in combustion chamber.

205. Which device can be used to measure aromatic hydrocarbon in exhaust gas?
(a) Dispersion analyzer
(b) Non-dispersive infrared analyzer
(c) Flame ionization detector
(d) All of these

OPSC AEE 2019 PAPER - II

Ans : (d) : All of these

206. The spark advance is specified in:
(a) Time in seconds
(b) Degree of crank rotation
(c) Percentage of engine speed in rpm
(d) None of these

OPSC AEE 2019 PAPER - II

Ans : (b) : The spark advance is specified in degree of crank rotation.

207. Which is the best option to avoid knock in SI engine?
(a) Supercharging of Engine
(b) Delay period should low
(c) Delay period should high
(d) Spark should be advanced

OPSC AEE 2019 PAPER - II

Ans : (c) : Delay period should be high is the best option to avoid knock in SI engine.

Search on Telegram @apna_pdf

208. Assertion (A) : A simple or elementary carburetor provides progressively rich mixture with increasing air flow.
Reason (R) : The density of the air tends to increase as the rate of air flow increases.
(a) Both A and R are individually true and R is the correct explanation of A.
(b) Both A and R are individually true and R is not the correct explanation of A.
(c) A is true but R is false
(d) A is false but R is true

Gujarat PSC AE 2019

Ans : (c) : At higher speed a simple carburetor provide rich mixture because of reduced mass flow rate of air. This reduced mass flow rate is due to decreases in density at higher speed. The density of air decrease at higher speed due to compressibility effect.

209. In a four stroke cycle diesel engine, the compression
(a) starts at 40º after bottom dead center and ends at 10º before top dead center
(b) starts at 40º before bottom dead center and ends at 10º after top dead center
(c) starts at top dead center and ends at 40º before bottom dead center
(d) may start and end anywhere

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : In four stroke cycle diesel engine the compression start at 40º after bottom dead center and ends at 10º before top dead center.

210. In IC engine
1. the ideal air capacity of a two-stroke engine is the mass of air required to concurrently fill the total cylinder volume at inlet temperature and exhaust pressure
2. with increase in air-fuel ratio beyond the value for maximum power, there is a fall in power developed and this fall is more with higher values of air-fuel ratio.
3. the volumetric efficiency of the engine depends on the design of intake and exhaust manifold.

Which of the above are correct?
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) : Volumetric efficiency indicates the breathing ability of the engine.
Intake system and exhaust manifold must be designed in such a way that the engine must be able to take in as much air as possible to the rate at which the volume is displaced by the system.

211. The essential function of the carburetor in a spark ignition engine is to :
(a) Meter the fuel into air stream and amount dictated by the load and speed
(b) Bring about mixing of air and fuel to get a homogeneous mixture
(c) Vaporise the fuel
(d) Distribute fuel uniformly to all cylinders in a multi cylinder engine and also vaporise it.

RPSC Vice Principal ITI 2018

Ans. (a) : The essential function of the carburetor in a spark ignition engine is to meter the fuel into air stream and amount dictated by the load and speed.

212. Consider the following statements:
1. Recycling exhaust gases by partial mixing with the intake gases increases the emission of oxides of nitrogen from the engine.
2. The effect of increase in altitude of operation on the carburetor is to enrich the entire port-throttle operation.
3. When the carburetor throttle is suddenly opened, the air-fuel mixture may lean out temporarily resulting in engine stall.
4. Use of multi-venturi system makes it possible to obtain a high velocity air stream when the fuel is introduced at the main venturi throat.

Which of the above statements are correct?
(a) 1 and 3 (b) 1 and 4
(c) 2 and 3 (d) 2 and 4

ESE 2018

Ans. (c) : (i) Exhaust Gas Recirculation (EGR) is an effective pretreatment technique, which is being used widely to reduce and control the oxides of nitrogen (NO_x) emission from diesel engine. Exhaust gas recycle is done by ducting some of the exhaust flow back into the intake system, usually immediately after the throttle. Hence statement-1 is wrong.
(ii) An altitude compensating system which can vary the operating characteristic of a carburetor for obtaining a desirable enriched air fuel ratio in accordance with changes in altitude.
(iii) In conventional carburetors, the air fuel ratio is enriched for obtaining increased engine power when the throttle valve of the carburetor is opened.
(iv) Multiple venturi systems having three venturies if fuel is injected in third venturi air flow rate will increases if fuel injection in main venturi air flow rate will not change.
Hence statement-4 is also wrong.

213. Which of the following actions will help to reduce the black smoke emission of a diesel engine?
1. Run at lower load, i.e., derating
2. Have regular maintenance of the diesel engine, particularly of injection system
3. Use diesel oil of higher cetane number

Select the correct answer using the code given below.
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (c) : The visible black smoke is generally due to injecting too much fuel for the amount of air available in the cylinder or due to poor mixing between fuel and air. This black smoke emission can be avoided by the proper design and maintenance of the injection system.
Derating reduces the power output, therefore, there will be a lean mixture of fuel and air, the combustion of fuel will be proper and there will be lesser black smoke emissions.

Search on Telegram @apna_pdf

214. If one cylinder of a diesel engine receives more fuel than the others, it is a serious condition for that cylinder and can be checked by

1. judging the seizure of the piston
2. checking incomplete combustion in that cylinder
3. checking cylinder exhaust temperature with a pyrometer

Which of the above is/are correct?

(a) 1 only (b) 2 only
(c) 3 only (d) 1, 2 and 3

ESE 2018

Ans. (c) : • If the exhaust temperature is high it can cause catastrophic engine failure.
• Therefore the exhaust gas temperature is checked whenever there is more fuel injected into the cylinder.

215. Consider the following statements with reference to combustion and performance in a four-stroke petrol engine:

1. The auto-ignition temperature of petrol as a fuel is higher than that of diesel oil as a fuel.
2. The highest compression ratio of petrol engines is constrained by the possibility of detonation.
3. A petrol engine is basically less suitable for supercharging than a diesel engine.

Which of the above statements are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) : Petrol have higher self ignition temperature, high volatile to burn when you compress that much it may burst out. Whereas diesel is low volatile and fire up at the compression without any external source. Supercharging is preferred in CI engine because it leads to decrease delay period, therefore decrease detonation where as in SI engine it increases compression ratio, increases detonation.
Hence all statements are correct.

216. In a four stroke cycle petrol engine, the compression

(a) starts at 40º after bottom dead center and ends at 30º before top dead center
(b) starts at 40º before bottom dead center and ends at 30º after top dead center
(c) starts at bottom dead center and ends at top dead center
(d) may start and end anywhere

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : In four stroke cycle petrol engine, the compression starts at 40º after top dead center while the expansion stats at 30º before top dead center and ends at 50º before bottom dead center.

217. In a four stroke cycle, the minimum temperature inside the engine cylinder occurs at the

(a) beginning of suction stroke
(b) end of suction stroke
(c) beginning of exhaust stroke
(d) end of exhaust stroke

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : In a four stroke cycle, the minimum temperature inside the engine cylinder occurs at the beginning of suction stroke while end of suction stroke air absorbs heat from cylinder and get warmed.

218. Which of the following statement is wrong?

(a) In compression ignition engines, detonation occurs near the beginning of combustion.
(b) Since the fuel in compression ignition engines is injected at the end of compression stroke, therefore there will be no pre-ignition.
(c) To eliminate knock in compression ignition engines, we want to achieve auto-ignition not early and desire a long delay period.
(d) In compression ignition engines, because of heterogeneous mixture, the rate of pressure rise is comparatively lower.

Karnataka PSC AE, 10.09.2017

Ans. (c) : To eliminate knock in compression ignition engines we want to have smaller delay period and nearly auto-ignition.

219. To mix air and petrol in the required proportion and to supply it to the engine during suction stroke, ... is employed.

(a) Injector (b) Carburetor
(c) Fuel pump (d) Spark plug

APGENCO AE, 2017

Ans. (b) : In petrol engine mixing of fuel and air in carburetor.

220. In the operation of four-stroke diesel engines, the term 'squish' refers to the :

(a) Injection of fuel in the pre-combustion chamber
(b) Discharge of gases from the pre-combustion chamber
(c) Entry of air into the combustion chamber
(d) Stripping of fuel from the core

HPPSC Asstt. Prof. 20.11.2017

Ans. (c) : In the operation of four stroke diesel engines, the term 'squish' refers to the entry of air into the combustion chamber.
Squish is an effect in internal combustion engines which creates sudden turbulence of the air-fuel mixture as the piston approaches top dead centre (TDC).

221. The most perfect method of scavenging is

(a) Cross scavenging
(b) Uniflow scavenging
(c) Loop scavenging
(d) Reverse flow scavenging

TNPSC AE 2017

Ans. (b) : The most perfect method of scavenging is uniflow scavenging.
Uniflow scavenging is a design used by some two-stroke engines where the fresh charge enters near the bottom of the cylinder and the exhaust gases exit through a valve situated at the top of the cylinder.

222. In a typical medium speed 4-stroke cycle diesel engine, the inlet valve [TDC-Top Dead Centre, BDC-Bottom Dead Centre]

(a) Opens at 20º before TDC and closes at 35º after BDC
(b) Opens at TDC and closes at BDC

Search on Telegram @apna_pdf

(c) Opens at 10º after TDC and closes at 20º before BDC
(d) Remain open for 200º

TNPSC AE 2017

Ans. (a) : In a typical medium speed 4-stroke cycle diesel engine, the inlet valve [TDC-Top Dead Centre, BDC-Bottom Dead Centre] Opens at 20º before TDC and closes at 35º after BDC.

223. Petrol engines are not suitable for part-load operation, because
(a) Mechanical efficiency is poor due to increasing internal losses at increased throttling
(b) Of fear of pre-ignition
(c) Of huge knocking
(d) Of increased detonation tendency

TNPSC AE 2017

Ans. (a) : Petrol engines are not suitable for part-load operation, because mechanical efficiency is poor due to increasing internal losses at increased throttling.

224. A distributor in spark ignition engines performs the function of
(a) Distributing the right quantity of fuel oil to the desired cylinder
(b) Distributing the air requirement appropriately
(c) Adding additives to fuel oil
(d) Providing the correct firing order in the engine

TNPSC AE 2017

Ans. (d) : A distributor in spark ignition engines performs the function of providing the correct firing order in the engine.

225. Engine knock can be measured by using
(a) Combustion pressure sensor
(b) Mechanical vibration sensor
(c) Ion current measurement
(d) All the above

TNPSC AE 2017

Ans. (d) : Engine knock can be measured by using
Combustion pressure sensor
Mechanical vibration
Ion current measurement

226. Statement (I): Air-blast injection in diesel engines could reduce engine efficiency.
Statement (II): Air-blast injection in diesel engines is not instantaneous but happens when the piston moves outward with the injection valve remaining open for whatever reason.

ESE 2017

Ans. (*) :

227. The knocking sensitivity of engines could be reduced by
(a) Compact combustion chamber geometry
(b) Central position of the spark plug
(c) Increased turbulence
(d) All the above

TNPSC AE 2017

Ans. (d) : The knocking sensitivity of engines could be reduced by compact combustion chamber geometry, central position of the spark plug, and increased turbulence.

228. Knocking takes place in C.I. Engines
(a) at the start of combustion
(b) at the end of combustion
(c) during combustion
(d) during the delay period

TNPSC AE 2017

Ans. (a) : Knocking takes place in C.I. Engines at the start of combustion.

229. Which of the following is the most effective air cleaner in case of diesel engine
(a) Dry type (b) Wet type
(c) Whirl type (d) Oil bath type

Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : Oil bath type most effective air-cleaner in diesel engine, because when air-fuel ratio is about 10% rich mixture, then a high flame speed is obtained in diesel engine.

230. Carburetion is process of
(a) Forming a combustible air-fuel mixture by mixing the proper amount of fuel and air before admitting it into the engine cylinder
(b) Igniting the air-fuel mixture into the engine cylinder during power stroke
(c) Combusting the carbon in the atmosphere
(d) None of these

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : Carburetion is process of forming a combustible air-fuel mixture by mixing the proper amount of fuel and air before entering to engine cylinder.

231. Modern CRDI engines uses injection pressure of the order of
(a) 400 bar (b) 800 bar
(c) 1000 bar (d) 1600 bar

TNPSC AE 2017

Ans. (d) : CRDI Engine- CRDI stands for common rail direct injection which means direct injection of fuel into the cylinder of a diesel engine through a single common line called rail which is connected to fuel injectors.

232. Reducing the combustion-chamber surface are
(a) reduces the amount of unburned HC in the exhaust gas
(b) increases the amount of unburned HC in the exhaust gas
(c) reduces the amount of NO_x in the exhaust gas
(d) increases the amount of unburned HC and NO_x in the exhaust gas

TNPSC AE 2017

Ans. (a) : Reducing the combustion-chamber surface are reduces the amount of unburned HC in the exhaust gas.

233. In the Passenger cars, the following type of carburetor is preferred
(a) Horizontal type
(b) Upward draught type
(c) Downward draught type
(d) Inclined draught type

TNPSC AE 2017

Ans. (c) : Downward draught type of carburetor is preferred in the passenger cars.

234. Statement (I) : Knocking and pre-ignition are the two words explaining the same phenomena.
Statement (II) : Pre-ignition occurs only in petrol engines.

Search on Telegram @apna_pdf

(a) Both Statement (I) and Statement (II) are individually true and Statement (II) is the correct explanation of Statement (I)
(b) Both Statement (I) and Statement (II) are individually true but Statement (II) is NOT the correct explanation of Statement (I)
(c) Statement (I) is true but Statement (II) is false
(d) Statement (I) is false but Statement (II) is true

JWM 2017

Ans. (b) : Knocking and pre-ignition are the two words explaining the same phenomena. Knocking occur only in the diesel engine while Pre-ignition occur only in petrol engines. Pre-ignition is the ignition of the air-fuel charge prior to the spark plug firing.

235. C.I. engine as compared to S.I. engine require
(a) No flywheel (b) Same size flywheel
(c) Smaller flywheel (d) Bigger flywheel

Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : C.I. engine compare S.I. engine require bigger flywheel.

236. The volume of air required to consume 1 litre of fuel by a four stroke engine is
(a) 5–6 m^3 (b) 9–10 m^3
(c) 2–3 m^3 (d) 15–18 m^3

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : Volume of 9-10 m^3 air is required for consuming 1 litre of fuel by a four-stroke engine.

237. The power to weight ratio in a two stroke engine as compared to four stroke engine is
(a) More
(b) Less
(c) Equal
(d) Depends on the power rating

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : The power to weight ratio is double in two stroke engine as compared to four stroke engine.

238. Which one of the following form a part of the fuel supply system for a diesel engine?
(a) Supply pump (b) Filter
(c) Spray Nozzle (d) All of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : Following are the part use to form the fuel supply system for a diesel engine.
• Supply pump • Filter • Injector Nozzle

239. The valve timing is controlled by
(a) camshaft (b) crank shaft
(c) governor (d) all of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : In 4-stroke cycle engines and some two-stroke engines, the valve timing controlled by the camshaft. This can varied by modifying the camshaft, or it can be varied during engine by variable valve timing.

240. If delivery ratio is 1.7, what will be the excess air factor in case of two stroke engine?
(a) 0.3 (b) 0.7
(c) 3.4 (d) 1.4
(e) 0.6

CGPSC ARTO & TSI 07.01.2017

Ans. (b) : Delivery ratio = 1.7
Excess air factor (λ) = ?
$\because$ $\lambda = R_{del} - 1$
$= 1.7 - 1$
$= 0.7$

241. Diesel engine can work on very lean air fuel ratio of the order of 30 : 1. A petrol engine can also work on such a lean ratio provided ..... .
(a) it is properly designed
(b) best quality fuel is used
(c) can not work as it is impossible
(d) flywheel size is proper

GWSSB DEE 07.07.2016

Ans. (c) :

242. Which of the following statements is true?
(a) In diesel engines, thermal losses are lower in the direct injection as compared to indirect injection
(b) In diesel engines, thermal losses are higher in the direct injection as compared to indirect injection
(c) In diesel engines, thermal losses in the direct injection are same as compared to indirect injection
(d) In diesel engines, thermal losses in the direct injection are either lower or higher as compared to indirect injection depending on the external temperature

KPCL AE 2016

Ans. (a) : In diesel engines, thermal losses are lower in the direct injection as compared to indirect injection.

243. Which of the following is the correct formula for Engine Volumetric Efficiency, given that V_a is the volume of air taken in the cylinder and V_c is the maximum possible volume in the cylinder?
(a) V_c/V_a (b) V_a/V_c
(c) $V_c . V_a$ (d) None of the above

KPCL AE 2016

Ans. (b) :

$$\eta_{volumetric} = \frac{\text{volume of air taken in the cylinder } (V_{air})}{\text{Maximum possible volume } (V_c) \text{ in the cylinder}}$$

$$\eta_{volumetric} = \frac{V_a}{V_c}$$

$$= \frac{V_a}{\frac{\pi}{4} D^2 \times L} \qquad \left[\because V_c = V_s = \frac{\pi}{4} D^2 L\right]$$

244. Which of the following denotes the power developed by combustion of fuel in the combustion chamber?
(a) Brake power (b) Indicated power
(c) Operational power (d) None of these

KPCL AE 2016

Ans. (b) : Indicated power is defined as the total power developed by combustion of fuel in the combustion chamber.

Search on Telegram @apna_pdf

245. To which of the following categories does a petrol, petrol engine belong?
(a) Compression engines
(b) Spark ignition engine
(c) Both A and B
(d) None of these

KPCL AE 2016

Ans. (b) : Petrol engine belongs to spark ignition engine (S.I.) while diesel engine is a compression ignition engine (C.I.).

246. Air fuel ratio of about ..... means too rich mixture for a S.I. engine
(a) 1:10 (b) 1:12
(c) 1:14 (d) 1:13

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : The reaction of mixture of fuel with Oxygen in the air is cause from burning of fuel. This is called air-fuel ratio (AFR).
A rich mixture would be one with a (AFR) ratio less than 10 : 1, which means 10 part of air to one part of fuel

247. ..... is the ignition of homogeneous mixture in the cylinder, before the timed ignition spark occurs, caused by the local overheating of the combustible mixture
(a) Detonation (b) Post detonation
(c) Pre-ignition (d) Before ignition

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Pre-ignition is the ignition of the homogeneous mixture in the cylinder, before the timed ignition spark occurs, caused by the local overheating of the combustible mixture.

248. Which of the following is not an affect of pre-ignition
(a) It increases tendency of detonation in engines
(b) Pre-ignition is a serious type of abnormal combustion
(c) Pre-ignition in single cylinder engine will result in a steady reduction in speed and power output
(d) The real desirable effects of pre-ignition are when it occurs only in one or more cylinders in a multi cylinder engine

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : The real undesirable effects of pre-ignition are which it occurs only in one or more cylinder in a multi cylinder engine.

249. At present the amount of power that can be developed in the cylinder of a petrol engine is fixed by the liability of a fuel to
(a) Detonate (b) Pre-ignition
(c) Unburnt charge (d) Slow ignition

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (a) : present the amount of power that can be developed in the cylinder of a petrol engine is fixed by the liability of a fuel to detonate

250. Which one of the following methods cannot control Detonation
(a) Increase engine speed
(b) Retarding spark
(c) Reducing pressure in the inlet manifold by throttling
(d) Making air fuel ratio neither too lean nor too rich

Nagaland PSC CTSE 2017, 2016 Paper-II

Ans. (d) : Making air-fuel ratio neither too lean nor too rich is wrong statement here. Right statement, says that air-fuel ratio either too lean or too rich, preferably latter.

251. Most engines operates with at least ..... excess air due to difficulty of introducing sufficient exposed oxygen to the fuel vapour in the given time available so that the combustion process can be completed before the exhaust valve opens.
(a) 10% (b) 20%
(c) 30% (d) 40%

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Excess air ensure that there is enough air for complete combustion. Excess air is expressed as a percentage of theoretical air required. Thus, 10% excess air indicates that 110% total air is being supplied. In a combustion process the complete burning cannot be accomplished with the exact theoretical amount of air

252. In C.I. engine, the fuel which is automised form is considerably colder than the hot compressed air in the cylinder. Although the actual ignition is almost instantaneous, an appreciable time elapses before the combustion is in full progress. This time occupied is called the
(a) Delay period
(b) Ignition lag
(c) Delay period or Ignition Lag
(d) Elapsed Time

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : In C.I. engine, the fuel which is automised form is considerably colder than the hot compressed air in the cylinder. Although the actual ignition is almost instantaneous, an appreciable time elapses before the combustion is in full progress. This time occupied is called the delay period or Ignition lag.

253. The power output from a spark ignition engine is varied by :
(a) Changing the ignition temperature
(b) Regulating the amount of air fuel inducted
(c) Regulating the amount of air fuel mixture
(d) Regulating the amount of fuel

HPPSC Asstt. Prof. 18.11.2016

Ans. (c) Increasing the power output can be achieved by-
1. Increasing the compression ratio.
2. Increasing the breathing capacity of engine (super charging).
3. Increasing the bore of engine.
4. Adding more fuel.

254. Which of the following factor (s) increase(s) the tendency for knocking in the C.I. engine?
(a) Increasing the speed injection advance and coolant temperature
(b) Increasing both the compression ratio and the coolant temperature

Search on Telegram @apna_pdf

(c) Increasing both the speed and the injection advance
(d) Increasing the compression ratio

UPRVUNL AE 21.08.2016

Ans. : (c) Factors tending to reduce knocking in CI engine
(i) Self ignition temperature of fuel – Low
(ii) Cylinder Size – Large
(iii) Speed – Low
(iv) Inlet temperature and pressure – High
(v) Compression ratio – High

255. Consider the following statements relevant to the ignition system of SI engine
1. Too large a dwell angle will result in misfiring
2 Too large a dwell angle will result in burning of condenser and contact points
3. Too small a dwell angle will lead to the burning of condenser and contact points.
4. Too small a dwell angle will result in misfiring

Which of the above statements are correct?
(a) 2 and 3 (b) 1 and 2
(c) 3 and 4 (d) 4 and 1

UPRVUNL AE 21.08.2016

Ans. : (b) • Too large a dwell angle will result in burning of condenser and contact points
• Too small a dwell angle will result in misfiring

256. Fuel injection pressure in solid injection system is approximately in the range of
(a) <10.5 bar (b) 10.5-21 bar
(c) 30 - 50 bar (d) 200 - 246 bar

UPPSC AE 12.04.2016 Paper-II

Ans.: (d) Fuel injection pressure in solid injection system is approximately in the range of 200-246 bar.

257. Problem of scavenging appears in case of
(a) Petrol engine (b) Diesel engine
(c) Four stroke engine (d) Two stroke engine

UJVNL AE 2016

Ans : (d) Problem of scavenging appears in case of two stroke engine
Scavenging:-The process of removing burnt gases, from the combustion chamber of the engine cylinder, is known as scavenging.
Scavenging are two types
1) Cross flow scavenging
2) Back or loop scavenging

258. In C.I. Engine, the function air swirl is
(a) Haphazard motion of air in the cylinder
(b) rotary motion of the air for proper distribution of fuel in the cylinder
(c) radial motion of air in the cylinder
(d) Mixing of air and fuel

APPSC AEE MAINS 2016 PAPER-III

Ans. (b) : In C.I. Engine, the function air swirl is rotary motion of the air for proper distribution of fuel in the cylinder.

259. Precise petrol injection system is :
(a) Direct injection
(b) Sequential injection
(c) Throttle body injection
(d) Port injection

HPPSC W.S. Poly. 2016

Ans : (c) Precise petrol injection system is throttle body injection.
The injector or atomizer is also an important part of the diesel engine which breaks up the fuel and sprays into the cylinder into a very fine divided particles.

260. In a three cylinder petrol engine the standard firing order is :
(a) 3-2-1 (b) 1-2-3
(c) 1-3-2 (d) None of the above

GPSC Lect. (Auto) 16.10.2016

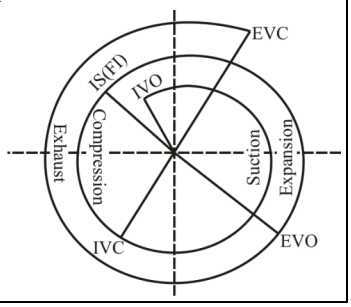
Ans. (c) : In a three cylinder petrol engine the standard firing order is 1-3-2.

261. The inlet valve of a four stroke cycle I.C. engine remains open approximately
(a) 205° (b) 190°
(c) 235° (d) 285°

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : The inlet valve at a four stroke cycle I.C. engine remains open approximately 235°.
Valve Timing Diagram–

IVO = Inlet valve open
IVC = Inlet valve close
EVO = Exhaust valve open
EVC = Exhaust valve close



262. Which of the following is associated with the valve operating mechanism?
(a) Gudgeon pin (b) Crown
(c) Tappet (d) Distributor

RPSC AE (GWD) 06.05.2016

Ans. (c) : A tappet is most commonly component in an internal combustion engine which converts the rotating motion of the camshaft into linear motion of valves, either directly or indirectly.

263. The maximum pressure of air fuel mixture at the end of compression in petrol engine varies from :
(a) 10-30 kg/cm^2 (b) 30-100 kg/cm^2
(c) 6-10 kg/cm^2 (d) 10-20 kg/cm^2

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) The maximum pressure of air fuel mixture at the end of compression in petrol engine varies from 10-20 kg/cm^2.

264. Which of the following is not true for internal combustion engine as compare to external combustion engine?
(a) It has a lower ratio of weight to output
(b) Higher overall efficiency
(c) They are all self starting
(d) Mechanical simplicity

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c)

Search on Telegram @apna_pdf

265. Which of the following is NOT a disadvantage of two stroke engines as compared to four stroke engines ?

(a) More cooling requirement
(b) Heavier fly wheel required
(c) More wear and tear
(d) Lower thermal efficiency

RPSC AE (GWD) 06.05.2016

Ans. (b) : Advantages

- A two stroke cycle engine has twice the number of power stroke than the four stroke cycle engine at the same on engine speed.
- For same power developed a two stroke cycle engine is lighter, less bulky and occupies less floor area.
- A two stroke engine has less maintenance cost since it requires only few parts.
- The weight of the two stroke engine is less than four stroke cycle engine because of the lighter flywheel due to more uniform torque on the crankshaft.

266. Pick the wrong statement about CI engines :

(a) They operate at higher compression ratio.
(b) The charge sucked in suction stroke consists of air only.
(c) They have lower thermal efficiency than SI engines of comparable size.
(d) They are more suitable for two-stroke operation.

RPSC AE (GWD) 06.05.2016

Ans. (c) : C.I. have higher thermal efficiency than S.I. engine of comparable size.

267. Consider the following statements about SI engines : (a) The air is sucked in the suction stroke and fuel is injected into the cylinder to obtain a homogenous mixture of air and fuel. (b) A homogeneous mixture of air and fuel is prepared externally and sucked in the cylinder during suction stroke. (c) Ignition is by a spark plug exactly at the end of compression stroke. (d) Ignition is by a spark plug little before the end of the compression stroke. Which of the above statement(s) are correct?

(a) Both (a) and (c) (b) Both (b) and (c)
(c) (a), (b) and (c) (d) Both (b) and (d)

RPSC AE (GWD) 06.05.2016

Ans. (d) : To about S.I. engine-

- A homogeneous mixture of air and fuel is prepared externally and sucked in the cylinder suction stroke.
- Ignition is by a spark plug little before the end of the compression stroke.

268. For a diesel engine, the maximum efficiency occurs at

(a) Very low loads (b) Around 50% load
(c) Around 80% load (d) Full load

RPSC AE (GWD) 06.05.2016

Ans. (c) : around 80% load

269. The air requirement of a petrol engine during starting compared to theoretical air required for complete combustion is:

(a) More
(b) Less
(c) Same
(d) May be more or less depending on engine capacity

GPSC Asstt. Prof. 28.08.2016

Ans. (b) : The ratio of mass of air sucked by engine to mass of fuel injected is air-fuel ratio. The air requirement of a petrol engine during starting compared to theoretical air (15:1- stoichiometric air fuel ratio) required for complete combustion is less.

270. The pressure inside the engine cylinder is …… atmospheric pressure during suction stroke.

(a) Above
(b) Below
(c) Equal
(d) Either below or above

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : The pressure inside the engine cylinder is below the atmospheric pressure during suction stroke. The gas is continuously sucked inside cylinder till its pressure not becomes more than atmospheric pressure.

271. Which of the following is not difference between four stroke cycle CI engine and SI engine?

(a) Four stroke CI works on diesel cycle and SI works on otto cycle.
(b) Four stroke CI are heavier due to higher peak pressure and SI are lighter due to lower peak pressure.
(c) Four stroke CI are self –ignition due to high compression ratio, on the other side SI requires ignition system with spark plug.
(d) Four stroke CI is internal combustion while SI engine is external combustion engine.

GPSC Lect. (Auto) 16.10.2016

Ans. (d) :

272. Single cylinder two stroke SI engine has :

(a) Transfer and exhaust ports
(b) Inlet and exhaust valve
(c) Spark distributor
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Two stroke SI engine have port mechanism. It consist of two ports. Transfer and exhaust ports. Four stroke SI engine have valve mechanism. It consist of inlet and exhaust valve.

273. A two stroke engine may be easily identified by:

(a) Absence of piston rings
(b) Size of flywheel
(c) Piston
(d) Absence of valves

KPSC ADF 2015

Ans. (d) : A two stroke engine may be easily identified by absence of valve. In 2-strokes engine inlet and exhaust ports are present.

274. Which of the following are the assumptions involved in the auto-ignition theory put forth for the onset of knock in SI engines?

Search on Telegram @apna_pdf

1. Flame velocity is normal before the onset of auto ignition.
2. A number of end-gas elements auto ignite simultaneously.
3. Pre flame reactions are responsible for preparing the end-gas to ignite.

Select the correct answer using the codes given below.

(a) 1 and 2 (b) 1 and 3
(c) 2 and 3 (d) 1, 2 and 3

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : Assumptions–
(1) Flame velocity is normal before the onset of auto ignition.
(2) A number of end-gas elements auto ignite simultaneously.
(3) Pre flame reactions are responsible for preparing the end-gas to ignite.

275. In the opposed piston diesel engine, the combustion chamber is located

(a) Above the piston (b) Below the piston
(c) Between the pistons (d) Anywhere

Nagaland PSC CTSE 2015 Paper-II

Ans. (c) : In opposed piston engine the combustion chamber is the space left between the two pistons when both are at inner dead centre position. It is this place between the pistons where in the fuel injection volume, air starting valve, air starting valve, pressure relief valve and indicating cocks are fixed.

276. Match List-I with List-II and select the correct answer :

	List-I		List-II
A.	Highest useful compression ratio	1.	Ignitable mixture
B.	Dopes	2.	Knock rating of fuels
C.	Limiting mixture strength	3.	Detonation
D.	Delay period	4.	Chain of chemical reactions in combustion chamber

	A	B	C	D
(a)	2	3	1	4
(c)	2	3	4	1

	A	B	C	D
(b)	3	2	1	4
(d)	3	4	2	1

Nagaland PSC CTSE 2015 Paper-II

Ans. (a)
- **Highest Useful Compression Ratio–** SI engine fuel is limited to knocking tendency of fuel as it is used as one of the methods for knocking rating of fuel.
- Dopes are chemical additive which are used to improve combustion performance of fuel.
- Limiting mixture strength is the range for ignitable mixture. The ignition limits are wider at increased temperature because of higher rates of reaction and high thermal diffusivity coefficient of mixture.
- Delay period is related with detonation in CI engine. Higher the delay period more is the tendency of knocking in CI engine.

277. Compensating devices are provided in carburetors

(a) To charge the quantity of mixture depending upon load
(b) To provide always an economy mixture
(c) To modify the mixture strength depending upon requirements under various operating conditions
(d) To supply extra fuel during acceleration only

MPPSC AE 08.11.2015

Ans. (c) : Compensating devices are provided in carburetors to modify the mixture strength depending upon requirements under various operating condition.

278. Which is not a part of magneto-ignition system?

(a) Condenser (b) Battery
(c) Circuit breaker (d) Induction coil

(KPSC AE 2015)

Ans : (b) Battery is not a part of magneto- ignition system.
Magneto ignition system:- The magneto ignition system has the same principle of working as that of coil ignition system. except that no battery is required, as the magneto acts its own generator.
This type of ignition system is generally employed in small spark ignition engines such as scooters, motor cycles and small motor boat engines.

279. A temperature indictor is usually provided for automobiles, which indicates temperature of

(a) Lubrication oil
(b) Engine cylinder wall
(c) Jacket cooing water
(d) Engine piston

GPSC AE 26.07.2015

Ans. (d) : A temperature indictor is usually provided for automobiles, which indicates temperature of engine piston.

280. Consider the following statements:
Detonation in the SI engine can be suppressed by
1. Retarding the spark timing
2. increasing the engine speed
3. using 10% rich mixture
4. using a fuel of high octane rating of these statements

(a) 1 and 3 are correct
(b) 2 and 3 are correct
(c) 1, 2 and 3 are correct
(d) 1 and 2 are correct
(e) 1, 2, 3 and 4 are correct

CGPSC AE 26.04.2015 SHIFT-II

Ans. (e) :
Detonation in the SI engine can be suppressed by
1. Retarding the spark timing
2. Increasing the engine speed
3. Using 10% rich mixture
4. Using a fuel of high octane rating.
5. Reduction in compression ratio, temperature of cylinder wall and over load on the engine.
6. Increasing turbulence in engine cylinder.

Search on Telegram @apna_pdf

281. Self-ignition temperature of petrol is of the order of :
(a) 150°C (b) 370°C
(c) 450°C (d) more than 500°C
(HPPSC AE 2014)

Ans : (d) The Self Ignition auto ignition temperature is lowest temperature at which a fuel such as petrol or diesel spontaneously ignites in normal atmosphere without an external source of ignition, such as a flame or spark.

282. The function of carburettor is to:-
(a) Refining the fuel
(b) Increase the pressure of fuel vapours
(c) Inject petrol in cylinder
(d) Automise and vapourise the fuel and to mix it with air in proper ratio
UKPSC AE-2013, Paper-II

Ans. (d) : The function of carburettor is to automise and vapourise the fuel and to mix it with air in proper ratio.

283. For compression ignition Engines minimum compression ratio is :
(a) 7 (b) 9
(c) 12 (d) 10
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : Compression ratio

$$(r) = \frac{V_T}{V_C} = \frac{V_S + V_C}{V_C} = 1 + \frac{V_S}{V_C}$$

V_S = Swept volume
V_C = Clearance volume
V_T = Total volume
Compression ratio of SI engine = 6 to 10
Compression ratio for CI engine = 16 to 22
Compression ratio for dual engine = 12 to 16
So, minimum compression ratio of CI engine is 12 as per question.

284. Modern cars, using petrol as a fuel, has compression ratio of about
(a) 6-7 : 1.0 (b) 9-10:1.0
(c) 18.0:1.0 (d) 12.0:1.0
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : Modern cars, using petrol as a fuel, has compression ratio of about 9-10:1.0.

285. If A_p is the area of piston & A_r is the area of piston rod, then for extension stroke effective area 'A' is.
(a) $A = A_p$ (b) $A = A_p - A_r$
(c) $A = A_r$ (d) $A = A_p + A_r$
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : A_p = Area of piston
A_r = Area of piston rod.
Then for extension stroke effective area A is
$A = A_p$
Stroke Volume $(V_s) = A_p \times L$

$$V_s = \frac{\pi}{4} D^2 \times L$$

286. Scavenging air in diesel engine means:
(a) Air used for combustion sent under pressure
(b) Forced air for cooling cylinder
(c) Burnt air containing product of combustion
(d) Air used for forcing burnt gases out of engine cylinder during the exhaust period.
SJVN ET 2013

Ans.(d) : In diesel engine, scavenging is the process of removing the burnt gases from the combustion chamber of the engine cylinder during exhaust period and fresh air coming inside the cylinder.

287. Which is correct for diesel power plant?
(a) No ash handling, but high operating cost
(b) Difficult to design, but low maintenance cost
(c) Low efficiency at part loads, but noise problem
(d) All of these
SJVN ET 2013

Ans. (a) : For diesel power plant no ash handling, but high operating cost.

288. In a low speed S.I. engine, the inlet valve closes approximately:-
(a) 40° after BDC (b) 30° before BDC
(c) 10° after BDC (d) 10° before BDC
UKPSC AE-2013, Paper-II

Ans. (c)

289. The function of fuel injector is to:-
(a) Pump the fuel at high pressure
(b) Mix diesel with air
(c) Automoise the fuel
(d) Ignite the fuel
UKPSC AE-2013, Paper-II

Ans. (c) : The function of fuel injector is to automoise the fuel.

290. The process of replacement of combustion products with fresh air charge
(a) Turbocharging (b) Idling
(c) Supercharging (d) Scavenging
TNPSC AE 2013

Ans. (d) : The process of replacement of combustion products with fresh air charge is known as scavenging.

291. In a cycle, the spark lasts roughly for
(a) 1 sec (b) 0.1 sec
(c) 0.01 sec (d) 0.001 sec
APPSC AEE 2012

Ans. (d) : In a cycle, the spark lasts roughly for 0.001 sec.

292. For low load operation, most economical engine is
(a) an S.I. engine
(b) a C.I. engine
(c) a two-stroke engine
(d) both S.I. and C.I. engines are equally good
APPSC AEE 2012

Ans. (b) : For low load operation most economical engine is a CI engine.

293. Ignition accelerators are substance which
(a) increase the rate of pre-flame reaction and reduce the ignition lag
(b) increase knock
(c) reduce detonation
(d) increase thermal efficiency
BPSC AE 2012 Paper - V

Search on Telegram @apna_pdf

Ans : (a) : Ignition accelerators are substance which increase the rate of pre-flame reaction and reduce the ignition lag.

294. Diesel, as compared to petrol is
(a) highly ignitable
(b) more difficult to ignite
(c) less difficult to ignite
(d) none of these

TNPSC ACF 2012

Ans. (b) : Diesel as compared to petrol is more difficult to ignite.
Method of ignition- In petrol engine spark plug is used to produce spark for the ignition. In CI engine heat of compressed air is used for the ignition.

295. In order to prevent knocking in spark ignition engines, the charge away from the spark plug should have
(a) low density (b) low temperature
(c) long ignition delay (d) all of these

TNPSC ACF 2012

Ans. (d) : Following parameter will minimize knocking in SI engine.
Compression ratio- Low
Self ignition temperature- High
Mass of charge- Low
Inlet temperature of charge- Low-

296. How many cylinders does a rotary internal combustion engine has ?
(a) 4 (b) 5
(c) 6 (d) 7

VIZAG STEEL MT 2011

Ans. (c) :

297. Consider the following factors:
Diesel engine knock can be reduced by increasing
1. Engine speed
2. Compression ratio
3. Degree of supercharge
4. Injection advance
Which of the statements is/are true?
(a) 1, 2 and 3 only (b) 2 and 3 only
(c) 1, 3 and 4 only (d) 2 only

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : Diesel knocking can be reduced by increasing compression ratio (which reduce the delay period) & Degree of supercharging increases the charge and encourage the atomization of fuel & prevent knocks.
Decreasing engine speed reduce knock & similar in injection advance.

298. When does ignition initiates in a Spark Ignition Engine?
(a) Immediately after spark
(b) Immediately after completion of physical and chemical delay
(c) Immediately after the completion of Ignition lag
(d) Just after completion of flame propagation

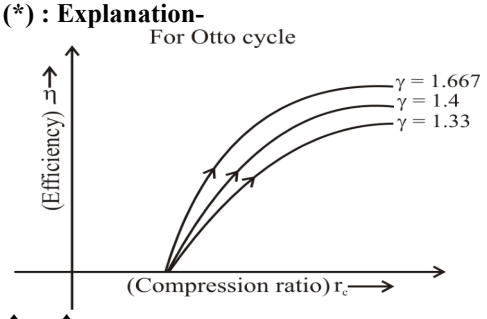
RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (c) : In Spark Ignition engine, ignition initiates immediately after the completion of ignition lag. Ignition lag in terms of crank angle is 10º to 20º & in terms of second 0.0015 sec. before reaching to top dead centre of cylinder.

299. Consider the following statements for the thermal efficiency of the Otto cycle :
1. The efficiency increases with increase in compression ratio.
2. The efficiency decreases with increase in specific heat ratio of working fluid.
3. The efficiency is independent of the temperature levels at which the cycle operates :
Which of these statements are correct?
(a) 1, 2 and 3 (b) 1 and 2 only
(c) 2 and 3 only (d) 1 and 3 only

UPSC JWM Advt. No.-52/2010

Ans. (*) : Explanation-



(1) $\eta \uparrow, r_c \uparrow$
(2) $\eta \uparrow, \gamma \uparrow$
(3) $\eta = 1-\frac{T_L}{T_H} = 1-\frac{1}{(r_c)^{\gamma-1}}$
$\eta = f(T_L, T_H)$
So only statement (1) is correct. But no suitable option is given.

300. The flame travel in SI engines is very slow initially due to :
(a) Low transposition rate and low turbulence
(b) Spark plug being located very close to the cylinder wall
(c) Low turbulence and low heat liberation
(d) Fraction of unburned mass which is a function of crank angle

APPSC IOF, 2009

Ans. (d) : The burned gas fraction in the unburned mixture, due to the residual gas fraction and any recycled exhaust gases recirculation (EGR), slow down both flame development and propagation. Residual gas fraction increases at part loads in SI-Engines, reducing flame propagation.

301. A simple carburettor has a venturi throat diameter of 22 mm and the coefficient of flow is 0.82. The fuel orifice has a diameter of 1.2 mm and the coefficient of fuel flow is 0.70. The petrol surface is 4 mm below the throat. Taking nozzle tip into account, the air/fuel ratio for a pressure drop of 0.075 bar is :
(a) 12.75 (b) 15.78
(c) 7 (d) 1.6155

APPSC IOF, 2009

Search on Telegram @apna_pdf

Ans. (b) : Using $\frac{A}{F}=\frac{C_{dv}A_v}{C_{dn}A_n}\sqrt{\frac{\rho_a}{\rho_f}},\ A_v=\frac{\pi}{4}d_v^2$

$$=\frac{0.82\times0.785\times(22\times10^{-3})^2}{0.70\times0.785\times(1.2\times10^{-3})^2}\sqrt{\frac{1.2}{750}}$$

$$\frac{A}{F}=15.74:1$$

For taking into account, x = 4 mm,

Using $\frac{A}{F}=\frac{C_{dv}}{C_{dn}}\frac{A_v}{A_n}\times\sqrt{\frac{\rho a(p_1-p_2)}{\rho_f(p_1-p_2-\rho_f.g.x)}}$

$$\frac{A}{F}=15.78:1$$

302. The temperature of the cooling water leaving the diesel engine should not be more than :
(a) 30°C (b) 60°C
(c) 74°C (d) 45°C

APPSC IOF, 2009

Ans. (b) : The temperature of cooling water leaving the diesel engine should not exceed 60°C or 140º F.

303. The fuel air ratio for maximum power of S.I. engines, should be
(a) Lean (b) Rich
(c) May be lean or rich (d) Chemically correct

WBPSC AE 2008

Ans. (b) : The fuel air ratio for maximum power of S.I. engines, should be rich.

304. Due to which of the following reasons a diesel engine gives a smoke exhaust
(a) Water in the fuel
(b) Fuel injection is late
(c) Fuel is not distributed equally to all the cylinders
(d) Exhaust valve receives too much lube oil

WBPSC AE 2008

Ans. (b) : Due to lack of appropriate time to burn the fuel a black or gray smoke may comes out in exhaust.

305. The thermal efficiency of petrol engines is about
(a) 15% (b) 30%
(c) 50% (d) 70%

TNPSC AE, 2008

Ans. (b) : The thermal efficiency of petrol engines is about 30%.

306. Thermal efficiency of a diesel engine used for power generation is
(a) Less than air standard value
(b) More than air standard value
(c) Equal to that of air standard value
(d) Twice that of air standard value

TNPSC AE, 2008

Ans. (a) : Thermal efficiency of a diesel engine used for power generation is less than air standard value.

307. Delay period of CI engine fuel is affected by
(a) Properties of fuel
(b) Atomization of fuel
(c) Compression ratio of engine
(d) All the above

UKPSC AE 2007 Paper -II

Ans. (d) : All the above

308. The amount of air which is supplied for complete combustion is called
(a) Primary air (b) Secondary air
(c) Tertiary air (d) None of these

UKPSC AE 2007 Paper -II

Ans. (b) : Secondary air

309. Source of electrical energy in SI engine is
(a) battery (b) magneto
(c) generator (d) any of the above

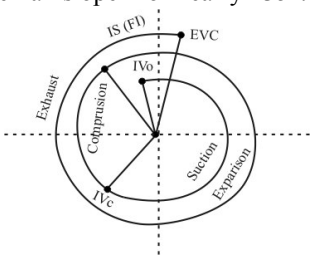
UKPSC AE 2007 Paper -II

Ans. (d) : Any of the above

310. The inlet valve of a four stroke cycle I.C. engine remains open for nearly :
(a) 180° (b) 125°
(c) 235° (d) 200°

J & K PSC Screening, 2006

Ans. (c) : The inlet valve for a four stroke cycle IC engine remains open for nearly 235°.



311. A four stroke diesel engine does not have
(a) Cooling (b) Ignition coil
(c) Cam shaft (d) Piston rings

WBPSC AE 2003

Ans. (b) : 4- stroke diesel engine have
→ Piston, Crankshaft, Camshaft, cylinder, valves, fly wheel connecting rod, fuel injectors thus 4-stroke diesel engine does not have Ignition coil.

312. In a naturally aspirated diesel engine, the air is supplied by :
(a) A supercharger
(b) A centrifugal blower
(c) A vacuum chamber
(d) An injection tube

J&K PSC Civil Services Pre, 2013

Ans. (c) : A vacuum is created in the cylinder during suction stroke in naturally aspirated diesel engine. The speed of diesel engine increases, this vacuum pulls in even more air and diesel fuel. So, the engine gas faster developing higher horsepower levels. The volumetric efficiency is less than 100%.
Note – Centrifugal blower are also used in super charger and air is supplied to piston as more pressure than atmospheric pressure. So, volumetric efficiency is more than 100% .

Search on Telegram @apna_pdf

313. Four cylinder four stroke petrol engine running at 1000 rpm will have in all how many sparks in one minute?

(a) 250 (b) 500
(c) 1000 (d) 2000

RPSC ADE 2016

Ans. (d) : Sparking take place one in each cycle in each cylinder and four stroke complete one cycle in two revolution of crankshaft.

So, number of sparks = $\frac{1000 \times 4}{2} = 2000$

314. Which of the following statement about two-stroke engines is wrong ?

(a) Valves are absent.
(b) The cycle is completed in two strokes or one revolution of crankshaft.
(c) Lighter than a four-stroke engine of same power.
(d) Due to absence of valves, a complex mechanism for admission of charge and discharge of burnt gases is required.

RPSC AE (GWD) 06.05.2016

Ans. (d) : About Two-stroke engine-

- Valves are absent
- In two stroke engine, the air-fuel mixture enters through the inlet port.
- The cycle is completed in two stroke or one revolution of crank shaft.
- Lighter than a four stroke engine of same power.

315. For a four stroke diesel engine exhaust gas temperature

(a) Increases with load
(b) Decreases with load
(c) Is constant throughout the variation of load
(d) No prediction is possible

UKPSC AE 2007 Paper -II

Ans. (a) :

316. Ignition in a SI engine takes place when the piston is :

(a) Exactly at TDC position on its compression stroke
(b) Leaving the TDC position on its compression stroke
(c) Approaching TDC position on its exhaust stroke
(d) Approaching TDC position on its Compression stroke

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) Ignition in a SI engine takes place when the piston is approaching TDC position on its compression stroke.

317. In a four-stroke cycle petrol engine, during suction stroke

(a) Only air is sucked in
(b) Only petrol is sucked in
(c) Mixture of petrol and air is sucked in
(d) None of the above

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) : In a four-stroke cycle petrol engine, during suction stroke Mixture of petrol and air is sucked in.

318. Ignition timing of a multi cylinder petrol engine can be adjusted by :

(a) Rotating the crank
(b) Adjusting the spark plug gap
(c) Adjusting ignition coil position
(d) Rotating the distributor

J&K PSC Civil Services Pre, 2013

Ans. (d) : Ignition timing of a multi cylinder petrol engine can be adjusted by rotating the distributor.

319. Knocking is compression ignition engine will increase:

(a) To a certain limits and then no change
(b) By increasing compression ratio
(c) Both fuel and air is sucked
(d) None of the above

HPPSC ADF 05.03.2019

Ans. (d) : The knocking tendency in compression ignition engines for a given fuel will be enhanced by decreasing compression ratio. If compression ratio is low in C.I. engines, there will not be enough temperature generation for ignition of fuel air mixture.

320. Which of the following factors increase detonation in the SI engine?

1. Increased spark advance
2. Increased engine rpm
3. Increased compression ratio.

Select the correct answer using the codes given below:

(a) 1 and 2 (b) 2 and 3
(c) 1 and 3 (d) 1, 2 and 3

RPSC ACF & FRO, 26.02.2021

Ans. (c) : Factors increasing detonation in SI engine →
(1) Increased spark advance.
(2) Increased compression ratio.
(3) Increase inlet measure and temperature
(4) Low engine speed
(5) Large flame travel distance.

321. In CI engines with increase in compression ratio the delay period -

(a) First increases and then decreases
(b) Increases
(c) Decreases
(d) Not affected

RPSC ACF & FRO, 26.02.2021

Ans. (c) : In CI engines with increase in compression ratio the delay period decreases.

322. Which is the best option to avoid knock is S.I. engine?

(a) Supercharging of engine
(b) Low delay period
(c) Higher spark advance
(d) Increase in engine speed

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : In SI engine increase in engine speed reduces knocking.

Search on Telegram @apna_pdf

323. Which of the following actions will not reduce the tendency of knocking in an SI engine?
(a) Reducing compression ratio.
(b) Reducing load
(c) Retarding spark timing.
(d) Reducing engine speed.

RPSC AEN Pre-2013

Ans. (d) : To reduce the tendency of knocking is an S.I. engine.
- Reducing compression ratio.
- Reduced load.
- Retarding spark ignition timing.
- Increase engine speed.

324. Which one of the following set of materials is most commonly used in catalytic converters for CI engines?
(a) Platinum, palladium and rhodium
(b) Palladium, rhodium and ruthenium
(c) Rhodium, ruthenium and platinum
(d) Ruthenium, platinum and palladium

GPSC ARTO Pre 30.12.2018

Ans. (a) : The materials most commonly used in catalytic convertors for CI engine are Platinum, Palladium and Rhodium.

325. In S.I. engine, the throttle valve of carburetor controls the quantity of:-
(a) Fuel (b) Air
(c) Fuel and air mixture (d) Lubricating oil

UKPSC AE-2013, Paper-II

Ans. (c) : In S.I. engine, the throttle valve of carburetor controls the quantity of fuel and air mixture.

326. In petrol engine, governor manipulates
(a) fuel pump (b) automiser
(c) filter (d) throttle valve

UKPSC AE 2007 Paper -I

Ans. (d) : Throttle valve

327. In C.I. engines, ignition delay can be reduced by:-
(a) Decreasing compression ratio
(b) Increase in air inlet temperature
(c) Decrease in coolant temperature
(d) Decreasing the engine speed

UKPSC AE-2013, Paper-II

Ans. (b) : In C.I. engines, ignition delay can be reduced by increase in air inlet temperature.

328. Primary cause of an excessively high pressure rise in diesel knock is due to
(a) Prolonged Delay period
(b) Pre ignition
(c) Pre ignition delay
(d) None of the above

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Diesel knock is the sound produced by the very rapid rate of pressure rise during the early part of the uncontrolled second phase of combustion. The primary cause of an excessively high pressure rise is due to a prolonged delay period.

329. Detonation is harmful as
(a) Increase in the rate of heat transfer causes a reduction in the power output and efficiency of the engine.
(b) Excessive turbulence removes most of the insulating gas boundary layer from the cylinder walls.
(c) High intensity of knock causes crankshaft vibration and the engine runs rough.
(d) None of the above

Karnataka PSC AE, 10.09.2017

Ans. (d) : None of the above option are correct.

330. The knocking in S.I. engines increases with
(a) Increase in inlet air temperature
(b) Increase in compression ratio
(c) Increase in cooling water temperature
(d) All of the above

JPSC AE, 10.04.2021, Paper-I

Ans. (d) : Knocking in S.I engine increases with–
- Increase in inlet air temperature.
- Increase in compression ratio.
- Increase in cooling water temperature.
- By supercharging.

331. In an S.I. engine, when most economical mixture is supplied, the colour of exhaust gases can be expected to be
(a) Bluish
(b) Dark red
(c) Dark blue and reddish yellow
(d) White

Karnataka PSC AE, 10.09.2017

Ans. (c) : Most economical mixture for S.I. engine is 15 : 1 to 16 : 1 where the colour of exhaust gases are dark blue and reddish yellow.

332. To have best efficiency in S.I. engine air-fuel mixture should be :
(a) Rich in fuel (b) Lean in fuel
(c) Both (a) and (b) (d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : For best efficiency air fuel mixture should be lean in fuel. For max power air fuel mixture should be rich in fuel.

333. For maximum power generation, the air fuel ratio for petrol engine vehicles is of the order of:
(a) 9 : 1 (b) 12 : 1
(c) 15 : 1 (d) 18 : 1

J&K PSC Civil Services Pre, 2013

Ans. (b) : Air fuel ratio to petrol engine
For max power – 12.6 : 1
For best fuel economy – 15.4 : 1

334. Which one of the following is not the chief effect of detonation?
(a) A loud pulsating noise, which may be accompanied by a vibration of the engine
(b) A loud pulsating noise from the wheel assembly
(c) An increase in the heat lost to the surface of combustion chamber
(d) An increase in carbon deposits

JPSC AE 2013 Paper-V

Search on Telegram @apna_pdf

Ans. (b) : A loud pulsating noise from the wheel assembly is not the chief effect of detonation.

335. In a diesel engine, during idling, the air fuel ratio may be of the order of

(a) 30 : 1 (b) 15 : 1
(c) 10 : 1 (d) 8 : 1

GPSC ARTO 01.05.2016

Ans. (c) : The rich air-fuel mixture is required during idling which is order of 10:1.

336. Increase in compression ratio in a diesel engine:

(a) Increases ignition delay
(b) Reduces ignition delay
(c) Keeps ignition delay constant
(d) Has no effect on ignition delay

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (b) : Increase in compression ratio (CR = 14 to 18) in a diesel engine reduce ignition delay, improve efficiency of engine and increase the brake thermal efficiency.

337. The tendency of knocking in CI engine is reduced by:

(a) high self-ignition temperature of fuel
(b) decrease in cooling water temperature
(c) short ignition lag of the fuel
(d) decrease in engine cylinder diameter
(e) low compression ratio

CGPSC ARTO & TSI 07.01.2017

Ans. (c) : The tendency of knocking in CI Engine is reduced by short ignition lag of the fuel.

- Knocking in an internal combustion engine, sharp caused by premature combustion of part of the compressed air fuel mixture in the Cylinder.

These pressure waves force parts of the engine to vibrate, which produce on audible knock.

338. Due to detonation the following parameters attains very high value:

(a) rate of temperature rise
(b) peak temperature
(c) rate of rise of horse power
(d) rate of pressure rise

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (d) : Detonation or engine knock, occurs simply when the fuel preignates before the piston reaches schedule spark ignition detonation is generally caused by excessive heat excessive cylinder pressure, improper, ignition timing inadequate fuel octane or a combination of these. So, As a result of detonation in an I.C. engine following parameter attains very high value rate of rise of pressure.

339. In order to eliminate knocking in compression ignition engines, there should be

(a) short delay period
(b) late auto-ignition
(c) low compression ratio
(d) high self ignition temperature of fuel

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : In order to eliminate knocking in compression ignition engines there should be short delay period Add 1% of ethyl nitrate or any nitrate to accelerate the combustion of fuel this process is known as doping and reduce delay period considerably and hence prevent diesel knock. For spontaneous ignition of the fuel, we require much higher temperature this can be achieved by compression ratio.

340. A higher compression ratio causes

(a) An acceleration in the rate of combustion
(b) Tendency of an engine to increase detonation
(c) Pre-ignition
(d) All of these

TNPSC AE, 2008

Ans. (d) : A higher compression ratio causes –

- An acceleration in the rate of combustion
- Tendency of an engine to increase detonation
- Pre-ignition

341. In diesel engine the duration between the start of injection and ignition is known as

(a) Physical delay (b) Chemical delay
(c) Ignition delay (d) Period of ignition

RPSC IOF, 2020

Ans. (c) : The ignition delay in diesel engine the duration between the start at injection and ignition.

This delay period consists of physical delay whereas automisation vaporization and mixing of air fuel occur and chemical delay attributed to precombustion reactions.

342. Which of the following will reduce knocking in diesel engines ?

(a) High compression ratio and short delay period of fuel.
(b) High compression ratio and long delay period of fuel.
(c) Low compression ratio and short delay period of fuel.
(d) Low compression ratio and long delay period of fuel.

RPSC AE (GWD) 06.05.2016

Ans. (a) : To reduce knocking in diesel engines, high compression ratio and short delay period of fuel.

343. The angle of rotation from the instant of spark to TDC position of the piston is known as :

(a) Spark delay (b) Spark advance
(c) Spark inlay (d) Spark timer

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : The angle of rotation from the instant of spark to TDC position of the piston is known as spark advance. The angle will be described as a certain angle advanced before top dead centre. Advancing the spark BTDC means that the spark is energized prior to the point where the combustion chamber reaches its minimum site.

344. With …… speed of rotation the spark will be advanced in I.C. engine.

(a) Increased (b) Decreased
(c) Zero (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Search on Telegram @apna_pdf

Ans. (a) : Effect of spark timing on performance spark advance is the time before top dead centre (TDC) when the spark is initiated. It is usually expressed in number of degree of crank shaft rotation relative to TDC. Hence with increased speed of rotation the spark will be advanced in I.C. engine.

345. If a large amount of mixture in an engine cylinder auto ignites rapid rise in pressure occurs causing a direct blow on the engine structure is known as :

(a) Knock (b) Block
(c) Choke (d) Pinkerling

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : Knocking in spark ignition I.C. engine occurs when combustion of some of the air/fuel mixture in the cylinder does not result from propagation of the flame front ignited by the spark plug, but one or more pockets of air/fuel mixture explode outside the envelope of the normal combustion front.

346. Though thermal efficiency of the constant volume combustion is higher than the constant pressure combustion, it is not preferred due to which of the following reasons?

1. Mechanical difficulties requiring valves to isolate the combustion chamber from the compressor and turbine
2. Combustion is intermittent impairing the smooth running of the machine

(a) neither 1 nor 2 (b) 1 only
(c) 2 only (d) 1 and 2

VIZAG MT, 14.12.2020

Ans. (d) : Constant volume combustion is not preferred because

(1) Mechanical difficulties requiring valves to isolate the combustion chamber from the compressor and turbine.
(2) Combustion is intermittent impairing the smooth running of the machine.

347. In multi cylinder SI engine required firing order is achieved with the help of :

(a) Carburetor (b) Battery
(c) Ignition coil (d) Distributor

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : In multicylinder SI engine required firing order is achieved with the help of distributor.
Firing order for a 4-cylinder engine – 1–3–4–2
Firing order for a 6-cylinder engine – 1–5–3–6–2–4

348. Which category of combustion is desired to avoiding knocking or detonation in engines?

(a) Premixed combustion
(b) Partially premixed combustion
(c) Non-premixed combustion
(d) HCCI combustion

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (d) : Homogeneous change compression ignition (HCCI) combustion is required to avoid knocking in engine.

349. Knocking in a spark ignition engine is

(a) Promoted by a short flame travel length
(b) Normally at the beginning of the combustion process
(c) Desirable for improving thermal efficiency
(d) Promoted by reduced turbulence of the fuel-air mixture during combustion.

WBPSC AE 2003

Ans. (d) : Knocking in a SI engine is promoted by reduced turbulence of the fuel air mixture during combustion.
Factors affecting knocking in SI engine–
(1) Compression (6-10)↑ → Knocking↑
(2) Spark timing advancing↑ → Knocking↑
(3) Load↑ → Knocking↑
(4) Turbulence (speed)↑ → Knocking↓
(5) Flame travel distance↑ → Knocking↑
(6) Octane rating of fuel↑ → Knocking↓

350. Match List-I with List-II and select the correct answer :

List-I	List-II
A. Association	1. Pseudo shock
B. Dissociation	2. Knock
C. Flame front	3. Endothermic
D. Abnormal combustion	4. Exothermic

	A	B	C	D
(a)	3	4	1	2
(b)	4	3	1	2
(c)	3	4	2	1
(d)	4	3	2	1

Nagaland PSC CTSE 2015 Paper-II

Ans. (b)

Association	—	Exothermic
Dissociation	—	Endothermic
Flame front	—	Pseudo shock
Abnormal combustion	—	Knock

351. In an internal combustion engine, firing order depends upon

(a) Crank shaft design
(b) Arrangement of cylinder
(c) Number of cylinders
(d) All of the above

UKPSC AE 2012 Paper–II

Ans. (d) : All of the above

352. Very high compression ratios are not used with petrol engines because :

(a) Self ignition would take place before the spark occurs
(b) Power required for compression ratio very high
(c) Lower thermal efficiency
(d) Cylinder walls are to be made thicker

TNPSC AE (Industries) 09.06.2013

Ans. (a) : Very high compression ratios are not used with petrol engines because self ignition would take place before the spark occurs.

353. The crankcase of many diesel engines are kept under a slight vacuum to

(a) Improve fuel economy
(b) Improve air charge velocity
(c) Reduce the risk of crankcase explosion
(d) All of the above

RPSC Lect. (Tech. Edu. Dept.) 2011

Search on Telegram @apna_pdf

Ans. (d) : The crankcase of many diesel engines are kept under a slight vacuum to improve fuel economy, air charge velocity and reduce the risk of crank case explosion.

354. In S.I. engine if the spark plug deposit indicates black coating of soot, it therefore indicates that the engine has been generally operating on

(a) Too rich mixture
(b) Too lean mixture
(c) Stoichiometric mixture
(d) Most economical mixture

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : If the Spark plug deposit indicates black coating of soot, in S.I. engine, it indicates that the engines has been generally operating on too rich mixture.

3. Fuels

355. In a SI Engine, which one of the following is the correct order of the fuels with increasing detonation tendency?

(a) Paraffins, Olefins, Naphthalenes, Aromatics
(b) Aromatics, Naphthalenes, Paraffins, Olefins
(c) Naphthalenes, Olefins, Aromatics, Paraffins
(d) Aromatics, Naphthalenes, Olefins, Paraffins.

GPSC ARTO Pre 30.12.2018, (KPSC AE. 2015)
Kerala PSC AE 06.08.2015, ESE 1997

Ans. (d) : The correct order of fuels with increasing detonation tendency.

Aromatics, Naphthalenes, Olefins, Paraffins.

356. Ignition quality of fuels for petrol engines in determined by

(a) Cetane number rating
(b) Octane number rating
(c) Calorific value rating
(d) Volatility of fuel

RPSC AE 2018, 2016
Mizoram PSC AE/SDO 2014, Paper-I
J&K PSC Civil Services Pre, 2013
UKPSC AE 2012 Paper–II
RPSC ACF-2011

Ans : (b) Ignition quality of fuels of petrol engine is determined by octane rating.
Octane number:- The Knocking tendency of a fuel in SI engines is generally expressed by its octane number The percentage by volume of iso- octane in a mixture of iso-octane and normal heptane, iso-octane is a very good anti-knock fuel, therefore it is assigned a rating of 100 octane number. on other hand normal heptane has very poor anti-knock qualities there for it is given a rating of 0 (Zero) octane number.

357. By higher octane number of SI fuel, it is meant that the fuel has

(a) Longer ignition delay
(b) Higher flash point
(c) Lower viscosity
(d) Higher heating value

Assam PSC AE (PHED), 18.10.2020
Punjab PSC (Lect.) 06.08.2017
GPSC ARTO 01.05.2016
UJVNL AE 2016, ESE 1995

Ans. (a) : By higher octane number of SI fuel, it is meant that the fuel has longer ignition delay.

358. The ignition quality of diesel fuel is expressed by

(a) Octane number (b) Cetane number
(c) Carbon percentage (d) Calorific value

RPSC IOF, 2020, BPSC Poly. Lect. 2016
GPSC Lect. 23.10.2016
OPSC AEE 2015 PAPER - II

Ans : (b) (i) The ignition quality of diesel fuel is expressed by cetane number. It is defined as the percentage, by volume of cetane in a mixture of cetane and alpha-methyl-napthalene.
The cetane which is a straight chain paraffin which good ignition quality is assigned a cetane number of 100 and alpha-methyl-napthalene which is hydrocarbon with is poor ignition quality is assigned 0 cetane number.
(ii) The knocking tendency of a fuel in SI engine is generally expressed by its octane number. The percentage, by volume of iso-octane in a mixture of iso-octane and normal heptane.

359. Velocity of flame propagation in the SI engine is maximum for a fuel-air mixture which is

(a) 10% richer than stoichiometric
(b) Equal to stoichiometric
(c) More than 10% richer than stoichiometric
(d) 10% leaner than stoichiometric

Gujarat PSC AE 2019
RPSC Vice Principal ITI 2018, ESE 1999

Ans. (a) : Flame velocity in SI engine combustion is maximum when mixture strength is 10% rich. Because in this condition, the temperature is maximum and combustion is very good resulting maximum combustion products. But at the same time, this is also the situation of detonation.

360. Stoichiometric ratio is :

(a) chemically correct air-fuel ratio by volume
(b) chemically correct air-fuel ratio by weight
(c) theoretical mixture of air for complete combustion
(d) actual ratio of air to fuel for maximum efficiency

RPSC AE 2016
OPSC AEE 2015 PAPER - II, RPSC ACF-2011

Ans. (a) : Stoichiometric ratio is chemically correct air-fuel ratio by volume.

361. Iso-octane content in a fuel for S.I. engines :

(a) Retards auto-ignition
(b) Accelerates auto-ignition
(c) Does not affect auto-ignition
(d) None of the above

OPSC AEE 2019 PAPER - II
HPPSC W.S. Poly. 2016, UKPSC AE 2012 Paper–II

Ans : (a) Iso-octane content in a fuel for S.I. engines retards autoignition.
Iso-octane is a very good anti-knock fuel, therefore it is assigned a rating of 100 octane number. on the other hand, normal heptane has very poor anti-knock qualities, therefore it is given a rating of zero octane number. These two fuels i.e. iso-octane and normal heptane are known as primary reference fuels.

Search on Telegram @apna_pdf

362. The two reference fuels used for cetane rating are

(a) Cetane and iso-octane
(b) Catane and tetraethyl lead
(c) Cetane and n-heptane
(d) Cetane and α-methyl naphthalene
(e) None of the above

OPSC AEE 2019 PAPER - II
CGPSC Poly. Lect. 22.05.2016
ESE 1995

Ans. (d) : Cetane and α methyl naphthalene are the reference fuel taken for cetane rating, fuel of cetane number 40 has the same ignition quality as a mixture of 40% cetance and 60% alpha-methyl naphthalene as cetance number is counted on cetance percentage.

363. The octane number 100 is assigned to

(a) Iso - octane (b) Normal heptane
(c) Cetane (d) Tetraethyl lead

TNPSC AE 2019
AAI Jr. Executive 29.11.2018
TNPSC AE 2013

Ans. (a) : 2, 2, 4- Trimethylpentane, also known as isooctane or iso-octane, is an organic compound with the formula C_8H_{18}. It is one of several isomers of octane have standard 100 point on the octane rating scale. Higher the octane number, lesser is the tendency to knock during combustion.

364. At flash point temperature:

(a) Fuel ignites without any spark
(b) Fuel emits vapours which produce an inflammable mixture with air
(c) Fuel vaporize sat very high rate
(d) the fuel spontaneously ignites for longer time

GPSC ARTO Pre 30.12.2018
OPSC AEE 2015 PAPER - II

Ans : (b) At flash point temperature fuels emits vapours which produce an inflammable mixture with air.

365. What does the composition of dry gas $CO_2 = 10.4\%$, $O_2 = 9.6\%$, $N_2 = 80\%$ indicates?

(a) Air is just sufficient
(b) Excess air is used
(c) Air is insufficient
(d) Hydrogen is not present in the fuel

OPSC AEE 2019 PAPER - II
ESE 1995

Ans : (b) : In dry flue gases analysis, water vapours are not present. The presence of oxygen and absence of carbon monoxide is present in the gases, it indicates complete combustion i.e. sufficient oxygen.

366. The theoretically correct mixture of air and petrol is

(a) 10 : 1 (b) 15 : 1
(c) 20 : 1 (d) 25 : 1

Nagaland PSC (CTSE) 2018, 2017, 2015 Paper-II
TNPSC AE 2014

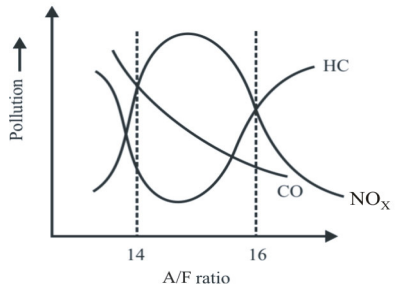
Ans. (b) : The theoretically correct mixture of air and petrol is 15:1.

367. With increase in A/F ratio the level of HCs in engine exhaust gas

(a) Increases
(b) Decreases
(c) Initially increase till chemically corrected ratio than reduces
(d) Initially reduces till chemically corrected ratio than increase

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
OPSC AEE 2019 PAPER - II

Ans. (d)



368. Scavenging means:

(a) Using fresh air for compressor
(b) To reduce detonation
(c) Using air for throwing burnt gases out of cylinder during exhaust stroke
(d) Using correct air fuel mixture

OPSC AEE 2015 PAPER - II
WBPSC AE 2003

Ans : (c) Scavenging of I.C. Engine:- The process of removing burnt gases form the combustion chamber of the engine cylinder, is known as scavenging.
Types of Scavenging:-
(i) Cross flow scavenging
(ii) Backflow or loop Scavenging
(iii) Uniflow scavenging.

369. Stochiometric air-fuel ratio by volume for combustion of methane in air is :

(a) 15:1 (b) 17.16:1
(c) 9.52:1 (d) 10.58:1
(e) None of the above

CGPSC Poly. Lect. 22.05.2016, ESE 2002

Ans. (c) : For combustion of methane –

$$CH_4 + O_2 \rightarrow CO_2 + H_2O$$
$$16 \quad 32 \quad 44 \quad 18$$
$$1 \quad 2 \quad \frac{44}{16} \quad \frac{18}{16}$$

Stochiometric air-fuel ratio by volume for combustion of methane –

$$\frac{2}{0.21} \Rightarrow 9.52:1$$

370. Which of the following symptoms shows that the combustion is necessarily complete?

(a) Presence of free carbon in exhaust
(b) Presence of CO in exhaust
(c) Presence of Oxygen in exhaust
(d) Presence of Nitrogen in exhaust

RPSC Lect. (Tech. Edu. Dept.) 2011
ESE 2009

Search on Telegram @apna_pdf

Ans. (c) : The combustion takes place in the presence of air which contain oxygen. If the oxygen is left after complete combustion, then remaining oxygen passes through exhaust. This condition/symptoms shows that the combustion is necessarily complete.

371. Alcohols are unsuitable as diesel engine fuels because

(a) The cetane number of alcohol fuels is very low which prevents their ignition by compression

(b) The cetane number of alcohol fuels is very high which prevents their ignition by compression

(c) The octane number of alcohol fuels is very low which prevents their ignition by compression

(d) None of the above

GPSC ARTO Pre 30.12.2018
GATE 1992

Ans. (a) : In diesel engines, self ignition of the fuel happens due to compression. This is due to lower ignition delay i.e., the time between rise in temperature and commencement of combustion.
This ability for self ignition under compression is better expressed as cetane number. This is where alcohol lacks, having a very low cetane number and hence poor ignition upon compression.

372. The cetane number of automotive diesel fuel used in India lies in which of the following ranges ?

(a) 30-40 (b) 41-50
(c) 51-60 (d) 61-70

UKPSC AE 2012 Paper–II
ESE 2007

Ans. (b) : Cetane number 41-50 octane number 91-93.

373. Which among the following automobile exhaust gas pollutants is a major cause of photochemical smog?

(a) CO (b) CO_2
(c) NO_2 (d) SO_2

ISRO Scientist/Engineer (RAC), 10.03.2019
ESE 2007

Ans. (c) : NO_x are major pollutant which cause photo chemical smog.

374. In order to achieve maximum possible fuel economy the design features which will be affected are

(a) Volumetric efficiency
(b) Compression ratio
(c) Method of charging
(d) Atomization

RPSC AE 2016, RPSC ACF-2011

Ans : (d) In order to achieve maximum possible fuel economy the design features will be affected are atomization.

375. Specific fuel consumption is defined as

(a) Fuel consumption per hour
(b) Fuel consumption per BHP
(c) Fuel consumption per hour per BHP
(d) Fuel consumption per hour per HP

BPSC AE 2012 Paper - V

Ans : (c) : Specific fuel consumption is defined as fuel consumption per hour per BHP

376. A fuel of cetane number 40 has same ignition quality as a mixture of

(a) 40% cetane and 60% alpha methyl naphthalene

(b) 40% alpha methyl napthalene and 60% cetane

(c) 40% petrol and 60% diesel

(d) 40% diesel and 60% petrol

GPSC EE Pre, 28.01.2017

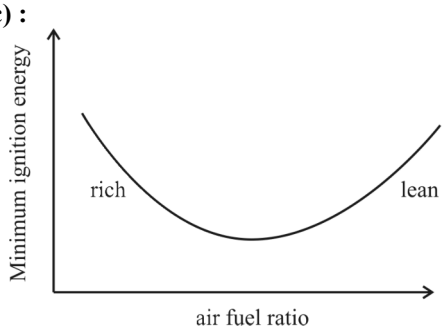
Ans. (a) : A fuel of cetane number 40 has the same ignition quality as a mixture of 40% cetane and 60% alpha methyl naphthalene.

377. The spark energy required for igniting the fuel-air mixture is minimum at :

(a) Equivalence ratio << 1
(b) Equivalence ratio >> 1
(c) Equivalence ratio nearly = 1
(d) Independent of the equivalence ratio

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) :



The equivalence ratio is defined as the ratio of the actual fuel/air ratio to the stoichiometric fuel air ratio (ϕ < 1) it is less than one the combustion is lean with excess air.
From figure minimum spark energy required for igniting the fuel is at equivalence ratio one.

378. Barium based fuel additives in C.I. engines contributes to :

(a) Control of emission
(b) More pollution
(c) Insufficient combustion
(d) Knocking

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : Barium based fuel additives in CI engine contribute to control of emission.

379. Which of the following is a desired quality of SI engine fuel for reduced knocking?

(a) Higher octane number
(b) Lower octane number
(c) Higher cetane number
(d) Higher Analine point.

RPSC AEN Pre-2013

Ans. (a) : Higher octane number is a desired quality of S.I. engine fuel for reduced knocking. Octane number is also known as octane rating. Octane numbers are based on a scale on iso-octane is 100 (minimal knock) and heptane is 0 (bad knock).

Search on Telegram @apna_pdf

380. Which is correct statement about reaction time for auto ignition of fuel and the fuel air ratio?
(a) Lean mixture has low reaction time
(b) Rich mixture has high reaction time
(c) Chemically correct mixture has minimum reaction time
(d) All of the above

(HPPSC AE 2014)

Ans : (d) Correct statement about reaction time for auto ignition of fuel and the fuel air ratio.
(i) lean mixture has low reaction time
(ii) Rich mixture has high reaction time
(iii) Chemically correct mixture has minimum reaction time.

381. Tetra ethyl lead in fuel is used to
(a) Increase the lubrications
(b) Decrease octane number
(c) Increase octane number
(d) None of the above

UKPSC AE 2007 Paper -II

Ans. (c) : Increase octane number

382. Fuel injector is used in
(a) steam engines
(b) gas engines
(c) spark ignition engines
(d) compression ignition engines

UKPSC AE 2012 Paper–II

Ans. (d) : compression ignition engines

383. Some qualities of C.I. engine fuels are given below. Select the quality which is not desirable:-
(a) Good ignition quality (b) High volatility
(c) High viscosity (d) Low flash point

UKPSC AE-2013, Paper-II

Ans. (c) : High viscosity of C.I. engine fuels are not desirable.

384. Major constituent of natural gas is:
(a) Ethane (b) Methane
(c) Propane (d) Butane

OPSC AEE 2015 PAPER - II

Ans : (b) Major constituent of natural gas is methane. The natural gas is usually. Found in or near the petroleum fields under the earth's surface. It essentially, consists of mars gas or methane (CH_4). Together with small amounts of other gases such as ethane (C_2H_6), Carbon dioxide (CO_2) and Carbon mono-oxide (CO).

385. Flash point of a volatile material is the lowest temperature at which material
(a) ignites in presence of ignition source
(b) evaporates
(c) ignites without the presence of ignition source
(d) none of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : The flash point of a volatile material is the lowest temperature at which vapour of materials will ignite, when given an ignition source.

386. Auto ignition point of the gasoline lies between the temperature range
(a) 147-200 ºC (b) 247-280 ºC
(c) 347-380 ºC (d) 347-447 ºC

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : Auto ignition point of the gasoline lies between the temperature range 247-280ºC.

387. The correct statement is
(a) Fire point is higher than the flash point
(b) Fire point is lower that the flash point
(c) There is no relation between Fire point and the flash point
(d) Sometimes Fire point is higher and some time is Flash point

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : The fire point is higher than the flash point because at the flash point more vapor may not be produced rapidly enough to sustain combustion.

388. Flammable fuels have
(a) Flash point more the than 37.8ºC
(b) Flash point lesser than 37.8ºC
(c) No temperature limits
(d) only pressure dependency

Nagaland PSC CTSE 2017 Paper-2

Ans. (b) : Flammable fuels have a flash point below 37.8ºC (100ºF).

389. The mass of excess air supplied is equal to
(a) $\frac{23}{100} \times$ mass of excess carbon
(b) $\frac{23}{100} \times$ mass of excess oxygen
(c) $\frac{100}{23} \times$ mass of excess carbon
(d) $\frac{100}{23} \times$ mass of excess oxygen

JPSC AE 2013 Paper-V

Ans. (d) : In order to ensure complete and rapid combustion of fuel. Some quantity of air, in excess of the theoretical minimum air, is supplied. We know that in order to supply one kg of oxygen, we need 100/23 of air, similarly, the mass of excess air supplied.
$= \frac{100}{23} \times$ mass of excess oxygen

390. For each mole of oxygen, number of moles of nitrogen required for complete combustion of carbon are
(a) 20/21 (b) 2/21
(c) 77/21 (d) 79/21

TNPSC AE 2017

Ans. (d) : Most commonly, the fuel is a hydrocarbon a compound of hydrogen and carbon. The ideal oxidizer is pure oxygen, but most commonly, it is air. For our work, air will be regarded as a mixture of nitrogen and oxygen, with respective mole fraction of 79% and 21%.
For each mole of oxygen in air, there was 79/21 = 3.76 moles of nitrogen.

391. Which of the following is the indicator of the combustion speed of diesel fuel?
(a) Heptane number (b) Cetane number
(c) Octane number (d) All the above

KPCL AE 2016

Ans. (b) : Centane number (CN) is an indicator of the ignitibility of diesel fuels. It provides information about the ignition delay i.e. the speed of self-ignition of diesel fuel when injected into hot air through the fuel injector.

Search on Telegram @apna_pdf

392. The probability of knocking in spark ignition engines, the charge away from the spark plug should have :

(a) High self ignition temperature
(b) Low volatility
(c) Low ignition delay
(d) All of the above

Punjab PSC SDE 12.02.2017

Ans. (d) : The probability of knocking in spark ignition engines, the charge away from the spark plug should have–

- high self ignition temperature
- low volatility
- low ignition delay

393. In case of hydrocarbon fuel the stoichiometric fuel air ratio is about :

(a) 1 : 15 (b) 1.12
(c) 12 : 1 (d) 1 : 18

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : In case of hydrocarbon fuel the stoichiometric fuel-air ratio is about 1 : 15

394. Pre-ignition is caused by the spontaneous combustion of the mixture before the end of the compression stroke, and is due to

(a) Cylinder walls being too hot
(b) Overheated spark plug points
(c) Red hot carbon deposits on cylinder walls
(d) Any one of these

Karnataka PSC AE, 10.09.2017

Ans. (d) : Pre-ignition caused by spontaneous combustions of the mixture before the end of compression stroke because of.

- Cylinder walls being too hot.
- Overheated spark plug points.
- Red hot carbon deposits on cylinder walls.

395. Fuel having maximum resistance to detonation is

(a) benzene (b) toluene
(c) iso-octance (d) n-heptane

TNPSC AE, 2008

Ans. (c) : For SI fuel having maximum resistance to detonation is iso-octane. Iso-octane has little tendency towards detonation gasoline with the same knocking characteristics as a mixture of 90% iso-octane and 10% heptane would have an octane rating of 90. Because some fuels are more knock-resistant than iso-octane, the definition has been extended to allow for octane numbers higher than 100.

396. The cetane values for high speed engines vary between

(a) 5 to 11 (b) 15 to 21
(c) 25 to 34 (d) 45 to 54

TNPSC AE, 2008

Ans. (d) : The cetane values for high speed engines vary between 45 to 54.

397. The mass of carbon per kg of flue gas is given by:

(a) $\frac{3}{7}CO_2+\frac{11}{3}CO$ (b) $\frac{7}{3}CO_2+\frac{7}{3}CO$
(c) $\frac{3}{11}CO_2+\frac{7}{3}CO$ (d) $\frac{11}{3}CO_2+\frac{3}{7}CO$

Kerala PSC Poly. Lect., 2017

Ans. (*) : $C + O_2 \rightarrow CO_2$

$12 \quad 32 \quad 44$

$1 \quad \frac{32}{12} \quad \frac{11}{3}$

Hence 1 kg of carbon produces $\frac{11}{3}$ kg of CO_2

$C+\frac{1}{2}O_2 \rightarrow CO$

$12 \quad 8 \quad 28$

$1 \quad \frac{8}{12} \quad \frac{28}{12}$

$1 \quad \frac{4}{3} \quad \frac{7}{3}$

Hence 1 kg of carbon produces $\frac{7}{3}$ kg of CO

Note- Official answer given by commission is (d).

398. Which of the following coal variety has least calorific value?

(a) Steam coal (b) Lignite
(c) Bituminous coal (d) Anthracite

Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (b) :

Coal type	**- Calorific value**
1. Lignite	– 4000 kcal/ kg
2. Bituminous	– 5800 kcal/kg – 8000 kcal/kg
3. Anthracite	– 7800 Kcal/kg – 8000 kcal/kg
4. Coal	– 7800 kcal/kg – 8000 kcal /kg

399. What is the octane number of a mixture containing 85% of iso-octane and 15% of normal heptanes?

(a) 15 (b) 42.5
(c) 85 (d) None of these

KPCL AE 2016

Ans. (c) :Octane no.- It is the percentage of iso-octane in the fuel containing iso-octane and normal heptane.

400. What is the octane number of compressed natural gas?

(a) 80 (b) 120
(c) 180 (d) None of these

KPCL AE 2016

Ans. (d) : The octane number of compressed natural gas (CNG) is 130. Natural gas is a smart, low emission and alternative to gasoline and diesel. Pneumatic gasoline has 91 octane number.

401. In a petrol engine, the gas which does not burn and passes out without transformation is

(a) Oxygen (b) Carbon dioxide
(c) Carbon monoxide (d) Nitrogen

Nagaland PSC (CTSE) 2016, Paper-II

Search on Telegram @apna_pdf

Ans. (d) : In a petrol engine, the gas which does not burn and passes out without transformation is Nitrogen

402. The threshold limit of benzene is

(a) 15 ppm (b) 20 ppm
(c) 25 ppm (d) 30 ppm

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : The threshold limit of benzene is 25 ppm

403. Which of the following is used as antiknock compound in gasoline?

(a) Tetramethyl lead (b) Tetraethyl lead
(c) Trimethyl lead (d) Triethyl lead

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (b) : Organic lead (tetraethyl lead) is used as antiknock in gasoline and jet fuels.

404. Iso octane is

(a) C_8H_{18} (b) $C_{12}H_{26}$
(c) $C_{10}H_{22}$ (d) $C_{15}H_{32}$

WBPSC AE 2003

Ans. (a) : Iso-Octane – C_8H_{18}
The Octane rating of a spark ignition engine fuel is the detonation resistance (anti-knock rating) compared to a mixture of iso-octane.

405. Match List-I with List-II and select the correct answer :

List-I	List-II
A. Semi-bituminous coal	1. Methane and carbon dioxide
B. High speed diesel oil	2. Propane and butane
C. Biogas	3. Calorific value of 45,000 kJ/kg
D. LPG	4. Power plants

	A	B	C	D
(a)	3	4	1	2
(b)	4	3	2	1
(c)	3	4	2	1
(d)	4	3	1	2

Nagaland PSC CTSE 2015 Paper-II

Ans. (d) :

List-I	List-II
A. Semi-bituminous coal	4. Power plants
B. High speed diesel oil	3. Calorific value of 45,000 kJ/kg
C. Biogas	1. Methane and carbon dioxide
D. LPG	2. Propane and butane

406. Octane number is determined by comparing the performance of the petrol with the following hydrocarbons

(a) Iso-octane
(b) Mixture of normal heptanes and iso-octane
(c) Alpha methyl napthalene
(d) Mixture of methane and ethane

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : The octane number is determined by comparing under standard conditions the knock intensity of the fuel with that of blends of two reference fuels.
Iso Octane– Which resists knocking tendency and heptane, which knocks readily.

407. Detonation is caused by the following unstable compounds

(a) Peroxides, aldehydes and ketones
(b) Peroxides, aldehydes, oxides and sulphides
(c) Aldehydes, oxides and ketones
(d) Ketones and sulphur compounds

Nagaland PSC CTSE 2015 Paper-II

Ans. (a) :

408. Combustion of 1 kg of hydrogen needs _____ of oxygen and generates _____ water.

(a) 6 kg, 7 kg (b) 8 kg, 9 kg
(c) 9 kg, 10 kg (d) 4 kg, 5 kg

NLCIL GET 17.11.2020, Shift-II

Ans. (b) : For combustion of hydrogen –

$$H_2 + \frac{1}{2}O_2 \rightarrow H_2O$$
$$2 \quad 16 \rightarrow 18$$
$$1 \quad 8 \quad 9$$

From above, we can say that for combustion of 1 kg of hydrogen needs 8 kg of oxygen and generates 9 kg of water.

409. When the fuel is burned and water is released in the liquid phase, the heating value of fuel is called –

(a) Higher heating value
(b) Lower heating value
(c) Enthalpy of formation
(d) Latent heat value

TSGENCO AE 14.11.2015

Ans. (a) : The heat of combustion is the amount of energy released when a substance is burned in the presence of oxygen. The heat of combustion also known as heating value, is reported in two forms. The higher or gross, heating values assumed that all of the water produced by combustion is in the liquid phase. The lower or net heating value assumes the water is vapour.

410. A 5 BHP engine running at full load would consume diesel of the order of:

(a) 0.3 kg/hr (b) 1 kg/hr
(c) 3 kg/hr (d) 5 kg/hr

HPPSC Asstt. Prof. 2014

Ans. (b) : 1 kg/hr

411. When the mixture is lean:

(a) Efficiency is less
(b) Power output is less
(c) Maximum temperature and pressure are higher
(d) All of the above

HPPSC ADF 05.03.2019

Ans. (b) When the mixture is lean power output is less.

412. How does cetane number varies with octane number in fuels in IC engines?

(a) No relation
(b) Directly proportional
(c) Inversely proportional
(d) Both are equal

ISRO Scientist/Engineer 07.05.2017

Search on Telegram @apna_pdf

Ans. (c) : $\text{Cetane Number} \propto \frac{1}{\text{Octane Number}}$

413. 1 kg of carbon produces following percentage of CO_2 in flue gases:
(a) 11% (b) 18%
(c) 23% (d) 29%

SJVN ET 2013

Ans. (d) : Complete combustion equation for carbon –

$$C + O_2 + \frac{79}{21}N_2 \rightarrow CO_2 + \frac{79}{21}N_2$$

$$\% \text{ of } CO_2 = \frac{44}{44 + \frac{79}{21} \times 28} \times 100$$

$$= 29.47\% \simeq 29\%$$

414. The chemically correct A/F ratio by weight for methanol is
(a) 10:1 (b) 8:1
(c) 6.5:1 (d) 9.0:1
(e) 12.0:1

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) : The chemically correct A/F ratio by weight for methanol is 6.5 : 1.

415. The range of A/F ratio for SI engine is:
(a) 9-18 (b) 1-9
(c) 18-50 (d) 50-100
(e) 20-30

CGPSC AE 25.02.2018

Ans. (a) • The range of A/F ratio for SI engine is 9-18
• The range of A/F ratio for CI engine is 18:1 to 70:1.

416. The specific gravity of commonly used diesel is
(a) 1 (b) 0.7
(c) 0.85 (d) 0.5

UKPSC AE 2007 Paper -II

Ans. (c) : 0.85

417. Anti knock property of C.I. engine fuel can be improved by adding:-
(a) Tetra – ethyl lead (b) Amylnitrate
(c) Hexadecane (d) Trimethyl pentane

UKPSC AE-2013, Paper-II

Ans. (b) :

418. Disadvantage of hydrogen as a fuel in IC engine:
(a) Storage is easy (b) Low NO_x emission
(c) Detonating tendency (d) Easy handling

Ans : (c) Detonation tendency increase if hydrogen as a fuel in IC Engine.

419. For complete burning of 1 kg of carbon, the air required will be about
(a) 2.67 kg (b) 11.6 kg
(c) 12.7 kg (d) 14.5 kg

UKPSC AE 2012 Paper–II

Ans. (b) : Combustion of 1 kg of carbon –

$$C + O_2 \rightarrow CO_2$$
$$12 \quad 32 \quad 44$$
$$1 \quad \frac{32}{12} \quad \frac{44}{12}$$

The air require for complete combustion –

$$\frac{32}{12 \times 0.23} = 11.6\,\text{kg}$$

420. Vapour lock in a gasoline - fueled internal combustion engine is basically .....
(a) Due to partial stoppage of fuel supply due to vaporization of fuel in the supply
(b) Due to mechanical seizure in the exhaust system
(c) Due to accelerated supply of fuel to the engine
(d) Due to freezing of liquid fuel

RPSC AE 2018

Ans. (a) : Vapour lock in a gasoline - fueled internal combustion engine is basically due to partial stoppage of fuel supply due to vaporization of fuel in the supply.

421. The specification for diesel fuel for India as per BIS is given by
(a) IS:1464 (b) IS:1460
(c) IS:1468 (d) IS:1462
(e) IS:1461

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : The specification for diesel fuel for India as per BIS is given by IS : 1460.

422. The normal operating range of air/fuel ratio for a CI engine with diesel fuel is
(a) 8 : 1 to 12 : 1 (b) 12 : 1 to 22 : 1
(c) 20 : 1 to 30 : 1 (d) 18 : 1 to 70 : 1

BPSC AE Mains 2017 Paper - V

Ans : (d) : 18 : 1 to 70 : 1

423. Consider the following statements:
1. Octane rating of ethanol is more than 100.
2. Cetane number of fuel used in diesel engines in India is in the range of 80 to 90.
3. Biodiesel in mono alkyl ester of vegetable oil.
4. Compressed natural gas is mainly composed of methane.
5. Motor gasoline is a mixture of various hydrocarbons with a major proportion being aromatic hydrocarbons.

Which of these statements are correct?
(a) 1 and 2 (b) 1, 2 and 3
(c) 1, 2, 3 and 4 (d) 1, 3 and 4
(e) 2, 3, 4 and 5

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) :
- Octane rating, ethanol has a rating of 113
- Biodiesel is mono alkyl ester of vegetable Oil.
- CNG is mainly composed of methane. [CH_4 - 84.5%, Ethane [C_2H_6] - 7.7%]
- Propane (C_3H_8) - 2.4%, Butane (C_4H_{10}) - 0.58%, pentane (C_5H_{12}) - 0.37%]

424. CFR engine is used to measure the following quality of diesel
(a) Cold Filter Plugging Point
(b) Cloud Point
(c) Cetane Number
(d) CHNS Ratio
(e) Lubricity

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) : CFR Engine - Cooperative Fuel Research [CFR] engine, the source for fuel rating equipment.
CFR engine is used to measure cetane number, quality of diesel and octane number, quality of Petrol and gasoline knock.

Search on Telegram @apna_pdf

425. Calorific values of gaseous fuels is determined by
(a) Bomb Calorimeter
(b) Junker's Calorimeter
(c) Separating Calorimeter
(d) Throttling Calorimeter

TSPSC AEE 2015

Ans : (b) Calorific values of gaseous fuels is determined by Junker's calorimeter.
Bomb Calorimeter–Bomb Calorimeter used to measure calorific value of solid and liquid fuels i.e.– Coal, gasoline, kerosene etc.
Junker Calorimeter–Junker calorimeter used to find out calorific value of gases fuel.
Throttling and separating calorimeter– Throttling and separating calorimeter are used to measure the dryness fraction of steam.

426. In the Orsat apparatus KOH solution is used to absorb :
(a) Carbon monoxide (b) Carbon dioxide
(c) Oxygen (d) None of the above

(KPSC AE. 2015)

Ans : (b) In the orsat apparatus KOH solution is used to absorb Carbon dioxide (CO_2) and Sulfur dioxide (SO_2)
Orsat Gas Analysis:- Orsat gas analyzer measures the volume or more fraction of CO_2,CO and O_2 in the dry flue gas. An orsat analyzer contains three pipes Containing chemical solutions.
- KOH absorbs CO_2, Pyragallol absorbs O_2 and $CuCl_2$ absorbs CO.

427. Which of the following statement is not correct with respect to alcohol as alternate fuels in I.C. Engine?
(a) Alcohols are corrosive in nature
(b) Alcohol contains about half the heat energy of gasoline
(c) Auto-knock characteristics of alcohol is poor
(d) Alcohol does not vaporize as easily as gasoline

TNPSC AE 2017

Ans. (c) : Alcohol– Alcohols are alternate fuels because they can be obtained from both natural and manufactured source. Methanol and ethanol are two kinds of alcohols that seem most promising.
Advantages-
1. It is high octane fuel, so it can be used efficiently for higher compression ratio.
2. It produce less overall emissions compared to gasoline.
3. It gives higher pressure and more power in the expansion stroke.
4. It has high latent heat of vaporization which results in a cooler intake process. This rise the volumetric efficiency of the engine and reduce the required work in the compression stroke.

Disadvantages-
1. The calorific value (29700) of the fuel is less.
2. With equal thermal efficiency and similar engine output usage, twice as much fuel would have to be purchased.
3. Alcohol is much more corrosive then gasoline on copper, brass, aluminium, rubber and many plastics.
4. It has poor cold weather starting characteristics due to low vapour pressure and evaporation.

428. Lead compound were added in gasoline to
(a) Reduce HC emissions
(b) Reduce knocking
(c) Reduce exhaust temperature
(d) Increase power output

TNPSC AE 2017

Ans. (b) : To reduce knocking, lead compounds were added in gasoline.

429. Hydro carbon emission in CI Engine is mainly due to
(a) Over mixing of fuel and air
(b) Under mixing of fuel and air
(c) Constant mixing of fuel and air
(d) Both (A) and (B)

TNPSC AE 2017

Ans. (d) : Hydro carbon emission in CI Engine is mainly due to over mixing of fuel and air, under mixing of fuel and air.

430. When air is used as oxidiser of a fuel, the nitrogen?
(a) Decrease to the inert level of the fuel
(b) Gets oxidized to NO
(c) Increases the inert content of the fuel
(d) May react with the fuel elements forming nitride

TNPSC AE 2019

Ans. (c) : When air is used as oxidiser of a fuel, the nitrogen increases the inert content of the fuel.

431. A 1 g sample of fuel is burned in a bomb calorimeter containing 1.2 kg of water at an initial temperature of 25°C. After the reaction, the final temperature of the water is 33.2°C. The heat capacity of the calorimeter is 837 J/°C. The specific heat of water is 4.18 J/ °C. The heat released by the fuel will be nearly
(a) 36 kJ/g (b) 42 kJ/g
(c) 48 kJ/g (d) 54 kJ/g

ESE 2019

Ans. (c) : Given,
$m_f = 1$ gm
$m_w = 1.2$ kg
$T_1 = 25°C$
$T_2 = 33.2°C$
Heat capacity of calorimeter (mc) = 837 J/°C
= 0.837 kJ/°C
Specific heat of water is taken as 4.18 kJ/°C
$m_f (c_v)_f = m_w c_p \Delta T + mc \Delta T$
$1 \times (c_v)_f = [1.2 \times 4.18 \times (33.2 - 25)] + [0.837 \times (33.2 - 25)]$
$= 47.995$
$(c_v)_f \simeq 48$ kJ/g

432. Flash point for diesel fuel should be
(a) Minimum 49ºC (b) Maximum 49ºC
(c) Minimum 99ºC (d) Maximum 99ºC

UKPSC AE 2007 Paper -II

Ans. (a) : Minimum 49ºC

Search on Telegram @apna_pdf

433. Sulphur content in diesel fuel should not be more than
(a) 10% (b) 5%
(c) 1% (d) 0.01%
UKPSC AE 2007 Paper -II

Ans. (c) : 1%

434. In Orsat apparatus, when the percentage of carbon dioxide, oxygen and carbon monoxide are known, the remaining gas is assumed to be
(a) Hydrogen (b) Sulphur dioxide
(c) Nitrogen (d) Air
ESE 2020

Ans. (c) : Orsat apparatus gives dry analysis of flue gases and in the flasks CO_2, O_2 and CO are absorbed.

435. Which property is related to Alcohol?
(a) Lower vapour pressure
(b) Higher cetane number
(c) Smaller octane number
(d) Good lubricating quality
OPSC AEE 2019 PAPER - II

Ans : (a) : Lower vapour pressure property is related to Alcohol.

436. Which property is not related with LPG as fuel for automotive applications?
(a) Lower knock resistance
(b) Lower crank case dilution
(c) Lower volumetric efficiency
(d) Lesser residue and oil contamination
OPSC AEE 2019 PAPER - II

Ans : (a) :

437. High API gravity of fuel means:
(a) Lower Diesel Index
(b) Lower Brake specific fuel consumption
(c) Lower heat of combustion
(d) Lower ignition quality
OPSC AEE 2019 PAPER - II

Ans : (b) : API Gravity– The American Petroleum Institute gravity, or API gravity, is measure of how heavy or light a petroleum liquid is compared to water. High API gravity of fuel means lower brake specific fuel consumption.

438. For same output the specific fuel consumption of petrol engine as compared to diesel engine is:
(a) Higher (b) Lower
(c) Same (d) None of these
OPSC AEE 2019 PAPER - II

Ans : (a) : The specific fuel consumption per B.P. hour for a petrol engine is about 0.25 kg. The specific fuel consumption per B.P. hour for a diesel engine is about 0.2 kg.

439. The problem of engine that can be reduces with the rise in front end volatility of fuel:
(a) Cold starting (b) Vapour lock
(c) Hot starting (d) Spark plug fouling
OPSC AEE 2019 PAPER - II

Ans. : (a) : The problem of engine that can be reduces with the rise in front end volatility is cold starting.

440. Which is not the correct option for fuel injection system of petrol engine?
(a) Increase in power
(b) Improve distribution of the mixture
(c) Reduce volumetric efficiency
(d) Reduce mixture temperature in the cylinder
OPSC AEE 2019 PAPER - II

Ans. : (c) : Reduce volumetric efficiency

441. During distillation process which fuel vaporise in the end?
(a) Kerosene (b) Aviation fuel
(c) Diesel (d) Petrol
OPSC AEE 2019 PAPER - II

Ans : (c) : During distillation process diesel fuel vaporise in the end.

442. Which one of the following fuels can be obtained by fermentation of vegetable matter?
(a) Benzene (b) Diesel
(c) Gasoline (d) Alcohol
Gujarat PSC AE 2019

Ans : (d) : Alcohol.

443. The preference of diesel engines for road transport is due to
(a) Easy starting
(b) Low specific fuel consumption over a large range of load
(c) Complete combustion of charge
(d) Harmless exhaust
Gujarat PSC AE 2019

Ans : (b) : The preference of diesel engine for road transport is due to low specific fuel consumption over a large range of load.

444. The specific fuel consumption per kW-hr for diesel engine is very close to
(a) 0.4 kg/kW-hr (b) 0.33 kg/kW-hr
(c) 0.27 kg/kW-hr (d) 0.47 kg/kW-hr
BPSC AE Mains 2017 Paper - V

Ans : (c) : 0.27 kg/kW-hr

445. Which of the following is the lightest and most volatile liquid fuel?
(a) Diesel (b) Kerosene
(c) Fuel oil (d) Gasoline
BPSC AE 2012 Paper - V

Ans : (d) : Gasoline is highly volatile due to its low flash point and easily vaporize when exposed to air.

446. Pour point of fuel oil is the
(a) Minimum temperature to which oil is heated in order to give off inflammable vapours in sufficient quantity to ignite momentarily when brought in contact with a flame
(b) Temperature at which it solidifies or congeals
(c) It catches fire without external aid
(d) Temperature at which it flows easily
BPSC AE 2012 Paper - V

Ans : (b) : Pour point of fuel oil is the temperature at which it solidifies or congeals. Pour point is the temperature at which a liquid becomes semisolid and loses its flowing characteristics. As the paraffin content is high in crude oil, thus it has a high pour point.

447. Which of the following fuels detonates readily?
(a) Benzene (b) Iso-octane
(c) n-heptane (d) Alcohol
BPSC AE 2012 Paper - V

Ans : (c) : Normal heptane fuel detonates readily. Octane number equates to the anti-knock qualities of a compressible mixture of heptane and iso-octane which is expressed as the percentage of isooctane in heptane and is listed on pumps for gasoline (petrol) dispensed globally.

Search on Telegram @apna_pdf

448. The commonly used ignition accelerator is
(a) Acetone peroxide
(b) Ethyl nitrate
(c) Isoamyl nitrate
(d) Any one of the above

BPSC AE 2012 Paper - V

Ans : (d) : The commonly used ignition accelerator is-
- Acetone peroxide
- Ethyl nitrate
- Isoamyl nitrate

449. The missing equality per stroke is equal to
(a) Cylinder feed – indicated mass of steam
(b) Cylinder feed + indicated mass of steam
(c) Mass of cushion steam + indicated mass of steam
(d) Mass of cushion steam – cylinder feed

JPSC AE 2013 Paper-V

Ans. (a) : Cylinder feed – indicated mass of steam

450. The temperature of the products of combustion when the maximum amount of chemical energy is converted to thermal energy is
(a) Higher than adiabatic flame temperature
(b) Lower than adiabatic flame temperature
(c) Equal to adiabatic flame temperature
(d) Independent of adiabatic flame temperature

ISRO Scientist/Engineer 17.12.2017

Ans. (c) : Maximum amount of chemical energy is converted to thermal energy when the air fuel ratio is stoichiometric. At that ratio, the adiabatic flame temperature is equal to the temperature of the product of combustion. When the air fuel ratio is less or more the temperature of products of combustion is always less than the adiabatic flame temperature.

451. LPG mainly consists of:
(a) Methane and ethane
(b) Propane and butane
(c) Petrol and diesel
(d) Hexane and butadiene

RPSC ADE 2016

Ans. (b) : Propane and butane, LPG mainly consists of propane and butane
CH_4 = methane
C_3H_8 = propane
C_4H_{10} = Butane
C_2H_6 = ethane

452. The fuel injection pressure in a diesel engine is in the range of :
(a) 20 to 25 atm (b) 30 to 40 atm
(c) 60 to 70 atm (d) 100 to 170 atm

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Injection pressure during the whole process should be above 1000–1200 bar for a good spray formation and air-fuel mixture, a tendency in practice to 1600–1800 bar and higher is noted. Total nozzle area should be as small as possible in relation to cylinder diameter for good combustion particularly at part load.

453. The freezing temperature of petrol is nearly
(a) 1°C (b) 10°C
(c) –10°C (d) below 30°C

GPSC ARTO 01.05.2016

Ans. (d) : Without knowing the composition of the particular fuels it's not possible to give a very precise answer. However petrol has much power freezing point that diesel fuel. The range for petrol freezes b/w –40°C to –60°C.

454. The type of pump used for fuel injection in C.I. engine is
(a) Plunger pump (b) Gear pump
(c) Vane pump (d) Centrifugal pump

GPSC Lect. (Poly.) 07.12.2014

Ans. (a) : The pump is used for fuel injection in CI engine is plunger pump
An injection pump is a device that pumps fuel into the cylinders of a diesel engine.

455. Which of the following symptoms shows that the combustion in air is necessarily complete?
(a) Absence of oxygen in exhaust
(b) Absence of nitrogen in exhaust
(c) Absence of free carbon in exhaust
(d) Absence of carbon monoxide in exhaust

HPPSC Asstt. Prof. 18.09.2017

Ans. (d) : Absence of carbon monoxide in exhaust

456. The percentage of energy in the petrol burnt in the engine which is actually utilized in propelling the vehicle is :
(a) 40% (b) 60%
(c) 25% (d) 20%

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c)

457. Which of the following gases is used as a fuel in internal combustion engine?
(a) Liquefied petroleum gas
(b) Blast furnace gas
(c) Coke even gas
(d) All of the above

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) :
- Liquefied petroleum gas
- Blast furnace gas
- Coke even gas

458. A mixture of theoretical air and fuel for complete combustion of fuel is called :
(a) Rich mixture
(b) Lean mixture
(c) Air-Fuel mixture
(d) Stoichiometric mixture

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) : A mixture of theoretical air and fuel for complete combustion of fuel is called stoichiometric mixture.

459. The process of breaking up of liquid fuel into droplets of fine spray is known as :
(a) Vaporization (b) Atomization
(c) Carburetion (d) Injection

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) : The process of breaking up of liquid fuel into droplets of fine spray is known as atomization.

Search on Telegram @apna_pdf

460. The heat energy released by a fuel is measured by :

(a) Energy meter (b) Thermometer
(c) Calorimeter (d) Anemometer

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) :

	Devices	Used to Measure
1.	Energy meter	Amount of electric energy consumed by building etc.
2.	Thermometer	Temperature
3.	Calorimeter	Calorific valve (heat energy)
4.	Anemometer	Wind speed

The heat energy released by a fuel is measured by calorimeter.

461. The anti knock property of the fuel depends on its:

(a) Molecular structure
(b) Self ignition temperature
(c) Chemical composition
(d) All of the above

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) : • Molecular structure
• Self ignition temperature
• Chemical composition

462. A coal containing high amount of volatile matter will have

(a) high ignition temperature
(b) low ignition temperature
(c) high ash fusion temperature
(d) very low ash content

APPSC AEE 2012

Ans. (b) : A coal containing high amount of volatile matter will have low ignition temperature.

463. HUCR is the highest compression ratio at which the

(a) Engine can be run
(b) Engine gives maximum power output
(c) Engine is most efficient
(d) Fuel can be used in a test engine without knocking

APPSC AEE 2012

Ans. (d) : HUCR (Highest Useful Compression Ratio) is the highest compression ratio at which the fuel can be used in a test engine without knocking.

464. Which of the following air-fuel ratio indicate that the mixture is rich?

(a) 10:1 (b) 14.7: 1
(c) 15:1 (d) 20:1

GPSC AE 26.07.2015

Ans. (a) : When the air-fuel ratio in mixture is less than stiochiometric ratio, then fuel is rich mixture.
We know, 14:7 is stiochiometric ratio, ratio lesser than this i.e., 10:1 is showing richer air-fuel ratio.

465. Carbon monoxide formation in internal combustion engine is due to

(a) insufficiency of air
(b) insufficiency of oxygen
(c) insufficiency of air and temperature
(d) insufficiency of oxygen and temperature

TANGEDCO AE 2015

Ans. (a) : Incomplete combustion of fuel is due to insufficient air and carbon monoxide which takes place in internal combustion engine.

466. Petrol is distilled at

(a) 65º to 220ºC (b) 220º to 345ºC
(c) 345º to 470ºC (d) 470º to 550ºC

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : Petrol is distilled at a temperature in range of 65–220ºC While kerosene is distilled at 220–350ºC.

467. The normal heptane (C_7H_{16}) is given a rating of ..... octane number

(a) 0 (b) 50
(c) 100 (d) 120

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : The normal heptanes (C_7H_{16}) is given a rating of 0 (zero) octane number, n-heptanes is defined as the zero point of has an octane rating scale 2,2,4 – Trimethylpentane has an octane rating. 100, whereas n-heptane has an octane rating of zero. The octane number is based on an arbitrary scale which is a measure of its ability to resist knocking as it burns on combustion.

468. One kg of carbon mono oxide requires how much quantity of oxygen to produce 11/7 kg of carbon dioxide gas?

(a) 4/7 kg (b) 11/4 kg
(c) 9/7 kg (d) None of the above

ISRO Scientist/Engineer 22.04.2018

Ans. (a) $CO + \frac{1}{2}O_2 \rightarrow CO_2$

So,

$\frac{1}{2}$ mole of O_2 would make 1 mole CO_2

So, 16 kg O_2 would make 44 kg CO_2

Then $\frac{16}{44}$ kg O_2 would make 1 kg CO_2

Therefore,

$$\frac{11}{7} \text{ kg } CO_2 \text{ make by } \frac{11}{7} \times \frac{16}{44} \text{ kg } O_2 = \frac{4}{7} \text{ kg } O_2$$

469. The octane number of petrol generally available is

(a) 20 to 40 (b) 40 to 60
(c) 60 to 80 (d) 80 to 100

RPSC IOF, 2020

Ans. (d) : The octane number of petrol generally available is 80 to 100.

4. Supercharging

470. In I.C. engine, Supercharging is used for:

(a) supplying compressed air to remove combustion products
(b) providing forced cooling to avoid excessive heating
(c) supplying air to the engine at higher density to increase its mass
(d) Injecting excess fuel for more load

ISRO Scientist/Engineer (RAC), 10.03.2019

Search on Telegram @apna_pdf

GPSC Executive Engineer 23.12.2018
APPSC AEE MAINS 2016 PAPER-III
GPSC Asstt. Prof. 28.08.2016
CGPSC AE 2014 II

Ans. (c) : Supplying air to the engine at higher density to increases its mass.

471. Which type of compressor mostly used in supercharger of internal combustion engines?
(a) Roots blower
(b) Axial flow compressor
(c) Radial flow compressor
(d) Reciprocating compressor

Kerala PSC Poly. Lect., 2017
Punjab PSC SDE 12.02.2017
J&K PSC Civil Services Pre, 2010
ESE 1996

Ans. (c) : A compressor mostly used for supercharging of I.C. engines is radial flow compressor (centrifugal compressor).

472. Purpose of supercharging an engine is to
(a) Increase power output of engine
(b) Reduce specific fuel consumption
(c) Reduce noise of engine
(d) Improve cooling of cylinders

RPSC AE 2016, RPSC ACF-2011
RPSC Lect. (Tech. Edu. Dept.) 2011
ESE 2009

Ans. : (a) Following are the objects of supercharging the engines
(i) To reduce mass of the engine per brake power.
(ii) To maintain power of aircraft engines at high Altitudes where less oxygen is available for combustion.
(iii) To reduce space occupied by the engine.
(iv) To reduce the consumption of lubricating oil
(v) To increase the power output of an engine when greater power is required.

473. The objective of supercharging the engine is
(a) To reduce mass of the engine per brake power
(b) To reduce space occupied by the engine
(c) To increase the power output of an engine when greater power is required
(d) All of the above

Sikkim PSC (Under Secretary), 2017
ESE 2007

Ans. (d) : The objective of supercharging is to increase the charge density of the working medium (air or air fuel mixture) by any means and with the help of a suitable system, before it enters the work cylinder i.e. to precompress the charge. In doing so the temperature of the working medium should not be marked raised, since this would influence the temperature profile of high pressure work cycle.
Supercharging process increases power output by increase the inlet pressure of the air in the C.I. engine during suction stroke. It does not response to the size and shape of engine.

474. The operation of forcing additional air under pressure, into the engine cylinder is known as
(a) Carburation (b) Supercharging
(c) Dissociation (d) Turbulence

MECON MT 2019, TNPSC AE, 2008

Ans. (b) : Supercharging– The operation of forcing additional air under pressure, into the engine cylinder is known as supercharging.

475. How can the output of a diesel engine be improved without increasing the engine revolution?
(a) Supercharging
(b) Increase flywheel size
(c) Scavenging
(d) Feeding more fuel

Rajasthan Nagar Nigam AE 2016, Shift-I
HPPSC Asstt. Prof. 2014

Ans. (a) : Supercharging – To increase the power output of the engine, following can be done–
- Increase the air inducted per unit time to burn more fuel.
- Improve the degree of utilization of air.
- Improve the thermal efficiency.
- Increasing the density of air to increase the power output of the engine is called supercharging.
- In CI engine, supercharging reduces detonation tendency. So it is always useful for CI engine i.e. more power, more economy and less detonation. The limit of supercharging is governed by thermal loading due to very high temperature.

476. Supercharging is essential in
(a) Diesel engines (b) Gas turbines
(c) Petrol engines (d) Aircraft engines

TNPSC AE, 2008

Ans. (d) : Supercharging is essential in aircraft engines. The operation of forcing additional air under pressure, into the engine cylinder is known as supercharging.

477. Supercharging increases the power output of the engine by:
(a) Increasing the charge temperature
(b) Increasing the charge pressure
(c) Increasing the speed of engine.
(d) Quality of fuel admitted.

RPSC ACF & FRO, 26.02.2021

Ans. (b) : A super charger is an air compressor that increases the pressure or density of air supplied to an internal combustion engine. This gives each intake cycle of the engine more oxygen, letting it burn more fuel and do more work, thus increasing power.

478. In a turbocharger, the exhaust gases
(a) Run the centrifugal pump rotor
(b) Heat the incoming air
(c) Run the turbine rotor
(d) Both (a) and (b) above

WBPSC AE, 2007

Ans. (d) :

Search on Telegram @apna_pdf

479. …. turbo charging is based upon the idea of increasing the expansion ratio relative to compression ratio by means of early closure of inlet valve as the boost pressure is increased.

(a) Pulse turbocharger
(b) Hyper bar turbocharger
(c) Two-stage turbocharger
(d) Miller turbocharger

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : In miller turbocharger, turbo charging is based upon the idea of increasing the expansion ratio relative to compression ratio by means of early closure of inlet valve as the boost pressure is increased.

480. Which of the following is used to given more oxygen in each intake cycle of the engine, letting it burn more fuel and do more work

(a) Additional Oxygen cylinder
(b) Supercharger
(c) Extra cam on the intake valve
(d) None of these

KPCL AE 2016

Ans. (b) : Supercharger is used to given more oxygen in each intake cycle of the engine, letting it burn more fuel and do more work.

481. Which of the following is true about compressors used as supercharger

(a) Positive displacement type
(b) Axial flow type
(c) Centrifugal type
(d) All of the above

Nagaland PSC (CTSE) 2017, 2016 Paper-II

Ans. (d) : The apparatus used to increase the air density is known as a supercharger. It is merely a compressor, which provides a denser charge to the engine, there by enabling the consumption of a greater mass of charge with the same total piston displacement.

482. By supercharging

(a) Power stroke becomes stronger
(b) Loss in exhaust is reduced
(c) Engine can be made to run smoother
(d) Thermal efficiency of the engine can be improved

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : It is the process of increasing the mass (density) of the air fuel mixture (in the S.I. engines) or air (in C.I engines) induced into the engine cylinder. This is usually close with the help of a compressor or blower known as supercharger

(i) Supercharging increases the power developed by the engine
(ii) To maintain the power of aircraft engine at high a altitudes where less oxygen is available for combustion
(iii) To reduce mains of the engine per brake power.
(iv) To reduce space occupied by the engines.
(v) To reduce consumption of lubricating oil.
(vi) To increase the power output of an engine when greater power is required.

483. For the same compression ratio and the same engine speed, supercharging I.C. engine leads to

(a) Increase in mechanical efficiency
(b) Better gas exhaust process
(c) Higher thermal loading
(d) All of the above
(e) None of these

CGPSC AE 16.10.2016

Ans. (d) : Supercharging is the general term for an air compressor to increase the pressure or density of air entering an engine, caused increase in mechanical efficiency, better exhaust & higher thermal loading.

484. What is the main objective of supercharging of the engine?

(a) To reduce the mass of the engine per brake power
(b) To reduce space occupied by engine
(c) To increase the power output of engine
(d) All of the above
(e) None of the above

CGPSC Poly. Lect. 22.05.2016

Ans. (d) : The objective of supercharging the engine is–

– To reduce mass of the engine per brake power.
– To reduce space occupied by the engine.
– To increase the power output of an engine when greater power is required.

485. The process of supercharging is meant for

(a) Raising exhaust pressure
(b) Increasing density of intake air
(c) Increasing quantity of fuel going into cylinder
(d) Providing air for cooling

UKPSC AE 2012 Paper–II

Ans. (b) : Increasing density of intake air

486. Supercharging is usually not suggested for a petrol engine due to:

(a) Decrease in volumetric efficiency
(b) Increase in specific fuel consumption
(c) Increase in power loss
(d) Increase in knocking

OPSC AEE 2019 PAPER - II

Ans. : (d) : The degree of supercharging in S.I. engines is limited by the knock. The increase in pressure and temperature reduces ignition delay and consequently increases the knocking tendency.

487. The compressor of turbocharger is driven

(a) By mechanical power of engine
(b) Manually
(c) By gas turbine mounted in the exhaust flow of engine
(d) By separate electrical motor driven by battery

SJVN ET 2019

Ans. (c) : Turbocharger increases the amount of air entering the engines to create more power. A turbocharger has the compressor powered by a turbine which is driven by exhaust gas from engines.

Search on Telegram @apna_pdf

488. The purpose of supercharging is to
(a) Increase detonation
(b) Increase the volumetric efficiency
(c) Decrease the volumetric efficiency
(d) Decrease mechanical efficiency

TNPSC AE 2013

Ans. (b) : Advantage of supercharging–
1. High power output.
2. Increase the volumetric efficiency.
3. Better mixing of air and fuel.
4. Better atomization of fuel.
5. Quicker acceleration of vehicle.

489. The process of increasing the mass of charge introduced into the same volume of an engine is called
(a) Supercharging (b) Scavenging
(c) Idling (d) Tumbling

TNPSC AE 2014

Ans. (a) : The process of increasing the mass of charge introduced into the same volume of an engine is called supercharging.

490. Which of the following is not the supercharge?
(a) Root type supercharge
(b) Vane type supercharge
(c) Centrifugal type supercharge
(d) Reciprocating supercharge
(e) Screw type supercharge

CGPSC AE 2014- II

Ans. (d) : Reciprocating supercharge is not the supercharge because of high pressure and low discharge of delivery air.

491. Turbo-charger is used
(a) In gas turbines for compression of air
(b) For supercharging diesel engine
(c) In jet propulsion units
(d) In rockets for producing air fuel mixture

RPSC AE 2016

Ans : (b) Turbo-charger is used for supercharging diesel engine.

492. Supercharging for CI engines is preferred because
(a) It decreases the knocking tendency
(b) It leads to reduction in smoke
(c) It improves combustion
(d) All of these

Nagaland PSC CTSE 2017 Paper-2

Ans. (d) : Supercharging for C.I. engine is preferred because
(I) It decrease the knocking tendency
(II) It lead to reduction in smoke
(III) It improves combustion
Explanation :
Super charging is the process of increasing the mass (or in other words density) of the air fuel mixture, which responsible to improvement in combustion and reduction of smoke and achieve higher power output.

493. What are the types of supercharger?
(a) Gear and Vane type
(b) Root and Reciprocating type
(c) Reciprocating and Centrifugal type
(d) Gear, Vane and Reciprocating type
(e) Centrifugal, Root and Vane type

CGPSC ARTO & TSI 07.01.2017

Ans. (e) : There are three main types of supercharger,
1. Root- type
2. Centrifugal
3. Twin Screw

494. Which of the following is not an objective of super charging?
(a) To increase the compression ratio
(b) To overcome power losses at high altitudes
(c) To increase the power output
(d) To reduce the weight to power ratio

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) : To increase the compression ratio is not an objective of super charging.

495. For the same power developed in I.C. engines, the cheaper system is ..... .
(a) naturally aspirated (b) supercharger
(c) centrifugal pump (d) turbo charger

GWSSB DEE 07.07.2016

Ans. (b) : For the same power developed in I.C. engines, the cheaper system is supercharger.

496. The operation of forcing additional air under pressure into the engine cylinder is known as
(a) supercharging (b) carburetion
(c) turbulence (d) delay period

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (a) : The operation of forcing additional air under pressure into the engine cylinder is known as supercharging.

497. By supercharging the diesel engine, the possibility of knocking
(a) Decreases (b) Increases
(c) Remains constant (d) Does not change

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : If the delay period is long, a large amount of fuel will be injected and accumulated in the chamber.
The auto ignition of this large amount of fuel may cause high rate of pressure rise and high maximum pressure which may cause knocking.
Super charging is the process of increasing the density of incoming air/charge in the cylinder by increasing the pressure to increase the power output of the engine.
⇒ Super charging is not preferred in petrol engine (SIE), because by increasing pressure of incoming charge the chances of knocking increases in SIE.
⇒ Supercharging is generally preferred in CIE (diesel engine) In fact by increasing pressure of incoming air, chances of knocking is decreases.

498. In SI engines, supercharging leads to :
(a) Increase in BHP and decrease in thermal efficiency
(b) Increase in thermal efficiency and decrease in BHP
(c) Increase in both thermal efficiency and BHP
(d) None of the above

Kerala PSC Asstt. Prof. 27.09.2016

Ans. (a) : Basically supercharging means supplying high pressure or high density air to the engine. When the high pressure air is supplied to the engines, the mass flow rate of fuel also increases results increase in BHP and decrease in thermal efficiency.

Search on Telegram @apna_pdf

499. The volumetric efficiency of super charged engine is

(a) Between 100–110% (b) Between 90–100%
(c) Between 80–90% (d) Between 70–80%

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : The volumetric efficiency of super charged engine is between 100-110%

500. In supercharged IC engines, the volumetric efficiency is

(a) 80% (b) 90%
(c) 100% (d) More than 100%

APGENCO AE, 2017

Ans. (d) : Superchargers are used to improve volumetric efficiency more than 100%

501. A turbo charger in a diesel engine is for :

(a) Fuel economy
(b) Avoiding knock
(c) Increased efficiency
(d) Increased power output for a given size of the engine

TNPSC AE (Industries) 09.06.2013

Ans. (d) : A turbo charger in a diesel engine is for increased power output for a given size of the engine.

502. Which are fuel cells? 1. Methane 2. Phosphoric acid fuel cell 3. Solid Oxide fuel cell

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) All 1, 2 and 3

RPSC VPITI 14.02.2016

Ans. (d) : Methane
Phosphoric acid fuel cell
Solid oxide fuel cell
All are fuel cell so option (d) is correct.

5. IC Engine performance and Testing

503. A two stroke engine has a speed of 750 rpm. A four stroke engine having an identical cylinder size running at 1500 rpm. The theoretical output of the two stroke engine will be :

(a) Twice that of the four stroke engine.
(b) Half that of the four stroke engine.
(c) The same as that of the four stroke engine
(d) Depend upon whether it is a CI or SI engine.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
(KPSC AE. 2015)
Nagaland PSC CTSE 2015 Paper-II
Kerala PSC AE 06.08.2015, ESE 1997

Ans. (c) : given,
Two stroke engine-
Speed 750 rpm
Four stroke engine –
Speed 1500 rpm
$\because$ indicated power of two stroke engine

$$\left[IP = \frac{PLANK}{60}\right] \text{ (kW)}$$

P = mean effective pressure, N/m^2
L = length of stroke, m
A = area of cross-section of the cylinder, sqm (m^2)
N = rpm, k = No. of cylinder

$N = \frac{N}{2}$ for four stroke engine, N for two stroke engine.

Now, $IP = \frac{PLANK}{60}$ (2Stroke)

$= \frac{PLAK}{60} \times (750)$ ....(i)

$IP = \frac{PLAK}{60} \times \frac{N}{2}$ (4Stroke)

$= \frac{PLAK}{60} \times \frac{1500}{2}$

$= \frac{PLAK}{60} \times 750$ ...(ii)

$\because$ equation (i) & (ii) are equal, if all the parameters are constant and speed is 750 & 1500 for two stroke & 4-stroke engine respectively.

504. The ratio of brake power to indicated power of an IC engine is called :

(a) Mechanical efficiency
(b) Thermal efficiency
(c) Volumetric efficiency
(d) Relative efficiency

Nagaland PSC CTSE 2017 Paper-2
Rajasthan AE (Nagar Nigam) 2016 Shift-3
RPSC AE 2016, TSPSC AEE 2015
UKPSC AE 2012, 2007 Paper -II
RPSC ACF-2011

Ans. (a) : The ratio of brake power to indicated power of an I.C. engine is called mechanical efficiency.

$$\eta_{mechanical} = \frac{B.P.}{I.P.}$$

505. Morse test is applicable only to -

(a) Single cylinder SI engines
(b) Single cylinder CI engines
(c) Multi-cylinder CI engines
(d) Single and multi-cylinder SI and CI engines

RPSC ACF & FRO, 26.02.2021
Harayana PSC AE (PHED) 04.09.2020, Paper-I
KPCL AE 2016, GPSC Lect. (Auto) 16.10.2016
WBPSC AE 2003

Ans. (c) : Morse test can be conducted for multi cylinder engines for SI and CI engine both. The purpose of this test is to obtain the approximate indicated power of a multi cylinder engine.

506. In a four stroke cycle engine, the four operations suction, compression, expansion and exhaust are completed in the number of revolutions of crankshaft equal to :

(a) 1 (b) 2
(c) 3 (d) 4

Nagaland PSC CTSE 2017, 2016 Paper-2
GWSSB AAE, 27.12.2015
TNPSC ACF 2012, RPSC ACF-2011

Search on Telegram @apna_pdf

Ans. (b) : In a four stroke engine, the engine requires four stroke of the piston (intake, compression, power, exhaust) to complete one cycle. Hence, it requires two rotations of crankshaft to complete one cycle.

507. In a four stroke cycle. S.I. engine the camshaft runs at

(a) same speed as crankshaft
(b) half the speed of crankshaft
(c) twice the speed of crankshaft
(d) any speed irrespective of crankshaft speed

Nagaland PSC (CTSE) 2018, Paper-II
TNPSC AE 2017, RPSC AE 2016
RPSC ACF-2011

Ans : (b) In a four stroke cycle SI engine the camshaft runs at half the speed of crankshaft.

508. In a variable speed SI engine, the maximum torque occurs at the maximum

(a) Speed
(b) Brake power
(c) Indicated power
(d) Volumetric efficiency
(e) None of the above

GPSC ARTO Pre 30.12.2018
CGPSC Poly. Lect. 22.05.2016
UKPSC AE 2012 Paper–II
ESE 1999

Ans. (b) : In a variable speed SI engine, the maximum torque occurs at the maximum brake power.

$$\boxed{BP = T \times \omega}$$

509. Brake Horse Power (BHP) of a diesel engine can be increased by :

(a) Increasing the pressure of intake air
(b) Increasing the temperature of intake air
(c) Decreasing the density of intake air
(d) Increasing temperature and decreasing density of intake air.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
APGENCO AE, 2017
Karnataka PSC AE, 10.09.2017
CGPSC Asstt. Workshop Supt., 17.07.2016
WBPSC AE 2003, GATE 1991

Ans. (a) : The BHP of diesel can be increased mostly by burning more fuel and that can be achieved by increasing the density of intake air and increasing pressure of intake air.

510. In I.C. Engines power developed inside the cylinder is called:

(or)

The power actually developed by the engine cylinder of an I.C. engine is known as

(a) Brake horse power
(b) Pumping power
(c) Indicated horse power
(d) None of these

JPSC AE, 10.04.2021, Paper-I
ISRO Scientist/Engineer (RAC) 07.05.2017
GPSC Asstt. Prof. 28.08.2016
GPSC Lect. 23.10.2016

Ans. (c) : Indicated power developed in the cylinder of an engine as calculated from the average pressure of the working fluid, piston area, the stroke, and no. of working strokes per minute. It is the theoretical power of reciprocating engine, converting gas (fuel) into energy.

511. The method of determination of indicated power of multi cylinder SI engine is by the use of :

(a) Morse test (b) Prony brake test
(c) Motoring test (d) Heat balance test

CGPSC Poly. Lect. 22.05.2016
UJVNL AE 2016, MPPSC AE 2016
ESE 1995

Ans : (a) The method of determination of indicated power of multicylinder SI engine is by the use of morse test.
The mores test is adopted to find the indicated power of each cylinder of a high speed I.C. engine without using Indicator diagram.

512. A 40 kW engine has a mechanical efficiency of 80%. If the frictional power is assumed to be constant with load what is the approximate value of the mechanical efficiency at 50% of the rated load?

(a) 55% (b) 45%
(c) 65% (d) 75%

GPSC ARTO Pre 30.12.2018
UPRVUNL AE 21.08.2016, ESE 2005

Ans. : (c) Brake Power = 40 kW

$$\eta_{mech} = 0.8 = \frac{\text{Brake power}}{\text{Indicated power}}$$

$$0.8 = \frac{40}{IP}$$

IP = 50 kW

Frictional power = Indicated power – Brake power

FP = 10 kW

At 50% of the rated load

BP = 20 kW

IP = BP + FP = 30 kW

$$\eta_{mech} = \frac{20}{30} \times 100 = 66.6\% = 65\%$$

513. The ratio of the indicated thermal efficiency to the air standard efficiency is known as

(a) Mechanical efficiency (b) Overall efficiency
(c) Volumetric efficiency (d) Relative efficiency

RPSC IOF, 2020, CIL MT 27.02.2020
PTCUL AE 25.06.2017

Ans. (d) : Relative efficiency- It is also known as efficiency ratio. The relative efficiency of an I.C. engine is the ratio of the indicated thermal efficiency to the air standard efficiency.

Mechanical efficiency- Ratio of brake power to the indicated power.

Overall efficiency- It is the ratio of the work obtained at the crank shaft in a given time to the energy supplied by the fuel during the same time.

Volumetric efficiency- It is the ratio of the actual volume of charge admitted during the suction stroke at N.T.P. to the swept volume of the piston.

Search on Telegram @apna_pdf

514. In a Morse test, for a 2 cylinder, 2 stroke spark ignition engine, the brake power was 9 kW whereas the brake power of individual cylinders with spark cut off were 4.25 kW and 3.75 kW respectively. The mechanical efficiency of the engine is

(a) 90% (b) 80%
(c) 45.5% (d) 52.5%

RPSC IOF, 2020
GPSC ARTO Pre 30.12.2018
ESE 2017, 1999

Ans. (a) : Indicated power of second cylinder is
9 – 4.25 = 4.75 kW
First engine IP = 9 – 3.75 = 5.25 kW
Total indicated power of engine
Total IP = 4.75 + 5.25 = 10 kW
Mechanical efficiency of engine

$$\eta_{mec} = \frac{9}{10} \times 100$$

$$\eta_{mech} = 90\%$$

515. A turbo-charged four-stroke direct injection diesel engine has a displacement volume of 0.0259 m^3 (25.9 litres). The engine has an output of 950 kW at 2200 rpm. The mean effective pressure in MPa is closest to

(a) 2 (b) 1
(c) 0.2 (d) 0.1

HPPSC ADF 05.03.2019
VIZAG STEEL MT 10.06.2012
GATE 2010

Ans. (a) : $BP = \frac{n.P_m.VN.k}{60}$
Where, P_m = mean effective pressure
n = number as cylinder = 1
V = Displace volume = 0.2510 cm^3
N = r.p.m
K = 1/2 for 4-stroke
= 1 for 2-stroke engine

$$\therefore P_m = \frac{B.P \times 60}{n.V.N.K.}$$

$$= \frac{950 \times 60}{0.0259 \times 2200 \times \left(\frac{1}{2}\right)}$$

= 2000 KPa

$\boxed{P_m = 2MPa}$

516. Specific fuel consumption of a diesel engine as compared to that for petrol engine is

(a) Lower
(b) Higher
(c) Same for same power output
(d) May be lower or higher

RPSC AE 2016
UKPSC AE 2012 Paper–II
RPSC ACF-2011

Ans : (a) Specific fuel consumption is amount of fuel consumed to produce unit power in one hour.

$$SFC = \frac{kg/h \text{ fuel consumed}}{\text{power (kW)}}$$

Specific fuel consumption of a diesel engine as compared to that for petrol engine is lower.

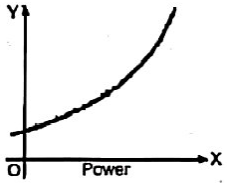
517. Morse test is used to determine the I.P. of a

(a) single cylindrical petrol engine
(b) four stroke engine
(c) single cylindrical diesel engine
(d) multi-cylindrical engine

Nagaland PSC (CTSE) 2018, Paper-II
HPPSC W.S. Poly. 2016, ESE 1995

Ans. (d) : Morse test can be conducted for multi cylinder engines the purpose approximate indicated power of a Multicylinder engine. It consist of running the engine against the dynamo-meter at a particular speed, cutting out the firing of each cylinder in turn and noting the fall in BP each time while maintaining the speed constant.

518. The curve show in the given figure is characteristic of diesel engines

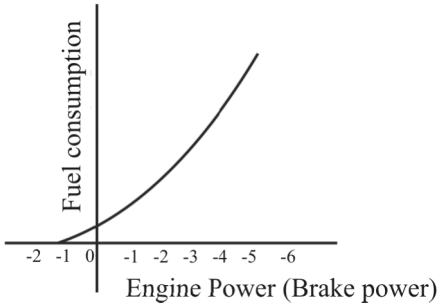


What does the Y-axis represent?

(a) Efficiency
(b) Air-fuel ratio
(c) Specific fuel consumption
(d) Total fuel consumption

Nagaland PSC CTSE 2015 Paper-II
ESE 1995

Ans. (d) :



This graph is extrapolated to get friction power.

519. The ratio of the work obtained at the crankshaft in a given time to the energy supplied during the same time is called

(a) mechanical efficiency
(b) overall efficiency
(c) indicated thermal efficiency
(d) volumetric efficiency

Nagaland PSC (CTSE) 2018, Paper-II
TNPSC ACF 2012

Search on Telegram @apna_pdf

Ans. (b) : The ratio of the work obtained at the crankshaft in a given time to the energy supplied during the same time is called overall efficiency.

$$\eta_0 = \frac{B.P. \times 3600}{m_f \times C}$$

Where B.P. = Brake power
m_f = mass of fuel consumed in kg
C = calorific value of fuel.

520. An engine indicator is used to determine the following
(a) Speed
(b) Temperature
(c) Mean effective pressure and indicated horse power
(d) Brake horse power

Nagaland PSC CTSE 2017 Paper-2
J&K PSC Civil Services Pre, 2010

Ans. (c) : Mean effective pressure and indicated horse power.

521. Which one of the following methods of determining the engine friction is applicable for diesel engines only?
(a) Morse test
(b) Motoring test
(c) Deceleration Method
(d) Willian's line method

OPSC AEE 2019 PAPER - II
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : Willian's line method is only applicable in CI engine for calculation of engine friction power.
Morse test – Determines Indicated power for multi cylinder engine.
Motoring test- used to find friction power of engine for SI & CI both.

522. In a Morse test for a 2-cylinder, 4-stroke, compression ignition engine, the brake power was 12 kW whereas the brake powers of individual cylinders with injection cut off were 4.25 kW and 4.75 kW respectively. The mechanical efficiency of the engine is
(a) 75.9% (b) 77.9%
(c) 76.9% (d) 80.0%

CGPSC AE 2014-II
Nagaland PSC CTSE 2015 Paper-II

Ans. (d) : Given,
Brake power = 12 kW
Power supplied by cylinder No. 1 = 12–4.25 = 7.75 kW
Power supplied by cylinder No. 2 = 12–4.75 = 7.25 kW
Total indicated power = 7.75 + 7.25 = 15 kW

$$\eta_{mechanical} = \frac{BP}{IP} = \frac{12}{15}$$
$$= .8 = 80\%$$

523. A four stroke engine having a brake power of 105 kW is supplied with a fuel at a rate of 4.4 kg per 10 minutes. The brake specific fuel consumption of the engine is
(a) 0.18 kg/kW-hr (b) 0.25 kg/kW-hr
(c) 0.36 kg/kW-hr (d) 0.42 kg/kW-hr

UPPSC AE 13.12.2020, Paper-2
ESE 2018

Ans. (b) : Given,
BP = 105 kW
$\dot{m}_f$ = 4.4 kg per 10 minutes

$$\dot{m}_f = \frac{4.4}{10} \times 60 \text{ per hour}$$

$\therefore$ (BSFC) brake specific fuel consumption

$$= \frac{m_f(kg/hr)}{BP(kW)} = \frac{4.4 \times 60}{10 \times 105}$$
$$= 0.25 \text{ kg/kW-hr}$$

524. If the speed of the engine is increased, the indicated power will :
(a) Increase (b) Decrease
(c) Remain same (d) All of these

RPSC ACF & FRO, 26.02.2021
RPSC IOF, 2020

Ans. (a) : If speed of an engine is increased, the indicated power will increase

$$\text{Indicated power (IP)} = \frac{P_m LAnk}{60}$$

n = N (for 2-stroke engine) (N = RPM)

$$n = \frac{N}{2} \text{ (for 4-stroke engine)}$$

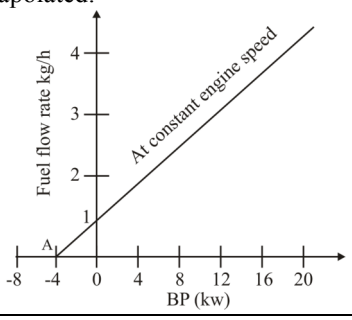
k= no of cylinder
IP $\propto$ N
If speed increases then IP increases

525. The measurement of frictional power by William's Line is applicable only to
(a) SI engines at a particular speed
(b) CI engines at a particular speed
(c) Any engine at a particular speed only
(d) None of the above

GPSC Lect. (Auto) 16.10.2016, TNPSC AE 2014

Ans. (b) : A graph between fuel consumption rate (kg/h) taken on y-axis and BP (kW) on x-axis is drawn, while energy is made to run at same constant speed, say 1500 rpm.

- A graph is extrapolated back to zero fuel consumption which cut on -ve x-axis at a point 'A'.
- The -ve intercept on x-axis represents FP at that speed of the engine.
- Although when BP = 0, some fuel consumption is there. This fuel is consumed to overcome engine friction.
- Only for CI engine to be run at a constant speed as fuel consumption rate v/s BP plot is almost straight line in case of diesel engine, hence can be extrapolated.



Search on Telegram @apna_pdf

526. If performance of S.I. engines of different manufacturers having different capacities, sizes and systems are to be compared, the common parameter would be.

(a) Engine cylinder diameter
(b) Brake power
(c) Mean effective pressure
(d) Weight of engine

RPSC AE 2016, RPSC ACF-2011

Ans. : (c) If performance of SI engine of different manufacturers having different capacities, size and systems are to be compared, the common parameter is the mean effective pressure.

$$\text{mean effective pressure} = \frac{\text{Work done per cycle}}{\text{Stroke Volume } (V_s)}$$

$$P_m = \frac{\text{WD / Cycle}}{V_s}$$

527. Morse test measures the indicated power of :

(a) SI engine (b) CI engine
(c) Steam engines (d) Steam turbine

Kerala PSC AE 06.08.2015 (KPSC AE. 2015)

Ans : (a, b) Morse test measure the indicated power of SI and CI engine
The morse test is adopted to find the indicated power of each cylinder of a high speed I.C. engine, without using indicator diagram.
■ But KPSC given option (a) as answer.

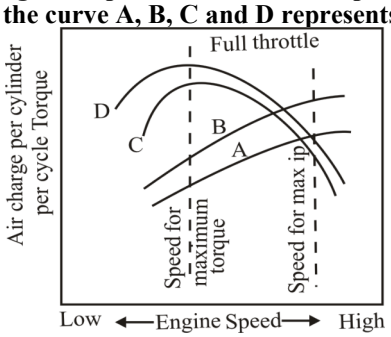
528. Torque developed by the engine is maximum at

(a) Minimum speed of engine
(b) Maximum speed of engine
(c) Maximum volumetric efficiency speed of engine
(d) Maximum power speed of engine

RPSC AE 2016, RPSC ACF-2011

Ans : (a) Torque developed by the engine is maximum at minimum speed of engine.

529. The figure shows typical performance plot against speed for a variable speed SI Engine. the curve A, B, C and D represents



(a) Air Consumption, Indicated Power, Indicated Torque, Air Charge
(b) Air Charge, Indicated Power, Indicated Torque, Air Consumption
(c) Indicated Torque, Indicated Power, Air Charge, Air Consumption
(d) Indicated Power, Air Consumption, Indicated Torque and Air Charge
(e) Indicated Power, Air Charge, Air Consumption, Indicated Torque

CGPSC AE 26.04.2015 SHIFT-II

Ans. (d) :
Curve A → Curve A represents Indicated power
Curve B - Curve B represents Air Consumption
Curve C - Indicated Torque
Curve D - Air Charge

530. During a morse test on a 4-cylinder engine, the following measurements of brake power were taken at constant speed.

All cylinders firing	3000 kW
Number 1 cylinder not firing	2062.5 kW
Number 2 cylinder not firing	2062.5 kW
Number 3 cylinder not firing	2061.5 kW
Number 4 cylinder not firing	2063.5 kW

The mechanical efficiency of the engine is :

(a) 91.53% (b) 85.00%
(c) 80.00% (d) 78.00%

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (c) : Given B.P. = 300 kW

$(I.P.)_1 = 3000 - 2062.5 = 937.5$ kW
$(I.P.)_2 = 3000 - 2062.5 = 937.5$ kW
$(I.P.)_3 = 3000 - 2061.5 = 938.5$ kW
$(I.P.)_4 = 3000 - 2063.5 = 936.5$ kW

$$\eta_{mech} = \frac{BP}{IP} = \frac{3000}{937.5 + 937.5 + 938.5 + 936.5}$$
$$= 0.80$$
$$\boxed{\eta_{mech} = 80\%}$$

531. The following data is given, Brake power is 80 kW, Frictional power is 20 kW, then the mechanical efficiency is _____.

(a) 40 percent (b) 60 percent
(c) 80 percent (d) 100 percent

VIZAG Steel MT 24.01.2021 Shift-II

Ans. (c) : Given,
Brake power (BP) = 80 kW
Friction power (FP) = 20 kW
Indicated power (IP) = BP + FP
= 80 + 20 = 100 kW

$$\text{Mechanical efficiency } (\eta_{mechanical}) = \frac{BP}{IP} = \frac{80}{100} \times 100$$
$$= 80\%$$

532. Ratio of brake power to swept volume is known as :

(a) Input (b) Specific input
(c) Specific output (d) Relative efficiency

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : $\text{Specific output} = \frac{\text{Brake power (BP)}}{\text{Swept volume } (V_{Swept})}$

533. A single-cylinder engine running at 1800 r.p.m develops a torque of 8 N-m. The indicated power of the engine is 1.8 kW. The loss of power due to friction is

(a) 0.4 kW (b) 0.35 kW
(c) 0.292 kW (d) 0.15 kW

Assam PSC AE (PHED), 18.10.2020

Search on Telegram @apna_pdf

Ans. (c) : Given- Single cylinder engine
Speed engine N = 1800 rpm
Torque T = 8 N-m
Indicated power IP = 1.8 kW

$$\text{Brake power B.P.} = \frac{2\pi NT}{60} = \frac{2\pi \times 1800 \times 8}{60}$$

B.P. = 1.50796 kW
Friction power F.P. = I.P. – B.P.
= 1.8 – 1.50796
F.P. = 0.29204 kW

534. The b.p of a four-cylinder engine is 30 with all cylinders firing and 20 with one cylinder cut. The mechanical efficiency is
(a) 75% (b) 65%
(c) 60% (d) 80%

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : Indicated power for one cylinder = 30 – 20
= 10 kW
Total indicated power = 4 × 10 = 40 kW

$$\eta_{mech} = \frac{\text{Brake power}}{\text{Indicated power}} \times 100$$

$$= \frac{30}{40} \times 100 = 75\%$$

535. An IC engine gives an output of 3 kW when the input is 10000 J/s. The thermal efficiency of the engine is
(a) 30% (b) 33.3%
(c) 60% (d) 66.6%

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : Thermal efficiency of engine

$$\eta_{th} = \frac{\text{Output}}{\text{Input}} \times 100$$

$$= \frac{3 \times 10^3}{10 \times 10^3} \times 100$$

$\eta_{th} = 30\%$

536. Find the piston speed of a diesel engine running at 1440 rpm. The engine has a 100 mm bore and stroke length to bore ratio is 1.5.
(a) 7.54 m/s (b) 7.2 m/s
(c) 6.54 m/s (d) 7.5 m/s

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : Given, D = 100 mm

$$\frac{L}{D} = 1.5, \; L = 150 \text{ mm}$$

$$\text{Average speed} = \frac{2LN}{60}$$

$$= \frac{2 \times 150 \times 10^{-3} \times 1440}{60}$$

= 7.2 m/s

537. In four-stroke diesel engine.
1. At high load. NO_x emission increases due to increases in combustion temperature.
2. At high speed, hydrocarbon emission increases due to low combustion temperature.
Choose most appropriate option.
(a) Statement 1 is right but 2 is wrong
(b) Statement 1 is wrong but 2 is right
(c) Both statements 1 and 2 are right
(d) Can't say

GPSC Lect. (Auto) 16.10.2016

Ans. (c) : In four stroke diesel engine.
(1) At high load, NO_x emission increases due to increases in combustion temperature.
(2) At high speed hydrocarbon emission increases due to low combustion temperature.
Both statements are correct.

538. The frictional power (F.P.) is given by-
(a) F.P = B.P. – I. P. (b) F.P. = I.P. – B. P.
(c) F.P. = B.P./I.P. (d) F.P. = I.P./B.P.

GMB AAE 25.06.2017

Ans. (b) : The frictional power (F.P) is given by –
F. P. = I.P. – B.P.
Frictional power is defined as the how much power will be used for running the engine. Engine having some friction in gears chain drives and shaft, mating parts. It consumes some energy from the power.

539. What is the brake thermal efficiency of an engine which consumes 7 kg of fuel in 20 minutes and develops BP of 65 kW ? CV of fuel used = 42 MJ/kg :
(a) 0.265 (b) 0.83
(c) 73% (d) 0.33

APPSC IOF, 2009

Ans. (a) : Fuel consumption $= \frac{7}{\left(\frac{20}{60}\right)} = 21 \text{kg/hr}$

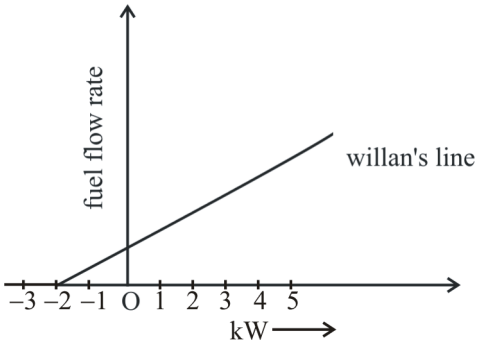
Brake thermal efficiency

$$\eta = \frac{\text{B.P}}{m_f \times \text{C.V}} = \frac{65 \times 3600}{21 \times 42000} = 0.265$$

540. If the fuel consumption of an engine is 0.2 g/s at no load, and 0.4 g/s while delivering 30 kW, the frictional power of the engine using William's line method is
(a) 30 kW (b) 45 kW
(c) 60 kW (d) 90 kW

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (a) :



The line can assume straight line.
Power = friction + constant × fuel flow
At no load,

Search on Telegram @apna_pdf

0 = friction + constant × 0.2
At P = 30 kW,
30 = friction + constant × 0.4
Solving above equation –
friction = –30
Constant = +15

541. The actual power supplied by the engine crankshaft is called

(a) Indicated power (b) Brake power
(c) Frictional power (d) None of these

Sikkim PSC (Under Secretary), 2017

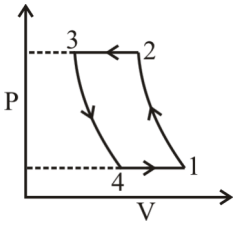
Ans. (b) : The actual power supplied by the engine crankshaft is called brake power.
It is considered as the backbone of an I.C. engine whose function is to convert the reciprocating motion of the position in to the rotary motion with the help of connecting rod. This shaft contains one or more eccentric portion is called crank.

542. With suction pressure being atmospheric, increase in delivery pressure with fixed clearance volume

(a) Increases volumetric efficiency
(b) Decreases volumetric efficiency
(c) Does not change
(d) None of these

MPPSC State Forest Service Exam, 2014

Ans. (b) : $\eta_v = \dfrac{v_1 - v_4}{v_1 - v_3} = \dfrac{\text{Effective swept vol.}}{\text{Swept volume}}$



$$\eta_v = 1 - c\left[\left(\frac{P_2}{P_1}\right)^{1/n} - 1\right]$$

- $P_2\uparrow$, $\eta_v\downarrow$
- $P_1\uparrow$, $\eta_v\uparrow$
- $n\uparrow$, $\eta_v\uparrow$
- $c\uparrow$, $\eta_v\downarrow$

543. What is brake power?

(a) It is the power required to bring the engine to a stop
(b) It is torque developed when the brake is applied, measured at the brake shoe
(c) It is the power developed by an engine and measured at the output shaft
(d) None of these

KPCL AE 2016

Ans. (c) : Brake power- The power developed by an engine at the output shaft is called the brake power.

$$\text{Brake power (B.P.)} = \frac{2\pi NT}{60000}\text{kW}$$

T = torque in 'N-m'
The difference between I.P. and B.P. is called friction power (F.P.)
F. P. = I.P. – B.P.
The ratio of B.P. to I.P. (Indicated power) is called mechanical efficiency.

$$\eta_{\text{mechanical}} = \frac{\text{B.P.}}{\text{I.P.}} \times 100\%$$

544. If the approximate mean pressure during induction, compression, power and exhaust strokes of an I.C. engine are respectively 15 kN/m^2 below atmosphere, 200 kN/m^2 above atmosphere, 1000 kN/m^2 above atmosphere and 20 kN/m^2 above atmosphere, then the mep of the engine in kN/m^2 is

(a) 765 (b) 795
(c) 800 (d) 805

WBPSC AE 2003

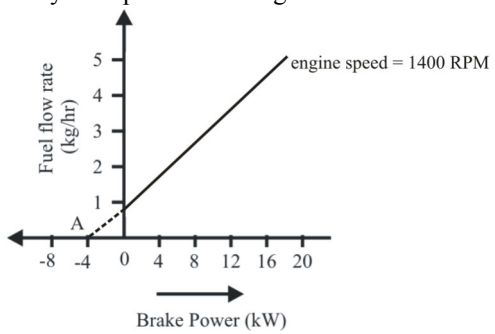
Ans. (a) :
Induction Pressure = 15 kN/m^2 below atmosphere
during Compression = 200 kN/m^2 above the atmosphere
during power = 1000 kN/m^2 above the atm
during exhaust = 20 kN/m^2 above the atm
(mep) mean effective pressure of the engine
mep = 1000 – 200 – (15 + 20) =1000–200–35
mep= 765 kN/m^2

545. Which one of the following quantities is assumed constant for an I.C. engine while estimating its friction power by extrapolation through William's line?

(a) Brake thermal efficiency
(b) Indicated thermal efficiency
(c) Mechanical efficiency
(d) Volumetric efficiency

WBPSC AE 2003

Ans. (b) : Indicated thermal efficiency is assumed constant for an I.C. engine while estimating its friction power by extrapolation through William's line.



$$\dot{m}_f = \lambda BP + \dot{m}_{0f}$$

Where, λ is the slope
→ Negative line on point A shows the friction power at the same speed of engine.
→ Willan's line method is only used in compression ignition (CI) engine. It is not applicable for SI engine.

546. If the mechanical efficiency of an IC engine is 80 percent and the indicated power is100 kW, the frictional power is:

Search on Telegram @apna_pdf

(a) 40 kW (b) 8 kW
(c) 10 kW (d) 20 kW

NLCIL GET 17.11.2020, Shift-II

Ans. (d) : Brake power = Mechanical efficiency × indicated power

$= 0.80 \times 100$

$= 80$ kW

Frictional power = Indicated power – Brake power

$= 100 - 80$

$\boxed{\text{Frictional power} = 20\,\text{kW}}$

547. An engine produces 12 kW brake power while working with a brake thermal efficiency of 36%. If the calorific value of the fuel used is 48 MJ/kg then what is the fuel consumption?

(a) 2.5 kg/hour (b) 1.5 kg/hour
(c) 2.0 kg/hour (d) 3.0 kg/hour

UPRVUNL AE 21.08.2016

Ans. : (a) Break power = 12 kW

η_{bth} (Brake thermal efficiency) = 36%

$C_V = 48$ MJ/kg

$$\eta_{bth} = \frac{BP}{m_f \times C_V}$$

C_v = Calorific value

m_f = mass of fuel

$$0.36 = \frac{12}{m_f \times 48000}$$

$$m_f = \frac{12}{0.36 \times 48000} \times 3600$$

$\boxed{m_f = 2.5\,\text{kg/hour}}$

548. A jet engine consumes 1 kg of fuel for each 40 kg of air intake. Fuel consumption is 1 kg/sec. When aircraft travels in still air at 200 m/sec, velocity of discharge gases with respect to engine is 700 m/sec. The power developed by engine is

(a) 7200 kW (b) 5600 kW
(c) 2070 kW (d) 4140 kW

ISRO Scientist/Engineer 17.12.2017

Ans. (d) : Given,

$\dot{m}_f = 1$ kg

$\dot{m}_a = 40$ kg

Velocity of aircraft $V_a = 200$ m/s

Velocity of discharge $V_d = 700$ m/s

$$F_{net} = (\dot{m}_a + \dot{m}_f) \times V_{exhaust(d)} - \dot{m}_a \times V_{jet(a)}$$

$$\text{Power} = \left[(\dot{m}_a + \dot{m}_f)V_d - \dot{m}_a V_a\right] V_a$$

$= [(40 + 1)\,700 - 40 \times 200] \times 200$

$= 4140000$ W

$= 4140$ kW

549. A large diesel engine runs on a stroke cycle at 2000 rpm. The engine has a displacement of 25 litre and a brake mean effective pressure of 0.6 MN/m^2. It consumes 0.018 kg/s of fuel (calorific value = 42000 kJ/kg). Determine the brake power.

(a) 250 kW (b) 225 kW
(c) 275 kW (d) none of the above

ISRO Scientist/Engineer 11.10.2015

Ans. (a) : Given, Speed (N) = 2000 rpm

Volume (V_S) = 25 litre

$$= \frac{25}{1000}\,m^3$$

$P_{mef.} = 0.6$ MPa $= 0.6$ MN/m^2

Consumes, $(\dot{m}_g) = 0.018$ kg/s

Calorific value (C_f) = 42000 kJ/kg

$\boxed{\text{B.P.} = P_{mef.} \times V_S \times \text{Number of cycle/sec}}$

$$\text{Brake power (BP)} = 0.6 \times 10^3 \times \frac{25}{1000} \times \frac{2000}{2 \times 60}$$

$= 250$ kW

550. Work done by an engine in 20 sec is 1000 Joules. What is the power generated by the engine in Watt?

(a) 50 Watt (b) 70 Watt
(c) 100 Watt (d) 120 Watt

MECON MT 2019

Ans. (a) : Power generated, $P = \frac{W}{t}$

$$= \frac{1000}{20} = 50\,\text{Watt}$$

551. The indicated mean effective pressure for four stroke single cylinder engine that produces 24 kW of power at engine crank shaft at 2000 rpm. having mechanical efficiency as 80%. Consider engine swept volume as 900 cc and stroke length as 9 cm:

(a) 0.33 bar (b) 10 bar
(c) 20 bar (d) 0.167 bar

OPSC AEE 2019 PAPER - II

Ans : (c) : Given,

$N = 2000$ rpm

B.P. $= 24$ kW

$V_s = 900$ cc

$L = 9$ cm

$$\eta_m = \frac{\text{B.P.}}{\text{I.P.}}$$

$$\text{I.P.} = \frac{24}{0.8}$$

$= 30$ kW

$V_s = 900$ cc

$$= \frac{0.0009 \times 1 \times 2000}{60 \times 2}$$

$= 0.015$ m^3/sec

I.P. $= P_{imep} \times V_s$

$$P_{imep} = \frac{30}{0.015}$$

$P_{imep} = 2000$ kPa $= 20$ bar

552. The volumetric efficiency of a well-designed SI engine lies in the range of

(a) 40%-50% (b) 51%-60%
(c) 61-%-70% (d) 71%-90%

BPSC AE Mains 2017 Paper - V

Ans : (d) : The normal range of volumetric efficiency at fuel throttle for SI engines is between 80 to 85% where as for CI engines it is between 85 to 90%.

Search on Telegram @apna_pdf

553. An increase in the mean effective pressure of a diesel engine with fixed compression ratio can be obtained with increase in

(a) Speed of the engine
(b) Charge density
(c) Cut-off ratio
(d) Back pressure

BPSC AE Mains 2017 Paper - V

Ans : (c) : By increasing the cut-off ratio, the work done increases and hence mean effective pressure increases.

554. The power to weight ratio of diesel engine compared to petrol engine is

(a) High (b) Low
(c) Same (d) Not comparable

BPSC AE 2012 Paper - V

Ans : (b) : The power to weight ratio of diesel engine compared to petrol engine is low.

555. A 2-stroke cycle internal combustion engine has a mean effective pressure of 6 bar. The speed of the engine is 1000 r.p.m. If the diameter of the piston and stroke are 110 mm and 140 mm respectively, then the Indicated power developed by the engine is

(a) 6.7 kW (b) 13.3 kW
(c) 26.6 kW (d) 39.9 kW

TNPSC AE 2014

Ans. (b) : Data given -

$P_{mep} = 6$ bar

N = 1000 r.p.m.

d = 110 mm = 0.11 m

L = 140 mm = 0.14 m

I.P. of the engine = ?

We know that

$$P_{mep} = \frac{\text{I.P.}}{\text{Swept volume}}$$

$$600 \times 10^3 = \frac{\text{I.P.}}{\frac{\pi}{4} d^2 \times L \times \frac{N}{60}}$$

$$600 \times 10^3 = \frac{\text{I.P.}}{\frac{\pi}{4} \times (0.11)^2 \times (0.14) \times \frac{1000}{60}}$$

I. P. = 13.2979 kW

556. Rate of work done on the piston by burning of the fuel inside the cylinder of IC engine is called

(a) Friction power (b) Indicated power
(c) Brake power (d) Mechanical power

RPSC LECTURER 16.01.2016

Ans. (b) : Indicated power—Indicated power is the total power available from the expanding of the gases in cylinders. Rate of work done on the piston by burning of the fuel inside the cylinder of IC engine is called Indicated power.

Brake Power (BP)—Brake Power can be defined as the power available at the crank shaft. Since it is measured with the help of Brake dynamometer so it is referred as brake power.

Friction Power (FP)—The power required or power lost to overcome the friction between the mating members of engine is called Friction Power.

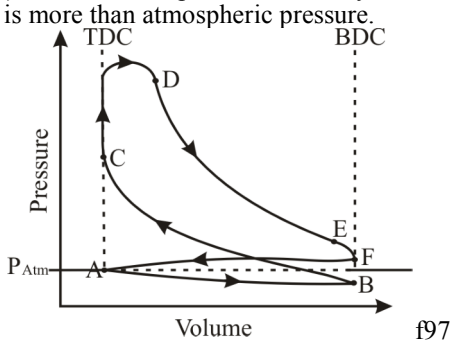
FP = IP - BP

557. The exhaust pressure in the cylinder of an IC engine is

(a) More than atmospheric pressure
(b) Less than atmospheric pressure
(c) Equal to atmospheric pressure
(d) Zero (absolute)

RPSC LECTURER 16.01.2016

Ans. (a) : The exhaust pressure in the cylinder of an IC engine is more than atmospheric pressure.



f97

Process BC - Compression

CD → Combustion

DE → Expansion

FA → Exhaust

From this actual combustion cycle

$P_F > P_{atm}$

558. If ip → indicated power, bp → brake power, fp → frictional power. Which of the following statement is true for IC engine:

(a) ip < bp (b) fp = ip + bp
(c) ip < fp (d) ip > bp

UPRVUNL AE 2016

Ans. (d) : We know that,

Indicated power (ip) = Brake power (bp) + Frictional power (fp)

So, ip > bp

559. Mechanical efficiency of a diesel engine is defined as

(a) $\frac{\text{Indicative Horse Power}}{\text{Brake Horse Power}}$

(b) $\frac{\text{Brake Horse Power}}{\text{Indicative Horse Power}}$

(c) $\frac{\text{Brake Horse Power}}{\text{Fuel Input Power}}$

(d) Brake Horse Power × Indicative Horse Power

TNPSC AE 2013

Ans. (b) : Mechanical efficiency of a diesel engine is defined as the ratio of brake horse power to indicative horse power.

$$\eta_m = \frac{BHP}{IHP}$$

560. The brake power of an engine whose mechanical efficiency is 80% and indicated power is 125000 W is

(a) 100 W (b) 10,000 kW
(c) 100 kW (d) 125 kW

TNPSC AE 2013

Search on Telegram @apna_pdf

Ans. (c) : Data given

$\eta_{m=}$ 80%

IP = 125000 W

BP = ?

We know that

$$\eta_m = \frac{BP}{IP}$$

$$BP = 125000 \times \frac{80}{100}$$

BP = 100000 W

$$\boxed{BP = 100\ kW}$$

561. An engine consumes 5 kg/hr of fuel and its brake power is 20 kW. The value of brake specific fuel consumption is

(a) 0.25 kg/kWh (b) 4 kg/kWh

(c) 2 kg/kWh (d) 15 kg/kWh

TNPSC AE 2013

Ans. (a) : Data given as-

$\dot{m}_f$ = 5 kg/hr

BP = 20 kW

bpsfc = ?

We know that

$$bpsfc = \frac{\dot{m}_f}{BP} = \frac{5}{20}$$

$$bpsfc = 0.25 \frac{kg}{kWhr}$$

562. Morse test in Multi cylinder engines is used to determine

(a) Volumetric efficiency

(b) Brake thermal efficiency

(c) Mechanical efficiency

(d) Brake power

TNPSC AE 2014

Ans. (c) : Morse test aim–

1. To study indicated power of individual cylinder.
2. Indicated power of engine.
3. Frictional power of engine.
4. Mechanical efficiency.

563. The output of an I.C. Engine is measured by a rope brake dynamometer. The diameter of the brake pulley is 750 mm and rope diameter is 50mm. The dead load on the tight side is 400 N and the spring balance reading is 50 N. The engine consumes 4.2 kg/h of fuel at rated speed of 1000 rpm. Then the brake specific fuel consumption of the engine is

(a) 0.143 kg/kWh (b) 0.286 kg/kWh

(c) 0.268 kg/kWh (d) 0.134 kg/kWh

TNPSC AE 2014

Ans. (b) : Data given-

D = 750 mm, d = 50 mm

P = 400 N, N = 1000 rpm

S = 50 N

$$\text{Brake power (BP)} = \frac{(P-S)\pi D_m N}{1000 \times 60} kW$$

where $D_m = (D + d) = 750 + 50 = 800$ mm

$$BP = \frac{(400-50) \times 3.14 \times 0.8 \times 1000}{1000 \times 60}$$

$$\boxed{BP = 14.6533\ kW}$$

then $$bsfc = \frac{m_c}{BP} = \frac{4.2}{14.653}$$

bsfc = 0.2866 kg/kWh

564. A 4-stroke diesel engine, when running at 2500 rpm has injection duration of 2.0 ms. What is the corresponding duration of the crank angle in degrees?

(a) 30 (b) 31

(c) 29 (d) 28

(e) 32

CGPSC AE 26.04.2015 SHIFT-II

Ans. (a : Data given

N = 2500 rpm

t [injection time] = 2×10^{-3} s

Rotation during Injection time

$$\theta = \omega \times t = \frac{2 \times \pi \times 2500}{60} \times 2 \times 10^{-3} \times \frac{180}{\pi}$$

$$\boxed{\theta = 30^0}$$

565. What is the compression ratio of a 4-stroke engine whose capacity is 245cc clearance volume is 27.2cc and diameter of bore is 10% higher than stroke?

(a) 9 (b) 10

(c) 11 (d) 12

JWM 2017

Ans. (b) : Compression ratio of engine(r)

$$= \frac{\text{Total volume}}{\text{clearance volume}}$$

$$r = \frac{\text{Swept volume + clearance volume}}{\text{clearance volume}}$$

$$r = \frac{245}{27.2} + 1 = 10$$

Note- Engine capacity is to be considered as swept volume.

566. What is the number of cycles completed per second for a four stroke diesel engine running at 6000 rpm?

(a) 50 (b) 500

(c) 6000 (d) 3000

CIL MT 26.03.2017

Ans. (a) : Engine speed = 6000 rpm

One cycle in four stroke requires two revolutions. So Number of cycles per minute = 6000/2 = 3000 cycles.

So number of cycles per second = 3000/60 = 50 cycles.

567. Automatic transmission as compared to manual transmission are usually

(a) More fuel efficient

(b) Less fuel efficient

(c) Equally efficient

(d) None of the above

TNPSC AE 2017

Ans. (b) : Automatic transmission as compared to manual transmission are usually Less fuel efficient.

Search on Telegram @apna_pdf

568. A 4-stroke diesel engine has length of 20 cm and diameter of 16 cm. The engine is producing power of 25 kW when it is running at 2500 r.p.m. The mean effective pressure of the engine will be nearly

(a) 5.32 bar (b) 4.54 bar
(c) 3.76 bar (d) 2.98 bar

ESE 2019

Ans. (d) : Given,

$L = 20\ cm = 0.20\ m$ $N = 2500\ rpm$

$D = 16\ cm = 0.16\ m$

$BP = 25\ kW$

Swept volume $(V_s) = \frac{\pi}{4}D^2L$

n = No. of Cylinder

n = 1

$$V_s = \frac{\pi}{4}(0.16)^2 \times 0.20$$

$$V_s = 0.004\ m^3$$

Mean effective pressure

$$p_m = \frac{BP}{V_s \times \frac{N}{120} \times n}$$

$\frac{N}{120}$ = For Four stroke engine (rps)

$$= \frac{25}{0.004 \times \left(\frac{2500}{120}\right)}$$

$= 298.41\ kPa$

$= 2.98\ bar$

569. A 4-stroke, 6-cylinder gas engine with a stroke volume of 1.75 litres develops 26.25 kW at 506 r.p.m. and the MEP is 600 kN/m^2. The number of misfires per minute per cylinder will be

(a) 3 (b) 4
(c) 5 (d) 6

ESE 2019

Ans. (a) : Given,

n = 6

$V_s = 1.75\ lit = 1.75 \times 10^{-3}\ m^3$

$BP = 26.25\ kW$

$p_m = 600\ kN/m^2$

$N = 506\ rpm$

$$p_m = \frac{BP}{V_s \times n \times \frac{N_1}{120}}$$

$$600 = \frac{26.25}{1.75 \times 10^{-3} \times 6 \times \frac{N_1}{120}}$$

$N_1 = 500\ rpm$

but given N = 506 rpm

For developing the given mean effective pressure only 500 rpm is required, where as actual is 506 rpm

Missed firing cycles $= \frac{N - N_1}{2}$

$$= \frac{506 - 500}{2} = 3$$

570. A 2-stroke oil engine has bore of 20 cm, stroke 30cm, speed 350 r.p.m., i.m.e.p. 275 kN/m^2, net brake load 610 N, diameter of brake drum 1m, oil consumption 4.25 kg/hr, calorific value of fuel 44 × 10^3 kJ/kg. The indicated thermal efficiency will be

(a) 29.1% (b) 31.3%
(c) 33.5% (d) 35.7%

ESE 2019

Ans. (a) : 2-stroke oil engine

$d = 0.2\ m$ $N = 350\ rpm$ $k = 1$

$\ell = 0.3\ m$ $p_m = 275\frac{kN}{m^2}$

$\dot{m} = 4.25\ kg/hr$

$CV = 44 \times 10^3\ kJ/kg$

$$\dot{m} = \frac{4.25}{3600} = 0.00118\ kg/s$$

Indicated power (IP) = $p_m \cdot v_s$

$$= p_m \times \left(\frac{\pi}{4}d^2 \times \ell \times k \times \frac{N}{60}\right)$$

$$= 275 \times \left[\frac{\pi}{4} \times (0.2)^2 \times 0.3 \times 1 \times \frac{350}{60}\right]$$

$= 15.118\ kW$

Indicated thermal efficiency

$$\eta_{ith} = \frac{IP}{\dot{m}\,CV} = \frac{15.118}{0.00118 \times 44 \times 10^3} = 0.291 = 29.1\%$$

571. The following are the results of a Morse test conducted on a four-cylinder, four-stroke petrol engine at a common constant speed in all cases: The brake power of the engine when all the cylinders are firing is 80 kW. The brake power of the engine when each cylinder is cut off in turn is 55 kW, 55.5 kW, 54.5 kW and 55 kW, respectively The mechanical efficiency of the engine when all the cylinders are firing will be

(a) 90% (b) 85%
(c) 80% (d) 75%

ESE 2018

Ans. (c) : BP = 80 kW

$IP_1 = 25\ kW = 80 - 55$

$IP_2 = 24.5\ kW = 80 - 55.5$

$IP_3 = 25.5\ kW = 80 - 54.5$

$IP_4 = 25\ kW = 80 - 55$

$IP = IP_1 + IP_2 + IP_3 + IP_4$

$= 25 + 24.5 + 25.5 + 25 = 100\ kW$

Mechanical efficiency $\eta_m = \frac{BP}{IP} = \frac{80}{100} = 80\%$

572. A 4-cylinder diesel engine running at 1200 r.p.m. developed 18.6 kW. The average torque when one cylinder was cut out was 105 Nm. If the calorific value of the fuel was 42000 kJ/kg and the engine used 0.34 kg of diesel/kW hr, the indicated thermal efficiency was nearly.

(a) 29% (b) 26%
(c) 31% (d) 23%

ESE 2017

Ans. (a) : Given,

$N = 1200\ rpm$ $T_{avg} = 105\ Nm$

$B.P. = 18.6\ kW$ $CV = 42000\ kJ/kg$

brake-specific fuel consumption (bsfc)

$= 0.34\ kg/kW\ hr$

Search on Telegram @apna_pdf

BP when one cylinder is cut off

$$= \frac{2\pi NT}{60\times1000} = \frac{2\pi\times1200\times105}{60\times1000}$$

$$= 13.19 \text{ kW}$$

Indicated power of one-cylinder

$$(IP)_{1\text{-cylinder}} = (BP)_{4\text{-cylinder}} - (BP)_{3\text{-cylinder}}$$

$$= 18.6 - 13.19 = 5.41 \text{ kW}$$

Indicated power for 4-cylinder

$$(IP)_{4\text{-cylinder}} = 5.41 \times 4 = 21.64 \text{ kW}$$

Brake specific fuel consumption

$$\text{bsfc} = \frac{\dot{m}_f}{BP}$$

$$0.34 = \frac{\dot{m}_f}{18.6}$$

$$\dot{m}_f = 6.324 \text{ kg/hr}$$

$$= \frac{6.324}{3600}\text{kg/s} = 0.00175 \text{ kg/s}$$

Indicated thermal efficiency

$$\eta = \frac{IP}{\dot{m}_f CV} = \frac{21.64}{0.00175\times42000}$$

$$= 0.2933$$

$$\eta = 29.33\%$$

573. The following data was observed for a CI engine :
Fuel-air ratio : 0.04, Volumetric efficiency : 85%, Indicated mean effective pressure; 8 bar Fuel calorific value : 44000 kJ/kg. Density of air : 1 kg/m^3. What is the indicated thermal efficiency of this engine?

(a) 43% (b) 64%
(c) 53% (d) 69%

BHEL ET 2019

Ans. (c) : Fuel-air ratio $= \frac{m_f}{m_a} = 0.04$

$$\eta_{ith} = \frac{P_{mean}\times m_a}{m_f.C.V.\rho_a\times\eta_{vol}}$$

$$= \frac{8\times10^5}{0.04\times44000\times10^3\times1\times0.85}$$

$$\eta_{ith} = 53.47\%$$

574. An IC engine produces an indicated power of 12 kW. If the mechanical efficiency of the engine is 90%, then loss of power due to friction is given as :

(a) 1.2 kW (b) 2.2 kW
(c) 3.2 kW (d) 0.2 kW

BHEL ET 2019

Ans. (a) : Given - Indicated power (IP) = 12 kW

$$\eta_m = 90\%$$

mechanical efficiency $\eta_m = \frac{BP}{IP}$

$$0.9 = \frac{BP}{12}$$

BP = 12 × .90 = 10.8 kW

Then power due to friction, FP = IP – bP

FP = 12 – 10.8

$$\boxed{FP = 1.2\text{kW}}$$

575. A single-cylinder, two-stroke petrol engine develops 4 kW indicated power. If the mean effective pressure is 6.5 bar and piston diameter is 100 mm, the average speed of the piston is

(a) 23.5 m/s (b) 47 m/s
(c) 94 m/s (d) 186 m/s

JPSC AE 2013 Paper-V

Ans. (c) : V = 2LN

$$I.P. = \frac{P_m LAN}{60}$$

$$LN = \frac{I.P.\times60}{P_m.A}$$

$$V = \frac{2\times I.P.\times60}{P_m.A} = \frac{2\times4\times10^3\times60}{6.5\times10^5\times\frac{\pi}{4}\times(0.1)^2}$$

$$= \frac{2\times4\times60\times4}{6.5\times\pi} = 94.0238 \text{ m/sec}$$

576. A four-stroke single-cylinder SI engine of 6 cm diameter and 10 cm stroke running at 4000 rpm develops power at a mean effective pressure of 10bar. The power developed by the engine is

(a) 9.42 kW (b) 5.54 kW
(c) 4.92 kW (d) 2.94 kW

ESE 2018

Ans. (a) : Given,
D = 0.06 m
L = 0.1 m
N = 4000 rpm
P_m = 1000 kPa

Brake power for 4-stroke engine $= \frac{P_m LAN}{120}$

$$= \frac{1000\times0.1\times\frac{\pi}{4}\times(0.06)^2\times4000}{120} = 9.42 \text{ kW}$$

577. The mechanical efficiency of a single-cylinder four-stroke engine is 60%. The frictional power is estimated to be 30 kW. What is the indicated power?

(a) 120 kW (b) 75 kW
(c) 150 kW (d) 130 kW

ESE 18.07.2021

Ans. (b) : $\eta_m = \frac{BP}{IP} = 0.6$

BP = 0.6 IP

IP – FP = 0.6 IP

$$IP = \frac{FP}{0.4} = \frac{30}{0.4} = 75\text{kW}$$

578. A four-stroke petrol engine at full load delivers 100 kW. It requires 10 kW to rotate it without load at same speed. What is the mechanical efficiency at half load?

(a) 67.82% (b) 70.24%
(c) 77.32% (d) 83.33%

ESE 18.07.2021

Search on Telegram @apna_pdf

Ans. (d) : BP = 100 kW at full load

$BP = \frac{100}{2}$ = 50kW at half load

at half load-

FP = constant = 10 kW

Mechanical efficiency at half load-

$$\eta_m = \frac{BP}{IP} = \frac{BP}{BP + FP} = \frac{50}{50 + 10} = 83.33\%$$

579. If crank shaft of four stroke S.I. engine rotates at 1000 rpm then cam shaft of the same engine rotates at :

(a) 1000 rpm (b) 100 rpm

(c) 2000 rpm (d) 500 rpm

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Cam shaft rotates at $= \frac{1000}{2} = 500$rpm

580. The ratio of work done per cycle to the stroke volume of a compressor is known as.

(a) Compressor capacity

(b) Compression ratio.

(c) Compressor efficiency

(d) Mean effective pressure

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : Mean Effective Pressure-The mean effective pressure (mep) is useful parameter in the study of the reciprocating devices that are used for power production.

WD per cycle = $p_m \times$ piston area $\times$ stroke

$$WD_{cycle} = p_m \times A \times L$$

$$p_m = \frac{WD_{cycle}}{AL} = \frac{WD}{V_s} = \frac{\text{Workdone per cycle}}{\text{Stroke volume}}$$

581. A four stroke single cylinder engine produces 24kW power at engine crank shaft at 2000 rpm. The mechanical efficiency of engine at 80%, swept volume 800 cc and stroke length as 9 cm. The indicated mean effective pressure of engine will be :

(a) 6.4 bar (b) 10 bar

(c) 12.8 bar (d) 20 bar

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (d) : Given,

BP = 24 kW

N = 2000 rpm

$\eta_{mech} = 0.80$ $V_S = \frac{\pi}{4} D^2 \times 2$

$V_S = 800$ cc $V_S = A \times L$

$L = 9 \text{ cm} = 9 \times 10^{-2}$ $A = \frac{V_S}{L} = \frac{800}{9} = 88.88 \text{cm}^2$

$= 88.88 \times 10^{-4} \text{ m}^2$

Indicated mean effective pressure (P_m) = ?

$$\eta_{mech} = \frac{BP}{IP}$$

$$IP = \frac{BP}{\eta_{mech}} = \frac{24}{0.80} = 30\text{kW}$$

$$IP = \frac{P_m LA(N/2)}{60}$$

$$30 \times 10^3 = \frac{P_m \times 9 \times 10^{-2} \times 88.88 \times 10^{-4} \times \left(\frac{2000}{2}\right)}{60}$$

$P_m = 22.5$ bar ≈ 20 bar

582. The bore and stroke of a single cylinder four-stroke engine are 100 mm and 160 mm respectively. If the brake torque is 50 N-m the bmep is

(a) 15 bar (b) 10 bar

(c) 5 bar (d) 7.6 bar

RPSC IOF, 2020

Ans. (c) : Given,

Bore, D = 100 mm = 0.1 m

Stroke, L = 160 mm = 0.16 m

Brake torque = 50 N-m

Brake power, BP = Torque $\times \omega$

For four stroke, speed $= \frac{N}{2}$

$$BP = \frac{50 \times 2\pi N}{60}$$

$$BP = \frac{B_{MEP} \times LAN}{60}$$

$$\frac{50 \times 2\pi N}{60} = \frac{B_{MEP} \times 0.16 \times \frac{\pi}{4} \times (0.1)^2 \times \frac{N}{2}}{60}$$

Brake mean effective pressure,

$B_{MEP} = 5 \times 10^5$ N/m^2

$= 5$ bar

583. A 4-stroke, 4- cylinder diesel engine running at 1200 rpm develops 70 kW. Given parameter are:

Brake thermal efficiency = 30%;

Calorific value of fuel = 42,000 kJ/kg;

Engine bore = 150 mm;

Engine stroke = 120 mm;

Air-fuel ration = 15:1;

Density of air = 1.15 kg/m^3:

Air consumption (in m^3/S) is:

(a) 0.07246 (b) 0.06124

(c) 0.1294 (d) 0.007432

HPPSC ADF 05.03.2019

Ans. (a) :

584. An engine working on Otto cycle consumes 8 litres of fuel per hour and develops 25 kW. The specific gravity of fuel is 0.75 and its calorific value is 44000 kJ/kg. The indicated thermal efficiency of the engine is:

(a) 34.1% (b) 24.2%

(c) 28.4% (d) 54.5%

AAI Jr. Executive 29.11.2018

Ans. (a) : Fuel consumption per hour (m_f) = Volume flow rate $\times$ density

$= 8 \times 10^{-3}$ (m^3/hr) $\times 0.75 \times 10^3$ (kg/m^3)

= 6 kg/hr

Search on Telegram @apna_pdf

$$\text{Indicated thermal efficiency} = \frac{IP}{m_f(kg/sec)\times C.V.}$$
$$= \frac{25}{\frac{6}{3600}\times 44000}$$
$$= 0.3409$$
$$= 34.09\% \approx 34.1\%$$

585. A 16 kW engine with 80% mechanical efficiency has the frictional power constant for all loads. If the engine is loaded with 75% of its rated power, then mechanical efficiency of this engine is :

(a) 65% (b) 80%
(c) 75% (d) 60%

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : Given that
I. P = 16 kW
B.P = 75% of its rated power
= 0.75 × 16 = 12 kW B.P. = Break power

$$\eta_{mech} = \frac{B.P}{I.P} = \frac{12}{16}$$ I.P. = Indicated power

$\eta_{mech} = 75\%$

586. An engine running at 3000 rpm has an injection duration 1 mS. What is the corresponding injection duration in crank angle in degrees?

(a) 16 (b) 18
(c) 30 (d) 4

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b)
1 min = 3000 revolution

$$1 \text{ sec} = \frac{3000}{60} = 50 \frac{\text{revolution}}{\text{sec}}$$

Then angle turned by crank in 1 mili second
$= 360 \times 50 \times 10^{-3}$
$= 18^0$

587. The cubic capacity of a four stroke over-square S.I. engine is 245 cc. The clearance volume is 27.2cc. The compression ratio of the engine is about:

(a) 7.8 (b) 6.5
(c) 9 (d) 10
(e) 12.9

CGPSC ARTO & TSI 07.01.2017

Ans. (d) : Given
Total volume = 245cc
Clearance Volume = 27.2cc
Swept Volume = 245-27.2
= 217.8cc

$$\text{Compression Ratio} = \frac{\text{Total Volume}}{\text{Clearance Volume}}$$
$$= \frac{2450}{27.2}$$
$$= 9.0073$$

Compression Ratio = 9

588. A 4-stroke diesel engine, when running at 1500 rpm has a duration of 2 mili-seconds. What is the corresponding duration of the crank angle, in degrees?

(a) 18º (b) 9º
(c) 38º (d) 15º
(e) 20º

CGPSC ARTO & TSI 07.01.2017

Ans. (a) : Given.
N = 1500 rpm ; t = 2 mili second $= 2\times10^{-3}$ second

$$\omega = \frac{2\pi N}{60} = \frac{2\times\pi\times1500}{60}$$
$$t = \frac{\theta}{\omega}$$
$$2\times10^{-3} = \frac{\theta}{\frac{2\pi\times1500}{60}}$$
$$\theta = 0.314159$$
$$\theta = \frac{03.4159\times180}{\pi}$$
$$\theta = \mathbf{18^o}$$

589. Engine misfiring is likely to result from

(a) spark plug gas too small
(b) spark plug gas too wide
(c) vapour lock in the fuel line
(d) stoichiometric fuel air mixture

APPSC AEE 2012

Ans. (c) : Engine misfiring is likely to result from vapour lock in the fuel line.

590. The Volumetric efficiency of an engine whose swept volume is 0.5 m^3/min and volume of intake air 0.4 m^3/min :

(a) 80% (b) 20%
(c) 10% (d) 50%

TNPSC AE (Industries) 09.06.2013

Ans. (a) :

591. The mechanical efficiency of a single-cylinder, four -stroke engine is 90%. The frictional power is 30 kW. What will be the brake power developed by the engine?

(a) 240 kW (b) 270 kW
(c) 300 kW (d) 330 kW

APPSC Poly Lect. 13.03.2020

Ans. (b) : Let;
BP = Brake power
IP = Indicated power
FP = Frictional Power = 30 kW
Given;
Mechanical efficiency (η_m) = 90% = 0.9
We know that,

$$\eta_m = \frac{BP}{IP}$$
$$\frac{BP}{IP} = 0.9 \Rightarrow IP = \frac{10\ BP}{9} \quad \text{..... (i)}$$

Now, IP = BP + FP

Search on Telegram @apna_pdf

$$\Rightarrow \frac{10\,BP}{9} = BP + 30kW \quad \text{[from equation (i)]}$$

$$\Rightarrow \frac{BP}{9} = 30\ kW$$

$$\Rightarrow \boxed{B.P. = 270kW}$$

592. The straight line plot of experimental values of total fuel consumption and the brake power is called

(a) Atkinson line (b) Otto Line
(c) Willans' line (d) Diesel line

VIZAG Steel MT 24.01.2021 Shift-II, Shift-I

Ans. (c) : The straight line plot of experimental values of total fuel consumption and the brake power is called Willan's line

Figure

593. A rope brake dynamometer is used to measure the brake power of a single cylinder four stroke petrol engine. It is found that the torque due to brake load is about 200 Nm and the engine makes and angular velocity of 52.36 rad/s The brake power developed by the engine is _____.

(a) 20.94 kW (b) 10.47 kW
(c) 6.98 kW (d) 5.24 kW

VIZAG Steel MT 24.01.2021 Shift-II, Shift-I

Ans. (b) : Given
torque, T = 200 N-m
angular velocity, $\omega = 52.36$ rad/sec
$\therefore$ Brake power, $P = T\omega$
$= 200 \times 52.36$
$= 10472$ W
$= 10.472$ kW

594. The ratio of the volume of charge admitted at N.T.P. to the swept volume of the piston is called

(a) mechanical efficiency
(b) overall efficiency
(c) volumetric efficiency
(d) relative efficiency

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : The ratio of the volume of charge admitted at N.T.P. to the swept volume of the piston is called volumetric efficiency. Volumetric efficiency is the ratio of the volume of fluid actually displaced by a piston or plunger to its swept volume.

595. The thermal efficiency of diesel engines is about

(a) 15% (b) 30%
(c) 50% (d) 70%

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : The thermal efficiency of petrol and gas engines is about 30% and the thermal efficiency of diesel engines is about 70%.

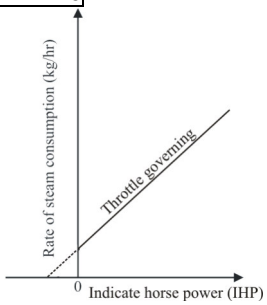
596. William's law gives a straight line graph between the rate of steam consumption and

(a) pressure of steam
(b) temperature of steam
(c) volume of steam
(d) indicated horse power

UKPSC AE 2012 Paper–II

Ans. (d) : William's law is hold's good for throttle governing.

$\boxed{W = a \times IP + b}$



597. The stroke of an engine is increased when the:

(a) Piston is shortened
(b) Connecting rod is lengthened
(c) Crank shaft throw is lengthened
(d) Gudgeon pin is moved nearer to the crank shaft

RPSC VPITI 14.02.2016

Ans. (c) : If crank shaft throw is lengthened the stroke of an engine is increased as L = 2r.

598. Which of the following is true for four-stroke engines?

(a) One power stroke is obtained in each revolution of crankshaft
(b) One power stroke is obtained in every two revolutions of crankshaft
(c) One power stroke is obtained in every four revolutions of crankshaft
(d) One power stroke is obtained in every six revolutions of crankshaft

APPSC Poly Lect. 13.03.2020

Ans. (b) : • In four-stroke engines, one power stroke is obtained in every two revolutions of crankshaft.
• For two-stroke engine one power stroke is obtained in each revolution of crank shaft.

599. A fictitious pressure that, if it acted on the piston during the entire power stroke, would produce the same amount of net work as that produced during the actual cycle is called

(a) Quasi equivalent pressure
(b) Mean equivalent pressure
(c) Mean effective pressure
(d) Quasi static pressure

ESE 2020

Ans. (c) : Mean effective pressure,

$$P_m = \frac{\text{Work output}}{\text{Swept volume}} = \frac{W_{net}}{V_s}$$

600. In a four stroke IC engine turning 1500 rev/min, how many revolutions the crankshaft will have to make for every power stroke?

Search on Telegram @apna_pdf

(a) 1500 (b) 375
(c) 3000 (d) 750

HPPSC Poly. Lect. 05.07.2021

Ans. (d) : In 4 stroke 2 revolution of crank shaft takes place.

$\therefore$ For every power stroke revolution is $\frac{1500}{2} = 750.$

601. Diagram factor is defined as the ratio of

(a) theoretical m.e.p. and actual m.e.p.
(b) actual m.e.p. and theoretical m.e.p.
(c) theoretical m.e.p. and swept volume
(d) actual m.e.p. and swept volume

ISRO Scientist/Engineer (RAC) 29.11.2015

Ans : (b) Diagram Factor- Diagram Factor is defined as the ratio of actual m.e.p. and theoretical m.e.p., where m.e.p. is mean effective pressure.

602. The number of power strokes per minute in a two stroke engine is

(a) equal to the rpm (b) half of the rpm
(c) twice of the rpm (d) four times of the rpm

Mizoram PSC AE/SDO 2014, Paper-I

Ans. (a) : Number of working strokes per min for a two stroke cycle engine are equal to the speed of the engine in r.p.m while the number of working strokes per min for a four stroke cycle engine are one half of the speed of the engine in r.p.m.

603. The cam shaft of a four stroke I.C. engine running at 2000 rpm will run at:

(a) 1500 rpm
(b) 1000 rpm
(c) 2000 rpm
(d) Any value independent of engine speed

GPSC Asstt. Prof. 28.08.2016

Ans. (b) : The Camshaft is either chain or gear driven from the crank shaft. Because the engine is a four stroke, the camshaft will rotate at half the speed of the camshaft. So engine speed

$N_{engine} = 2 \times N_{camshaft}$

$N_{camshaft} = \frac{N_{engine}}{2} = \frac{2000}{2}$

$= 1000$ rpm.

604. The Brake Mean effective Pressure (BMEP) of 1200 CC four stroke engine delivering 20 kW at 2000 rpm is :

(a) 5 bar (b) 8 bar
(c) 10 bar (d) 12 bar

Haryana PSC AE (PHED) 04.09.2020, Paper-I

Ans. (c) : BMEP (brake mean effective pressure)

Brake power $= \frac{P_m LAnK}{60}$

n = N/2 for four stroke; n = N for two stroke

K = No. of cylinder

$\because P_m$ = BMEP

$20 \times 10^3 = P_m \times 1200 \times 10^{-6} \times \frac{2000}{2} \times 1 \times \frac{1}{60}$

$P_m = 1 \times 10^6$ N/m^2

$= 10$ bar

605. A diesel engine develops a Brake power of 4.5 kW. Its indicated thermal efficiency is 30% and the mechanical efficiency is 85%. Considering calorific value of the fuel as 40000 kJ/kg, the fuel consumption will be :

(a) 2.1 kg/hr (b) 3.9 kg/hr
(c) 1.6 kg/hr (d) 4.6 kg/hr

ISRO Scientist/Engineer (RAC), 10.03.2019

Ans. (c) : Given, B.P. = 4.5 kW

Indicated thermal efficiency η_{ith}= 30%

Mechanical efficiency η_{mech}= 85%

Calorific value = 40000 kJ/kg

$$\eta_{mech} = \frac{BP}{IP}$$

$$0.85 = \frac{4.5}{IP}$$

$$IP = \frac{4.5}{0.85} = 5.294 kW$$

$$= 5.294 \frac{kJ}{\text{sec}} = 5.294 \times 3600 \frac{kJ}{hr}$$

$$= 19058.82 \frac{kJ}{hr}$$

$$\eta_{ith} = \frac{IP}{m_f . c_v}$$

$$m_f = \frac{IP}{\eta_{ith} \times c_v} = \frac{19058.82}{0.30 \times 40000} = 1.58 \simeq 1.6 kg/hr$$

606. A tank contains a mixture of CO_2 and N_2 in the mole proportions of 0.2 and 0.8 at 1 bar and 290 K. It is connected by a duct of sectional area 0.1 m^2 to another tank containing a mixture of CO_2 and N_2 in the mole proportion of 0.8 and 0.2. The duct is 0.5 m long. The diffusion of CO_2 is. (Take Diffusion coefficient = 0.16×10^{-4} m^2/s)

(a) 3.43×10^{-6} kg/s (b) 2.23×10^{-6} kg/s
(c) 3.5×10^{-6} kg/s (d) 3.8×10^{-6} kg/s
(e) 2.5×10^{-6} kg/s

CGPSC AE 26.04.2015 SHIFT-II

Ans. (c) Given, L = 0.5 m p = 1 bar

$A_c = 0.1$ m^2 T = 290 K

$D_{AB} = 0.17 \times 10^{-4}$ m^2/s

The partial pressure of two gases in two tanks are :

$p = p_1 + p_2$, $p_i = x_i p$

$p_{A,1} = 0.2$ bar, $p_{A,2} = 0.8$ bar

$p_{B,1} = 0.8$ bar, $p_{B,2} = 0.2$ bar

For the rate of molar diffusion of CO_2 using equation,

$$\dot{N}_A = \frac{D_{AB} \cdot A}{R_u T}\left[\frac{p_{A_2} - p_{A_1}}{L}\right]$$

$$= \frac{0.16 \times 10^{-4} \times 0.1(0.8 - 0.2) \times 10^5}{8314 \times 290 \times 0.5}$$

$= 7.96 \times 10^{-8}$ kg-mol/s

And, $\dot{m}_A = \dot{N}_A M_A = 7.96 \times 10^{-8} \times 44$

$= 3.503 \times 10^{-6}$ kg/s

$\simeq 3.5 \times 10^{-6}$ kg/s

Search on Telegram @apna_pdf

607. The brake of an IC Engine having speed 1200 rpm with torque 15 Nm is:

(a) 300 π watts (b) 450 π watts
(c) 150 π watts (d) 600 π watts

Kerala PSC IOF 19.04.2016

Ans. (d) $BP = \frac{2\pi N}{60} \times T$

$= 2\pi \times \frac{1200}{60} \times 15$

$= 600\pi$ watts

608. Diesel engine having brake thermal efficiency of 30% and the calorific value of fuel used is 10000 kcal/kg the brake specific fuel consumption will be

(a) 0.21 kg/HP.hr (b) 0.29 kg/HP.hr
(c) 0.39 kg/HP.hr (d) 0.49 kg/HP.hr

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (a) : We know that

Brake thermal efficiency is given as

$$\eta_b = \frac{BP}{m_f \times CV}$$

and Brake sp. fuel consumption is given as

$$bsfc = \frac{m_f}{BP}$$

So using above formulas we have,

$$bsfc = \frac{1}{\eta_b \times CV}$$

then

$CV = 10000 \times 10^3 \times 4.184$ J/kg

$$\left[\frac{J}{kg} = \frac{J}{\sec} \times \frac{\sec}{kg} = W\frac{\sec}{kg}\right]$$

$$CV = 10000 \times 10^3 \times 4.184 \times \frac{1}{746}\ HP \times \frac{hr}{3600 kg}$$

$= 15.579$ HP-hr/kg

Now we have

$$bsfc = \frac{1}{\eta_b \times CV} = \frac{1}{0.3 \times 15.579} = 0.214\ kg/HP.hr$$

609. A four-cylinder petrol engine is tested for its mechanical efficiency. During the test, spark plugs of each cylinder were inoperative and the corresponding brake loads noted are 100, 120, 130, 120 N. If the net brake load is 180 N, then the mechanical efficiency of the engine is :

(a) 75% (b) 66.6%
(c) 60% (d) 72%

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d)

$I_1 = 180 - 100 = 80$
$I_2 = 180 - 120 = 60$
$I_3 = 180 - 130 = 50$
$I_4 = 180 - 120 = 60$

Total IP = 80 + 60 + 50 + 60 = 250

$$\eta_{mech} = \frac{B.P}{I.P} = \frac{180}{250} = 0.72$$

$\eta_{mech} = 72\%$

610. Engine operating conditions may be indicated by the colour of exhaust smoke. Black smoke could indicate

(a) Insufficient speed droop setting
(b) Overloaded engine
(c) Clogged drain holes in the oil control rings
(d) Complete combustion

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (b) : Black exhaust smoke can appear when the vehicle is burning to much fuel/gasoline in order to make the engine run. This condition is occurred during the overloaded engine & this could be caused by a clogged air filter, malfunctioning fuel injection system and a blocked manifold.

611. A Mercedes-Benz car engine has swept volume of 300 cc and clearance of 25 cc. Its volumetric efficiency is 0.88 and mechanical efficiency is 0.90. The volume of mixture taken in per stroke is:

(a) 198 cc (b) 164 cc
(c) 264 cc (d) 284 cc

AAI Jr. Executive 29.11.2018

Ans. (c) : $V_s = 300$ cc

$V_c = 25$ cc

Volumetric efficiency = 0.88

Mechanical efficiency = 0.90

The volume of mixture taken per stroke = Actual volume

$$\eta_{vol} = \frac{\text{Actual volume}}{\text{Swept volume}}$$

$$0.88 = \frac{\text{Actual volume}}{300}$$

Actual volume = 264 cc

6. Engine Cooling and Lubrication

612. Which is more viscous lubricant oil given below?

(a) SAE 30 (b) SAE 40
(c) SAE 70 (d) SAE 80

TNPSC AE 2017, GWSSB AAE, 27.12.2015
GPSC AE 26.07.2015

Ans. (d) : According to The society of Automotive engineers (SAE), SAE 80 is more viscous lubricant oil.

613. The following type of Lubrication system is used in two stroke engines.

(a) Petroil (mist) system
(b) Wet sump system
(c) Dry sump system
(d) All of these

RPSC ACF & FRO, 26.02.2021
HPPSC W.S. Poly. 2016
GPSC Lect. 23.10.2016

Search on Telegram @apna_pdf

Ans. (a) : Petroil (mist) lubrication system is used in two stroke engine.

Wet sump lubrication system & dry sump lubrication system is used in four stroke engine.

Wet sump system- Small engines such as automobile engines.

Dry sump system- Large stationary, marine and air craft engines.

Mist/Petroil lubrication – Two stroke

Wet sump, Dry sump } → Four stroke.

614. In automobile engines a thermostat is provided for :

(a) Regulating the temperature of suction air
(b) Regulating the temperature of lubrication oil
(c) Controlling the temperature of the cooling system
(d) Regulating the temperature of exhaust gases

RPSC ADE 2016, RPSC AE 2016
RPSC ACF-2011

Ans. (c) : When the engine is cold, the thermostat is closed and prevents coolant from flowing into the engine and allows the engine to warm up

Once the engine has warmed, the thermostat will open and allow coolant to flow and cool the engine when it starts to get too hot. This function is vital for optimal engine performance.

615. The purpose of thermostat in an engine cooling system is to

(a) Indicate coolant temperature
(b) Prevent coolant from boiling
(c) Allow the engine to warm up quickly
(d) Pressurize coolant for effective cooling

RPSC IOF, 2020
ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (c) : Any liquid-cooled car engine has a small device called thermostat that sits between the engine and radiator. The thermostat is most in cars about 2 inches in diameter. It used to block the flow of coolant to the radiator until the engine has warmed up. When the engine is cold, no coolant flows through the engine. Once the engine reaches its operating temperature (generally about 95ºC), the thermostat opens. By lifting the engine warm up of quickly as possible, the thermostat reduces engine wear, deposits and emissions.

616. Detergents are oil additives used to

(a) Reduce viscosity
(b) Increase fire point
(c) Prevent sludge formation
(d) Prevent foaming

RPSC IOF, 2020

Ans. (c) : Detergent additives are used to clean and neutralize oil impurities which would normally cause deposits (oil study) on vital engine part typical detergents are magnesium sulfonates. Corrosion or rust inhibiting additives retard the oxidation of metals inside an engine.

617. In a normally operating diesel engine the main source of lubricating oil contamination in the crank case is a result of the

(a) Metal particles loosened by wear
(b) Condensation of water vapour
(c) Break down of the lubricating oil itself
(d) Fuel dilution

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (a) : Note- No answer is given by commission.

618. The lower cylindrical portion of the piston which improves piston cooling performance is called:

(a) Piston crown (b) Connecting rod
(c) Piston pin boss (d) Piston skirt

GPSC Asstt. Prof. 28.08.2016

Ans. (d) : Piston skirt is the cylindrical walls of a piston. The surface of the piston skirt is left slightly rough which helps retain lubrication. Due to lubrication, it improves piston cooling performance.

619. The function of oil ring provided on piston is :

(a) To provide gas seal
(b) To meter and distribute oil directed on cylinder wall
(c) To conduct heat from piston to cylinder wall
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : The function of oil ring provided on the piston is to meter and distribute oil directed on cylinder wall.

620. Additives are added in an aqueous ethylene glycol solution, which is used as engine coolant.

(a) To prevent metal corrosion
(b) To prevent a buffering action against acids
(c) To dissolve certain additives to improve antiform property and ready identification
(d) All options are correct.

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Additives added in engine coolant for following purposes-

(1) To prevent metal corrosion
(2) To prevent a buffering action against acids
(3) To dissolve certain additives to improve antiform property and ready identifications.
(4) Antifreeze material.

621. The volumetric efficiency of an air cooled engine is lower due to..

(a) Simple engine design
(b) Use of fins on cylinder
(c) Higher cylinder head temperatures
(d) Higher specific output from engine.

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : The volumetric efficiency of an air cooled engine is lower due to higher cylinder head temperatures.

Volumetric efficiency $(\eta_v) = \frac{V_a}{V_s}$

Search on Telegram @apna_pdf

Where, V_a = Actual volume
V_s = Swept volume
Volumetric efficiency- It is the ratio of the actual volume of charge admitted during the suction stroke at NTP to the swept volume of piston.

622. Accumulation of rust and scale in the engine cooling system will cause
(a) Slow worm up
(b) Reduced output
(c) Low exhaust temperature
(d) Overheating

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : In engine cooling system, accumulation of rust and scale in the engine block the flow of cooling causing the engine to overheat and leak, which lead to very expensive repairs.

623. Mark the incorrect statement :
In air cooling of IC engines, the heat dissipated depends on
(a) The area of the cooling surface in contact with air
(b) Mass rate of flow of air
(c) Temperature difference between the cylinder and air
(d) Conductivity of the metal
(e) None of these

CGPSC AE 16.10.2016

Ans. (e) : In an air cooled system, heat generated due to combustion in the engine, will be conducted to the fins when air flow over fins and heat dissipated depends on the area of cooling surface in contact with air, mass rate of flow of air, temperature difference between both air & engine cylinder & conductivity of metal.

624. Force feed lubrication system means that oil is delivered to the engine by
(a) Gravity
(b) Pressure created by oil pump
(c) Splashing of the crank shaft
(d) None of the above

ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (b) : Pressure created by oil pump for force feed lubrication system in engine.

625. Lubrication system for high capacity engines
(a) Wet Sump Lubrication
(b) Mist Lubrication
(c) Splash system
(d) Dry Sump Lubrication

TNPSC AE 2013

Ans. (d) : Dry sump lubrication– Dry sump lubrication system is an engine lubrication system in which the lubrication oil is carried in an external tank and not internally in a sump. The sump is kept relatively free from oil by scavengine pumps, which return the oil to the tank after cooling. This is the opposite of a wet pump system.

626. In petrol engine, increases of cooling water temperature will
(a) Increase the knocking tendency
(b) Decrease the knocking tendency
(c) Not affect the knocking tendency
(d) Increase or decrease knocking tendency depending on strength and time of spark

TNPSC AE 2017

Ans. (a) : In petrol engine, increases of cooling water temperature will increase the knocking tendency.

627. The thermostat in I.C. engines permitting hot water to go to radiator is set around
(a) 70 - 80º C (b) 80 - 85º C
(c) 85 - 95º C (d) Above 100º C

TNPSC AE 2017

Ans. (b) : The function of thermostat in I.C. engine is block the flow of coolant to the radiator until the engine has warmed up once the engine reaches its operating temperature (generally 80 - 85°C), the thermostat opens.

628. Most commonly used lubrication system in heavy vehicles is the
(a) Splash Lubrication system
(b) Pressure Lubrication system
(c) Gravity Lubrication system
(d) Petrol Lubrication system

TNPSC AE 2017

Ans. (b) : Most commonly used lubrication system in heavy vehicles is the Pressure Lubrication system.

629. A system in which the lubricating oil is carried in separate tanks from where it is fed to the engine is called the :
(a) dry sump system
(b) wet sump system
(c) splash system
(d) mist lubrication system

APPSC Poly Lect. Automobile Engg., 2020

Ans. (a) : In a dry-sump system the oil still falls to the base of the engine, but into a much shallower sump. Where one or more scavenge pump draw it away and transfer it to a (usually external) reservoir where it is both cooled and de-aerated before being re-circulated through the engine by a pressure pump.

630. The function of oil scrapper ring is to :
(a) Retain compression
(b) Lubricate cylinder walls
(c) Maintain vaccum
(d) Reduce piston wear

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) The function of oil scrapper ring is to lubricate cylinder walls.

631. Excessive pressure build up in force feed lubrication system prevented by :
(a) Relief valve
(b) Stop valve
(c) Balancer
(d) Pressure reducing valve

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) Excessive pressure build up in force feed lubrication system prevented by relief valve.

632. Which type of pump is preferred for pumping lubricating oil in automobile:
(a) Open impeller type
(b) Centrifugal pump with impeller shrouded on one side only

Search on Telegram @apna_pdf

(c) Centrifugal pump with impeller shrouded on both side only
(d) Gear pump

RPSC ADE 2016

Ans. (d) : Gear pump is preferred for pumping lubricating oil in automobile.

7. Automobile Engineering

633. For a four cylinder vertical engine, the commonly used firing order is

(a) 1 – 2 – 3 – 4 (b) 3 – 1 – 2 – 4
(c) 4 – 2 – 3 – 1 (d) 1 – 3 – 4 – 2

Assam PSC AE (PHED), 18.10.2020
RPSC IOF, 2020, RPSC AE 2016
TNPSC AE 2014, APGENCO AE 2012
RPSC ACF- 2011
J&K PSC Civil Services Pre, 2010

Ans. (d) : 1 – 3 – 4 – 2 firing order is commonly used for a four cylinder engine. For the four-cylinder engine, the firing order is decided such that a power stroke occurs every 180 degrees.

634. Piston compression rings are manufactured by:

(a) Aluminium –WC (b) Cast iron
(c) HSS (d) Any material

HPPSC Lect. (Auto) 23.04.2016
UKPSC AE 2012 Paper–II
UKPSC AE 2007 Paper -II, ESE 2007

Ans. (b) : Piston compression rings are manufactured by cast iron has high damping capacity. Ductile material causes blow by loss.

635. The NOx level in engine exhaust gas can be reduces by following method :

(a) Thermal reactor
(b) Exhaust gas recirculation
(c) Advance spark timing or fuel injection
(d) Use of after burner

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
Assam PSC AE (PHED), 18.10.2020
OPSC AEE 2019 PAPER - II

Ans. (b) : The NO_X level in engine exhaust gas can be reduces by Exhaust gas recirculation (EGR).

636. The three way catalytic converter cannot control which one of the following?

(a) HC emission (b) CO emission
(c) NO_x emission (d) PM emission

GPSC ARTO Pre 30.12.2018
MPPSC AE 2016, ESE 2008

Ans : (d) PM emission

637. The method of governing for a petrol engine is:

(a) Hit and misgoverning
(b) Quality governing
(c) Quantity governing
(d) Misgoverning

APGENCO AE, 2017
OPSC AEE 2015 PAPER - II
TSPSC AEE 2015

Ans : (c) Governing of I.C. Engine:- In order to have a high efficiency of an I.C. engine at different load conditions, its speed must be kept constant as far as possible. The process of providing any arrangement, which will keep the speed constant is known as governing of I.C Engines.

(i) The method of governing for a petrol engine is Quantity governing.
(ii) The method of governing for a diesel engine is Quality governing.

638. Consider the following emissions of an IC engine:

1. CO 2. Smoke Emissions
3. No_x 4. Particulate Matter
5. HC

Which of these emissions cause photochemical smog?

(a) 1 and 2 (b) 1, 2 and 3
(c) 2, 3 and 4 (d) 2, 3 and 5
(e) 3 and 5

UPPSC AE 12.04.2016 Paper-II
CGPSC AE 26.04.2015 SHIFT-II
ESE 1999

Ans. (e) : Nitrogen oxide (NO_x) , hydrocarbons, carbon monoxide, particulate matter, hydro fluorocarbon 134a, CH_4, and nitrous oxide emit by vehicles. but NO_x and HC emission cause photochemical smog.

639. Longitudinal distance between the centers of front and rear axles of an automotive vehicle is called as.....

(a) Wheel track (b) Wheel base
(c) Wheel over hang (d) None of these

GPSC Lect. 23.10.2016
RPSC AE 2016, RPSC ACF-2011

Ans. (b) : Wheel base is the horizontal distance between the centre of the front and rear wheels or distance between the centers of front and rear axles.

640. Engine pistons are usually made of aluminum alloy because it :

(a) Is lighter (b) Wears less
(c) Absorbs shocks (d) Is stronger

GWSSB DEE 07.07.2016
GWSSB AAE, 27.12.2015
J&K PSC Civil Services Pre, 2013

Ans. (a) : Aluminum alloy piston has high thermal conducting so less variation in temperature from the crown to piston ring. It is also less density therefore light weight construction and less inertia force.

641. The design of piston head is based on,

(a) strength and rigidity considerations
(b) bending and torsional moments
(c) buckling consideration
(d) strength and heat transfer considerations

RPSC Vice Principal ITI 2018
HPPSC Asstt. Prof. 20.11.2017

Ans. (d) : The piston head of an internal combustion engine was designed to withstand the cylinder pressure and dissipate the heat as quickly as possible. Therefore the thickness of piston head was determined based on two criteria, strength to withstand the cylinder pressure and heat dissipation.

Search on Telegram @apna_pdf

642. Which one of the following in-line engine working on a four stroke cycle is completely balanced inherently?

(a) 2 cylinder engine (b) 3 cylinder engine
(c) 4 cylinder engine (d) 6 cylinder engine

Assam PSC CCE Pre 2015
UKPSC AE-2013, Paper-I

Ans. (d) : In-line engine working on a four stroke cycle is completely balanced inherently 6 cylinder engine.

643. Which of the following set of material in most commonly used in catalytic converter is for CI engines?

(a) Platinum, Palladium and Rhodium
(b) Palladium, Rhodium and Ruthenium
(c) Rhodium, Ruthenium and Platinum
(d) Ruthenium, platinum and Palladium

MPPSC AE 2016, ESE 2008

Ans. : (a) Platinum, Palladium, and Rhodium set of materials in most commonly used in catalytic converters for CI engine.
Platinum, Rhodium for-NO_x elimination.
Platinum, Palladium for-CO, HC elimination.

644. In loop scavenging top of the piston is :

(a) Flat (b) Contoured
(c) Slanted (d) Depressed

Kerala PSC Poly. Lect. (Auto) 05.05.2016
TANGEDCO AE 2015

Ans. (b) : In loop scavenging top of the piston is contoured.

645. The most commonly used supplementary restraint system is

(a) Seat belt
(b) Disc brakes
(c) Air bags
(d) Telescopic steering column

TNPSC AE 2017, KPCL AE 2016

Ans. (c) : The most commonly used supplementary restraint system is Air bags.

646. The top ring nearest to the piston crown is known as:

(a) Compression ring (b) Oil ring
(c) Scrapper ring (d) Grove ring

RPSC ACF & FRO, 26.02.2021
TNPSC AE (Industries) 09.06.2013

Ans. (a) : The top ring nearest to the piston crown is known as compression rings.

647. Toe-in is adjusted by :

(a) Adding slims
(b) Changing the effective length of the tie rods
(c) Changing gear trains with crank
(d) None of the above

HPPSC Lect. (Auto) 23.04.2016
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) : Toe-in and Toe-out adjustment are made by screwing the track rod ball joint end up or down the track rods to alter their length. It is not possible to make totally accurate adjustments at home without proper wheel aligning equipment. Hence Toe-in is adjusted by changing the effectives length of the tie rod.

648. Purpose of using differential gear in automobile is to.

(a) Help in turning
(b) Control speed
(c) Avoid jerks
(d) Obtain rear movement

UPRVUNL AE 05.07.2021
ISRO Scientist/Engineer 2006

Ans. (a) : The purpose of differential gear on rear axle is to allow the back wheels on at different speed during turn and at same speed in straight motion. Because at turn the outer wheel moves faster than inner to cover more distance and inner wheel moves slow to cover less distance.

649. In automobiles Hooke's joint is used between which of the following?

(a) Clutch and gear box
(b) Differential and wheels
(c) Flywheel and clutch
(d) Gear box and differential

UPRVUNL AE 21.08.2016
TSPSC AEE 2015

Ans. : (d) In Automobiles, Hooke's Joint is used between gear box and differential.
Hooke's Joint – A hooke's joint is used to connect two shaft which are interesecting at a small angle
Application – The main application of the universal or Hooke's joint is found in the transmission from the gear box to the differential or back axle of the Automobiles.

650. A Gasoline engine running in a closed room is dangerous because the exhaust gas contains mainly

(a) Blue smoke (b) Water vapour
(c) Carbon monoxide (d) Air

TNPSC AE 2017, GPSC AE 26.07.2015

Ans. (c) : A Gasoline engine running in a closed room is dangerous because the exhaust gas contains mainly carbon monoxide.

651. The effective torque at the contact between road and driving wheel is known as :

(a) engine torque (b) friction power
(c) tractive effort (d) brake power

APPSC Poly Lect. Automobile Engg., 2020
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) : Tractive Effort– Tractive Effort is defined as the force at the rims or the outer edges of the driving wheels of the moving trains. In the other words it is the sum of the tractive force and rolling effort on the road surface.

652. The dynamo in an automobile :

(a) Converts mechanical energy into electrical energy
(b) Continually recharge the battery
(c) Acts as a reservoir of electrical energy
(d) Supplies electric power

RPSC AE 2016, RPSC ACF-2011

Ans. (a) : The dynamo in an automobile converts mechanical energy into electrical energy.

Search on Telegram @apna_pdf

653. An automobile moving at a velocity of 40 km/hr is experiencing a wind resistance of 2 kN. If the automobile is moving at a velocity of 50 km/hr, the power required to overcome the wind resistance is

(a) 43.4 kW (b) 3.125 kW
(c) 2.5 kW (d) 27.776 kW

UPPSC AE 13.12.2020, Paper-2
ISRO Scientist/Engineer 2006

Ans. (a) : Given,

$F_1 = 2$ kN

$v_1 = 40$ km/hr

$v_2 = 50$ km/hr

$$\text{Wind Resistance } (F) = \frac{1}{2} C_D \rho A v^2$$

$$F \propto v^2$$

$$\frac{F_1}{F_2} = \frac{v_1^2}{v_2^2}$$

$$\frac{2}{F_2} = \left(\frac{40}{50}\right)^2 \Rightarrow F_2 = 3.125\,\text{kN}$$

Power required, $P = F \times v$

$$= 3.125 \times 50 \times \frac{5}{18}$$

$P = 43.4$ kW

654. Precise petrol injection system is :

(a) Direct injection
(b) Sequential injection
(c) Throttle body injection
(d) Port injection

HPPSC W.S. Poly. 2016

Ans : (c) Precise petrol injection system is throttle body injection.
The injector or atomizer is also an important part of the diesel engine which breaks up the fuel and sprays into the cylinder into a very fine divided particles.

655. For premature ignition of any local hot-spot to occur in advance of the time spark on the combustion stroke it must attain a minimum temperature of something like

(a) 700-800ºC (b) 300-400ºC
(c) 400-500ºC (d) 900-1000ºC

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (a) : Pre-ignition is the ignition of the homogenous mixture in the cylinder, before the time ignition spark occurs, caused by the local overheating of the combustible mixture.
For pre-mature ignition of any local hot-spot to occur in advance of the timed spark on the combustion stroke, it must attain a minimum temperature of something like 700-800ºC

656. The float of a carburetor controls :

(a) Fuel flow rate
(b) Fuel and air mixture flow rate
(c) Air flow rate
(d) Level of fuel

BPSC Asstt. Prof. 29.11.2015

Ans. (d) : The float of a carburetor controls level of fuel in float (fuel) chamber.
The main function of carburetor to mix air and gasoline and provides a high combustion mixture. There are also addition function of carburetor.

- It controls the engine speed.
- It regulates the air-fuel ratio.
- It increases/decreases the amount of mixture according to the engine speed and load changing.

657. Dynamo in automobile is a :

(a) Series generator
(b) Shunt generator
(c) Either of series generator or shunt generator
(d) none of these

RPSC ADE 2016

Ans. (b) : Dynamo in automobile is a shunt generator dynamo convert mechanical energy into electrical energy.

658. The fins at the top of a motor cycle engine cylinder are longer than those at the bottom because:

(a) Hot air rises
(b) The top is the hottest part
(c) They are in an unexposed position
(d) Extra strength is required at the top

RPSC VPITI 14.02.2016

Ans. (b) : Longer fins provided on the top of motor cycle engine cylinder because the top of the engine is hottest part so that larger heat convection area can be provided.

659. The word "castor" in automobile is associated with which of the following:

(a) Transmission system
(b) Oils for automobile
(c) Front axle alignment
(d) Propeller shaft for power transmission

RPSC VPITI 14.02.2016

Ans. (c) : Castor angle is the angular displacement of the steering axis from the vertical axis of a steered wheel in a car, motor cycle, bicycle as seen from the side of the vehicle.
Caster causes a wheel to align with the direction of travel and can be accomplished either by caster displacement or caster angle.
Caster displacement moves the steering axis ahead of the axis of wheel rotation, caster angle moves the steering axis from vertical.

660. For cars, which is the most popular manual steering gear?

(a) Worm and nut type
(b) Worm and wheel type
(c) Cam and roller type
(d) Rack & pinion type

RPSC VPITI 14.02.2016

Ans. (d) : Many modern cars uses rack and pinion steering mechanism where the steering wheels turn on pinion gear. The pinion moves the rack. Which is linear gear that meshes with the pinion, converting circular motion into linear motion along the transverse axis of cars.

Search on Telegram @apna_pdf

661. The angle between the King-pin centre line and the vertical in the plane of the wheel is called :

(a) King –pin inclination (b) Caster angle
(c) Camber angle (d) Included angle

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (b) : King Pin Inclination–It is the angle between king pin centre line and vertical line when seen from the front of the vehicle. It is also called steering axle inclinator.

Caster Angle–Caster is the angle between the vertical line and king pin centre line in the plane of wheel when viewed from the side is called the caster angle.

Camber Angle–Camber is the angle at which wheel and the stored relative to the road-assuming it is perfectly flat.

Included Angle–It is sum of camber and S.A.I. (Steering axis inclination).

662. Which is the combination for following statements for suspension system?

(a)	Antiroll bar	(I)	High wheel wobbling
(b)	Independent suspension	(II)	High damping
(c)	Rigid axle suspension	(III)	Reduce rolling effect
(d)	Leaf spring	(IV)	High riding comfort

(a) (a-III), (b-II), (c-IV), (d-I)
(b) (a-III), (b-IV), (c-I), (d-II)
(c) (a-IV), (b-III), (c-II), (d-I)
(d) (a-IV), (b-III), (c-I), (d-II)

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II

Ans. (a) :

663. Maintenance that involves a system of periodic inspection and maintenance designed to keep a machine in operation is called.

(a) Preventive maintenance
(b) Total productive maintenance
(c) Predictive maintenance
(d) Breakdown maintenance

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (a) : Preventive maintenance is maintenance that is regularly performed on a piece of equipment to lessen the likelihood of it failing. It is performed while the equipment is still working so that it does not break down unexpectedly, to keep a machine in operation.

664. Condition for correct steering for a four-wheeler is:

(a) $\sin\phi - \sin\theta = \frac{W}{H}$

(b) $\tan\phi + \cot\theta = \frac{W}{H}$

(c) $\cot\phi - \cot\theta = \frac{W}{H}$

(d) $\cos\phi - \cos\theta = \frac{W}{H}$

Where W = wheel base : H = distance between the pivots of front axle, and ϕ, θ are angles through which axes of outer and inner wheels turn, respectively.

CGPSC AE 15.01.2021

Ans. (c) : Condition for correct steering for a four wheeler is

$$\boxed{\cot\phi - \cot\theta = \frac{W}{H}}$$

where, W = wheel base
H = distance b/w pivots of front axle
ϕ & θ are angles through which axes of outer and inner wheels turn respectively.

665. ……. type nozzle can be used in automobiles for converting the high pressure of fuel into velocity.

(a) Prandtl (b) Bezier
(c) Pintle (d) Ericsson

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : Types of Nozzle in IC engine
- Pintle nozzle
- Single hole nozzle
- Multi hole nozzle
- Pintaux nozzle.

Nozzle is that part of an injector through which the liquid fuel is sprayed into the combustion chamber. It is used in diesel engine in which fuel is drawn separately through injector of end of compression stroke and air is drawn into cylinder in suction stroke.

Hence pintle type nozzle can be used in automobiles for converting the high pressure of fuel into velocity.

666. The point at which the centre line of the wheel and the centre line of the ball joints cross is called the point of :

(a) Intersection (b) Aperture
(c) Cross-section (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : The point at which the centre line of the wheel and the centre line of the ball joints cross is called the point of intersection.

667. In order to facilitate starting of locomotive in any position, the cranks of a locomotive with two cylinders are placed at-

(a) 45° to each other (b) 90° to each other
(c) 120° to each other (d) 180° to each other

NPCIL ET, 2015

Ans. (b) : In order to facilitate starting of locomotive in any position, the cranks of a locomotive with two cylinders are placed at 90º to each other.

668. The choke in an automobile is meant for supplying

(a) Lean mixture
(b) Weak mixture
(c) Stoichiometric mixture
(d) Rich mixture

Assam PSC AE (PHED), 18.10.2020

Search on Telegram @apna_pdf

Ans. (d) : In an automobile engine such as in an internal combustion engine a choke valve modifies the air pressure in the intake manifold, thereby altering the ratio of fuel and air quantity entering the engine. Choke valves are generally used in naturally aspirated engines with carburetors to supply a richer fuel mixture at starting the engine.

669. The device used to capture fuel vapour from carburetor is

(a) Lambda sensor (b) Catalytic converter
(c) Canister (d) Scrubber

Assam PSC AE (PHED), 18.10.2020

Ans. (c) Canister- An activated carbon canister is used to capture hydrocarbon vapor emissions from the carburetor or fuel tank as part of an evaporative emission control system.

Lambda Sensor- An oxygen sensor is an electronic device that measures the proportion of oxygen in the gas or liquid being analysed.

Catalytic convertor- A catalytic converter is an exhaust emission control device that reduces toxic gases and pollutant in exhaust gas from an internal combustion engine into less toxic pollutant by catalyzing a Redox reaction.

Scrubber- Scrubbers comprise those devices in which a power driven rotor produces the fine spray and the contacting of gas and liquid. As in other types of scrubber, it is the droplets that are the principal collecting bodies for the dust particles.

670. Catalytic converters are used to convert____ through____ reaction at the exhaust of the engine.

(a) CO and HC; reduction
(b) CO_2 and H_2O; oxidation
(c) CO and HC; oxidation
(d) CO_2 and H_2O; reduction

Assam PSC AE (PHED), 18.10.2020

Ans. (c) : Catalytic converters are used to convert CO and HC through oxidation reaction at the exhaust of the engine.

671. The gearbox in automobile is placed between.

(a) Clutch and differential
(b) Steering and engine
(c) Engine and clutch
(d) Differential and Hooke's joint

Assam PSC AE (PHED), 18.10.2020

Ans. (c) : The main function of the clutch is to transmit the power from engine to the transmission system. The clutch is engaged when the vehicle is running.

The purpose of the gear box is to give means so that the torque can be varied as required between engine and the road wheels.

The gear box is placed between engine and clutch.

672. Gudgeon pin forms the link between

(a) Piston and big end of the connecting rod
(b) Piston and small end of the connecting rod
(c) Connecting rod and crank
(d) Big end and small end

Assam PSC AE (PHED), 18.10.2020

Ans. (b) : In internal combustion engine the gudgeon pin, wrist pin or piston pin connects the piston to the small end of the connecting rod to pivot upon as the piston moves.

A gudgeon is a pivot or journal.

673. Advantages of radial ply-tyres over cross ply-tyres is/are :

(a) Less rolling resistance
(b) Longer life
(c) Higher braking efficiency
(d) All of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : A radial ply tyre is a particular design of vehicular tyre. In this design the cord plies are arranged at 90° to the direction of travel or radially from the centre of tyre.

Advantage of radial ply tyres over cross ply tyres are :

1. Less rolling resistance.
2. Longer life
3. Higher breaking efficiency.
4. Reduced fuel consumption due to less rolling resistance.
5. Radial ply tyres provides good steering control because of the flexibility that the tyres often which results in better control of vehicle.

674. Aerodynamic drag caused by the wind resistance depends upon the :

(a) Shape of the vehicle
(b) Frontal area of the vehicle
(c) Air density and vehicle speed
(d) All of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Aerodynamic drag caused by the wind resistance depends upon the-

1. Shape of the vehicle
2. Frontal area of the vehicle
3. Air density and vehicle speed.

Factors that affect Drag of –

The object of – Shape and size

The motion of – Velocity and indination to flow.

The Air of – mass, viscosity, compressibility.

675. Full floating axle

(a) Transmit torque only
(b) Take side thrust and transmit torque
(c) Take weight of vehicle side thrust and transmit torque
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Full Floating Axle – A Full Floating axle consist of a wheel hub assemble that is separate from the axle shaft. A spindle bolted to the axle tube supports the wheel hub by means of a pair of wheel bearings Therefore, the weight of the vehicle and its cargo is transfered to the axle tube, rather than the axle shaft itself. As a result, a full floating axle shaft is not subjected to the bending moment or shear force. It's only task is to transmit power to the wheel hub. As a result, the shaft is only subjected to torsional loads.

Search on Telegram @apna_pdf

676. If the brake wheels gets locked before vehicle stops the vehicle is said to be :

(a) Skidding (b) Rolling
(c) Pitching (d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : If the brake wheels gets locked before vehicle stops the vehicle is said to be skidding.

677. What is a cause of brake disc run out; which happens for brakes employed in automotives? Choose most appropriate option :

(a) Ineffectiveness of the brakes
(b) Judder while braking
(c) Wearing of brake pads at restricted areas
(d) Quick wearing of brake pads.

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : Judder during braking is caused as a result of brake disc run out.

678. What is purpose of differential gear box?

(a) To control the speed and torque of the vehicle as per requirement
(b) To transfer the power from engine to front wheel.
(c) To allow each wheel to rotate independently each at its own speed so there will not "wind-up"
(d) It is equally applicable for straight roads as well as at the time turn for smooth power transmission.

GPSC Lect. (Auto) 16.10.2016

Ans. (c) : Differential gear, in automotive mechanics, gear arrangement that permits power from the engine to be transmitted to a pair of driving wheels, dividing the force equally between them but permitting them to follow paths of different lengths as when turning a corner or traversing an uneven road. On a straight road the wheels rotate at the same speed, when turning a corner the outside wheel has farther to go and will run faster than inner wheel.

679. For wheel alignment, which of the following parameters are most important ?

1. Camber
2. Steering axis inclination (SAI)
3. Toe
4. Caster

(a) Statement 1, 2, 3 and 4
(b) Statement 1 and 3
(c) Statement 1, 2 and 4
(d) Statement 1

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : For wheel alignments important parameters are –
1. Camber
2. Steering axis inclination (SAI)
3. Toe
4. Caster

680. Suspension systems have following primary functions.

(a) Isolate passengers and cargo from vibration and shock.
(b) Improve mobility and provides lateral and longitudinal stability and resists chassis roll.
(c) Provide the vehicle control
(d) All above options are correct.

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Primary Function of suspension systems-
1. Isolate passengers and cargo from vibration and shock.
2. Improve mobility and provides lateral and longitudinal stability and resist chassis roll.
3. Provide the vehicle control.

681. What are the factors affecting the rolling resisting of vehicle?

(a) Tyre material
(b) Flex side wall and contact area of the tyre
(c) Pressure in tyre may change inflation
(d) All above options are correct

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : Factors affecting rolling resistances of vehicle-
1. Tyre material
2. Tyre diameter, tyre width.
3. Flex side wall and contact area of the tyre.
4. Tyre construction, tyre thread
5. Tyre inflation pressure.

682. An ideal antilock braking system measures skid by:

(a) Measuring the difference between wheel speed and vehicle speed
(b) Differentiating vehicle speed with respect and vehicle speed
(c) Measuring crank shaft angular speed
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : An ideal antilock braking system (ABS) measures skid by measuring the difference between wheel speed and vehicle speed.
The function of anti-lock brake system (ABS) is that it maintains directional control during braking by preventing the wheels from locking.

683. Springing and damping on a vehicle are not responsible for

(a) Ride comfort and dynamic wheel load.
(b) Kinematic changes and elasto-kinematics of the wheels as they hung and jounce
(c) Direction change of the vehicle
(d) The tendency of the body to roll and pitch.

GPSC Lect. (Auto) 16.10.2016

Ans. (c) : Springing and damping suspension on a vehicle are responsible for :
1. Comfort ride and dynamic wheel
2. Kinematic changes and elasto kinematics of the wheels as they hung and jounce.
3. The tendency of the body to roll and pitch.
It is not responsible for direction change of vehicle.

Search on Telegram @apna_pdf

684. The distance between front of the front tyres and rear of the front tyre is called :

(a) Toe in or toe-out
(b) King pin inclination
(c) Camber angle
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : The distance between front of the front tyres and rear of the front tyre is called toe-in or toe-out.

685. Which is the odd option with respect to parameters affecting the engine heat transfer?

(a) Fuel air ratio, compression ratio
(b) Cam shaft and material of crank shaft
(c) Spark advance, pre-ignition and knocking
(d) Engine output, cylinder wall temperature

GPSC Lect. (Auto) 16.10.2016

Ans. (b) :

686. The wheel at a moving car posses?

(a) Potential energy
(b) Kinetic energy of translation and Rotation both
(c) Kinetic energy of translation
(d) Kinetic energy of rotation

GPSC Lect. (Auto) 16.10.2016

Ans. (b) : The wheel of a moving car posses kinetic energy of translation and Rotation both.

687. With which of the following engines term scavenging is associated ?

(a) Aero Engine
(b) Diesel Engine
(c) High efficiency engines
(d) None of these

J&K PSC Civil Services Pre, 2010

Ans. (c) : The term scavenging is generally associated with high efficiency engines. In automobiles, scavenging is a process of pushing exhaust gas out of the cylinder and drawing in fresh draught of air or air fuel mixture for the next cycle. The process is essential in having a smooth running of I.C. engine. If scavenging is incomplete of the following stroke will begin with mix of exhaust fumes rather than clean air. This may be insufficient for poor combustion which leading to poor running condition on an engine. Scavenging is equally important for both 2 strokes and 4-stroke engine, However, its more difficult to achieve in 2 stroke engine.

688. What is the purpose of a particulate trap?

(a) Filter the impurities, oxidize them and cleans the filter
(b) It is a three way catalyst which removes all the three pollutants simultaneously
(c) It is a single converter used to oxidize carbon monoxide and hydrocarbons
(d) It is a thin steel linear in a thermal reactor to minimize heat losses by thermally isolating the core

APPSC IOF, 2009

Ans. (a) : A DPF typically uses, a substrate made up of a ceramic material formed into a honey comb structure in order to reduce emissions from diesel vehicles and store exhaust soot, which must be periodically burned off to regenerate the filter.

689. Exhaust Gas Recirculation is integrated in automobiles in order to :

(a) Increase the NO_x emision
(b) Reduce exhaust temperature of flue gases
(c) Increase engine peak operating temperature
(d) Reduce engine peak operating temperature

KPSC ADF 2015

Ans. (d) : Exhaust gas Recirculation is integrated in automobiles in order to reduce engine peak operating temperature. The main advantage of exhaust gas recirculation is reduce the emission of NO_x.

690. What is the function of a shackle with a leaf spring?

(a) Control sideways.
(b) Allow spring to expand in length.
(c) Allow pivoting of spring end
(d) Articulated vehicle's

MPSC Dy. Engg. (GWD) 19.05.2013

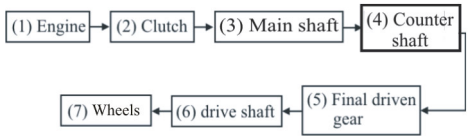
Ans. (b) : The-Shackle used in leaf spring to takes up the tendency to elongate or expand the leaf spring when compressed and support vehicles weight.

691. The correct flow of power through the driven train in automobile is.

(a) Engine-Driveshaft-Clutch-Mainshaft-Countershaft-Final driven gear-Wheels
(b) Engine-Clutch-Main Shaft-Countershaft-Final driven gear-Driveshaft-Wheels.
(c) Engine-Clutch-Countershaft-Main Shaft-Final driven gear-Driveshaft-Wheels.
(d) Engine-Main shaft-Countershaft-Clutch-Final driven gear-Driveshaft-Wheels.

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : Correct flow of power in Automobile –



692. Which of the following is not a defect of a chassis frame?

(a) Broken weld (b) Dislocated parts
(c) Cracks (d) Knock

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (d) : Defects of a chassis frame are –
(1) Broken weld
(2) dislocated parts
(3) cracks

693. Due to driving or braking efforts, a load is acting at the centre of the wheel called as.

(a) Fore and aft load (b) Vertical load.
(c) Side thrust (d) Shock load

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : Due to driving or braking efforts, a load is acting at centre of the wheel called as fore and aft load.

Search on Telegram @apna_pdf

694. Incorrect caster angle causes

a) Hard steering and develop a tendency to wander

b) Vehicle would pull to one side when the brakes are applied

c) Clutch fails to disengage

d) Excessive tension loss at engine operating temperature

Which of the above statements is /are correct.

(a) a only (b) a & b only

(c) a, b and c (d) All of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (b) : Incorrect caster angle causes-

(a) Hard steering and develop a tendency to wander

(b) Vehicle would pull to one side when the brakes are applied.

695. ….are used to connect leaf springs with the chassis frame.

(a) Spring shackles

(b) Torsion bars

(c) Helper springs.

(d) Rubber torsion units

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : Spring shackles are used to correct leaf spring with the chassis frame. It takes up the tendency to elongate the leaf spring when compressed and thus makes for soften springness.

696. As per Indian Automobiles engine specifications, small cars are considered…

(a) up to 1000 cc (b) 1000-2000 cc

(c) More than 2000 cc (d) None of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : As per Indian Automobiles engine specifications, small cars are considered up to 1000 cc.

697. The steering and braking systems of automobile are parts of

(a) Power plant of engine

(b) Basic structure of vehicle

(c) Control system of vehicle

(d) Accessories of vehicle

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : The steering and braking systems of automobile are parts of control system of vehicle.

698. The commonly used material for frame construction is …

(a) Cold rolled open hearth steel

(b) Brass

(c) Copper

(d) Hot rolled steel

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : The commonly used material for frame construction is cold rolled open hearth steel.

699. In cars, generally…. chassis is used.

(a) Full forward (b) Semi forward

(c) Central (d) Overhang

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : In cars, generally full forward chassis is used.

700. The Vahan and Sarathi are conceptualized to capture the functionality as mandated by which Act :

(a) Central Motor Vehicle Act, 1988

(b) Central Motor Vehicle Act, 1999

(c) Central Motor Vehicle Act, 1989

(d) None of the above

GPSC ARTO Pre 30.12.2018

Ans. (a) : The Vahan and Sarathi are conceptualized to capture the functionality as mandated under central Motor Vehicle Act, 1988.

701. Which rule has been amended to standardise the form and the manner in which registration numbers are displayed in the country :

(a) Central Motor Vehicle Act, 1988

(b) Central Motor Vehicle Act, 1999

(c) Central Motor Vehicle Act, 1989

(d) None of the above

GPSC ARTO Pre 30.12.2018

Ans. (c) : Central Motor Vehicle Rule, 1989 has been amended to standardise the form and the manner in which registration number are displayed in the country.

702. The basic requirement of a good combustion chamber is :

(a) Minimum turbulence

(b) Low compression ratio

(c) High thermal efficiency and power output.

(d) Low volumetric efficiency

Punjab PSC SDE 12.02.2017

Ans. (c) : The basic requirements of a good combustion chamber are to provide–

(i) High Power output

(ii) High thermal efficiency

(iii) Low specific fuel consumption

(iv) Smooth engine operation

(v) Reduced exhaust pollutants

703. What are Swirl flaps?

(a) They are small butterfly valves fitted to the intake manifold just before the cylinder head intake ports of modern automotive diesel engines

(b) They are small butterfly valves fitted to the intake manifold just before the cylinder head intake ports of modern automotive petrol engines

(c) They are small fuel injectors fitted to the intake manifold just before the cylinder head intake ports of modern steam engines

(d) None of these

KPCL AE 2016

Ans. (a) : Swirl flaps are small butterfly valves fitted to intake manifold just before the cylinder head, intake ports of modern automotive (Mazda, Audi, BMW, Vauxhall and Alfa Romeo) diesel engines.

704. Which of the following connects the steering rack to the knuckles in an automobile?

(a) Spindle (b) Tie rod

(c) Differential (d) None of these

KPCL AE 2016

Search on Telegram @apna_pdf

Ans. (b) : Tie rod ends are used to connect one steering rod to another steering rod or the steering knuckle. Basically the tie rod end is the ball socket with a threaded sleeve or rod attached. It is generally caused metal.

705. Which of the following type of joints the ball joints are used on the tie-rod ends, because they can deal with movement of suspension not only vertically but also in other direction?

(a) T-joints (b) Ball joints
(c) Straight joints (d) None of these

KPCL AE 2016

Ans. (b) : The ball joints are used on the tie rod ends because they can deal with movement of the suspension both vertically and in other directions.

706. The braking system that maintains directional control during braking is called_____

(a) Self locking braking system
(b) Skid locking braking system
(c) Anti locking braking system
(d) None of these

KPCL AE 2016

Ans. (c) : The function of anti-lock brake system (ABS) maintains directional control during braking by preventing the wheels from locking. An anti-lock braking system is safety anti-skid braking system used on aircraft and on land vehicles.

707. Which of the following is true with a V6 engine?

(a) It is more compact than the inline 4 and more compact than the V8 engine
(b) It is widely used as a transverse engine with front-wheel drive layout
(c) It has two banks of three cylinders each, set at either a 60 or 90 degree angle to each other
(d) All the above

KPCL AE 2016

Ans. (d) : V6 engine is more compact than the inline 4 and more compact than the V8 engine.

- Its widely used as a transverse engine with front-wheel drive layout.
- It has two banks of three cylinders each set at either a 60 or 90 degree angle to each other.

708. In an automobile "wheel base" is the distance between centre of the .....wheel to the centre of the .....wheel.

(a) Left front, left rear
(b) Left front, right rear
(c) Right front, left rear
(d) Left rear, right rear

HPPSC Asstt. Prof. 29.10.2016

Ans. (a) : A vehicle's wheel base is the distance between the centers of the front and rear wheels.

709. Which one of the following automobile exhaust gas pollutants is a major cause of photochemical smog?

(a) CO (b) HC
(c) NO_X (d) SO_X

HPPSC Asstt. Prof. 20.11.2017

Ans. (c) : NO_X pollutants is a major cause of photochemical smog.

710. A motor car moving at a certain speed takes a left turn in a curved path. If the engine rotates in the same direction as that of wheels, then due to the centrifugal forces :

(a) The reaction on the inner wheels increases and on the outer wheels decreases
(b) The reaction on the outer wheels increases and on the inner wheels decreases.
(c) The reaction on the front wheels increases and on the rear wheels decreases
(d) The reaction on the rear wheels increases and on the front wheels decreases.

HPPSC Asstt. Prof. 20.11.2017

Ans. (b) : Because centrifugal forces acts outward direction from the centre of the curved path (radially outward). So vehicle has the tendency to slightly tilt on outer side. So that the reaction on the outer wheels increases and on the inner wheels decreases.

711. Which one of the following does not form a part of the fuel supply system for a diesel engine?

(a) Supply pump (b) Filter
(c) Air Cleaner (d) Spray Nozzle

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (c) : Fuel Supply System in diesel engine is made of the following part are:-
(i) Diesel tank or reservoir.
(ii) Low pressure pump.
(iii) Filter.
(iv) Fuel injection pump.
(v) Fuel injection nozzle.

712. In the fuel injection pumps for diesel engines the effective pressure strokes of the plungers in the fuel injection pump are regulated by means of a

(a) Fuel pump (b) Control Rack
(c) Needle valve (d) Cam shaft

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b): In fuel injection pumps for diesel engines the effective pressure strokes of the plungers in the fuel injections pump are regulated. By means of a control rack.

713. Worn out carburetor jets are likely to cause

(a) Excess engine output
(b) Excess fuel consumption
(c) More noise
(d) Knocking

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : Worn out carburetor jets are likely to cause excess fuel consumption, responsible & effect on engine performance. Black smoke from exhaust are comes out, back firing or overheating in the carburetor arises.

714. Automobile radiator is filled with

(a) Alkaline water (b) Acidic water
(c) Hard water (d) Soft water

Nagaland PSC CTSE 2017, 2016 Paper-II

Search on Telegram @apna_pdf

Ans. (d) : Automobile radiator is filled with soft water. (mixture of 60% coolant and 40% water)

715. The function of automobile catalytic converter is to control emissions of

(a) Carbon dioxide and hydrogen
(b) Carbon monoxide and hydrogen
(c) Carbon monoxide and carbon dioxide
(d) Carbon monoxide and nitrogen dioxide

Nagaland PSC (CTSE) 2016, Paper-II

Ans. (d) : A catalytic converter is an exhaust emission control device that reduces toxic gases and pollutants in exhaust gas from an internal combustion engine into less-toxic pollutant by catalyzing a redo reaction (an oxidation and control and a reduction reaction). Example to convert carbon monoxide, hydrocarbons and NO_x (NO_2/NO).

716. An automobile heats up while lying in a parking lot on a sunny day. The process can be assumed to be

(a) Isothermal (b) Isobaric
(c) Isometric (d) Isentropic

Nagaland PSC CTSE 2015 Paper-II

Ans. (b) : An automobile heats up while lying in a parking lot on a sunny day. The process can be assumed to be isobaric.
As we know that heat from sun in the mode of radiative nature and adds up to the car, due to which temperature as well as pressure both.

717. Rubber-tired mountings are not useful where.

(a) Onsite and job to job mobility is important
(b) Rocky and hard surface
(c) Speed of movement is important
(d) High moisture /wet surface

MPSC Dy. Engineer 2014

Ans. (d) : Rubber tired mountings are not useful where high moistured surfaces are present.
Extremely humid conditions should be avoided. Humidity in store room air must not be so high that condensation occurs on tyres must not be stored where they are exposed to rain, splashes etc.

718. Where is the Hooke's joint used in an automobile?

(a) Between gearbox and propeller shaft
(b) Between flywheel and clutch
(c) Between differential gear and wheel
(d) Between clutch and gear box

Kerala PSC AE 06.08.2015

Ans. (a) : Hooke's joint – It is also known as universal gear box and propeller shaft.
Hooke's joints whose axes are inclined to each other, and is commonly used in shaft that transmit rotary motion.

719. A differential gear in an automobile is :

(a) Simple gear train
(b) Epicyclic gear train
(c) Compound gear train
(d) None of these

Kerala PSC AE 06.08.2015

Ans. (b) : A differential gear in automobile is a epycyclic gear train.
The epycyclic gear train are effect for transmitting high velocity ratio with gears of moderate size in a comparatively lesser space. The epicyclic gear train used in the back gear of lathe, differential gear of the automobiles, hoists, pulley blocks, wrist watch etc.

720. The ratio between the width of the front axle and that of the wheel base of a steering mechanism is 0.3. At the instance when the front inner wheel is turned by 15°, the angle by which the outer front wheel will turn for perfect steering is:

(a) 13.9° (b) 15.9°
(c) 14.9° (d) 12.9°

AAI Jr. Executive 29.11.2018

Ans. (a) : Given,

$\text{Ratio} = \frac{w}{l} = 0.3$, $\theta_{inner} = 15^0$

According to Ackerman condition

$$\cot\theta_{outer} - \cot\theta_{inner} = \frac{w}{l}$$

$$\cot\theta_{outer} - \cot 15^0 = 0.3$$

$$\cot\theta_{outer} = 0.3 + \cos 15^0 = 0.3 + 3.732$$

$$\cot\theta_{outer} = 4.032$$

$$\theta_{outer} = 13.92^0$$

721. Wankel engine operates by transferring..... motion.

(a) Rotary (b) Translation
(c) Eccentric (d) Linear

HPPSC AE (PWD) 10.09.2016

Ans. (a) : The wankel engine is a type of internal combustion engine using an eccentric rotary design to convert pressure into rotating motion compared to the reciprocating piston engine the wankel engine has more uniform torque and less vibration and for a given power is more compact and weight less.

722. Power impulses from an I.C. engine are smoothed out by

(a) Governor (b) Crank shaft
(c) Gear Box (d) Flywheel

GPSC AE 26.07.2015

Ans. (d) : Power impulses from an I.C. engine are smoothed out by flywheel.

723. The ratio of air rotational speed to crankshaft rotational speed is :

(a) Swirl Ratio (b) Speed ratio
(c) Turbulence Ratio (d) Compression ration

TNPSC AE (Industries) 09.06.2013

Ans. (a) : The ratio of air rotational speed to crankshaft rotational speed is swirl ratio.

724. What is the main objectives for engine control?

(a) Users demand for precise controls
(b) The automotive industry's need to do creative research for sustainable development.

Search on Telegram @apna_pdf

(c) Government regulation concerning emissions and fuel economy
(d) None of the above.

GPSC Lect. (Auto) 16.10.2016

Ans. (c) : The main objectives for engine control, is government regulations concerning emissions and fuel economy .
From the emission perspective, the goal of the engine control system is to provide the demanded quantity of fuel air, and EGR (if only) at the required time and in the required temperature and pressure state.
EGR – Exhaust gas recirculation.

725. In the present day racing cars ….. arrangement is preferred
(a) Central engine
(b) Rear engine rear wheel/drive
(c) Front engine from wheel drive
(d) Articulated vehicle's

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : In the present day racing cars central engine arrangement is preferred.

726. The angle of inclination of the front wheel tyre with respect to the vertical plane is
(a) Caster (b) Camber
(c) Wheel track (d) Toe-out

TNPSC AE 2017

Ans. (b) : The angle of inclination of the front wheel tyre with respect to the vertical plane is Camber.

727. In constant speed test, the vehicle is driven with
(a) Constant speed at various steer angle
(b) Constant speed at constant steer angle
(c) Constant speed at various turing radii
(d) Constant speed at constant steer angle with constant radius

TNPSC AE 2017

Ans. (c) : In constant speed test, the vehicle is driven with Constant speed at various turing radii.

728. Choose one feature that improves the forward visibility of a vehicle.
(a) Brake light (b) Hazard lights
(c) Turn indicators (d) Cornering head light

TNPSC AE 2017

Ans. (d) : Cornering head light that improves the forward visibility of a vehicle.

729. Which type of bus is more suited for the following features?
Engine is front of passenger compartment
Low ratio of useful length to overall length
Poor aerodynamic shape and high tyre weight
(a) Classic type bus (b) Double ducker bus
(c) Split level bus (d) Articulated bus

TNPSC AE 2017

Ans. (a) : Classic type bus

730. In work cell control checking the continuation of work cycle is known as
(a) Interlock (b) Bottleneck
(c) Automatic lock (d) Check point

TNPSC AE 2018

Ans. (a) : In work cell control checking the continuation of work cycle is known as interlock.

731. Which of the following chasis layout is fitted with transfer case?
(a) Front engine - Front wheel drive
(b) Rear engine - Rear wheel drive
(c) Front engine - All wheel drive
(d) Front engine - Rear wheel drive

TNPSC AE 2017

Ans. (c) : Front engine - all wheel drive chasis layout is fitted with transfer case.

732. The slots or openings in a disc wheel enhances
(a) Vehicle body cooling
(b) Passenger compartment cooling
(c) Engine - Radiator cooling
(d) Brake system cooling

TNPSC AE 2017

Ans. (d) : The slots or openings in a disc wheel enhances brake system cooling.

733. Air brakes are mostly used in case of
(a) Cars (b) Jeeps
(c) Trucks (d) Three-wheelers

TNPSC AE 2017

Ans. (c) : Air brakes are mostly used in case of trucks.

734. The purpose of preventive maintenance is to
(a) Help schedule breakdowns
(b) Eliminate routine service work
(c) Force the driver to use his own service station
(d) Help prevent failure

TNPSC AE 2017

Ans. (d) : The purpose of preventive maintenance is to help prevent failure.

735. Service specifications are set by the
(a) Vehicle manufacturer
(b) Technician
(c) Service manager
(d) Society of Automotive Engineers

TNPSC AE 2017

Ans. (a) : Service specifications are set by the Vehicle manufacturer.

736. Which of the following is not a part of the vehicle chassis?
(a) Wheels (b) Front axle
(c) Steering system (d) Seats

TSPSC AEE 2015

Ans : (d) Seats is not a part of the vehicles chassis.

737. The basic function of the suspension in an automobile is to
(a) Absorb vibration and impact forces from the road surface
(b) Automatically correct the effect of over steering
(c) Ensure that the wheel alignment is not disturbed during driving
(d) Ensure that the steering wheel can deliver a suitable amount of steering force

TSPSC AEE 2015

Ans : (a) The basic function of the suspension is an automobile is to absorb vibration and impact forces from the road surface.

Search on Telegram @apna_pdf

738. Gearbox is produced by–
(a) Design by drawing
(b) Design by craft evolution
(c) Design synthesis
(d) Simultaneous design

Nagaland CTSE 2017 Ist Paper

Ans. (a) : Gearbox is produced by design by drawing.

739. Modern automobile car is produced by–
(a) Sequential design
(b) Design by craft evolution
(c) Design synthesis
(d) Simultaneous design

Nagaland CTSE 2017 Ist Paper

Ans. (d) : Modern automobile car is produced by "simultaneous design".

740. In a test to determine braking efficiency of a vehicle weighing 1200 kg is placed on a brake testing machine. The brake tester shows the following reading. Front right : 2120 N; Front left 2080 N; Rear Right. : 1490 N; Rear left : 1510 N; Then the braking efficiency is
(a) 50% (b) 60%
(c) 70% (d) 80%

TNPSC AE 2017

Ans. (b) : 60%

741. Crankshaft journals should be reground if they are tapered or out of round by more than
(a) 0.0076mm (b) 0.025mm
(c) 0.25mm (d) 0.76mm
(e) 0.076mm

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : Crankshft journals should be reground if they are tapered or out of round by more than 0.025 mm.

742. The tyre is designated as "175/65 R14 82s", then the load index for the tyre is
(a) 175 (b) 65
(c) 14 (d) 82

TNPSC AE 2017

Ans. (d) : "175/65 R14 82s" tyre 175 is the width of the contact path or the area of the tyre that touches the ground, 65 is the profile of the tyre or the distance between the inner and outer circle of the tyre, both of these are in millimeters, while, R 14 is the diameter of the wheel or the inner circle of the tyre, it means, in this case, the tyre has an inner diameter of 14 inches and the load index for the tyre is 82.

743. Metallic noise in torque converter is due to-
(a) Seal leakage in torque converter
(b) Spring of outlet relief valve being too weak
(c) Loose stator blades.
(d) Screen in scavenge line not open.

MPSC Dy. Engineer 2014

Ans. (c) : Metallic noise in torque converter is due to loose stator blades.

744. A leaf spring in automobiles is used
(a) to apply forces
(b) to measure forces
(c) to absorb shocks
(d) to store strain energy

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (c) :

745. The magneto in an automobile is basically :
(a) Transformer (b) D.C. generator
(c) Magnetic circuit (d) A.C. generator

(HPPSC AE 2014)

Ans : (b) The magneto in an automobile is basically D.C. generator

Magneto Ignition system:- The magneto ignition system has the same principle of working as that of coil ignition system, except that no battery is required as the magneto acts as its own generator.

It consists of either rotating magnets in fixed coils, or rotating coils in fixed magnets. The current produced by the magneto is made to flow to the induction coil which works in the same way as that of coil ignition system. The high voltage current is then made to flow to the distributor, which connects the sparking plugs in rotation depending upon the firing order of the engine.

This type of ignition system is generally employed in small spark ignition engines such as scooters, motor cycle and small motor boat engine.

746. In a metal-shell type ignition coil. the core is wound with
(a) Primary winding
(b) Secondary winding
(c) Primary and secondary winding together
(d) None of the above

WBPSC AE, 2007

Ans. (c) :

747. Nipping of leaf springs in a vehicle is to :
(a) vary the interleaf sliding
(b) increase the load carrying capacity
(c) keep stresses uniform in the springs
(d) vary the effective length of spring

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : One of the methods of equalizing the stresses in different leaves is to pre-stress the spring. The initial gap between the extra full length leaf and the graduate-length before the assembly is called a nip. Such pre-stressing achieved by a difference in raddi of curvature is known as nipping.

748. Which of the following is a part of chassis?
(a) Doors (b) Differential
(c) Brakes (d) Wind shields

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : Part of chassis are like, wheels, front axle steering system, brakes.

749. Which of the following is NOT an arrangement pattern of an IC engine cylinder?
(a) Opposed cylinder engine
(b) Radial
(c) V-type engine
(d) Circular

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Cylinder arrangement– Vertical, Horizontal, Inline, V-type radial, opposed cylinder or piston engines.

Volve or port design and location overhead in two stroke engine, cross scavenging, loop scavenging, uniflow scavenging.

Search on Telegram @apna_pdf

750. The speed of a vehicle is 'S' in km/hr and the wheel radius is 'R'. Then the rpm of the wheel is :

(a) $S/(120\pi R)$ (b) $1000S/(120\pi R)$
(c) $1000S/(2\pi R)$ (d) $1000S/(60\pi R)$

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : The speed of a vehicle is 'S' in km/hr and wheel radius is R then the RPM

$$RPM = \frac{1000S}{120\pi R}$$

751. In an automobile pneumatic governor, the amount of vacuum applied to the diaphragm is controlled by the :

(a) spring (b) lever
(c) accelerator pedal (d) butterfly valve

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : The accelerator is also known as gas pedal. It is the pedal located on the floor or the far-right. This pedal controls the amount of gas being fed into the engine and thereby controls the speed of the vehicle. In an automobile pneumatic governor, the amount of vacuum applied to the diaphragm is controlled by the accelerator pedal.

752. A condition that causes vapour locking in a braking system is due to :

(a) overcooling of the brakes during high speed driving
(b) keeping the vehicle without use for an extended period
(c) an excessively high engine speed on a downhill road
(d) overheating of the fluid due to frequent brake application

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Vapour locking in a brake system is overheating of the fluid due to frequent brake application.

753. The material used for gas-filled cartridge in a car bumper is :

(a) aluminium (b) HDPE
(c) LDPE (d) steel

APPSC Poly Lect. Automobile Engg., 2020

Ans. (b) : HDPE stands for high density poly ethylene is a thermoplastic polymer made from petroleum. As one of the most versatile plastic material around HDPE plastic is used in a wide variety of applications including plastic, bottles, milk jugs shampoo bottles, bleach bottles, cutting boards and piping.

754. In front wheel drive vehicles, which type of axle is used to transmit power from the drive shaft to wheels?

(a) Real drive axle
(b) Dead axle
(c) Front drive axle
(d) One piece axle housing

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : Front wheel drive axles, also called axle shafts or front drive shaft, transfer power from the transaxle differential to the Hub and Wheel of a vehicle. Front wheel drive axles turn much slower than a drive shaft for a rear-wheel drive vehicle, universal joints that connect the drive axle are called CV joint.

755. Which component is located between the axles which permits wheel fitted on one axle to turn at a different speed from that of the other wheel fitted on the another axle during power transmission through shaft in heavy vehicles?

(a) Universal joint (b) Journal bearing
(c) Differential gear (d) Rack and pinion

APPSC Poly Lect. Automobile Engg., 2020

Ans. (c) : Differential gear component is located between the axles which permits wheel fitted on one axle to turn at a differential speed from that of the outer wheel fitted on the another axle during power transmission through the shaft in heavy vehicles.
Differential gear in automotive mechanics gear arrangement that permit power from the engine to be transmitted to a pair of driving wheels dividing the force equally between them but permitting them to follow paths of different lengths as when turning a corner or traversing an uneven load.

756. Why are hydraulic and electric brakes usually used only in heavy vehicles such as locomotives and heavy trucks?

(a) They are complex in design
(b) They are very costly to operate
(c) These brakes are so strong that vehicles stop suddenly and the chance of an accident in light vehicles is high if used
(d) These brakes are only used when large amount of energy is required to retard the speed of the vehicles and it takes time to stop the vehicle

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Hydraulic and electric brakes usually used only in heavy vehicles such as locomotives heavy trucks these brakes are only used when the large amount of energy is required to retard the speed of the vehicles and it takes time to stop the vehicle.

757. In an automobile, choke is applied for

(a) increasing speed
(b) fuel economy
(c) starting in cold weather
(d) starting in hot weather

GPSC ARTO 01.05.2016

Ans. (c) : Fact is that fuel in the engine is cold when the engine is first started and in order to heat it up, a fuel and air mixture is required, and that's what a choke is designed to do.

758. Which of the following is a type of chassis of an automobile?

(a) Semiforward (b) Centrifugal
(c) Steering (d) Wind
(e) Automatic

CGPSC ARTO & TSI 07.01.2017

Search on Telegram @apna_pdf

Ans. (a) : Chassis is the main support structure of the vehicle which is also known as frame. It bears all the stresses on the vehicle in both static and dynamic condition.
Semi Forward Control chassis :-
In which engine is mounted that half of it is in the driver's cabin where as the other half is in front, outside the driver's cabin.
Eg- Tata SE series of vehicles.
Full forward control chassis :-
- In which engine is mounted completely inside the driver's cabin
- Maximum utilization of space is achieved.

Eg - Tata E series of vehicle.

759. Cylinder block construction by mono block is preferred to individual engine construction because of :
(a) Compact engine size
(b) Stiff and combined structure
(c) Easy manufacturing operations
(d) All of the above
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) • Compact engine size
• Stiff and combined structure
• Easy manufacturing operations

760. In the transmission system provision of slip joints allows a change in the :
(a) Angle of shaft
(b) Length of shaft
(c) Speed of rotation
(d) Amount of power transmission
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) In the transmission system provision of slip joints allows a change in the length of shaft.

761. The most effective section to build chassis frame against bending is :
(a) Rectangular bar
(b) Round Hollow tube
(c) Square hollow section
(d) Round bar
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) The most effective section to build chassis frame against bending is square hollow section.

762. An under inflated tyre will wear the tread most:
(a) Near the centre
(b) In the cross section direction
(c) In the lateral direction
(d) Near the edges
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) An under inflated tyre will wear the tread most near the edges.

763. Trafficators are light singal used for :
(a) Indicating the direction in which turning
(b) Light traffic
(c) Reversing the car in traffic
(d) Heavy Traffic
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) Trafficators are light singal used for indicating the direction in which turning.

764. The term ply rating with reference to a tyre refers to the :
(a) Actual number of plies
(b) Recommended inflation pressure
(c) Rated strength
(d) Aspect ratio
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) Rated strength

765. In the recirculating ball type steering gear, the balls travel between the ball nut and the :
(a) Gear rack (b) Worm wheel
(c) Steering wheel shaft (d) Worm shaft
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) Worm shaft

766. The included angle in steering geometry is the sum of the :
(a) Camber and caster
(b) Caster and Steering axis inclination
(c) Camber and Steering axis inclination
(d) Camber and toe-in
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) : The included angle in steering geometry is the sum of the camber and Steering axis inclination.

767. Valve overlap is the number of degrees of camshaft rotation during which
(a) Both valves are closed
(b) Both valves are open
(c) Both (A) and (B)
(d) All of the above
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) : Both valves are open

768. In vehicles with till steering, the steering column is pivoted in :
(a) Upper bracket (b) Lower bracket
(c) Tile bracket (d) Steering yoke joint
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (d) : In vehicles with till steering, the steering column is pivoted in steering yoke joint.

769. The caster is called as positive when the top of the kingpin is inclined to the :
(a) Rear of the wheel (b) Front of the wheel
(c) Left of the wheel (d) Right of the wheel
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) : The caster is called as positive when the top of the kingpin is inclined to the rear of the wheel.

770. The vehicle ride will be comfortable if :
(a) Unsprung weight is kept minimum
(b) Sprung weight is kept minimum
(c) Vehicle weight is kept minimum
(d) All of the above
Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (a) : The vehicle ride will be comfortable if unsprung weight is kept minimum.

Search on Telegram @apna_pdf

771. The most commonly used cranking motor drive is:

(a) Barrel type
(b) Bendix drive
(c) Friction clutch drive
(d) Over running clutch

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (b) The most commonly used cranking motor drive is bendix drive.

772. Tractive effort in an automobile is maximum in

(a) first gear (b) second gear
(c) third gear (d) top gear

APPSC AEE 2012

Ans. (a) : Tractive effort is defined as the force at the rims or the outer edges of the driving wheels of moving trains. The maximum allowable tractive effort that can be applied without wheel slip is $f_m = 9.81\mu M_t N$ f_{max} at the first gear,
Where,
μ = co-efficient of adhesion

773. 'Ladder Frame' is an example for _____.

(a) supports of machine tool
(b) chassis of automobile
(c) suspension
(d) roof

HPPSC Workshop Suptd. 08.07.02021

Ans. (b) : 'Ladder Frame' is an example for chassis of automobile.

774. Which aspect is not correct in the context of manual transmission; conventionally called gear boxes ?

(a) lot of fatigue to driver in operation
(b) simplicity of design
(c) low initial cost
(d) high friction losses

HPPSC Poly. Lect. 05.07.2021

Ans. (d) : high friction losses

775. The automobile gears are generally made of

(a) mild steel (b) alloy steel
(c) cast steel (d) cast iron

HPPSC Poly. Lect. 05.07.2021

Ans. (b) : alloy steel

776. A brake commonly used in motor cars is

(a) shoe brake
(b) band brake
(c) band and block brake
(d) internal expanding brake

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (d) : The internal expanding type of brake is commonly used in motor car and light trucks. When the break are applied to all the four wheels, the braking distance in which the vehicle is brought to rest after applying the break will be the least.

777. Identify the correct order of classification of Internal Combustion Engines :

(a) Reciprocating type, internal Combustion Engine, non-reciprocating type
(b) Reciprocating type, external combustion engine, Non-reciprocating Type
(c) SI Engine, CI Engine, internal combustion engine
(d) Internal combustion engine, reciprocating type, non-reciprocating type

TNPSC AE, 2008

Ans. (d) : Internal combustion engine, reciprocating type, non-reciprocating type.

778. The specific gravity of the completely discharged battery is of order of

(a) 1.11 to 1.14 (b) 1.26 to 1.299
(c) 1.17 to 1.205 (d) 1.205 to 1.235

GPSC AE 26.07.2015

Ans. (a) : The specific gravity of the completely discharged battery is of order of 1.11 to 1.14

779. In a fire hazard area, prime mover used is :

(a) Petrol engine (b) Diesel Engine
(c) Air motor (d) All of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : In a fire hazard area, prime mover used is Air motor.

780. The purpose of large spring loaded valve in a radiator cap is to:

(a) Lower temperature at which the coolant boils
(b) Prevent the coolant escaping when it boils
(c) Reduce the risk of the rubber hoses collapsing when the pressure is low
(d) Pressurize the system which raises the boiling point of the coolant

RPSC VPITI 14.02.2016

Ans. (*) : No answer is given by commission.

781. Flat head engines are also known as ….. engine.

(a) G-Head (b) O-Head
(c) L-Head (d) Z-Head

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : A flat head engine also known as a side valve engine or valve in block engine is an internal combustion engine with its poppet valve contained with the engine valve, instead of in the cylinder head as in an overhead valve engine.
The advantages of a side valve engine include, simplicity, reliability, low part count, low cost, low weight, compactness, responsive low-speed power, low mechanical engine noise and insensitivity to low octane fuel. As the cylinder cross-section has the shake of an inverted 'L' other name such as L-block or L-head engine.

782. The ignition coil in an auto mobile acts as a

(a) Rectifier
(b) Switch
(c) Step up transformer
(d) DC to AC converter

WBPSC AE 2003

Search on Telegram @apna_pdf

Ans. (c) : The ignition coil in an auto mobile acts as a step up transformer.
Ignition coil is an induction coil in an automobiles ignition system that transforms the battery's voltage to the thousands of volts which are needed to create an electric spark in spark plugs to ignite the fuel.

783. The silencer of internal combustion engine :
(a) Reduces noise
(b) Decrease break specific fuel consumption
(c) Increase break specific fuel consumption
(d) Has no effect on its efficiency

HPPSC Asstt. Prof. 18.11.2016

Ans. (a) : Muffler, also called silencer, device through which the exhaust gases from an internal combustion engine are passed to attenuate (reduce) the airborne noise of the engine.

784. Aneroid is a device
(a) For cold starting
(b) For controlling emission
(c) For decompression
(d) None of the above

WBPSC AE, 2007

Ans. (b) : For controlling emission

785. Piston in IC Engine is usually made of
(a) Copper alloy (b) Tungsten alloy
(c) Nickel alloy (d) Aluminium alloy

Gujarat PSC AE 2019

Ans. : (d) : Piston in IC engine is usually made of aluminium alloy because it is lighter aluminium alloy. Commonly used materials for IC engine piston are cast iron, cast steel, forged steel, cast aluminium alloys and forged aluminium alloy. Advantages of aluminium over cast iron high thermal conductivity.

786. Piston pins are usually either a press fit in the rod or:
(a) locked to the rod with a bolt
(b) free floating in the rod and piston
(c) locked to the piston with a bolt
(d) a press fit in the piston

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (d) : The small end attaches to the piston pin or wrist pin, which is currently most often press fit into the con rod but can swivel in piston, a floating wrist pin design.

787. A Jerk pump used for fuel injection system is
(a) Vane type (b) Rotary type
(c) Reciprocating type (d) None of the above

UKPSC AE 2007 Paper -II

Ans. (c) : Reciprocating type

788. The elements of most concern in regard to pollution caused by engines are :
(a) CO and CO_2
(b) CO and hydrocarbons
(c) CO_2 and hydrocarbons
(d) hot products of combustion

J&K PSC Civil Services Pre, 2013

Ans. (b) : Major pollutant from motor vehicle.
(a) Volatile organic compounds
(b) Carbon monoxide (CO)
(c) Nitrogen oxides (NO_X)
(d) sulphur dioxide (SO_2)
(e) Green house gases
(f) lead
(g) hydro carbons (HC)

789. Consider the following:
1. Catalytic convertor
2. Use of high compression ratio
3. Oxidation catalyst in the exhaust manifold
4. Use of high degree of supercharger
By which of these techniques, can the oxides of nitrogen in the exhaust be controlled?
(a) 1 only (b) 2 and 4 only
(c) 2, 3 and 4 only (d) 1, 2, 3 and 4

RPSC Lect. (Tech. Edu. Dept.) 2011

Ans. (a) : Catalytic converters change harmful substances in a car's exhaust gases such as carbon monoxide, Nitric oxide, Nitrogen dioxide and hydrocarbons, into less harmful substances like CO_2 and water.

790. In emission measuring equipments, the HC is measured using
(a) Gas Chromatograph
(b) Flame Ionization Detector
(c) Chemiluminescence Detector
(d) NDIR Analyzer
(e) HFFR Test Rig

CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : With the help of Flame Ionization Detector, the HC is measured in emission.

791. Rhodium in the catalytic converter promotes the reduction of
(a) HC (b) CO
(c) NO_x (d) Smoke

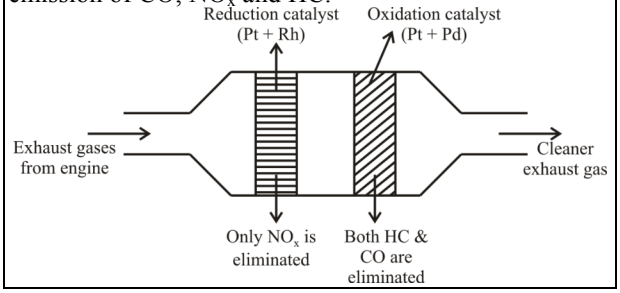
TNPSC AE 2017

Ans. (c) : Rhodium is the catalytic convertor promotes the reduction of NO_x.

792. Three way catalytic converters reduce the emission of
(a) CO, CO_2 and soot (b) CO, NO_x and HC
(c) CO_2, NO_x and HC (d) CO, HC and soot

TNPSC AE 2017

Ans. (b) : Three way catalytic converters reduce the emission of CO, NO_x and HC.



793. NO_x emission is maximum in S.I. engines when the air fuel ratio is
(a) Exactly stoichiometric
(b) Lean mixture
(c) Rich mixture
(d) Nearby stoichiometric

TNPSC AE 2017

Search on Telegram @apna_pdf

Ans. (d) : NO_x emission is maximum in S.I. engines when the air fuel ratio is nearby stoichiometric.

794. Reducing the compression ratio of an engine reduces the combustion temperature, and this
(a) Reduces the amount of NO_x formed
(b) Increases the amount of NO_x formed
(c) Reduces the amount of HC formed
(d) Increases the amount of H_2O formed

TNPSC AE 2017

Ans. (a) : Reducing the compression ratio of an engine reduces the combustion temperature, and this reduces the amount of NO_x formed.

795. The function of the air aspirator system is
(a) Furnishes the addition air for reduce HC and NO_x emission
(b) Furnishes the addition air for reduce HC and CO emission
(c) Furnishes the addition air for reduce HC and CO but increase of NO_x
(d) Furnishes the addition air for increase of HC and reduce CO and NO_x

TNPSC AE 2017

Ans. (b) : The function of the air aspirator system is Furnishes the addition air for reduce HC and CO emission.

796. NO_x emission in SI engines will be lowest during
(a) Acceleration (b) Deceleration
(c) Cruising (d) Idling

TNPSC AE 2017

Ans. (d) : During idling NO_x emission in SI engines will be lowest.

797. The important requirement of a catalytic convertor is
(a) High surface area and low volume heat capacity
(b) Low surface area and low volume heat capacity
(c) High surface area and high volume heat capacity
(d) Low surface area and high volume heat capacity

TNPSC AE 2017

Ans. (a) : The important requirement of a catalytic convertor is High surface area and low volume heat capacity

798. The capacity of battery is expressed in terms of:
(a) Current rating (b) Voltage rating
(c) Ampere-hour-rating (d) None of the above

Kerala PSC Poly. Lect. (Auto) 05.05.2016

Ans. (c) Battery capacity is measured in milliampere × hours (MAH)

799. MPFI used in automobile engines stands for
(a) Multipoint Petrol Flow Injector
(b) Micro Point Fuel Injector
(c) Multi Point Fuel Injector
(d) Micro Point Flow Injector

HPPSC Workshop Suptd. 08.07.02021

Ans. (c) : Multi Point Fuel Injector

800. Carbon monoxide and Cabron-di-oxide emissions can be measured using.
(a) Infra red method
(b) Chemiluminescent method
(c) Flame ionization method
(d) Ultra violet method

TANGEDCO AE 2015

Ans. (a) : Infrared method are used for measuring carbon monoxide and carbon-di-oxide emission from internal combustion engine.

801. Consider the following probable causes of sticking injection plunger in a shovel.
(a) Improper injection adjustment
(b) Plugged injection spray hole
(c) Incorrect valve and injection timing
(d) Water in the fuel
Which of the following is correct?
(a) a and b (b) a, b and c
(c) c and d (d) d and a

MPSC Dy. Engineer 2014

Ans. (d) : The cause of sticking injection plunger in a shovel–
(1) Improper injection adjustment.
(2) Water in the fuel.

802. The valve of a CI engine nozzle has a cylindrical or conical projection protruding through the mouth of the nozzle and the nozzle body has an auxiliary hole. What is this type of nozzle called?
(a) Multihole nozzle (b) Pintle nozzle
(c) Pintaux nozzle (d) Open nozzle

RPSC AEN Pre-2013

Ans. (c) : In pintaux nozzle, the valve of a C.I. engine-nozzle has a cylindrical or conical projection protruding through the mouth of nozzle and nozzle body has an auxiliary hole.

803. Common rail injection system uses injection pressures of the order
(a) 100 – 200 bar (b) 200 – 400 bar
(c) 400 – 600 bar (d) 1500 bar

RPSC IOF, 2020

Ans. (d) : Generally, the common rail injection system uses injection pressure of the order of 1500 bar.

804. The maximum temperature of I.C engine cylinder is
(a) 1500-1800 deg C (b) 1800-2000 deg C
(c) 500-1500 deg C (d) 2000-2500 deg C

Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (d) :

805. Ribs are provided inside below the piston head of an I.C. Engine:
(a) To increase strength
(b) To increase stiffness
(c) To increase toughness
(d) To increase surface area for dissipation of heat.

GPSC Asstt. Prof. 28.08.2016

Search on Telegram @apna_pdf

Ans. (d) : Ribs strengthen the piston head against the gas pressure they increase the rigidity and prevent the distortion of the piston head and also transmit a large portion of combustion heat from piston head.

806. In two-stroke engines the valve ports are provided at :

(a) Crankshaft (b) Piston
(c) Cylinder walls (d) None of these

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : In two stroke engine the valve ports are provided at cylinders wall.
There are two ports
(i) Inlet port, (ii) Exhaust port

807. The injected fuel evaporates and it is injected at various points along the stream in :

(a) Carburetor (b) Economiser
(c) MPFI (d) MDIF

HPPSC Lect. (Auto) 23.04.2016

Ans. (c) : Multi point fuel injection (MPFI) system of injecting fuel into internal combustion engine through multi ports situated on intake valve of each cylinder, it delivers an exact quantity of fuel in each cylinder at the right time.
There are three types of MPFI system.
(i) Batched
(ii) Simultaneous
(iii) Sequential.
Batched MPFI- In it fuel is injected to the groups of the cylinder without bringing their intake stroke together.
Simultaneous MPFI– In it, fuel is inserted to all cylinder at same time.
Sequential MPFI– In it injection is timed to overlap with intake stroke of each cylinder.
Hence, the injected fuel evaporates and it is injected of various points along the stream in MPFI.

808. Ante-chambers are sometimes provided in an I.C. Engine as :

(a) Pre-combustion chamber
(b) Post-combustion chamber
(c) Combustion chamber
(d) Exhaust chamber

HPPSC Lect. (Auto) 23.04.2016

Ans. (a) : Pre-combustion chamber is an auxiliary space in which combustible gases are ignited and combustion started ahead of the main combustion chamber of a jet or gas engine. Hence Ante-chamber are sometimes provided in an IC-engine as Pre-combustion chamber.

809. Poppet valve is also known as :

(a) Star valve (b) Mushroom valve
(c) Direct valve (d) Booster valve

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : A poppet valve is a valve typically used to control the timing and quantity of gas or vapour flow into an engine. It consists of a hole or open ended chamber usually round or oval in cross-section and a plug usually a disk shape on the end of a shaft known as a valve system.
A poppet valve is also known as mushroom valve.

810. In S.I. engine ….. ignition system can be used.

(a) Thermo-fluid (b) Magneto
(c) Colman (d) Condensate

HPPSC Lect. (Auto) 23.04.2016

Ans. (b) : An ignition system generates a spark heats an electrode to a high temperature to ignite a fuel air mixture in spark ignition I.C. engine.
Magneto ignition system is used in SI engine. The basic component of a magneto ignition system consists of a magneto, breaker points, capacitor, ignition switch, distributer, spark plug leads and spark give.

811. If the spark plug on a petrol engine runs hotter, the engine may-

(a) Stop (b) Run smoothly
(c) Misfire (d) Detonate

NPCIL ET, 2015

Ans. (d) : The operating temperature of a spark plug is the actual physical temperature at the tip of the spark plug within the running engine. If the tip of the spark plug is too hot it can cause pre-ignition leading to detonation/knocking and damage may occur.

812. The voltage required to produce a spark across the electrode gap of the spark plug is:

(a) 2000 to 4000 V (b) 4000 to 6000 V
(c) 6000 to 10000 V (d) 10000 to 12000 V

NPCIL ET, 2015

Ans. (c) : The voltage required to produce a spark across the gap, between the sparking points is 6000 to 10,000 volts.

813. The objective of providing masked inlet valve in the air passage of compression ignition engine is to:

(a) Enhance flow rate
(b) Control air flow
(c) Induce primary swirl
(d) Induce secondary turbulence

NPCIL ET, 2015

Ans. (c) : The object of providing masked inlet valve in the pair passage of compression ignition engines is to primary swirl.

814. List the required operation of a catalytic convertors on HC emissions.

(a) Oxidation to H_2O and CO_2
(b) Reduction to H and C
(c) Reaction with NO_x
(d) None of the above

GPSC Lect. (Auto) 16.10.2016

Ans. (a) : Catalytic Convertors- Catalytic Convertor is an exhaust emission control device that reduced toxic gases and pollutants in exhaust gas from an internal Combustion engine into less toxic pollutants by catalyzing a redox reaction (an oxidation and a reduction reaction)

$2CO + O_2 \rightarrow CO_2$ (Oxidation)

$C_xH_y + O_2 \rightarrow CO_2 + H_2O$ (Reduction)

The catalytic convertor combine oxygen (O_2) with carbon monoxide (CO) and unburned Hydrocarbons (C_nH_n) to produce Carbon dioxide (CO_2) and water (H_2O).

Search on Telegram @apna_pdf

815. To improve fuel economy …..... choose most appropriate option.

(a) While driving avoid quick starts and sudden stop
(b) Keep tires inflated to the recommended maximum pressure and don't carry unnecessary weight in or on the vehicle
(c) Option (B) is right and A is wrong
(d) Both option A and B are right.

GPSC Lect. (Auto) 16.10.2016

Ans. (d) : To improve fuel economy
1. Avoid quick starts and sudden stop.
2. Keeps tyre inflation proper as per recommendation
3. Avoid over loadings
4. proper maintenance of vehicle

816. The skirt of piston.....

(a) Is used to withstand the pressure of gas in the cylinder
(b) Acts as a bearing for the side thrust of the connecting rod
(c) Is used to seal the cylinder in order to prevent leakage of the gas past the piston
(d) None of the above

GPSC EE Pre, 28.01.2017

Ans. (b) : Piston skirt is fitted in both two stroke and four stroke engines. It has different function for different engines. In large cross head two stroke engine with uniflow scavenging these skirts are short in length and are fitted to act as a guide and stablise the position of the piston inside the linear. It is generally made of cast iron. The diameter of the skirt is usually kept slightly larger than that of the piston. This is done to prevent damage to the linear surface due to the piston movement.

817. As per the technical specifications of automotive vehicles, what is the Engine type used in TATA INDICA V2'02?

(a) 4 cylinder in-line
(b) 5-cylinder, 4 stroke, in-line
(c) 6-cylinder in-line
(d) One of the above

MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (a) : 4 cylinder in-line engine is used in TATA INDICA V2'02.

818. Identify the correct set of approximations made in the thermodynamic analysis of internal combustion engines:

P. The combustion process is replaced by an equivalent energy addition process
Q. The working fluid is a mixture of carbon dioxide and water vapor.
R. The exhaust process is replaced by an equivalent energy rejection process.
S. The working fluids have constant heat capacities.

(a) P, R, S (b) P, R
(c) R, S (d) P, Q, R

APGENCO AE 2012

Ans. (a) : Thermodynamics Analysis of Internal Combustion Engine–

- The combustion process is replaced by an equivalent energy addition process.
- The exhaust process is replaced by an equivalent energy rejection process.
- The working fluids have constant heat capacities

$$(mC_p)_A = (mC_p)_R$$

819. Which one of the following is incorrect with respect to painting of vehicles?

(a) Paints creates a thermal boundary layer on the surface
(b) Paints prevents rapid corrosion of parts
(c) Paints colour increases the ability to be seen
(d) Paint colour increases the aesthetic look

TNPSC AE 2017

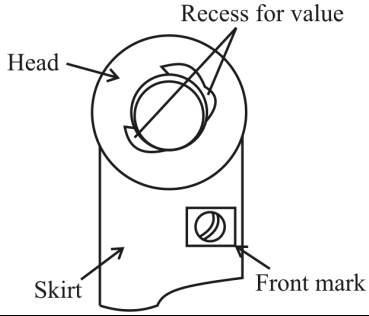
Ans. (a) : Paints creates a thermal boundary layer on the surface is incorrect with respect to painting of vehicles.

820. What is the name given to the crescent-shaped cavity on the top surface of the piston head?

(a) Valve recess (b) Crescent hole
(c) Valve cup (d) None of these

KPCL AE 2016

Ans. (a) : The crescent shaped cavity on the piston head top surface is called as valve recess



821. Which one of the following valves is provided for starting the engine manually, during cold weather conditions?

(a) Starting jet valve
(b) Compensating jet valve
(c) Choke valve
(d) Auxiliary air valve

ESE 2020

Ans. (c) : Choke valve

822. Engine overheating may be due to

(a) Struck radiator pressure cap
(b) Open thermostat
(c) Excess coolant
(d) Broken fan belt

TNPSC AE 2017

Ans. (d) : Engine overheating may be due to broken fan belt.

05.

Fluid Mechanics

1. Properties of Fluid

1. Viscosity has the following dimensions:

(a) MLT^{-2} (b) $ML^{-1}T^{-2}$

(c) $ML^{-2}T^{-2}$ (d) $ML^{-1}T^{-1}$

Assam PSC AE (PHED), 18.10.2020
VIZAG STEEL MT 2015
TNPSC AE 2014
ISRO Scientist/Engineer 24.05.2014
APPSC Poly. Lect. 2013
APPSC AEE 2012
J&K PSC Civil Services Pre, 2010
UKPSC AE 2007 Paper -II

Ans. (d) : Unit of viscosity(dynamic viscosity) $\Rightarrow \frac{N-s}{m^2}$

$$1\frac{N-s}{m^2} = 10 \text{ poise}$$

At 20^0C viscosity of water is 1 C.P. (Centi Poise).

$$\text{Dynamic viscosity} = \frac{\tau}{\frac{du}{dy}}$$

$$\mu = \frac{\text{Force}}{\text{Area} \times \text{Velocity gradient}}$$

Force = $[MLT^{-2}]$

Area = $[L^2]$

$$\text{Velocity gradient } \frac{du}{dx} = \frac{[LT^{-1}]}{[L]} = [T^{-1}]$$

Therefore

$$\mu = \frac{[MLT^{-2}]}{[L^2][T^{-1}]}$$

$$\mu = [ML^{-1}T^{-1}]$$

* Dimension of viscosity $\Rightarrow ML^{-1}T^{-1}$.

2. Newton's law of viscosity depend upon the :

(a) Stress and strain in a fluid

(b) Shear stress pressure and velocity.

(c) Shear stress and rate of strain

(d) Viscosity and shear stress

JPSC AE, 10.04.2021, Paper-I
RPSC ACF & FRO, 26.02.2021
TSPSC Manager (Engg.) HMWSSB 12.11.2020
Gujarat PSC AE 2019
Sikkim PSC (Under Secretary), 2017
UJVNL AE 2016
BPSC Asstt. Prof. 29.11.2015
OPSC Civil Services Pre 2006, ESE 1998

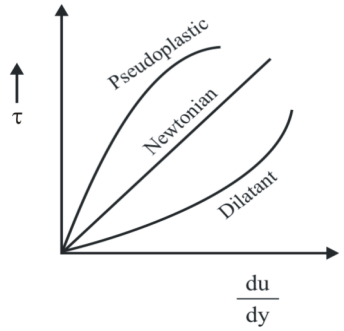
Ans. (c) : Newton's law of viscosity- A fluid is said to be Newtonian fluid if,

Shear stress $\propto$ Rate of shear strain $\left(\frac{d\phi}{dt}\right)$

Shear stress $\propto$ velocity gradient $\left(\frac{du}{dy}\right)$

$$\boxed{\tau = \mu\frac{du}{dy} = \mu\frac{d\phi}{dt}}$$

Where, τ = Shear stress



3. Unit of Kinematic viscosity is

(a) m/sec^2 (b) m^2/sec

(c) m/sec (d) m^2/sec^3

Vadodara Muncipal Corp. DEE, 2018
TSPSC AEE 2017
BPSC Asstt. Prof. 29.11.2015
CGPSC AE 26.04.2015 SHIFT-II
UPRVUNL AE 2014
UKPSC AE-2013, Paper-II
RPSC Lect. (Tech. Edu. Dept.) 2011
GATE 2001

Ans. (b) : Kinematic Viscosity (ν)

$$= \frac{\text{Dynamic Viscosity}(\mu)}{\text{Density of fluid}(\rho)}$$

$$\nu = \frac{\mu}{\rho} \qquad (\mu = \text{kg/m-sec})$$

$$(\rho = \text{kg/m}^3)$$

$$\nu = \frac{\text{kg/m-sec}}{\text{kg/m}^3} = \text{m}^2/\text{sec}$$

Unit of kinematic viscosity is "m^2/sec".

Search on Telegram @apna_pdf

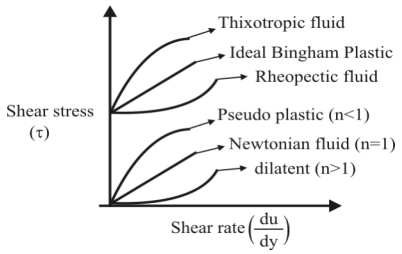
4. The stress-strain relation of Newtonian fluid is

(a) linear (b) parabolic

(c) hyperbolic (d) cubic

HPPSC ADF 05.03.2019, HPPSC AE 2018
ISRO Scientist/Engineer 22.04.2018
Nagaland PSC (CTSE) 2018, Paper-II
Vizag Steel (MT) 2017
TRB Asstt. Prof., 2012, WBPSC AE 2003

Ans. (a) : A Newtonian fluid is one where there is a linear relationship between shear stress and strain-rate. The ratio of shear stress to strain-rate is the viscosity of the fluid. A fluid where there is no linear relationship between shear stress & strain-rate is called a Non-Newtonian fluid.



5. Which one of the following sets of condition clearly apply to an ideal fluid?

(a) Viscous and compressible
(b) Non Viscous and incompressible
(c) Non Viscous and compressible
(d) Viscous and incompressible

CIL MT 27.02.2020, RPSC AE 2018
WBPSC AE, 2017
Rajasthan AE (Nagar Nigam) 2016 Shift-3
UKPSC AE 2012 Paper–II
OPSC Civil Services Pre 2006, CSE Pre-1995

Ans. (b) : Condition for an ideal fluid

- Fluid must be non-viscous (inviscous)
  $\mu = 0, \tau = 0$
- Fluid must be incompressible.
- $\Delta\rho = 0, \rho =$ constant
- Fluid should be irrotational.
  $\omega = 0$

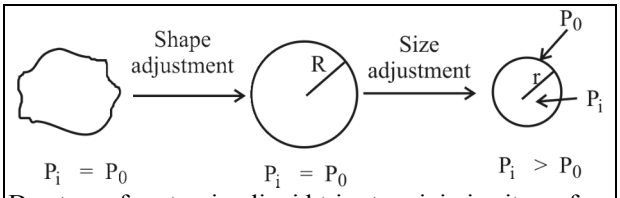
6. Due to which one of the following properties, falling drops of water become spherical in shape?

(a) Viscosity (b) Surface tension

(c) Cohesion (d) Adhesion

Nagaland PSC (CTSE) 2018, Paper-II
Kerala PSC IOF 19.04.2016,
GWSSB DEE 07.07.2016
Rajasthan Nagar Nigam AE 2016, Shift-II
GWSSB AAE, 27.12.2015, TSPSC AEE 2015

Ans. (b) : Any system tries to attain the condition of stable equilibrium, keeping its potential energy as minimum as possible. Thus the quantity of liquid will adjust its shape until its surface area and its surface energy becomes minimum. This minimization of surface area is possible only due to surface tension.



Due to surface tension liquid tries to minimize its surface area. This is reason why drops are spherical in shape.

7. Newton's Law of viscosity states that

(a) Shear stress is directly proportional to velocity
(b) Shear stress is directly proportional to velocity gradient
(c) Shear stress is directly proportional to shear strain
(d) Shear stress is directly proportional to viscosity

GPSC Executive Engineer 23.12.2018
APGENCO AE, 2017
HPPSC Lect. (Auto) 23.04.2016
TNPSC AE 2014, UPRVUNL AE 2014
GATE 1995

Ans. (b) : Newton's Law of viscosity states that shear stress is directly proportional to rate of shear strain of velocity gradient.

$$\tau \propto \frac{du}{dy}$$

$$\tau = \mu\frac{du}{dy} = \mu\frac{d\phi}{dt}$$

8. Dimension of surface tension is:

(a) ML^2T^{-2} (b) MT^{-2}

(c) $ML^{-1}T^{-2}$ (d) MT^{-1}

CIL MT 27.02.2020, SJVN ET 2019
GPSC Executive Engineer 23.12.2018
GMB AAE 25.06.2017
Assam PSC CCE Pre 2015, GATE 1996

Ans. (b) :

Surface tension $\sigma = \frac{\text{Force}}{\text{Length}} = \frac{MLT^{-2}}{L} = MT^{-2}$

9. For a Newtonian fluid

(a) shear stress is proportional to acceleration.
(b) rate of shear stress is proportional to shear strain
(c) shear stress is proportional to density.
(d) shear stress is proportional to rate of shear strain.

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021 Paper-II
APPSC AEE SCREENING 17.02.2019
ISRO Scientist/Engineer (RAC) 07.05.2017
GPSC Asstt. Prof. (Prod.) 21.08.2016
UPRVUNL AE 2014, GATE 2006

Ans. (d) : For a Newtonian fluid
Shear stress ∝ rate of shear strain
Shear stress ∝ velocity gradient

Search on Telegram @apna_pdf

$\tau \propto \frac{d\phi}{dt}$ or $\tau \propto \frac{du}{dy}$

$\boxed{\tau = \mu \frac{d\phi}{dt}}$ $\boxed{\tau = \mu \frac{du}{dy}}$

10. S.I. Unit of absolute (dynamic) viscosity is..

(a) N/mm^2 (b) N.mm/s

(c) $N.s/m^2$ (d) N.mm

Haryana PSC AE (PHED) 04.09.2020, Paper-I
Nagaland PSC (CTSE) 2018, 2015 Paper-II
WBPSC AE, 2017
MPSC Dy. Engg. (GWD) 19.05.2013

Ans. (c) : Unit of dynamic Viscosity $= \frac{N.s}{m^2} = 10$ poise

Unit of kinematic viscosity = $m^2/s = 10^4$ stokes

11. Kinematic viscosity is equal to

(a) Density/dynamic viscosity

(b) Dynamic viscosity/density

(c) Dynamic viscosity × density

(d) None of these

Punjab PSC SDE 12.02.2017, (HPPSC LECT. 2016)
KPCL AE 2016, (KPSC AE 2015)
Assam PSC CCE Pre 2015

Ans : (b) Kinematic viscosity,

$$\nu = \frac{\text{Dynamic Viscosity or absolute viscosity}}{\text{Density}} = \frac{\mu}{\rho}$$

Unit of kinematic viscosity = m^2/sec. (SI unit)

Unit of kinematic viscosity = cm^2/sec or stoke (CGS unit)

$1 m^2/sec = 10^4 cm^2/sec = 10^4$ stoke

12. Kinematic viscosity of air at 20°C is given to be 1.6×10^{-5} m^2/s. Its kinematic viscosity at 70°C will be approximately-

(a) 2.2×10^{-5} m^2/s (b) 1.6×10^{-5} m^2/s

(c) 1.2×10^{-5} m^2/s (d) 3.2×10^{-5} m^2/s

APPSC AE Subordinate Service Civil/Mech. 2016
VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 1999

Ans. (a) : We know,

Kinematic viscosity $(\nu) = \frac{\mu}{\rho}\ m^2/s$

Relation between dynamic viscosity & temperature,

i.e. $\mu \propto \sqrt{T}$

Relation between density & temperature,

$PV = mRT$

$P = \rho RT$

$\rho \propto \frac{1}{T}$

$\nu = \frac{\sqrt{T}}{1/T} = T^{1/2} \times T$

$\nu = T^{3/2}$

Given, $\nu_1 = \nu_{at\ 20°C} = 1.6 \times 10^{-5}$ m^2/s, $\nu_2 = \nu_{at\ 70°C} = ?$

$$\frac{\nu_1}{T_1^{3/2}} = \frac{\nu_2}{T_2^{3/2}}, \quad \begin{bmatrix} T_1 = 20+273 = 293\,K \\ T_2 = 70+273 = 343\,K \end{bmatrix}$$

$$\frac{1.6\times10^{-5}}{293^{3/2}} = \frac{\nu_2}{343^{3/2}}$$

$\nu_2 = 2.02 \times 10^{-5}$ m^2/s

13. If temperature increases, viscosity of the gases _____ and the viscosity of liquids _____.

(a) decreases, decreases

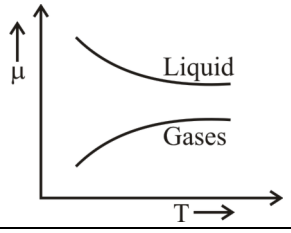
(b) decreases, increases

(c) increases, increases

(d) increases, decreases

VIZAG MT, 14.12.2020, WBPSC AE, 2017
GPSC Asstt. Prof. (Prod.) 21.08.2016
RPSC VPITI 14.02.2016

Ans. (d) : If temperature increases, viscosity of the gases increases and the viscosity of liquid decreases.



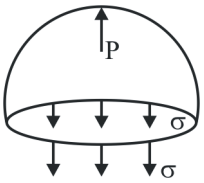
14. The pressure difference between the inside and outside of a liquid droplet of diameter 'd' due to surface tension (σ) is given by the relation

(a) $\Delta P = \frac{4\sigma}{d}$ (b) $\Delta P = \frac{8\sigma}{d}$

(c) $\Delta P = \frac{2\sigma}{d}$ (d) $\Delta P = \frac{6\sigma}{d}$

Oil India Senior Officer 23.12.2020
ISRO Scientist/Engineer 03.07.2016
TSPSC AEE 2015, ESE 2008

Ans. (a) : Pressure force = Surface tension force



$P \times \frac{\pi}{4} d^2 = \sigma \pi d$

$\boxed{P = \frac{4\sigma}{d}}$

15. Surface tension is due to

(a) Cohesion

(b) Viscous force

(c) Adhesion

(d) The difference between adhesive and cohesive force

JPSC AE, 10.04.2021, Paper-I
MPPSC AE 2016
UKPSC AE 2012 Paper–II
ESE 1998

Search on Telegram @apna_pdf

Ans : (a) Surface tension is due to cohesion force.
Surface tension:- Surface tension occur at the interface of liquid and gas or at the interface of two liquid.
* It is a surface phenomenon
* It is force per unit length (N/m)
* For water-air interface at 20°C, its value is 0.0736 N/m
* It is due to cohesion only.

16. Which of the following instrument is used to measure the specific gravity of liquid?
(a) Hydrometer
(b) Densitometer
(c) Differential manometer
(d) Hygrometer

APPSC AE Subordinate Service Civil/Mech. 2016
Rajasthan Nagar Nigam AE 2016, Shift-I
GWSSB DEE 07.07.2016

Ans. (a) :

Instrument	Used for Measure
Hydrometer	Specific gravity
Densitometer	Degree of darkness
Differential Manometer	Pressure difference
Hygrometer	Humidity

17. The bulk modulus of a fluid
(a) is independent of pressure and density
(b) is higher is the fluid is more compressible
(c) increases with pressure of fluid
(d) has the dimensions of volumetric chain

OPSC AEE 2019 PAPER - II
TNPSC ACF 2012, ESE 2011

Ans. (c) : Bulk modulus –

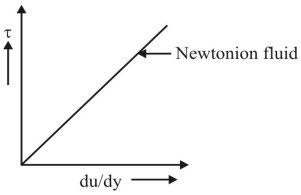
$$K = \frac{dP}{\left(\frac{dV}{V}\right)}$$

$$\boxed{K \propto dP}$$

18. Newton's law of viscosity is given by the relation
(a) $\tau = \mu^2 \frac{du}{dy}$ (b) $\tau = \sqrt{\mu} \frac{du}{dy}$
(c) $\tau = \mu \frac{du}{dy}$ (d) $\tau = \mu^3 \frac{du}{dy}$

TNPSC AE 2018, TPSC AE. 2015, CSE Pre-1995

Ans : (c)



$\tau \propto \frac{du}{dy}$ (According to Newton's law of viscosity)

$$\tau = \mu . \frac{du}{dy}$$

τ = shear stress

$\frac{du}{dy}$ = Velocity gradient.

19. Study of fluid at rest is known as
(a) Kinematics (b) Dynamics
(c) Statics (d) None of the above

NPCIL ET, 2015, APPSC AEE 2012
APPSC AE 04.12.2012

Ans. (c) : Fluid statics or hydrostatics is the branch of fluid mechanics that studies fluid at rest.

20. Select the correct statement
(a) Viscosity of gas increases with temperature .
(b) Density of gas increase with temperature.
(c) Surface tension of liquid increases with temperature.
(d) Bulk modulus is independent of temperature.

RPSC IOF & Boiler 20.09.2017
APPSC AE 04.12.2012, APPSC AEE 2012

Ans. (a) : Viscosity of gases increases with increase in temperature.
In case of gases the cohesive forces are small and molecular momentum transfer predominates.
With the increase in temperature, molecular momentum transfer increases and hence viscosity increases.
For a gas; $\mu = \mu_0 + \alpha t - \beta t^2$
Where; α and β are constant for gas
μ_0 = Viscosity of gas at 0ºC in poise
μ = Viscosity of gas at tºC in poise

21. The mercury does not wet the glass. This is due to the property of the liquid known as
(a) Cohesion (b) Adhesion
(c) Viscosity (d) Surface tension

Nagaland PSC (CTSE) 2018, Paper-II
Rajasthan Nagar Nigam AE 2016, Shift-II
GWSSB AAE, 27.12.2015

Ans. (d) : The mercury does not wet the glass. This is due to the property of the liquid known as surface tension. The liquid molecules on the surface experience a net inward pull due to which there will be tension in the liquid surface. This tension is referred as surface Tension.

22. A fluid is a substance that
(a) always expands until it fills any container.
(b) has the same shear stress at a point regardless of its motion.
(c) cannot remain at rest under the action of any shear force.
(d) cannot be subjected to shear forces.

HPPSC Poly. Lect. 05.07.2021
Karnataka PSC Lect., 27.05.2017
TSPSC Managers, 2015

Search on Telegram @apna_pdf

Ans. (c) : A fluid is a substance that cannot remain at rest under the action of only shear force.
A substance in liquid or gaseous phase is referred as fluid. They are capable of deforming continuously under the action of tangential force or shear force.

23. If the surface tension of water-air interface is 0.073 N/m, the gauge pressure inside a rain drop of 1mm diameter will be

(a) 0.146 N/m^2 (b) 73 N/m^2
(c) 146 N/m^2 (d) 292 N/m^2

UPPSC AE 13.12.2020, Paper-2
ISRO Scientist/Engineer 2011
ESE 1999

Ans. (d) : Surface tension (σ) = 0.073 N/m
d = 1 mm
Pressure of rain droplet

$$P = \frac{4\sigma}{d}$$

$$P = \frac{4 \times 0.073}{1 \times 10^{-3}}$$

P = 292 N/m^2

24. The dimension of kinematic viscosity in terms of the dimension of mass. M, length L and time T is

(a) $ML^{-1}T^{-1}$ (b) $ML^{-1}T^{-2}$
(c) L^2T^{-1} (d) LT^{-2}

Kerala LBS Centre For Sci. & Tech. Asstt. Prof. 2014
GATE 2001, ESE 2007

Ans. (c)

$$\upsilon = \frac{\mu}{\rho}$$

$$\upsilon = \frac{N-s}{m^2} \times \frac{m^3}{kg}$$

$$= \frac{kg-m-sec}{sec^2 . m^2} \times \frac{m^3}{kg}$$

$$= \frac{m^2}{sec}$$

$$= \frac{L^2}{T} = \left[L^2T^{-1}\right]$$

25. A static fluid can have

(a) non-zero normal and shear stress.
(b) negative normal stress and zero shear stress.
(c) positive normal stress and zero shear stress.
(d) zero normal stress and zero shear stress.

VIZAG STEEL MT 18.08.2013
VIZAG STEEL MT 10.06.2012
GATE 2001

Ans. (b) : negative normal stress and zero shear stress.

26. One poise is equal to

(a) 0.1 N-s/m^2 (b) 1 N-s/m^2
(c) 10 N-s/m^2 (d) 100 N-s/m^2

Assam PSC CCE Pre 2015
(HPPSC LECT. 2016)
J & K PSC Screening, 2006

Ans. (a)

$$1 \text{ Poise} = \frac{\text{Dyne} - \text{sec}}{\text{cm}^2}$$

$$\left\{\text{Dyne} = \frac{\text{gm} - \text{cm}}{\text{sec}^2}\right\}$$

$$1 \text{ Poise} = \frac{\text{gm}}{\text{cm} - \text{sec}}$$

Conversion

$$1 \text{ Poise} = \frac{1}{10} \text{ Pa} - \text{sec}$$

Dimension of dynamic viscosity

$$\left[ML^{-1}\ T^{-1}\right]$$

27. Viscosity of water in comparison to mercury is:

(a) higher (b) same
(c) unpredictable (d) lower

Gujarat PSC AE 2019
GWSSB AAE, 27.12.2015
ISRO Scientist/Engineer 12.05.2013

Ans. (d) :

Dynamic Viscosity	Kinematic Viscosity
$\mu_{water} = 1.0 \times 10^{-3} \frac{N-s}{m^2}$	$v_{water} = 1 \times 10^{-6} \frac{m^2}{sec}$
$\mu_{Hg} = 1.56 \times 10^{-3} \frac{N-s}{m^2}$	$v_{Hg} = 1.15 \times 10^{-7} \frac{m^2}{sec}$

28. A liquid compressed in cylinder has a volume of 0.04m^3 at 50 kg/cm^2 and a volume of 0.039m^3 at 150 kg/cm^2. The bulk modulus of elasticity of liquid is

(a) 400 kg/cm^2 (b) 40 × 10^6 kg/cm^2
(c) 40 × 10^5 kg/cm^2 (d) 4000 kg/cm^2

SJVN ET 2013
ISRO Scientist/Engineer 2011, 2007

Ans. (d) : V_1 = 0.04 m^3, P_1 = 50kg/cm^2, V_2 = 0.039 m^3, P_2 =150 kg/cm^2
Bulk Modulus

$$K = \frac{dP}{-\frac{dV}{V}}$$

$$= \frac{P_2 - P_1}{-\frac{(V_2 - V_1)}{V_1}} = \frac{150 - 50}{-\left(\frac{0.039 - 0.04}{0.04}\right)}$$

$$= \frac{100}{\left(\frac{0.001}{0.04}\right)}$$

= 4000 kg/cm^2

Search on Telegram @apna_pdf

29. Inside a soap bubble, the pressure is

(a) $\frac{4\sigma}{d}$ (b) $\frac{2\sigma}{d}$

(c) $\frac{8\sigma}{d}$ (d) $\frac{6\sigma}{d}$

Nagaland PSC CTSE 2017, 2016 Paper-II
APPSC AEE Mains 2016 (Civil Mechanical)
TNPSC AE 2013

Ans. (c) :
- Pressure inside drop (solid like sphere)

$P = \frac{4\sigma}{d}$

- Pressure inside soap bubble

$P = \frac{8\sigma}{d}$

- Pressure inside jet

$P = \frac{2\sigma}{d}$

30. A liquid would wet the solid,

(a) If adhesion force is less than cohesion force
(b) If adhesion force is zero
(c) If adhesion force is more than cohesion force
(d) If adhesion force is equal to cohesion force

Vadodara Muncipal Corp. DEE, 2018
Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (c) : A liquid would wet the solid, when
– Adhesive force greater than cohesive force
– Contact angle $\theta < 90^0$ (Acute angle)
– Water is a wetting fluid

31. Which of the following is unitless?

(a) Kinematic viscosity (b) Bulk modulus
(c) Surface tension (d) Strain

Rajasthan Nagar Nigam AE 2016, Shift-II
(KPSC AE 2015)

Ans. (d) : Strain is the unitless quantity–

$\text{Strain} = \frac{\text{Change in dimension}}{\text{original dimension}} = \frac{\Delta L}{L}$

- Bulk modulus – Unit N/m^2 or Pa

$K = \frac{\Delta P}{\left(-\frac{\Delta V}{V}\right)}$

- Unit of kinematic viscosity –

$\upsilon = \frac{\mu}{\rho}$

MKS – m^2/sec
S.I. – m^2/sec
CGS – cm^2/sec = stokes

- Unit of surface tension = N/m or J/m^2

$T = \frac{F}{\ell}$

$\text{Also tension} = \frac{\text{Energy}}{\text{Area}} = \frac{E}{A}(J/m^2)$

32. The density of water is maximum at

(a) 100^0C (b) 0^0C
(c) 0^0K (d) 4^0C

GMB AAE 25.06.2017
Rajasthan Nagar Nigam AE 2016, Shift-I

Ans. (d) : The density of water is maximum at 4^0C. At 4^0C, the density of water starts reducing due to hydrogen bond formation.

33. A fluid having no viscosity is known as

(a) real fluid
(b) ideal fluid
(c) Newtonian fluid
(d) non-Newtonian fluid

CGPSC AE 15.01.2021
Assam PSC CCE Pre 2015

Ans. (b) : Properties of an ideal fluid
- Non viscous, frictionless and incompressible.
- Does not offer shear resistance against flow.
- Bulk modulus is infinite.
- No such fluid exist in practical situation.

34. If the fluid is at rest, then

(a) The shear stress changes according to the coefficient of viscosity
(b) Value of shear stress is zero
(c) Shear stress along the horizontal plane is zero
(d) All of the above options

Nagaland PSC CTSE 2017 Paper-2
GPSC Lect. (Auto) 16.10.2016

Ans. (b) : If the fluid is at rest then value of shear stress is zero.

35. The property of fluid which determines its resistance to shearing stress is called.

(a) Surface tension (b) Viscosity
(c) Compressibility (d) None of the above

GPSC Lect. (Auto) 16.10.2016
VIZAG STEEL MT 2011

Ans. (b) : Viscosity- Viscosity is a measure of a fluids resistance to flow. It describes the internal friction of a moving fluid. A fluid with large viscosity resist motion because its molecules gives it a lot of internal friction. It offers resistance to shearing stress.

36. If the diameter of a capillary tube is doubled, the capillary rise will become

(a) $\sqrt{2}$ times less (b) double
(c) half (d) $\sqrt{2}$ times more

JPSC AE, 10.04.2021, Paper-I
CSE Pre-2001

Ans. (c) : Capillary rise $= \frac{4\sigma\cos\theta}{\rho Dg} \Rightarrow h_1 \propto \frac{1}{D}$

If tube diameter is double

$h_2 \propto \frac{1}{2D}$

$\boxed{h_2 = \frac{h_1}{2}}$

Search on Telegram @apna_pdf

37. In CGS unit, dynamic viscosity is expressed as:

(a) poise (b) Pa-s
(c) stoke (d) None of the above

BPSC Poly. Lect. 2016
BPSC Asstt. Prof. 29.11.2015

Ans. (a) : Dynamic viscosity (μ)

SI system : Pa – sec, or $\frac{N-sec}{m^2}$ or $\frac{kg}{m-sec}$

CGS system : 1 Poise $= \frac{Dyne-sec}{cm^2}\left\{Dyne = \frac{gm-cm}{sec^2}\right\}$

$1\ Poise = \frac{gm}{cm-sec}$

1 poise = 0.1 Pa-sec

Dimension of dynamic viscosity

$[ML^{-1}T^{-1}]$

38. Pick the correct dimension of surface tension.

(a) N/m^2 (b) J/m
(c) W/m^2 (d) J/m^2

AAI Jr. Executive 29.11.2018
GATE 1997

Ans. (d) :

N/m^2	–	Pressure
J/m	–	Force
W/m^2	–	Heat flux
J/m^2	–	Surface tension

39. The shear developed in lubricating oil, of viscosity 9.81 poise, filled between two parallel plates 1 cm apart and moving with relative velocity of 2 m/s is :

(a) 196.2 N/m^2 (b) 20 N/m^2
(c) 40 N/m^2 (d) 29.62 N/m^2

APPSC AE Subordinate Service Civil/Mech. 2016
ESE 2001

Ans. (a) : Given : Viscosity (μ) = 0.981 Ns/m^2

Distance between plates = dy = 1 cm = 1×10^{-2} m

Relative velocity of plates = du = 2 m/s

According to Newton's law of viscosity

$$\tau = \mu\frac{du}{dy} = 0.981 \times \frac{2}{1\times10^{-2}} = 196.2\ N/m^2$$

40. Fluid is a substance which offers no resistance to change of

(a) Pressure (b) Flow
(c) Volume (d) Shape

TNPSC AE 2019
Rajasthan AE (Nagar Nigam) 2016 Shift-3

Ans. (d) : Fluid is a substance which offers no resistance to change of shape.

41. A fluid which obeys Newton's law of viscosity is termed as

(a) Real fluid
(b) Newtonian fluid
(c) Non-Newtonian fluid
(d) Ideal fluid

JPSC AE Pre 2019
ISRO Scientist/Engineer (RAC) 22.04.2018

Ans. (b) : A fluid which obeys Newton's law of viscosity is termed as Newtonian fluid.

42. Viscosity of the gas

(a) decreases with increases in temperature
(b) increases with increase in temperature
(c) remains same with increase in temperature
(d) may increase or decrease with increase in temperature depending upon the atomic structure of the gas

Assam PSC AE (IWT) 14.03.2021
WBPSC AE, 2017
CGPSC AE 26.04.2015 SHIFT-II

Ans. (b) : Viscosity (dynamic viscosity) of gas increase with increase in temperature because viscosity of gas depends on molecular velocity or molecular momentum transfer

Temperature	Liquid (μ)	Gas (μ)
T ↑	↓	↑

43. S.I. unit of viscosity is:

(a) 1 poise (b) 10 poise
(c) Centipoise (d) None of the above

OPSC AEE 2015 PAPER - II
J & K PSC Screening, 2006

Ans : (b) Unit of viscosity:-

(i) MKS unit of viscosity $= \frac{Kgf-sec}{m^2}$

(ii) CGS unit of viscosity $= \frac{dyne-sec}{cm^2}$

(iii) SI unit of viscosity $= \frac{N-sec}{m^2}$

$$\frac{1kgf-sec}{m^2} = \frac{9.81N-sec}{m^2} = 9.81\ poise$$

$$\boxed{10poise = 1\frac{N-sec}{m^2}}$$

44. The capillary rise at 20°C in a clean glass tube of 1 mm bore containing water is approximately :

(a) 5 mm (b) 10 mm
(c) 20 mm (d) 30 mm

HPPSC W.S. Poly. 2016, ESE 2001

Ans : (d) Given, t = 20°c

glass tube dia = 1 mm

$\sigma = 0.0736$ N/m

$$h = \frac{4\sigma\cos\theta}{\rho dg}$$

$\cos\theta = 1$ $(\theta = 0^0)$

$$h = \frac{4\sigma}{\rho gd}$$

$$h = \frac{4\times0.0736}{9810\times1\times10^{-3}}\ m$$

h = 30 mm

45. Units for surface tension is expressed in

(a) N/m (b) N/m^2
(c) m/N (d) n^2/m

APPSC AEE Screening Test 2016
TSPSC AEE 2015

Search on Telegram @apna_pdf

Ans : (a) Surface tension:- Surface tension occur at the interface of liquid and gas or at the interface of two liquid.
* It is a surface phenomenon
* It is force per unit length (N/m)
* For water-air interface at 20°C its value is 0.0736 N/m
* It is due to cohesion only.

46. If P is the gauge pressure within a spherical droplet, then gauge pressure within a bubble of the same fluid and of same size will be :
(a) P/4 (b) P/2
(c) P (d) 2P

HPPSC Asstt. Prof. 18.11.2016, GATE 1999

Ans. (d) : Gauge pressure for spherical droplet–

$$\Delta P = \frac{4\sigma}{D}$$

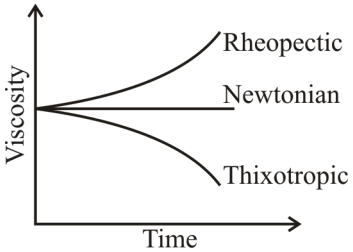
On soap bubble $\Delta P = \frac{8\sigma}{D}$

So 2P

47. The printer's ink is an example of :
(a) Newtonian fluid
(b) ideal fluid
(c) Thixotropic fluid
(d) Plastic fluid

Kerala PSC Asstt. Prof. 27.09.2016
WBPSC AE 2008

Ans. (c) : The printer's ink is an example of thixotropic fluid. Thixotropic is time dependent Non-newtonian fluids. Its viscosity decreases with time.
Thixotropic–Viscosity decrease with stress overtime.
e.g. Honey – Keep stirring and solid becomes liquid.
Rheopectic– Viscosity increases with stress overtime.
e.g. Cream– The longer you whip, thicker it gets.



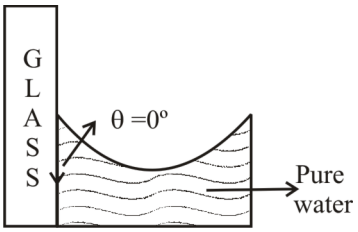
48. The angle of contact between pure water and clean glass is

(OR)

In the equation for capillary rise or fall of a liquid h = 4 σ cosθ/wd, the value of θ for water is :
(a) 0° (b) 45°
(c) 90° (d) 130°

APPSC AEE Mains 2016 (Civil Mechanical)
TSPSC Managers, 2015

Ans. (a) : In case of pure water & clean glass, the angle of contact will be '0°' since if is pure & does not have any type of impurities dissolve in it.



49. Cavitation will take place if the pressure of the flowing fluid at any point is :
(a) more than vapour pressure of the fluid
(b) equal to vapour pressure of the fluid
(c) less than vapour pressure of the fluid
(d) None of the above

GPSC Executive Engineer 23.12.2018
APPSC AE 04.12.2012

Ans. (c) : If the pressure of the flowing fluid at any point is less than the vapour pressure of the fluid then there cavitation will take place.
Due to the cavitation erosion occurs in the runner blade of turbine etc.

50. Compressibility is equal to :
(a) $\frac{dV/V}{dp}$ (b) $\frac{dp}{-(dV/V)}$
(c) $\frac{dp}{dp}$ (d) $\sqrt{\frac{dp}{dp}}$

APPSC AE 04.12.2012
APPSC AEE 2012

Ans. (a) : Compressibility (β) : It is inverse of bulk modulus of elasticity (K).

$$\therefore \boxed{\beta = \frac{1}{K} = \frac{dV/V}{dp}}$$

Where, dV/V = Change in volume per unit volume.
dp = Change in the pressure.

51. One stoke is equal to
(a) 10^{-2} m^2/s (b) 10^{-3} m^2/s
(c) 10^{-4} m^2/s (d) 10^{-6} m^2/s

CGPSC AE 15.01.2021
Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : One stoke is equal to 10^{-4} m^2/sec.

52. An ideal fluid is one which
(a) is incompressible
(b) has negligible surface tension
(c) is compressible
(d) is non viscous and incompressible

GPSC Asstt. Prof. 28.08.2016
UKPSC AE 2007 Paper -II

Ans. (d) : An ideal fluid is one which is non viscous and incompressible and also has negligible surface tension.

Search on Telegram @apna_pdf

53. The capillary rise or depression in a small diameter tube is :

(a) Directly proportional to the specific weight of the fluid
(b) Inversely proportional to the surface tension
(c) Inversely proportional to the diameter
(d) Directly proportional to the surface area

RPSC ACF & FRO, 26.02.2021, ESE 2008

Ans. (c) : Capillarity rise or depression.

$$h = \frac{4\sigma\cos\theta}{\rho g d}$$

$$\boxed{h = \frac{4\sigma\cos\theta}{wd}}$$

$$h \propto \frac{1}{w(\text{specific weight})}$$

$$h \propto \sigma(\text{surface tension})$$

$$h \propto \frac{1}{d(\text{Diameter})}$$

54. For a fluid, the shear stress was found to be directly proportional to the rate of angular deformation. The fluid is classified as

(a) Newtonian (b) non-Newtonian
(c) dilatant (d) thixotropic

Assam PSC AE (PHED), 18.10.2020
Oil India Ltd. Sr. Engg. (Production) 30.11.2019

Ans. (a) : For a fluid, the shear stress was found to be directly proportional to the rate of angular deformation. The fluid is classified as Newtonian fluid.

55. The product of Kinematic Viscosity and mass density is:

(a) Specific viscosity
(b) viscosity index
(c) Coefficient of viscosity
(d) Absolute viscosity

CIL MT 27.02.2020, TNPSC AE 2019

Ans. (d) : Kinematic viscosity (v) is the ratio of absolute viscosity or dynamic viscosity (μ) to the mass density (ρ).

Then, absolute viscosity = Kinematic viscosity × Mass density

$$\mu = v \times \rho$$

56. A soap bubble of radius 25 mm has inside pressure 25 N/m^2 above atmospheric pressure. The surface tension in the soap film will be:

(a) 2.156 N/m (b) 0.156 N/m
(c) 0 N/m (d) 1.156 N/m

AAI Jr. Executive 29.11.2018, ESE 2014

Ans. (b) : r = 25 mm, d = 2r, d = 50 mm

$d = 50 \times 10^{-3}$ m = 0.05 m

$P = 25$ N/m^2

$\sigma = ?$

Soap bubble,

$$P = \frac{8\sigma}{d}$$

$$25 = \frac{8\sigma}{0.05}$$

$$8\sigma = 1.25$$

$$\sigma = \frac{1.25}{8}$$

$$\sigma = 0.156 \text{ N/m}$$

57. The ratio of specific weight of a liquid to the specific weight of pure water at a standard temperature is called

(a) Density of liquid
(b) Specific gravity of liquid
(c) Compressibility of liquid
(d) Surface tension of liquid

Nagaland PSC (CTSE) 2018, Paper-II
VIZAG STEEL MT 2011

Ans. (b) : The ratio of specific weight of a liquid to the specific weight of pure water at a standard temperature is called specific gravity of liquid.

The usual standard of comparison For solids and liquids is water at 4ºC which has a density of 1.0 kg per litre.

58. Oil in a hydraulic cylinder is compressed from an initial volume 2 m^3 to 1.96 m^3 and the pressure increase is from 40 MPa to 80 MPa. The bulk modulus of elasticity of oil is

(a) 1000 MPa (b) 2000 MPa
(c) 4000 MPa (d) 8000 MPa

ISRO Scientist/Engineer (RAC) 07.05.2017
GATE 2007

Ans. (b) : Given,

$V_1 = 2\text{m}^3$, $P_1 = 40$ MPa

$V_2 = 1.96$ m^3, $P_2 = 80$ MPa

Bulk modulus of elasticity (K)

$$K = -\frac{Change\ in\ pressure}{Volumetric\ strain}$$

$$= -\frac{(P_2 - P_1)}{\frac{(V_2 - V_1)}{V_1}} = -\frac{(80-40)}{\left(\frac{1.96-2}{2}\right)}$$

$$= \frac{40 \times 2}{0.04}$$

K = 2000 MPa

59. An ideal fluid is

(a) One which obeys Newton's law of viscosity
(b) Frictionless and incompressible
(c) Very viscous
(d) Frictionless and compressible

Nagaland PSC CTSE 2017 Paper-2
Nagaland PSC (CTSE) 2016, Paper-II

Ans. (b) : An ideal fluid is an incompressible fluid & frictionless which has a zero viscosity (μ = 0). In ideal flow, there is no existence of shear force because of absence of viscosity.

Search on Telegram @apna_pdf

60. A fluid in which resistance of deformation is independent of the shear stress, is known as

(a) Bingham plastic fluid (b) Pseudo plastic fluid
(c) Dilatent fluid (d) Newtonian fluid

TNPSC AE 2014
Mizoram PSC AE/SDO 2014, Paper-I

Ans. (d) : For Newtonian fluid there is constant viscosity for different fluid of particular temp which resist the deformation without any influence of shear stress. In other words dynamic viscosity is constant for particular fluid at particular temperature.

61. A fluid is a substance which deforms continuously under the action of :

(a) Shearing Force (b) Tensile Force
(c) Compressive Force (d) None of these

HPPSC Poly. Lect. 05.07.2021
MPSC HOD (Govt. Poly. Colleges) 04.10.2014

Ans. (a) : Fluid- A fluid does not have any preferred shape. It can deform continuously when subjected to infinitesimally small shear force. The space between fluids molecules is relatively large i.e. intermolecular force or cohesive force is low.

62. Pascal-Second (Pa-s) is the unit of

(a) Pressure
(b) Kinematic Viscosity
(c) Dynamic Viscosity
(d) Surface tension

RPSC IOF, 2020, UPRVUNL AE 2014

Ans. (c) : Pascal second is the unit of (viscosity) dynamic viscosity.

- Pascal is the unit of pressure
- m^2/sec is the unit of kinematic viscosity
- N/m is unit of surface tension

63. The viscosity of a liquid is

(a) Decreases with increase in temperature
(b) Remains practically constant with temperature rise of fall
(c) Fairly large as compared to viscosity for gases
(d) Consider body influenced by molecular momentum transfer

TNPSC AE 2019, 2018

Ans. (a) : The viscosity of a liquid is decreases with increase in temperature because of molecular cohesive force of liquid decrease with increase in temperature of liquid.

For liquid $T \uparrow \mu \downarrow$

For gas $T \uparrow \mu \uparrow$ [Molecular momentum transfer rate $\uparrow$]

64. For which of the following fluids, the apparent viscosity can be considered to be independent of the rate of shear strain and equal to the fluid's viscosity?

(a) Ketchup (b) Water
(c) Corn Starch Solution (d) Blood

RPSC Lect. (Tech. Edu. Dept.) 13.03.2021

Ans. (b) : Apparent viscosity is the shear stress applied to fluid divided by the rate of shear strain $\left(\mu = \frac{\tau}{du/dy}\right)$. For a Newtonian fluid, the apparent viscosity is constant and equal to Newtonian viscosity of the fluid.
Exp.- Water, air, alcohol, oil etc.
Ketchup, corn starch & blood are example of non Newtonian fluid for that apparent viscosity depends on shear rate.

65. Which of the following is a property of a fluid?

(a) Eddy viscosity
(b) Eddy diffusivity
(c) Kinematic viscosity
(d) Turbulent Prandtl number

Assam PSC AE (IWT) 14.03.2021

Ans. (c) : Kinematic viscosity is the property of fluid.

66. A Newtonian fluid is one for which :

(a) $\tau = \mu\left(\frac{\partial u}{\partial y}\right)^m . m \neq 1$

(b) $\tau = \tau_c + \mu\frac{\partial u}{\partial y}$

(c) $\tau = \mu\frac{\partial u}{\partial y}$

(d) $\tau = \tau_c + \mu\left(\frac{\partial u}{\partial y}\right)^m . m \neq 1$

CGPSC AE 15.01.2021

Ans. (c) : A Newtonian fluid is one which obeys Newton's law of viscosity.
Acc. to Newton's law of viscosity

$$\tau \propto \frac{du}{dy}$$

$$\boxed{\tau = \mu\frac{du}{dy}}$$

where, μ is the dynamic viscosity of fluid.

67. Dimension of viscosity is :

(a) L^2/T (b) $N\text{-}s^2/m$
(c) kg/m-s (d) kg-s/m

CGPSC AE 15.01.2021

Ans. (a) : Dimension of kinematic viscosity = L^2/T
Unit of kinematic viscosity = m^2/sec
Unit of viscosity (Dynamic viscosity) = $N\text{-}s/m^2$
= kg/m-s
Dimension of viscosity = $[ML^{-1}T^{-1}]$
And,
Dimension of kinematic viscosity = $[L^2T^{-1}]$

68. The property of the liquid surface film to exert a tension so that even small loads can be supported over it is known as

(a) Viscosity (b) Adhesion
(c) Surface tension (d) Capillary

APGCL AM, 2021

Search on Telegram @apna_pdf

Ans. (c) : The property of the liquid surface film to exert a tension so that even small loads can be supported over it is known as Surface tension.
It is due to unalarmed cohesive forces at the liquid gas interface or liquid-liquid interface, in liquid side.

69. A liquid has a specific gravity of 1.9 and a kinematic viscosity of 6 stokes. What is the dynamic viscosity?

(a) 1.14 Ns/m^2 (b) 2.44 Ns/m^2
(c) 3.40 Ns/m^2 (d) 11.40 Ns/m^2

ESE 18.07.2021

Ans. (a) : Given, Specific gravity = 1.9
Kinematic viscosity, $\nu = 6$ stokes

$$\nu = 6 \times 10^{-4}\ m^2/s$$

$$\nu = \frac{\mu}{\rho} \ (\rho = \text{density})$$

Dynamic viscosity, $\mu = \nu\rho$

$$= 6 \times 10^{-4} \times 1.9 \times 10^3 = 1.14\ N\text{-}s/m^2$$

70. Statement (I): The viscosity of liquids decreases with the increase of temperature while the viscosity of gases increases with the increase of temperature.
Statement (II): The viscous forces in a fluid are due to cohesive forces and molecular Momentum transfer.

ESE 18.07.2021

Ans. (a) :

71. Fluids for which the flow behaviour index 'n' is greater than unity are called _____

(a) dilutant (b) coherent
(c) dilatant (d) none of the above

HPPSC Workshop Suptd. 08.07.02021

Ans. (c) :

72. A 2 liter liquid weights 15N. Its specific gravity will be

(a) 0.764 (b) 7500N m^{-3}
(c) 764.5kgm^{-3} (d) 764

GPSC DEE, Class-2 (GWSSB) 04.07.2021

Ans. (a) :

73. The surface tension at the soap-air interface is 0.1 N/m. The internal pressure in the soap bubbles of 32 mm diameter is _____ N/m^2.

(a) 12.5 (b) 25
(c) 37.5 (d) 50

VIZAG Steel MT 24.01.2021 Shift-II, Shift-I

Ans. (b) : Given,
Surface tension, $\sigma = 0.1$ N/m
Diameter, d = 32 mm

$$d = 32 \times 10^{-3}\ m$$

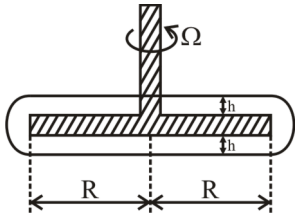
Pressure in the soap bubble,

$$P = \frac{8\sigma}{d}$$

$$= \frac{8 \times 0.1}{32 \times 10^{-3}} = \frac{800}{32}$$

$$P = 25\ N/m^2$$

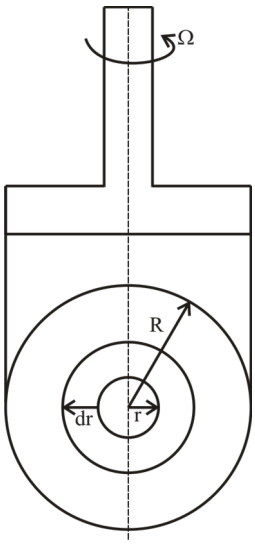
74. A disc of radius R rotates at an angular velocity Ω inside a disc shaped container filled with oil of viscosity μ, as shown in figure. Assuming a linear velocity profile and neglecting shear stress on the outer disc edges, the formula for viscous torque on the disc is



(a) $\frac{\pi\mu\Omega R^2}{h}$ (b) $\pi\mu\Omega h R^3$
(c) $\frac{\pi\mu\Omega R^5}{h^2}$ (d) $\frac{\pi\mu\Omega R^4}{h}$

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (d) :



From Newton law of viscosity,

$$\gamma = \mu \cdot \frac{du}{dy} = \mu \cdot \frac{r\Omega}{h} \qquad du = v - 0 = r\omega = r\Omega$$

$$dy = h$$

Consider a strip of thickness dr at radius r,
Friction force on strip, $dF_f = \tau.2\pi rdr$
Frictional torque on strip $dT_f = dF_f \times r$

$$dT_f = \tau.2\pi rdv.r$$

$$dT_f = \mu \cdot \frac{r\Omega}{h} \cdot 2\pi r^2 dr$$

$$\int dT_f = \frac{2\pi\mu\Omega}{h} \int_0^R r^3 dr$$

One surface torque $T_f = \frac{\pi\mu\Omega R^4}{2h}$

So viscous torque on the both surface of the disc,

$$T_f = \frac{\pi\mu\Omega R^4}{h}$$

Search on Telegram @apna_pdf

75. Find the change in height (h) in a circular tube (of radius R = 1 mm) filled with liquid (water) with surface tension T = 0.073 N/m. Contact angle of water-air-glass interface is 0°

(a) 1.5 cm (b) 2.5 cm
(c) 0.5 cm (d) 0.15 cm

ISRO Scientist/Engineer (RAC) 12.01.2020

Ans. (a) : Capillary rise (h) $= \frac{4\sigma\cos\theta}{\rho g D}$

R = 1 m, D = 2 mm, $\theta = 0°$C, g = 9.81 m/sec^2

σ = 0.073 N/m, ρ = 1000 kg/m^3

$$h = \frac{4\times0.073\times\cos\theta}{1000\times9.81\times2\times10^{-3}} = 0.0148\,m$$

h = 1.5 cm

76. Which of the following is a non-Newtonian fluid?

(a) Air (b) Water
(c) Gasoline (d) None of the above

ISRO Scientist/Engineer 12.01.2020

Ans. (d) : Examples of various types of fluids.
(1) Newtonian fluid- Water, Air, kerosene, gasoline, diesel, petrol, methyl alcohol, ethyl alcohol, etc.
(2) Non Newtonian fluid
(a) Time dependent fluid
(i) Thixotropic : Printer ink
(ii) Rheopectic : Gypsum paste
(b) Time independent fluid:
(i) Pseudo plastic : Blood, tomato, ketchup, paint etc.
(ii) Dilatant : Sugar solution, Butter solution, starch solution, quick sand etc.
(iii) Ideal plastic or Bingham plastic : Tooth paste.

77. A flat plate 0.1 m^2 area is pulled at 30 cm/s relative to another plate located at a distance of 0.01 cm from it, the fluid separating them being water with viscosity of 0.001 Ns/m^2. The power required to maintain velocity will be

(a) 0.05 W (b) 0.07 W
(c) 0.09 W (d) 0.11 W

ESE 2020

Ans. (c) :

$\because$ Shear stress, $\tau = \mu\frac{du}{dy} = \mu\frac{u}{y}$

Power, $P = (\tau\times A)\times u$

$$= \left(\mu\frac{u}{y}\times A\right)\times u \quad = \mu A\frac{u^2}{y}$$

Given : μ = 0.001 N-s/m^2
y = 0.01 cm
u = 30 cm/s
A = 0.1 m^2
So, putting the respective values,

$$P = 0.001\times0.1\times\frac{(30)^2\times10^{-4}}{0.01\times10^{-2}}$$

$\boxed{P = 0.09\,W}$

78. When the pressure of liquid is increased from 3 MN/m^2 to 6 MN/m^2, its volume is decreased by 0.1%. The bulk modulus of elasticity of the liquid will be

(a) 3×10^{12} N/m^2
(b) 3×10^{9} N/m^2
(c) 3×10^{8} N/m^2
(d) 3×10^{4} N/m^2

ESE 2020

Ans. (b) : $\because$ Bulk modulus of elasticity,

$$K = -\frac{dp}{\left(\frac{dv}{v}\right)} = -\frac{(6-3)\times10^6}{\left(\frac{0.1}{100}\right)} = 3\times10^9\ N/m^2$$

79. The dynamic viscosity of a liquid is 1.6 × 10^{-4} Ns/m^2, whereas the density is 400 kg/m^3. The kinematic viscosity in m^2/s is :

(a) 64×10^{-8} (b) 40×10^{8}
(c) 64×10^{-6} (d) 40×10^{-8}

APPSC Poly Lect. Automobile Engg., 2020

Ans. (d) : Given that dynamic viscosity (μ) = 1.6×10^{-4} N sec/m^2, density (ρ) = 400 kg/m^3

Kinematic viscosity (ν) = $\frac{\mu}{\rho}$

$$\nu = \frac{1.6\times10^{-4}}{400}$$

$$\nu = \frac{1.6\times10^{-4}\times10^{-2}}{4}$$

$\nu = 4\times10^{-7}$ m^2/sec. $= 40\times10^{-8}$

80. A substance whose specific volume is constant is called

(a) Incompressible substance
(b) Ideal substance
(c) Pure substance
(d) Actual substance

TNCSC AE 2020

Ans. (a) : A substance whose specific volume (or density) is constant is called an incompressible substance, the specific volumes of solids and liquids essential remain constant during a process.

81. Two large horizontal surfaces are 2 cm apart. The space between the surface is filled with the fluid of dynamic viscosity of 8 poise. What will be the force required to large a very thin plate of surface area 1 m^2 between the two large plane surface with the speed of 0.5 m/s. The thin plate is equidistance of 1 cm from each large plane surface. Buoyancy and gravitational effect are considered to the negligible.

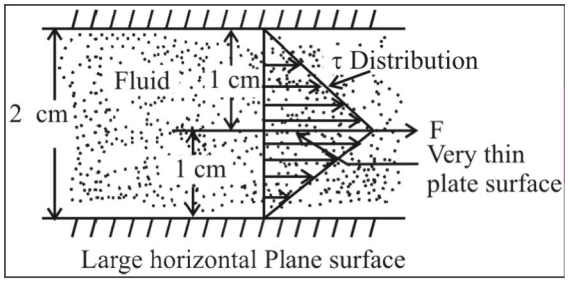
(a) 0.8 N (b) 8 N
(c) 80 N (d) 800 N

APPSC Poly Lect. 13.03.2020

Search on Telegram @apna_pdf

Ans. (c) : Given data :

Dynamic viscosity (μ) of fluid = 0.8 N-s/m^2 = 8 poise



Very thin plate surface area (A) = 1 m^2

speed (v)= 0.5 m/s

distance (y) = 1 cm = 0.01 m

let,

F = force required to drag a very thin plate

$\because \quad \tau = \frac{F}{A} = \mu\frac{du}{dy}$ or $\mu\left(\frac{v}{y}\right)$

Drag force, $F_D = \mu A\left(\frac{v}{y}\right)$

Drag force will act both side of the plate –

Total drag force (F) = $2\mu A\left(\frac{v}{y}\right)$ (i.e. both side of plate)

$$= 2\times 0.8\times 1\times\left(\frac{0.5}{0.01}\right) = 2\times 0.8\times 50$$

F = 80 N

82. The pressure inside a droplet of water is 0.2 kPa greater than outside atmospheric pressure. What will be the diameter of droplet of water? [Surface tension of water in contact with air is 0.07 N/m]

(a) 0.7 mm (b) 1.4 mm

(c) 14 mm (d) 0.14 mm

APPSC Poly Lect. 13.03.2020

Ans. (b) : Given data :

Pressure (ΔP) = 0.2 kPa = 0.2×10^3 Pa

Surface tension (σ) = 0.07 N/m

Let,

d= diameter of the droplet of water

$\because$ Pressure inside droplet

$$(\Delta P) = \frac{4\sigma}{d} \qquad \text{(In case of water droplet)}$$

$$\therefore \quad d = \frac{4\sigma}{\Delta P} = \frac{4\times 0.07}{0.2\times10^3} = \frac{0.28}{0.2}\times10^{-3}\,m$$

$d = 1.4\times10^{-3}$ m

d = 1.4 mm

83. The pH for the potable water should be in the range of

(a) 5-6 (b) 7-8.5

(c) 9-10 (d) 12-13

Assam PSC AE (PHED), 18.10.2020

Ans. (b) : The pH for the potable water (drinking water) lies within the range 7 to 8.5.

Natural waters can be of lower pH, as a result of for example acid rain or higher pH in limestone areas.

pH < 7 $\rightarrow$ Acidic

pH > 7 $\rightarrow$ Basic

84. A small shear force is applied on an element and then removed. If the element regains its original position, what kind of an element can it be?

(a) Solid (b) Liquid

(c) Fluid (d) Gaseous

Assam PSC AE (PHED), 18.10.2020

Ans. (a) : Fluid such as liquid fluid and gaseous cannot resist even a small shear force and get permanently deformed. Hence, the element must be a solid element.

85. A beaker is filled with a liquid up to the mark of one litre and weighed. The weight of the liquid is found to be 6.5 N. The specific gravity of the liquid will be

(a) 0.65 (b) 0.66

(c) 0.67 (d) 0.68

Assam PSC AE (PHED), 18.10.2020

Ans. (b) : Specific gravity of a liquid is defined as the ratio of the density of the liquid to that of water density

of the liquid (ρ_l) = $\frac{6.5/9.81}{10^3}$ kg/m^3

density of water (ρ_w) = 1000 kg/m^3

Thus specific gravity S = 0.66

86. For an incompressible fluid, the density

(a) Varies with temperature only

(b) Varies with pressure only

(c) Varies with both pressure and temperature

(d) Remain constant

JPSC AE PRE 2019

Ans. (d) : Incompressible flow—A flow in which the volume of a fluid and its density does not change during the flow is called an incompressible flow. All the liquids are considered to have incompressible flow.

87. Pick the correct statement about viscosity.

(a) In general, it decreases with temperature for liquids because the internal force of attraction between two fluid layers gets decreased.

(b) In general, it decreases with temperature for gases because the internal force of attraction between two fluid layers gets decreased.

(c) In general, it increases with temperature for liquids because the internal force of attraction between two fluid layers gets increased.

(d) In general, it increases with temperature for gases because the internal force of attraction between two fluid layers gets increased.

BHEL ET 2019

Search on Telegram @apna_pdf

Ans. (a) : In general, it decreases with temperature for liquid because the internal force of attraction between two fluid layers gets decreased.
In case of gases as the temperature increases the molecular momentum transfer increases so viscosity of gases increases.

88. Calculate the specific weight of one litre of petrol of specific gravity 0.7
(a) 700 N/m^3 (b) 6867 N/m^3
(c) 9810 N/m^3 (d) 6.8 N/m^3
TNPSC AE 2019

Ans. (b) : sp. gravity of petrol

$$= \frac{\text{Density of petrol}\left(\rho_p\right)}{\text{Density of water}\ \left(\rho_w\right)}$$

$$\rho_p = \rho_w \times \text{ sp. gravity of petrol}$$

$$\rho_p = 1000 \times 0.7 = 700 \frac{kg}{m^3}$$

Specific weight of petrol = $\rho_p \times g$
$= 700 \times 9.81$
$= 6867\ N/m^3$

89. In an incompressible fluid flow, the density of the medium is
(a) Zero (b) Infinity
(c) Constant (d) Unity
APPSC AEE SCREENING 17.02.2019

Ans. (c) : For incompressible flow
density (ρ) = constant

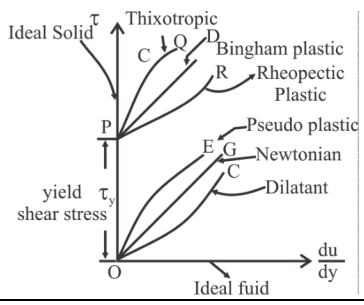
90. If σ is the surface tension and R is the cylinder radius, the pressure increase (ΔP) in the interior of a liquid cylinder is given by
(a) $\frac{\sigma}{R}$ (b) $\frac{2\sigma}{R}$
(c) $\frac{3\sigma}{R}$ (d) $\frac{4\sigma}{R}$
APPSC AEE SCREENING 17.02.2019

Ans. (a) : The pressure rise across cylindrical liquid jet is given by

$$\Delta P = \frac{2\sigma}{D} = \frac{\sigma}{R}$$

91. For pseudoplastic non-Newtonian fluids, the apparent viscosity
(a) increases with increasing deformation rate
(b) decreases with increasing deformation rate
(c) is independent of the deformation rate
(d) decreases with time
APPSC AEE SCREENING 17.02.2019

Ans. (b) :



Pseudo plastic fluid : (represented by line OE).
- $\tau_y = 0$ and $n < 1$
- The apparent viscosity decreases with the rate of deformation or rate of shear strain. Hence, Pseudo plastic fluids are also called shear thinning fluids.

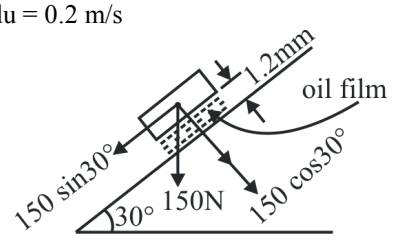
e.g. Blood, milk, Paper Pulp, Polymeric solutions such as rubber, suspension paints.

92. Which fluid does not experience stress during flow?
(a) Dilatant (b) Bingham
(c) Viscoplastic (d) Inviscid
JPSC AE Pre 2019

Ans. (d) : $\tau = \mu \frac{du}{dy}$
for Inviscid, $\mu = 0$, Then $\tau = 0$

93. A plate weighing 150 N and measuring 0.8 ×0.8 m^2 just slides down an inclined plane over an oil film of 1.2 mm thickness for an inclination of 30° and velocity of 0.2 m/s. Then the viscosity of the oil used is
(a) 0.3 Ns/m^2 (b) 0.4 Ns/m^2
(c) 0.5 Ns/m^2 (d) 0.7 Ns/m^2
ESE 2019

Ans. (d) : Given, W = 150 N
$A = 0.8 \times 0.8\ m^2$
dy = 1.2 mm
$\theta = 30°$
du = 0.2 m/s



For Newtonian fluid

$$\tau = \mu \frac{du}{dy}$$

where τ = shear stress $= \frac{F}{A} = \frac{150 \sin 30}{0.8 \times 0.8}$

$$\tau = \frac{15000}{128} \frac{N}{m^2}$$

$$\frac{15000}{128} = \mu \frac{du}{dy} = \mu \frac{0.2}{1.2 \times 10^{-3}}$$

$$\mu = 0.70 \frac{N-s}{m^2}$$

94. If the bulk modulus of elasticity of the water is 2.2 × 10^6 kN/m^2, the speed of pressure wave is given by
(a) 22000 m/s (b) 1483.2 m/s
(c) 3561.2 m/s (d) 500.3 m/s
APPSC AEE SCREENING 17.02.2019

Ans. (b) : The speed of pressure wave (or sonic speed) is given by

$$v = \sqrt{\frac{K}{\rho}} = \sqrt{\frac{2.2 \times 10^9}{1000}} = 1483.2\ m/s$$

Search on Telegram @apna_pdf

95. Pick the correct statement about the bulk modulus of elasticity :

(a) it is a dimensionless number
(b) is independent of pressure and viscosity
(c) it is larger if fluid is more compressible
(d) it is higher if the fluid is less compressible

BHEL ET 2019

Ans. (d) : Bulk modulus of elasticity (K) is defined as the ratio of compressive stress to voloumetric strain.

$$\text{Bulk modulus} = K \uparrow = \frac{dp}{-\frac{dV}{V}} = -\frac{Vdp}{dV \downarrow}$$

96. In the surface tension of a soap bubble is 0.035 N/m, then work done in blowing the soap bubble of radius 5 cm in air is :

(a) 220 mJ (b) 2.2 mJ
(c) 22 mJ (d) 0.22 mJ

BHEL ET 2019

Ans. (b) : Given -

Surface tension of soap bubbles

$\sigma = 0.035$ N/m

Radius of soap bubble R = 5 cm

Work done $= \sigma[\text{change of surface area}]$

$= \sigma\left[2 \times 4\pi R^2\right]$

$= 0.035 \times (2 \times 4 \times \pi \times 0.05^2)$

$= 0.002199$

$= 2.199 \times 10^{-3}$ J

$= 2.2$ mJ

97. Pick the correct statement about mechanical pressure of fluid element.

(a) It is a first order tensor and depends upon the orientation of the surface upon which it acts.
(b) It is a zero order tensor and does not depend upon the orientation of the surface upon which it acts.
(c) It is zero order tensor and depends upon the orientation of the surface upon which it acts.
(d) It is a first order and does not depend upon the orientation of the surface upon which it acts.

BHEL ET 2019

Ans. (b) :

- Net pressure acting upon element doesn't depend on its inclination.
- Pressure is a scalar quantity and it have only magnitude not direction.
- Pressure is a zero order tensor.

98. 'A fluid is at rest' means that :

(a) it has zero normal stress and non-zero shear stress.
(b) it has non-zero normal stress and zero shear stress.
(c) it has non-zero normal stress and shear stress.
(d) it has zero-normal stress and zero shear stress.

BHEL ET 2019

Ans. (b) : A fluid is at rest means, it has non-zero normal stress and zero shear stress.

99. Select the quantity in the following that is not a dimensionless parameter

(a) Froude number (b) Weber number
(c) Kinematic viscosity (d) Pressure coefficient

Gujarat PSC AE 2019

Ans : (c) : Kinematic viscosity 'v'

$$\nu = \frac{\text{Dynamic viscosity}}{\text{Density}}$$

Kinematic viscosity has the dimensions $L^2\ T^{-1}$ and the units $m^2\ s^{-1}$.

100. A cubical wooden block of edge 100 mm and weight 1 kN sliding down on an inclined plane of inclination 30^0 with the horizontal. A Newtonian fluid with a viscosity of 0.2 Ns/m^2 is layered on the incline plane. If the thickness of the fluid layer is 0.02 mm, then terminal velocity of the block in m/s is :

(a) 0.25 (b) 2.5
(c) 5 (d) 0.5

BHEL ET 2019

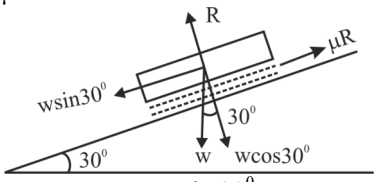
Ans. (c) : Given -

Cubic block, a = 100 mm = 0.1 m

Weight (W) = 1 kN, y = 0.02 mm = 0.02×10^{-3}m

$\theta = 30^0$

$\mu = 0.2$ N-s/m^2



$F_x = W \sin 30^0$

$= 1 \times 10^3 \times \frac{1}{2}$

$F_x = 1000 \times \frac{1}{2} = 500\text{N}$

Area $= a \times a$

$= 0.1 \times 0.1$

$= 0.01\ m^2$

According to Newtonian fluid

$$\tau = \mu \frac{du}{dy}$$

$$\tau = \mu \frac{v}{y}$$

$$\frac{F_x}{A} = \mu \frac{v}{y}$$

$$v = \frac{F_x y}{A\mu}$$

$$= \frac{500 \times 0.02 \times 10^{-3}}{0.01 \times 0.2} = \frac{500 \times 0.02}{0.002}$$

$$= \frac{10}{2} = 5\ \text{m/sec}$$

Search on Telegram @apna_pdf

101. One litre of a certain fluid weighs 12 N. What is its specific volume?

(a) $8.175 \times 10^{-4} m^3/kg$ (b) $8.175 \times 10^{-3} m^3/kg$

(c) $69.24 \times 10^{-4} m^3/kg$ (d) $69.24 \times 10^{-3} m^3/kg$

MECON MT 2019

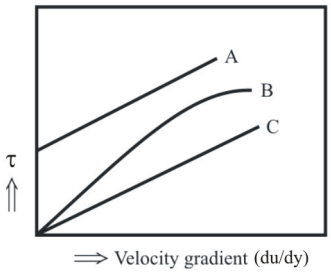
Ans. (a) : Specific volume $= \frac{V}{m}$

Where, $V = 1 \times 10^{-3}\ m^3$

$$m = \frac{12}{9.81}\ kg$$

$$\text{Specific volume} = \frac{1 \times 10^{-3} \times 9.81}{12} = 8.175 \times 10^{-4}\ m^3/kg$$

102. Figure shows a plot of shear stress (τ) versus velocity gradient (du/dy). Name the type of fluids corresponding to A, B and C



(a) A = ideal plastic fluid, B = Newtonian fluid and C = Non–Newtonian fluid

(b) A = ideal plastic fluid, B = Non- Newtonian fluid and C = Newtonian fluid

(c) A = ideal fluid, B = Non- Newtonian fluid and C = Newtonian fluid

(d) A = ideal fluid, B = Newtonian fluid and C= Non-Newtonian fluid

Oil India Ltd. Sr. Engg. (Drilling) 30.11.2019

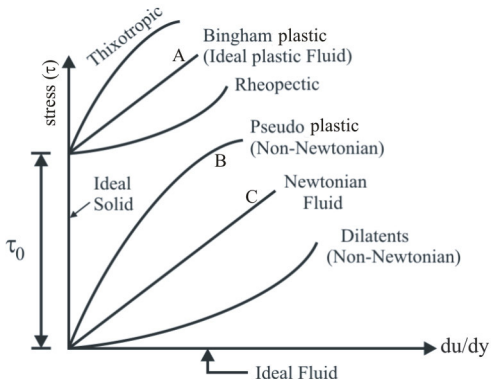
Ans. (b) : Shear stress and velocity gradient diagram for various types of fluid.

For Newtonian Fluid.

$$\tau = \mu\left(\frac{du}{dy}\right)$$

For Non-Newtonian Fluid-

$$\tau = B + k\left(\frac{du}{dy}\right)^n$$



- Dilatent (shear thicking fluid) → B = 0; n > 1
  Example– Honey, Sugar solution, quick sand etc.
- Pseudoplastic (shear thining fluid) → B = 0; n < 1
  Example– Blood, milk, polymer solution (colloidal solution) etc.
- Bingham plastics → B ≠ 0; B = τ_0, n = 1
  Example- Toothpaste, gel, cream, drilling mud etc.

103. The specific gravity of mercury is

(a) 1360 (b) 13600

(c) 1.36 (d) 13.6

APPSC AEE SCREENING 17.02.2019

Ans. (d) : $S_m = \frac{\rho_m}{\rho_w} = \frac{13600}{1000} = 13.6$

104. If σ refers to the surface, tension of the water, ρ refers to mass density, g refers to gravitational accelerations, d refers to the diameter of the glass tube, then the capillary rise of water in the glass tube h is given by

(a) $h = \frac{2\sigma}{\rho g d}$ (b) $h = \frac{3\sigma}{\rho g d}$

(c) $h = \frac{4\sigma}{\rho g d}$ (d) $h = \frac{6\sigma}{\rho g d}$

TNPSC AE 2019

Ans. (c) : The capillary rise of water in the glass tube h is given as

$$h = \frac{4\sigma \cos\theta}{\rho g.d}$$

$$\text{So, } h = \frac{4\sigma}{\rho g d}$$

$\theta = 0^o$ [For water in glass tube]

105. What will be the density of fluid having dynamic viscosity of 0.05 poise and kinematic viscosity of 0.04 stokes?

(a) 125 kg/m^3 (b) 12.5 kg/m^3

(c) 1250 kg/m^3 (d) 1.25 kg/m^3

(e) 12500 kg/m^3

CGPSC AE 25.02.2018

Ans. (c) : We know that

$$\text{kinematic vicsocity}(\nu) = \frac{\text{Dynamic viscosity}(\mu)}{\text{Density}(\rho)}$$

$$\rho = \frac{0.05 \times 10^{-1}}{0.04 \times 10^{-4}} = 1250\ kg/m^3$$

$$1\ \text{Poise} = 10^{-1}\ \frac{N\text{-}s}{m^2}$$

$$1\ \text{Stokes} = 10^{-4}\ \frac{m^2}{s}$$

106. A glass tube of 8 mm diameter is immersed in water. Surface tension of water is 0.0075 kg m^{-1} and rise of water in the tube due to capillary effect is

(a) 7.5 mm (b) 3.75 mm

(c) 11.25 mm (d) None of these

ISRO Scientist/Engineer 22.04.2018

Search on Telegram @apna_pdf

Ans. (b) : Rise of water in the tube due to capillary effect

$$h = \frac{4\sigma\cos\theta}{\rho g d}$$ For water in glass tube θ = 0°,

Cos 0° = 1

$$h = \frac{4\times 0.0075\times 1}{1000\times 0.008} \qquad (\sigma = 0.0075\times g \;\; N/m)$$

h = 0.00375 m

$$\boxed{h = 3.75\,mm}$$

107. Property of a fluid by which molecules of different kinds of fluids are attracted to each other is called

(a) adhesion (b) cohesion
(c) viscosity (d) surface tension

TNPSC AE 2018

Ans. (a) : Adhesion, is the property of fluid by which molecules of different kinds of fluids are attracted to each other.

108. Compressibility is the reciprocal of

(a) bulk modulus of elasticity
(b) shear modulus of elasticity
(c) young's modulus of elasticity
(d) viscosity

TNPSC AE 2018

Ans. (a) : Compressibility is the reciprocal of bulk modulus of elasticity.

$$\beta = \frac{1}{K} = \frac{\left[\frac{\Delta V}{V}\right]}{\Delta P}$$

109. The normal stresses within an isotropic Newtonian fluid are related to

1. Pressure
2. Viscosity of fluid
3. Velocity gradient

Which of the above are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

ESE 2018

Ans. (d) : The normal stresses of an isotropic Newtonian fluid are related to pressure, viscocity and velocity gradient. The relationships for the normal stresses is

$$\sigma_x = -p + 2\mu\frac{\partial u}{\partial x}$$

110. The mass of 2.5 m^3 of a certain liquid is 2 tonnes. Its mass density is

(a) 200 kg/m^3 (b) 400 kg/m^3
(c) 600 kg/m^3 (d) 800 kg/m^3

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : Mass of liquid = 2 tonn = 2000 kg

volume of the solution = 2.5 m^3

mass density is defined as mass per unit volume.

So mass density = $\frac{M}{V} = \frac{2000}{2.6} = 800\ kg/m^3$

111. A vessel of 4 m^3 contains an oil which weights 30 kN. The specific weight of the oil is

(a) 4.5 k N/m^3 (b) 6 k N/m^3
(c) 7.5 k N/m^3 (d) 10 k N/m^3

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Specific weight is the amount of weight per unit volume of a substance

$$\gamma = \frac{w}{v}$$

$$\gamma = \frac{30}{4} = 7.5 \;\; kN/m^3$$

112. The variation in the volume of a liquid with the variation of pressure is called its

(a) Surface tension (b) Compressibility
(c) Capillary (d) Viscosity

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (b) : The variation in the volume of a liquid with the variation of pressure is called its compressibility.

113. One litre of water occupies a volume of

(a) 100 cm^3 (b) 250 cm^3
(c) 500 cm^3 (d) 1000 cm^3

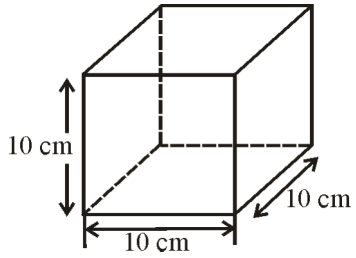
Nagaland PSC (CTSE) 2018, Paper-II

Ans. (d) : One liter is the volume of a cube that is 10 cm on each side.

Volume of cube = length × width × height

1 liter = 1000 cm^3

1 liter = 1000 × 10^{-6} m^3



114. Bulk modulus of a fluid is the ratio of

(a) Shear stress to shear strain
(b) Increase in volume to the viscosity of fluid
(c) Increase in pressure to the volumetric strain
(d) Critical velocity to the viscosity of fluid

Nagaland PSC (CTSE) 2018, Paper-II

Ans. (c) : Bulk modulus is a measure of the resistance of a fluid to compression. It is defined as the ratio of pressure stress to volumetric strain.

115. How does the viscosity of fluids vary with increase in temperature?

(a) Increases for both liquids and gases
(b) Increases for liquids, decreases for gases
(c) Increases for gases, decreases for liquids
(d) Decreases for both liquids and gases

ISRO Scientist/Engineer 07.05.2017

Search on Telegram @apna_pdf

Ans. (c) :
Temperature↑= μ_{gas} ↑ (viscosity of gas increases)
and Temperature↑= μ_{liquid} ↓ (Viscosity of liquid decreases)

116. Viscosity is the property of fluid evolved due to
(a) Resistance offered by the layers of fluid
(b) Resistance offered by sidewalls of the channel
(c) Spontaneous reactions in the fluid
(d) None of the above

Nagaland PSC CTSE 2017 Paper-2

Ans. (a) : Viscosity is defined as the property of fluid evolved due to internal resistance offered by one layer of the fluid to the adjacent layer.

117. The viscosity of liquids decreases with increase in temperature due to:
(a) Decreased cohesive forces
(b) Increased cohesive forces
(c) Decreased molecular momentum transfer
(d) Increased molecular momentum transfer

CIL MT 26.03.2017

Ans. (a) : In liquids main cause of viscosity is **cohesion** between the molecules. With increase in temperature the cohesive force decreases as the energy of particles become more, hence movement of particles become easy. Hence viscosity of water decreases with increase in temperature.
In gases the important cause of viscosity is **randomness/molecular** collision due to C_{rms}(root mean square) velocity. Due to rise in temperature, kinetic energy of molecules increases which makes C_{rms} increase, hence randomness and collision of molecules increased. This makes the flow difficult and hence viscosity in gases increases with temperature.

118. One kgf/cm^2 when converted to SI units is
(a) 0.0981 MPa (b) 0.98 MPa
(c) 10^4 Pa (d) 1 Pa

TNPSC AE 2017

Ans. (a) : $\text{kgf/cm}^2 = \dfrac{9.81}{10^{-4}}\dfrac{\text{N}}{\text{m}^2} = 9.81\times10^4\text{Pa}$
$= 0.0981 \times 10^6$ Pa = 0.0981 MPa

119. The excess pressure in a droplet of 0.002m diameter a fluid with surface tension of 0.01 N/m is
(a) 10 (b) 20
(c) 4 π (d) 0.0004 π

TNPSC AE 2017

Ans. (b) :
$$P_{gauge} = \frac{4\sigma}{d}$$
$$= \frac{4\times0.01}{0.002}$$
$$= 20 \text{ Pa}$$

120. Statement (I): Non viscous flow between two plates is an example for irrotational flow.
Statement (II): Forced vortex is irrotational in nature.
(a) Both Statement (I) and Statement (II) are individually true and Statement (II) is the correct explanation of Statement (I)
(b) Both Statement (I) and Statement (II) are individually true but Statement (II) is NOT the correct explanation of Statement (I)
(c) Statement (I) is true but Statement (II) is false
(d) Statement (I) is false but Statement (II) is true

UPSC JWM 2017

Ans. (c) : Non-viscous flow is a flow has zero viscosity
$$\mu = 0$$
$$\tau = \mu\frac{du}{dy};\quad \tau = 0;\quad \frac{F}{A} = 0$$
Shear force, F = 0
In non-viscous flow– fluid particle do not revolve its own centre of mass as absence of shear force which makes it irrotational flow.
Forced vortex flow– When a fluid is rotated about a vertical axis with constant speed and every particle of this fluid has some angular velocity.
Forced vortex is rotational in nature.

121. A plate 0.02 mm distance from a fixed plate moves at 20 cm/s requires a shear stress of 4 N/m^2 to maintain this speed. Viscosity of fluid available inside these plates is :
(a) 4×10^{-4} Poise (b) 4×10^{-6} Poise
(c) $4\times10^{-5}\ \dfrac{\text{Ns}}{\text{m}^2}$ (d) $4\times10^{-4}\ \dfrac{\text{Ns}}{\text{m}^2}$

TRB Polytechnic Lecturer 2017

Ans. (d) : Data given,
$y = 0.02 \times 10^{-3}$ m, u = 0.2 m/s, $\tau = 4\dfrac{\text{N}}{\text{m}^2}$, $\mu = ?$
We know that,
$$\mu = \frac{\tau}{u/y} = \frac{4}{0.2/\left(0.02\times10^{-3}\right)} = 4\times10^{-4}\frac{\text{Ns}}{\text{m}^2}$$

122. If one litre of a fluid has a mass of 7.5 kg then its specific gravity is:
(a) 0.75 (b) 7.5
(c) 75 (d) 750

TRB Polytechnic Lecturer 2017

Ans. (b) : Data given,
m = 7.5 kg, V = 1 litre = 10^{-3}m^3, $\rho = \dfrac{m}{V} = 7.5\times10^3\ \dfrac{\text{kg}}{\text{m}^3}$
Then, Specific gravity of fluid
$$= \frac{\rho_{fluid}}{\rho_{water}} = \frac{7.5\times10^{+3}}{1000} = 7.5$$

123. For the conversion of one poise into MKS unit of dynamic viscosity dividing factor will be
(a) 9.81 (b) 0.981
(c) 98.1 (d) 981

Nagaland PSC CTSE 2017 Paper-2

Search on Telegram @apna_pdf

Ans. (c) : The dividing factor of converting one poise into MKS unit of dynamic viscosity is 98.1.

$1 \text{ poise} = \frac{1}{10}\frac{\text{Ns}}{\text{m}^2} = \frac{1}{98.1}\frac{\text{kgf}-\text{s}}{\text{m}^2} \quad (\because 1\text{kgf} = 9.81\text{N})$

124. A Spherical water drop of 1 mm in diameter splits up in air in to 64 smaller drops of equal size. The surface tension coefficient of water in air is 0.073 N/m. The work required in splitting up the drop is

(a) 0.96×10^{-6} J (b) 0.69×10^{-6} J
(c) 0.32×10^{-6} J (d) 0.23×10^{-6} J

ESE 2017

Ans. (b) : Given–

D = 1 mm
R = 0.5 mm
n = 64
σ = 0.073 N/m

Volume before splitting = Volume after splitting

$$\frac{4}{3}\pi R^3 = n\cdot\frac{4}{3}\pi r^3$$

$$R^3 = nr^3$$

$$r = \frac{R}{n^{1/3}} = \frac{0.5}{(64)^{1/3}} = \frac{1}{8}$$

$$r = 0.125 \text{ mm}$$

Surface energy before splitting $E_1 = \sigma.4\pi R^2$
Surface energy after splitting $E_2 = n.(\sigma 4\pi r^2)$
So, work require in splitting = $E_2 - E_1$
$= 4\pi\sigma\,[nr^2 - R^2]$
$= 4 \times 3.14 \times 0.073\,[64\,(0.125)^2 - (0.5)^2] \times (10^{-3})^2$
$E_2 - E_1 = 0.687 \times 10^{-6}$ J

125. If no resistance is encountered by displacement, such a substance is known as:

(a) perfect solid (b) perfect liquid
(c) gas (d) ideal fluid

Kerala PSC AE (Irrigation) 05.04.2017

Ans. (d) : If no resistance is encountered by displacement, such a substance is known as ideal fluid.
Fluid is said to be ideal if it is assumed to be both incompressible and non-viscous.
Its bulk modulus is infinite. Ideal fluid has no surface tension.

126. Liquids are generally used as insulating materials upto stress of about:

(a) 100 MV/cm (b) 50 MV/cm
(c) 50 KV/cm (d) 500 MV/cm

PTCUL AE 25.06.2017

Ans. (c) :

127. Unit of mass density is -

(a) kg /km (b) kg/m^3
(c) $kg.sec^2/m^3$ (d) $kg.sec^2/m^4$

GMB AAE 25.06.2017

Ans. (b) : kg/m^3

128. The kinematic viscosity is dependent upon

(a) pressure (b) distance
(c) flow (d) density

WBPSC AE, 2017

Ans. (d) : Kinematic viscosity = $\frac{\text{Dynamic viscosity}}{\text{Density}}$

$$\nu = \frac{\mu}{\rho}$$

$$\nu \propto \frac{1}{\rho}$$

129. Which of the following is the unit of kinematic viscosity?

(a) Pascal (b) Poise
(c) Stoke (d) Faraday

WBPSC AE, 2017

Ans. (c) : Kinematic Viscosity–It is the ratio of dynamic viscosity to density of substance.

- Formula $\nu = \frac{\mu}{\rho}$
- Unit of kinematic viscosity $= \frac{\text{Unit of dynamic viscosity}}{\text{Unit of mass density}}$

$$\text{SI/MKS unit} = \frac{\text{kg/m.s}}{\text{kg/m}^3}$$

$$\text{SI/MKS unit} = \frac{\text{m}^2}{\text{s}}$$

$$\text{CGS unit} = \frac{\text{cm}^2}{\text{s}} = \text{stokes}$$

- Dimensional formula $\Rightarrow L^2T^{-1}$ or $M^0L^2T^{-1}$

$1\ m^2/s = 10^4$ stoke
1 stoke = $10^{-4}\ m^2/s$

130. A fluid whose viscosity does not change with the rate of deformation or shear strain is known as

(a) real fluid
(b) ideal fluid
(c) Newtonian fluid
(d) Non-Newtonian fluid

Sikkim PSC (Under Secretary), 2017

Ans. (c) : A fluid whose viscosity does not change with the rate of deformation or shear strain is known as Newtonian fluid.
A real fluid, in which shear stress is directly proportional to velocity gradient (Rate of shear stress is known as Newtonian fluid)

$$\tau = \mu\frac{du}{dy}$$

e.g. Newtonian fluid– Oil, water, petrol, diesel, Hg etc.

131. In fluid statics

(a) There is no relative motion between adjacent layers of fluid where shear stress is maximum
(b) Velocity gradient and shear stress is zero
(c) Liquid particles are at rest with no velocity gradient with maximum shear stress

Search on Telegram @apna_pdf

(d) Forces acting on fluid particles are due to gravity which cause spinning of molecules leading to steady increase in velocity

Karnataka PSC Lect., 27.05.2017

Ans (b) : For a static fluid, i.e. a body of fluid that is at rest or has zero velocity the shear stress is always zero. Also for static fluids, the normal stress is always positive.

132. Which of the following forces does NOT act on a fluid in rest?

(a) Gravity force
(b) Hydrostatic force
(c) Surface tension force
(d) Viscous force

Punjab PSC (Lect.) 06.08.2017

Ans. (d) : Viscous force does not act on a fluid in rest.

133. Which of the following liquids is classified as Newtonian fluid?

(a) Honey (b) Petrol
(c) Glycerine (d) Paint

HPPSC Asstt. Prof. 20.11.2017

Ans. (b) : Examples of Newtonian Fluid- Water, Air, Kerosene, Diesel, Petrol, Methyl Alcohol, ethyl alcohol etc.

134. The density of a liquid is 1000 kg/m^3. At location where g = 5 m/s^2, the specific weight of the liquid will be :

(a) 200 N/m^3
(b) 5000 × 9.81/5 N/m^3
(c) 5000 N/m^3
(d) 5000 × 5/9.81 N/m^3

HPPSC Asstt. Prof. 20.11.2017

Ans. (c) : Given, $\rho = 1000$ kg/m^3, $g = 5$ m/sec^2

Specific weight (w) = ρg

= 1000 × 5 = 5,000 N/m^3

135. The density of one litre of liquid which weighs 7.5 N is

(a) 764.53 Kg/m^3 (b) 754.55 Kg/m^3
(c) 760.53 Kg/m^3 (d) 750.55 Kg/m^3

Jharkhand Urja Vikas Nigam Ltd. AE 2017

Ans. (a) : Given –

Weights = 7.5 N

$$\text{Volume} = \frac{1}{1000}\text{m}^3 = 10^{-3}\ \text{m}^3$$

$$\text{Specific weight } w = \frac{\text{weight}}{\text{volume}}$$

$$= \frac{7.5}{10^{-3}} = 7500\ \text{N/m}^3$$

$$\text{Now density } \rho = \frac{w}{g} = \frac{7500}{9.81} = 764.53\ \text{kg/m}^3$$

136. What happens to the liquid level, when a small diameter tube is inserted into a liquid whose contact angle is 125°?

(a) Liquid level in the tube will fall first and then rise.
(b) Liquid level in the tube falls.
(c) Liquid level in the tube remains constant.
(d) Liquid level in the tube rises.

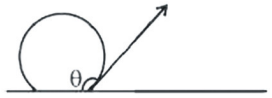
CIL MT 26.03.2017

Ans. (b) : Case – 1 contact angle is acute

Wetting fluid

In case of wetting fluid, level in capillary tube will rise.

Case – 2 Contact angle is obtuse



Non - wetting fluid

In case of non – wetting fluid, level in capillary tube will fall.

137. The pressure in metres of oil (specific gravity 0.85) equivalent to 85 meters of water is :

(a) 100m (b) 85m
(c) 8.5 m (d) none of the above

Kerala PSC IOF 19.04.2016

Ans. (a) : $(\rho gh)_w = (\rho gh)_{oil}$

$1000 \times g \times 85 = 850 \times g \times h$

$h_{oil} = 100$ m

138. The temperature influence of dynamic viscosity on a fluid is as follows :

(a) For gases viscosity increases with increase in temperature and for liquids it decreases with increase in temperature
(b) For gases viscosity increases with increase in temperature and for liquids it increases with increase in temperature
